On Tuesday Lord Campbell and the Court of Error reversed this judgment. "After listening" said his Lordship, "to a very learned argument, we are all of opinion that the evidence was sufficient to entitle the plaintiff to a verdict on both the issues, and therefore there must be a *venire de novo* (new trial). The Court, he continued, saw no sufficient reason for thinking that it was the intention of the Legislature to exclude foreigners from the benefits of the statute. The British Parliament has no power to legislate for aliens beyond the British territory, but within the limits of that territory it has the power, and the Court conceived that the general words must be presumed to do so. The monopoly which the statutes confer, and the conditions for the enjoyment of it are to be presumed here. What was there to rebut the presumption that aliens are entitled? The statute 8 Anne, c. 19, is for the encouragement of learning by vesting the right in printed books in the authors thereof. Assuming that the Legislature intended this expressly for the encouragement of learning in great Britain, might it not be for the encouragement of learning that foreigners should send their works here to be first published? If Rapin and De Lolme had written their va uable works on our Constitution on the Continent without visiting this country, instead of first publishing them in England, as they did, was it to be contended that they would have been debarred from assigning their property in these works to an Englishman? The real question was, whether a foreigner could send by a publisher here, could acquire a copyright it. Upon that question depended his right to assign to another. It was admitted that if a foreigner composed his work here, he might acquire a copyright in it; and the learned counsel for the defendant would not deny that if a foreigner while living here for a temporary purpose wrote a poem, he might publish it and acquire a copyright in it here. If he composed it in his own country, and brought it over in his memory and produced it here for the first time, or if he had written out a book in manuscript, would it have made any difference? Could the fact of his having once been within our realm be essential to his right as an author, if he did that by an agent which it was not disputed he might do in his own proper person?"

A new trial was accordingly ordered.

NAVAL AND MILITARY INTELLIGENCE.

No successor has as yet been appointed to take the command of the Nore, in the room of Vice-Admiral the Hon. George Elliot, C.B., but it is the general impression the Captain Sir Thomas Hastings, Bart., Superintendent, 438. Of the first officers, 11; captains, 75; commanders, 75; lieutenants, 438. Of the first hundred officers on the captains' list who have not as yet served a sufficient time as captains to entitle them to their flag, there are 54; and, of the second hundred, 84.

The Master-General and Board of Ordnance have approved of the erection of new schools in Woolwich, to be constructed two stories in height, in front of the Royal Artillery Arms Tavern, at the north-west gate of the barracks for the instruction of 300 boys and 200 girls, one and de ughters of the non-commissioned officers and men of the Royal Artillery and Royal Sappers and Miners. The quarters of the schoolmasters will be on the right, and the schoolmistresses on the left, and on an elevation in the centre will be placed a clock.

The yearly return of the expenditure for the relief of the poor in Ireland, in 153 unions, to the 29th of September last, shews the gross amount to be £1,430,108, of which £710,945 was for in-door relief, £12,789 for out-door relief, and the enormous sum of £708,373 for salaries of officers, &c.

IMPERIAL PARLIAMENT.

HOUSE OF LORDS.—MONDAY.

The Expenses of Prosecutions Bill was read a second time.

PROPERTY-TAX BILL

The Marquis of Lansdowne moved the second reading of the Property-tax Bill, the unpopularity of which he admitted, owing to the inequalities which pervaded the impost. Although the tax was originally a war tax, yet, under the circumstances of the country, it was justifiable to resort to it, owing to the financial exigences; and there were just grounds for hoping that the commercial changes which the tax had been the means of enabling them to effect would create such a degree of prosperity to the country, and such a consequent increase of revenue, as to enable the Government to dispense with the tax altogether. The noble Lord entered at some length into a defence of the financial projects of the Chancellor of the Exchequer.

Lord Stanley could not understand the policy of the Government as exemplified in the Budget of the Chancellor of the Exchequer, but, believing the Property-tax to be indispensable during the present year, and, he feared, for the next year also, he was not prepared to reject a measure which they had no power to modify. In the case of coffee he could not understand how the Government could allow the revenue to be lessened, and the poor to be defrauded by adulterations, with which they declined to interfere; nor could he understand why they should reduce the taxes, as in the case of the timber duties, which the producer immediately added to the price of the article an amount equivalent to the extent of duty reduced. In the case of the window duties, which they had changed to a house tax, he could not understand why they should exempt houses under £20 value. If they gave the franchise to £10 houses, they ought, on the principle that taxation and representation should go together, to extend the tax at all events to the limits of the franchise.

After some observations from the Earl of Malmesbury, Lord Berners, Lord Monteagle, and Earl Grey, the bill was read a second time.—Adjourned.

HOUSE OF COMMONS.—MONDAY.

THE HARWICH ELECTION PETITION.

Mr. K. Seymer, as chairman of the select committee appointed to inquire into the merits of a certain petition presented against the late return for the borough of Harwich, reported the House had met H. T. Prinsep was not of age and as a member of that House, not being qualified according to the terms of the act requiring members to possess certain qualifications, and that the last election for the borough was a void election. Mr. K. Seymer further informed the House that the committee had altered the poll by striking off the roll the names of several persons who had no right to vote as electors on that occasion.

NEW WRIT.

On the motion of Mr. Hayter, a new writ was ordered to issue for Cockermouth and Kinross, in the room of General Sir William Morison, deceased.

SEWERS COMMISSION.

Lord Duncan wished to know when a bill relating to the Commissioners of Sewers would be laid on the table of the House?

Sir G. Grey replied, that it was impossible at that moment to state when it would be laid on the table.

Mr. Fitzroy hoped that whenever it was presented full opportunity would be given for discussion.

THE KAFFIR WAR.

Mr. Hume asked whether there would be any objection to produce the dispatch last received from the Cape, stating the charges of the Kaffir war? He understood it would amount to a million sterling, instead of £300,000

Mr. Hawes said, if the hon. member would put the question to-morrow, he would give a reply.

Mr. Anderson asked whether commissioners had been appointed to inquire into the affairs of Kaffraria?

Lord J. Russell replied that commissioners would be appointed to go as assistant commissioners to the Cape to inquire into the affairs of Kaffraria, but it was not intended to supersede Sir Harry Smith. It was always intended to send persons from this country to the Cape.

Mr. Roebuck asked, would the noble Lord give the House a description of the powers to be given to these commissioners—the powers respecting peace and war for instance?

Lord J. Russell answered that he would consider. The persons that would be sent out would be assistant-commissioners.

Mr. Roebuck: Will the assistant-commissioners have power to make peace?

Lord J. Russell: Sir Harry Smith is the Commissioner.

THE EXHIBITION.

Mr. Hume said he understood the Government had given leave to the dockyard servants to visit London for six or ten days to see the Exhibition, and he had come to ask whether the Government would pay their expenses, and whether they would give a like privilege to all the public servants.

Sir F. Baring replied that the Admiralty had only given leave to the dockyard men to come up for a few days to see the Exhibition, but they did not propose to pay the men's expenses.

ECCLESIASTICAL TITLES ASSUMPTION BILL.

The House went into committee on the Ecclesiastical Titles Assumption Bill; Mr. Bernal in the chair.

On the first usual formal notice put by the Chairman, "That this bill be read a first time,"

Mr. Reynolds moved that the Chairman report progress, and contended that his so doing was no infraction of the understanding which had been come to on Friday evening, either in letter or spirit, because the bill was so extensively altered that there had been no time to understand it in its new shape, the printed copies having been placed in their hands only very late in the day.

Sir G. Grey said he would leave it to the House whether the motion of the hon. gentleman was or was not an infraction of the understanding which had been come to; but he hoped they would be allowed to proceed with the consideration of the clauses of the bill

The Earl of Arundel and Surrey seconded the motion of Mr. Reynolds. The bill was now a wholly different one from what it had been, and there had been no time whatever given for understanding it in its present form.

Mr. Roebuck was of a similar opinion, and appealed to the law officers of the Crown to say whether it was possible that the House could understand the bill in the short time which had been given for its consideration, since the extensive alterations which had been made in it

Mr. Gladstone opposed the motion of Mr. Reynolds, because it was, in his opinion, a breach of the bad bargain which the hon. gentleman and his friends had made on Friday night. He thought, however, that some days ought to be given for the consideration of the bill, and at all events the law officers of the Crown ought to state to the House the nature and scope of the alterations which had been made for now the third time, and the effect they would be likely to produce in operation.

After some discussion, in which Mr. Keogh, Mr. F. Howard, Mr. Roche, and Lord J. Russell took part,

The House divided; and the numbers were.—

For reporting progress	..	..	..	..	46
Against it	..	..	..	..	269
Majority	..	..	..	..	—216

The Attorney-General then entered into a statement of the nature of the alterations that had been made, denying that the bill was a new one. The only clause which could be called new, was the first (Mr. Walpole's declaratory amendment), but that clause did not alter the character of the measure. In fact, it was included in a recital of the bill as it originally stood, and its introduction as a clause was resolved upon merely to satisfy a general feeling that a more formal enunciation should be made. As a clause, it contained no more than it did when recited, in the preamble; namely, that the Pope's rescript, so far as barring jurisdiction and titles, was illegal. With regard to the second clause (prohibiting the use of titles, under a penalty of £100), it had been so much discussed, that it was really unnecessary to enter into an explanation. It was only an extension of the provisions of the Emancipation Act, to prevent the assumption of titles of places not already filled by prelates of the Church of England.

On the question that the preamble be postponed,

Mr. P. Howard enforced the necessity for giving time for consideration before proceeding to discuss the bill.

In reply to Mr. Seymer, the Solicitor-General said that the new bishopric of Ross, recently created by rescript from the Pope, would be clearly illegal under the provisions of the bill.

In reply to a question from Mr. Gladstone, the Solicitor-General said that rescripts from Rome, in reference to matters of discipline in the Roman Catholic Church, would remain as previously the same position after the passing of this bill as they stood in since the act of 1829.

After some discussion of a legal character,

Mr. M. Gibson condemned the bill as the most obscure, perplexed, and unintelligible he had ever known presented to the House. He read from the last report of the Committee of Council on Education a magnificent clause for the poor Catholics of London, in which the council expressly recognised the title of the Catholic bishop of the district. This was the very offence which the new bill would make penal.

After a lengthened discussion, in which Sir F. Thesiger, Mr P. Howard, Lord Bernard, Mr. T. Duncombe, Mr. Keogh, and other hon. members took part,

Mr. Reynolds moved that the Chairman report progress.

The House divided, and the motion for reporting progress was negatived by a majority of 271 to 30.

A second division took place on the question that the preamble be postponed, which resolution was carried by a majority of 288 to 45.

The Earl of Arundel and Surrey then moved that the chairman report progress

After considerable further discussion on the point,

Sir G. Grey would assent to the Chairman reporting progress, as he understood several hon. members intended to give notice of amendments, which he thought a fair reason for delay. He would, therefore, further postpone the progress of the bill in committee until Friday.

The House then resumed, the Chairman reported progress, and obtained leave to sit again on Friday.

NEW FOREST DEER.

Lord Seymour obtained leave to bring in a bill to extinguish the right of the Crown to deer in the New Forest, and for other purposes; which was read a first time.

Mr. M. J. O'Connell moved that the Earl of Arundel and Surrey be discharged from attendance on the select committee on mortmain, and that Mr. Keogh be added to the committee.—Agreed to.

Adjourned at a quarter to one o'clock.

HOUSE OF LORDS.—TUESDAY.

The Royal assent was given, by commission, to the Servants and Apprentices Bill, and a long list of public and private bills.

CRIMINAL JUSTICE IMPROVEMENT AND PREVENTION OF OFFENCES BILLS

Lord Campbell brought up the report of the select committee, and moved the order of the day that these bills should pass through a committee of the House. They now extended to Ireland, and he had received a suggestion from Lord Chief Justice Clerk that they should also include Scotland. A separate bill, however, would be more desirable; and he would either bring it in, or assist the Lord-Advocate in passing such a measure, if he would bring it forward.

The bills then severally passed through committee, and were reported to the House.

THE CAPE OF GOOD HOPE.

In reply to Lord Wharncliffe,

Earl Grey stated the reasons that had induced the Government to send out two commissioners to South Africa, to assist the Governor under the pending difficulties on the Kaffrarian frontier. A commission of inquiry had been suggested, but it was considered that step was inadvisable at the present moment, when it might interfere with the operations necessary to meet an existing exigency, without much chance of obtaining any information of value. Two gentlemen now sent—Major Hogg and Mr. Owen—had acquired much experience during the last Kaffir war, and were now intended to assist Sir H. Smith, by undertaking, in subordination to his authority, the political department of the proceedings that might be instituted, the whole attention of the Governor being probably monopolised by the military services.

To a further question of the same noble Lord, Earl Grey declined for the present to lay on the table a copy of the commission under which Major Hogg and Mr. Owen were to act, but promised the speedy production of some supplementary papers, correspondence, &c., subsequent to that already in their Lordships' hands.

Lord Campbell brought up the report with the amendments of the Registration of Assurances Bill, which was received, after some discussion shared between Lord Colchester and Lord Beaumont.

The Property-tax Bill passed through committee.—Adjourned.

HOUSE OF COMMONS.—TUESDAY.

NEW WRIT.

On the motion of Mr. Hayter, a new writ was issued for the election of a new member for the borough of Harwich, in the room of Mr. Prinsep, unseated.

ADMISSION TO THE UNIVERSITIES

Mr. Heywood gave notice that, on the 9th of June, he would make a motion with regard to the qualifications for admission to the universities of Oxford and Cambridge.

On the motion of Major Beresford, it was agreed, that the House, at its rising, adjourn over the "Derby Day" to Thursday.

TRANSPORTATION.—VAN DIEMEN'S LAND.

Sir W. Molesworth, after presenting several numerously signed petitions from Van Diemen's Land, praying for the discontinuance of transportation to that colony, supported the prayer of the petitioners with an elaborate detail of facts and arguments. He produced a copious array of evidence from official correspondence, public meetings, and ministerial despatches, to prove the case set forth by the colonists, and which he divided into three branches. First, that a mass of accumulating and most appalling crime had resulted within the settlement from the transportation system: secondly, that the present governor, Sir W. Denison, had promised some years since, in the name of the Government, and under their authority, that a stop should be put to the system; and, thirdly, that up to the present moment the promise was unfulfilled, thus vio ating the contract made with the colonists, and tending to diminish their attachment to the mother country. The hon. Baronet concluded by moving an address to the Crown, praying that no further transmission of convicts be allowed to Van Diemen's Land.

Sir G. Grey reminded the House, that the question, though ostensibly narrowed to the case of a single colony, in reality involved the whole controversy whether transportation should be continued as a secondary punishment; and if not, in what manner the Government were to get rid of the convicted criminals that accumulated in our prisons at home. He contended that transportation as a system was at present indispensable, and, after repeated consideration, had received the approval of the House generally, and of committees of inquiry, as the only available resource for the disposal of a convict population. With regard to the special case pleaded in behalf of Van Diemen's Land, the Home Secretary admitted that the system was extensively disliked in the colony; but he could not concede the position that any definite promise of discontinuance had been made by the Government, so as to justify the charge of breach of faith. Sovereign appeals had been received from the colonists, and an understanding entered into that a temporary suspension of transportation should be granted. This engagement had been carried out, and the expectations of the inhabitants were in some measure belied by the resumption of the system after two years' interval, this arose entirely from the accumulation of prisoners in this country, and the practical difficulties that stood in the way of every attempt to dispose of them otherwise than by the convict system as heretofore worked He then addressed himself to the statements offered by Sir W. Molesworth, with the view to know that they were coloured, mostly in respect to the case of the convicts lately sent to, and accumulated in Van Diemen's Land, and read extracts from official documents setting forth the prosperous and improved condition in which that colony existed at the present moment. In favour of this improvement he assigned to the care taken at home to impress lessons of industry and morality upon the convicts before the sentences of transportation was carried into effect. The Pentonville and Parkhurst prisons worked well in this way, and the transported felons now often became valuable labourers in the colonies to which they were sent. Further arrangements were contemplated, principally with the view of distributing the number of convicts over a wider area, or their employment upon remunerative works, into which the right hon. Baronet entered at considerable length. He trusted the House would not, by assenting to the present motion, increase the difficulties of the Government while shrinking from the task of finding some substitute for transportation as a punishment and outlet for criminals.

Mr. C. Anstey supported the motion. The hon member was proceeding with his argument, when

The House was counted out (there being only 33 members present) at half-past seven.

HOUSE OF LORDS.—THURSDAY.

The Property-tax Bill was read a third time and passed.

EPISCOPAL AND CAPITULAR ESTATES MANAGEMENT BILL

The Earl of Carlisle moved the second reading of this bill, with a view to its being referred to a select committee.

The Bishop of Oxford moved, as an amendment, that it be referred, along with the various reports of the commissioners on the subject, to a select committee, previous to its second reading.

After some discussion, the House divided—

For the second reading..	..	..	..	..	46
Against it	..	..	..	..	28
Majority for the second reading					—18

The bill was accordingly read a second time, and referred to a select committee.—Adjourned.

HOUSE OF COMMONS.—THURSDAY.

NEW WRIT.

On the motion of Mr. Cumming Bruce, a new writ was ordered for the county of Argyll, in the room of Mr. Duncan MacNeil, who had accepted the office of one of the Judges in Scotland

ATTORNEYS' CERTIFICATE DUTY

Lord R Grosvenor announced that it was not his intention to bring forward his motion on this subject.

ISLINGTON CATTLE MARKET.

Mr Wilson Patten moved that the Islington Cattle Market Bill be referred to the Committee on Smithfield Market Removal Bill.—Agreed to.

ECCLESIASTICAL TITLES BILL.

Mr. T. Duncombe gave notice, that, on going into Committee on this Bill, he should move that the first clause be omitted, and that the House go into committee of the brief, rescript, or letter apostolic on which the said clause is founded.

RAILWAY ACCIDENTS

Sir G. Clerk wished to ask the right hon. gentleman at the head of the Board of Trade what steps had been taken by the Rail way Board in relation to the two late railway accidents; and whether, if the Railway Board had not power to stop regular trains for the public safety, it was the intention of the right hon. gentleman to introduce a bill for the purpose of enabling that Board to interfere for the safety of life and limb to the public.

Mr. Labouchere said the subject had been for some time, and was still under the consideration of the Railway Board. With regard to the first accident, a very able report had been presented to the Commissioners on the subject by the gentleman who had been sent down for the purpose, which report he should feel it his duty to lay upon the table of the House. (Hear, hear.) An inspector had also been sent down to attend the inquest on the second when it took place. With regard to the most material part of the right hon. Baronet's inquiry, the propriety of the Railway Commissioners undertaking the special control of rail way arrangements, in order to ensure public safety, he would take the liberty of asking the House to be very cautious before they adopted the opinion that the public safety would be increased by being placed under the control of a railway board

CAPITAL PUNISHMENT.

Mr. Ewart rose to move that it is expedient that the mitigations which have been made in the laws for capital punishment in England be extended to Scotland, and (as far as possible) to the colonies. possessions of this country

Sir G. Grey was understood to say that instructions had been forwarded to Scotland to make the law there in criminal cases as lenient as it is in England. (Hear)

Mr. Ewart said the purpose of his motion had been answered by the discussion which it had given rise to, and he would not, therefore, put the House to the trouble of dividing upon it.

The motion was accordingly withdrawn with leave.

SECULAR EDUCATION

Mr. W. J. Fox then rose, pursuant to notice, to move that it was expedient to promote the education of the people, in England and Wales, by the establishment of free schools for secular instruction to be supported by local rates, and managed by committees elected especially for that purpose by the ratepayers.

Sir G. Grey opposed the motion; and, after considerable discussion,

The House divided—

For the motion	..	..	..	..	49
Against it	..	..	..	..	134
Majority	..	..	..	..	—90

The motion was accordingly lost.—Adjourned.

FIRE.—LARGE LOSS OF LIFE.

At an early hour on Sunday morning last, a fire of very calamitous character occurred at the Rose and Crown public-house, Love-lane, Tower Thames-street, in the occupation of Mr. Richard Harvey. Four lives were lost on the occasion, and the only survivor has been most seriously injured. The spot is scarcely more than 200 yards from the scene of the catastrophe which took place on Saturday, in Gracechurch-street.

The rose and Crown stood on the west side of Love-lane, a narrow, confined thoroughfare, running out of Lower Thames-street on the north side, nearly opposite to Billingsgate Market, into Eastcheap. It was three stories in height with a proportionate depth and frontage.

About half-past two o'clock, City police-constable Trinder, No. 866, was passing up the lane, when he observed smoke issuing from between the shutters, and other apertures on the basement floor. He immediately raised an alarm; but, although fire-escapes and engines were very speedily on the spot, they were not in time to render any effectual assistance in diminishing the fatal character of the calamity. On the arrival of the police a man was seen at the third-floor window, struggling to escape. He is supposed to have been a young man named Clark, who had taken a bed at the house for the night. The unfortunate creature clung to the window for a period of nearly ten minutes, during which time it was found impracticable to bring the escapes into operation, on account of the extreme narrowness of the lane; his cries became fainter, and at length he disappeared amidst a dense body of smoke and flame. Within a quarter of an hour the entire building was in one general blaze, the stock of spirits and liquors adding considerably to the fury of the conflagration. Elizabeth Chambers, the servant-girl, escaped by jumping from her bed-room window upon the roof of an outhouse belonging to the White Hart Tavern, Botolph-lane. She fell upon the skylight, and was much burnt, cut, and bruised; and being too disabled to extricate herself, she remained for some time in that critical position, while the flames rushing from the window towards her person, until some parties within, having broken the glass, pulled the poor creature through the hole, and found blood gushing from various parts of her body. She was forthwith placed in a cab and conveyed to Guy's Hospital, where she is likely to remain for some considerable time before she can recover from the effects of the dreadful injuries she has sustained.

By five o'clock the destructive element was effectually subdued, but of the Rose and Crown nothing was left but the blackened walls and the charred timbers of the floors.

Inquiries were then instituted as to the fate of the inmates, as none of them, with the exception of the poor servant-girl, had been seen to escape. Mrs. Harvey, the wife of the landlord, was known not to be in the house, as she was on a visit to some friends at Barking, but it was certain that there were, in addition to the servant, inmates, Mr Harvey, Mrs. Elizabeth Grey (Mrs. Harvey's mother), a postman known by the name of "George," and the lodger, Abraham Clark. Fears being entertained that they had perished, Mr. Braidwood, the superintendent of the brigade, as soon as the ruins had been sufficiently cooled, directed some of his men to proceed by their scaling-ladders up to the windows of the upper floors, with a view of seeing whether any of the remains of the missing creatures were there. Accordingly, Bradley and Storks, two expert firemen, ascended, and beneath the window of the second floor they discovered the charred remains of a human being, supposed to be Mrs. Grey. Search was then continued to the third floor, and there were found the bodies of the three remaining missing inmates. Mr. Harvey the landlord, George the postman, and Clark the lodger.

In the course of the day the poor girl Chambers sufficiently recovered to afford the authorities what information she could in respect to the deplorable occurrence. She stated that she retired to rest at a quarter past twelve, as did her master and the rest of the inmates. She was awoke by the dense suffocating smoke that filled her room. She opened her bed-room door with a view of making her escape down the staircase, but the smoke and heat drove her back, and finding that the flames were fast approaching her apartment, she resolved upon leaping from the window as the only means of escaping. She neither heard nor saw any of the inmates, with the exception of Mrs. Grey, who was calling "Richard Harvey, Richard Harvey!" the landlord, her son-in-law. She, however, did not hear her.

It is presumed, from the finding of Mr. Harvey on the third floor (he slept on the second), that he had gone up to escape through a trap-door which led on to the leads. He had succeeded in forcing it from its position, but upon the lodger's room, in which also slept the postman, and, arousing them and returning to the landing, was overcome by the heat and smoke, for a neighbour roused about half-past four that they would be found on the roof, and he answered the cry where he resided, so as to render assistance. He lifted the trap, but nothing was seen or heard of the poor creatures. Mr. Harvey was a very quiet, inoffensive man, and had only been married about twelve months.

The report made by the district brigade officer to Mr. Braidwood, of the damage done, contains no further information than is found in the above details, beyond stating that the property is supposed to be insured.

Mr. Woodthorpe, the City surveyor, and several other scientific gentlemen, have examined the ruins, in order to find out in what part of the building the disaster commenced. The result of their investigations has left no doubt but that the flames commenced on the ground-floor, and rapidly communicated with the upper portions of this building. The cause, however, is as much as ever enveloped in obscurity.

On Tuesday evening, Mr. Payne opened an inquest at the Coal Exchange Tavern, St. Mary-at-Hill, when the facts above given were deposed to, and the inquest was adjourned for a week, to admit of hearing the servant's evidence..

RAILWAY ACCIDENTS.—FATAL AND SERIOUS INJURY TO LIFE

On the Midland Railway, at Clayerose, near Chesterfield, a collision of a frightful nature took place on Monday night, by which two gentlemen were killed on the spot, and some fourteen or fifteen persons seriously wounded.

The express train which starts from London at 5 P.M., leaves Derby at 9 P.M. About five minutes after the express train left the Derby station, it was followed by a goods train. The former pursued its course until it had passed the Clayerose tunnel, when, in consequence of the engine becoming disabled, it was brought to a stand. Meanwhile the goods train continued its course, and, about ten minutes after the express train had passed the Clayerose station, it followed at a speed of about twenty miles an hour, and directly afterwards ran with tremendous force into the passenger train, then stationery. A scene of indescribable confusion ensued; for, amidst the crashing of the carriages and the shrieks of those of the locomotives, rose the piercing cry of the affrighted passengers. As soon as possible information was forwarded to the different. J. Meynell, Esq., of Tapton Grove, near Chesterfield, an active and fire ligent magistrate, whose loss will be greatly felt, and J. Blake, Esq., of the firm of Blake and Parkin, merchants, Sheffield, were found to have received fata. injuries; and most of the passengers were more or less seriously injured.

The accident was immediately telegraphed to Derby, and about midnight several of the company's officials arrived on the spot. Those of the passengers whose bruises were not of a very serious character, were, after a few hours' delay, forwarded to their respective destinations; but those whose injuries were more dangerous, were accommodated at the station and in the immediate vicinity. The catastrophe soon became known in the neighbourhood, and the local surgeons attended and rendered valuable assistance.

Below is given an official list of the parties, together with the nature and extent of their injuries:—Mr. Meynell, of Tapton, dead; Mr. Blake, of Sheffield, dead; Mr. Tennant, United States, bruised slightly; Mrs. Iconent, United States, fractured thigh; Mr. Allan, of Derby, bruised severely; Mr. Bunnett, of Chesterfield, knee and leg injured; Mr. Broadbent, of Sheffield, bruised; Mr. Horrocksie, of Sheffield, bruised; Mr. Ashworth, of Sheffield, bruised; Mr. Ward, United States, head injured; Mr. Peebles, United States, head injured; Mr. Blackcock, Dumfries, head injured and leg fractured; Mr. John Alexander, of Dundo, both legs broken; Mr. Andrew Johnstone, of Dubuq, injury to the shoulder-blade; Rev. Mathie, ankle and leg severe injured; Mr. Fox, of Chesterfield, injured; Mrs. Meynell, slightly bruised on the head; James Anderson, fireman to the porter, in the employ of the company, and who was in the guard's break of the express train at the time of the accident, seriously injured. The disastrous affair is alleged to have arisen in consequence of the guard of the express train having neglected to signal the accident to the approaching goods train. The inquest, however, which has been opened, will throw more light on the matter.

A second Collision on the same railway (the Midland) took place on Tuesday, at the Long Eaton junction. A passenger-train from Nottingham to Codnor Park came into collision with a coal-train at the junction, owing to inattention to the signals. The engines were doubled up, but fortunately the passengers escaped with a few bruises only.

A Tragedy at Suicide.—On Tuesday, shortly after one o'clock, as the Liverpool day mail was coming down the incline from the Camden station of the North-Western Railway, an elderly gentleman crossed from the up line and deliberately laid his neck across the down rail, on which the in-coming train was approaching. In another second the train passed, and his head was rolling in the centre of the line, under the carriages. The occurrence took place about a quarter of a mile from the Euston station, and was distinctly visible to the guards, but the warning was too short to make the application of brakes of the least use for arresting or delaying its progress. The unfortunate deceased was Mr. James Young, of 35, Augusta-street, Regent's Park, a gentleman of fortune, and possessing a large amount of house property in the neighbourhood He left home about eleven o'clock in the morning for a walk, and it appears called on Mr. Murphy, the collector, and paid his poor-rates, and must have proceeded immediately to commit the rash act.

THE START FOR "THE DERBY."

THE DERBY DAY.

RANDOM NOTES ABOUT THE TURF AND TURF MATTERS.

GREAT as the glories of the Crystal Palace undoubtedly are—teeming with contributions of beauty of luxury, of marvellous device, from all parts of the world—shall even the world itself yield the palm for the nonce to the more stupendous pageantry, and the weightier and wider-spread interest of a "Derby Day." To the foreigner, at least, who visits our shores in honour of the Great Exhibition of 1851, we venture to say, that not all the varied and heart moving splendour of the inauguration day, not all the wonders of wealth and ingenuity crowded within the walls of the Glass Museum, can present anything to compete in suggestive attributes with the picture presented by the Downs of Epsom, and the various roads leading to them, on Wednesday morning last, and the accomplishment of the all-important incident which brought them together. The very sight of so many thousands (we were going to say hundreds of thousands) of human beings of all ranks massed together upon that broad backed mountain range; the unity of purpose and of object which engrossed their every thought and power of consciousness as with a spell; the tremendous and long-protracted shout, rolling and swelling along the serried ranks, with which the pent-up feelings and aspirations of months found relief upon the eventful moment of that one day the whole multitude presented to a stranger, witnessing it for the first time, a scene which the most stupendous exertions of creative fancy could never have pre-conceived—a scene, the moral effect of which no words can realise.

Ay, the moral effect! For, let us not stop, just now, to ask all those cheers come from happy hearts—some from men who have got a "turn of luck" for the first time this many a long day—some from men who lose now as they have always lost, and yet so infatuated with their favourite "sport," that, in the face of ruin, they cannot refuse to cheer the honest exertions of a good horse.

Up goes the number, and, as in cold white on black up it goes, how many long-cherished visions of fortunes to be made or retrieved vanish. How many anxious heart-in-the-distant bosoms-ls are hanging in suspense about that yet unsettled number, which is to restore home to its long absent comforts, or to break up that struggling home for ever. And beneath the devil-me-care manner of many in that crowd, in the hoarse accents of many a laugh and cheer which rises from it, can we discover no recognition of that far-off misery of which they are the authors and are to be the helpless sharers? Ah! all is not joy on a Derby Day. Would that its expressions taught touch and teach many whom it has already brought within the danger-zone the use of turf speculation!

But to get to the race. Rightly to enter into the spirit of this extraordinary matter, of course by far-fetched exaggeration, it may be called. It must be borne in mind that with all gladiatorial, horse-racing is almost a sort of religious mystery—a race-horse is much an object of idolatry as the bull was to the Egyptians. Besides, the sport has a perfect mania of nobility. This fantasy is not confined to any particular class—it pervades, more or less directly, every grade of society, every walk in life, every age, extending even to the "softer sex." The head-quarters of turf-speculation, as it is called, are, undoubtedly, the Subscription-rooms at Tattersall's. Here the aristocracy of the land, the owners of large studs of horses, meet the book-makers, who bet about them in thousands and tens of thousands, and give the *mot d'ordre* as to the odds of the day, for the guidance of minor operators elsewhere. But this is only the centre of the great circle; it is not the circle itself, whose circumference extends wherever an Englishman may meet an Englishman. For, not only in London and throughout England, but in the colonies, in foreign states, on ship-board, on the wide Pacific, the dates of the great "meetings" of the season are religiously treasured in the Englishman's memory, together with the names of the probable competitors, and bets laid upon the result with the same zest and the same affectionate interest as if the parties were actually on the spot. In fact, is not every club-house a little Tattersall?—every pot-house a "Corner," in which "knowing ones," in threadbare coats and shoes down at heel, boast of an amount of judgment and private information upon events past and to come, which makes one wonder that they have not long ago made their fortunes and retired from business. At the *soirées* of the great, between the quadrille and the close-following polka, wearied with the stereotyped commonplaces about the last opera, how charmingly does our fair partner throw life into the discourse, by inquiring who is now the favourite for the Derby?—nay, perhaps even making a bet—in gloves, of course—in support of her opinion in the matter. In the City, after concluding a bargain in iron or corn how naturally comes the inquiry, just before parting, "What do you think about the Derby?" Your tailor, after you have ordered half-a-dozen waistcoats, in satisfaction, or, at least, in abatement, of his bill filed and delivered last Christmas, in a very deferential tone, asks you if you can put him upon a good thing for the Derby? which, of course, you do to the best of your judgment. Barristers, in the robing-room and in the intervals of repose between the cross-examination of witnesses, learnedly canvass the pretensions of each new popular nag. Physicians, as they consult about the fate of some struggling member of humanity can yet find time to interchange a passing note about the health of the favourite. And let any clumsy blunderer propose to fix an appointment on business with any sane and respectable person for the Wednesday in the Epsom week, and see with what a look of astonishment an answer he will be reminded that "It's the Derby Day!" Does not the House of Commons adjourn over the Derby Day? Is not all London deserted on the Derby Day? Have not anxious deputations from all corners of the country poured up to the sacred hill of Epsom on the Derby Day, anxious to pay homage to the hero of the Derby Day, and tribute too, should the fates be adverse—tribute of the last shilling in pocket, which the chances of the Derby Day award, in the shape of bets, to some more favoured children of Fortune?

Why the race for the Derby is so much more important than any other event of the kind we all occasion in the year, may be accounted for by the enormous amount of stakes and bets depending upon it and the length of time over which the preparations for it have been spread; the care, the money, the skill, which have been lavished upon the education of the candidates, the accidents which have in many cases thwarted the most honest exertions and dashed the brightest hopes, and, finally, the charm which always hangs about events long pending in the womb of time, and in the decision of which, after all, chance, mere chance, must necessarily have a large share.

The amount of the stakes of the present Derby may be judged of from the number of horses in the original entry, 195 (in some Derbys the entry has been large, once showing as many as 229 candidates), who will all pay a forfeit—that is, those who do not run, of £25 each, making for absentees alone nearly £5000. Those which run, pay an extra £25, or £50 in all, so that the stakes this year will amount to upwards of £8500. But this is the smallest part of the pecuniary considerations involved in this great speculative transaction. Two years ago, these 195 horses, then yearlings, were entered, and we may reasonably suppose were each in its owner's estimation considered to have a possible chance of winning. What sums of money have been spent upon their training since (the usual cost of a race-horse in training being estimated at £100 a year), what sums staked from time to time in backing them, at long odds upon the discovery of some promise of ability, what disappointment of individual hopes and cares, as, one by one, these interesting creatures have broken faith in their promises, shown themselves incompetent for the great struggle for which they had once been thought worthy, and so diminishing the lists of candidates, that, on the day of running, out of nearly 200 horses entered two years ago, not more than twenty or five-and-twenty (sometimes the runners have been as few as half that number) will come to the post and contest the laurels of the year.

The mystery of horse-racing, *per se*, confining the term to that which concerns the rearing and training and riding of race-horses, is a science, in three distinct branches, of which a modern Encyclopædia would not contain the details, nor a whole life suffice to master the practice. Shall we attempt, therefore, in this paper, to give an idea of either? Certainly not; for, after many years patient study, all we know about it is that we know nothing, to borrow the epigrammatic phraseology of an ancient philosopher whose name we cannot be supposed to recollect at this moment, seeing it is not in the entry for the Derby. But we may still have our little say and our little investment upon the race, as a betting transaction, with just as much confidence and self-importance as if we were the owner of half the horses. This, indeed, is horse-racing in the popular sense, for, except at "the Derby," the most part of the denizens of "the sporting world," as they constitute themselves, have never seen a race or a race-horse, and yet know all their names, and their pedigrees, and their public performances, and their private trials, and the state of their health, and of their temper, and their owners' intentions, and the "moves out of the stable" in which they are, and the movements at "the Corner" respecting them, as if they had constantly been in their company. Indeed, it sometimes happens that your sporting man, in the person of some bewildered attorney's clerk, or nervous tailor perhaps, is so infatuated about the horse which he has taken under his especial patronage, that, although he has never seen the colour of its tail, he almost believes it to belong to himself, simply because he has invested two crowns, one on the top of the other, in backing him for a great coming event. There are some jurists of the public press, moreover, who would seem to sanction such impressions, having very deliberately laid it down as law, "crowner's law," that although the man who bred or purchased the horse, and pays for his keep and training, and the stakes he may lose, and other little incidental etceteras, is in point of law, the absolute owner, the animal is in reality public property, and should be made to run upon all occasions whether he can or will, just to satisfy the prejudices of those who have honoured him by supporting his pretensions in the market. The soundness of this doctrine has not yet been authoritatively established by the Court of Queen's Bench, but a little more than a twelvemonth ago it was incidentally involved in a case gravely argued before the Court of Chancery, as to whether a certain horse—Bolingbroke to wit—should be compelled to run, and run his best, for the last year's Derby, in spite of the supposed predictions and wishes of its owner to the contrary. And to the great contentment of the public, the decision was in the affirmative, and Bolingbroke ran but did not win.

To return to the subject of betting. It must be obvious, that, if I back a horse for the Derby, twelve months before the race, at long odds, say 50 to 1, and that horse dies, or goes wrong in the interim, I must either lose my £10, or back another horse for the chance of winning. So, also, if I back one horse, the best in my particular stable, we will suppose, and then hear of another as good or better in another stable, I am tempted to back that horse also, and so on with a dozen more, perhaps, as I fondly flatter myself, the most likely horses of the whole entry. But, whilst my information, or judgment, or caprice, or good luck may occasion my backing the winner amongst this numerous lot, there are hundreds of others who are not so fortunate—hundreds, ay, thousands, who, amongst them, back almost every horse in the entry, at odds not of 100 to 1, as they would, supposing the horses had remained at a level chance, but at odds as they would, supposing the horses had remained at a level chance, but at odds much shorter—at 50, 40, or say, 30 and 5 to 1. Notably two horses, Grecian and Mountain Deer, have been backed for enormous sums, in the course of the winter and spring, at 5 and 6 to 1 respectively, neither of which, for many weeks past, has been considered to have the remotest chance of winning. As a natural consequence of their decline, other horses have come into equal, and even better favour—two being at 5 and 4 to 1, besides dozens that have been at 12, 10, 8, and 6 to 1. Now, only imagine the balance account of the man who should have laid all these odds, that is, who should have steadily backed the chances of "the field" against each of these particular favourites of the day. It must stand to reason, requiring little calculation to prove it, that he must receive, on his bet to him, much more than he will have to pay, even should one of the heavily-backed favourites win; whilst, should an "outsider," or non-favourite horse win, his gains will be proportionably greater, inasmuch as the larger stakes on the favourite, instead of the smaller stakes upon the outsider, will go to swell the credit-side of his account. To make this position clear by illustration—if I have laid 50s to 10s against A, and 500 to 10 against B, of course I would rather B won than A, because I should receive £100 instead of

SKETCH ON THE ROAD.—THE COCK INN, SUTTON.

£10 to put against my £500. Observing that a professional bettor, or book-maker," always lays, or proposes to lay, a certain maximum amount against every horse—say £5000 against each—he is 'more generally able to lay the full sum against favourites than outsiders, the consequence being, that, when an outsider pops his nose in first past the judge, he gains many thousands to the "bookmaker."

There are bookmakers of all sorts and sizes, from the lordling or exquisite, who proclaims his readiness to deal with the world at large, in very genteel accents, partaking equally of a drawl and a lisp, and notes down his bets with gold pencil on gilt-edged betting-book; and the leviathan who lays £50,000 with as little concern as fifty pence, and bawls out full statement of everything he can do with a voice as loud as that of a boatswain's mate, to the little speculator in cigar-shop or betting-office, who takes your shilling to return you six about Teddington, and gives you a dirty printed card by way of a voucher for the transaction. O

MORDEN CHURCH.

NOOKS AND CORNERS OF OLD ENGLAND.

MERTON AND MORDEN CHURCHES.

THESE are two road-side "Nooks" familiar to most visitors of Epsom. Merton Church, however, lies at some distance from the road, and is a long and narrow structure, merely consisting of a nave and chancel, a north entrance-porch, and a small spire issuing from the roof at the west end, and containing three bells. The walls are chiefly of flint coated with plaister, and may, possibly, be those of the ancient church mentioned in Domesday Book: the doorway is surmounted by a Norman arch, with zig-zag mouldings. In the churchyard lies a benevolent native of Merton, who was embroiderer to to Charles II., and bequeathed tenements and land for apprenticing children of poor parishioners.

Morden Church, a long and narrow fabric, dedicated to St. Lawrence, was rebuilt with brick about the year 1636. The ancient windows are of stone, and in the pointed style; that at the east end is elegant. The building consists of a nave and chancel, with a low embattled tower at the west end (containing three bells), and a small south porch, forming the chief entrance. The east window has some fine stained and painted glass; the dove and cherubim, in the upper compartment, being designed by an accomplished lady long resident in the parish. The church contains numerous monuments, gravestones, and inscriptions on brass, to the memory of distinguished families; and in the churchyard are a few tombs of old families.

ABREGE EN FRANÇAIS DE LA LOI PROVISOIRE SUR L'EXPOSITION DE 1851.—THE PROTECTION OF INVENTIONS ACT FOR THE EXHIBITION OF 1851.—This brief supplement to Godson and Burke's work on patents and copyright has a somewhat curious feature. It gives the law relative to the Exhibition of 1851 in French as well as English, and will, no doubt, prove useful to all foreigners taking an interest in the Crystal Palace and its wonders.

Smith, £12,000; J. Letts, £12 000. Also the wills of the Earl of Airlie and Sir H. S. Northcote have been administered to.

MERTON CHURCH.

TATTENHAM-CORNER.

NATIONAL SPORTS.

After the plethora of Epsom a week's rest will not be unacceptable to the metropolitan, and from the engagements on paper they are likely to have it, the only race-meeting announced being Harpenden, on Wednesday; Wye, on Thursday; and North Herts, on Friday—all small affairs, and not likely to prove very attractive except in the immediate locality. On Monday there will be interesting matches at Lord's and Gainsborough; on Tuesday, at Dunne Park, Sussex; on Thursday, at Cambridge, Manchester, and the Oval (Kennington); and on Saturday at Cambridge. The Thames Yacht Club have their first match this day, from Erith to the Nore and back on Monday. This is the only aquatic feature of any interest.

EPSOM RACES.—TUESDAY.

It is scarcely possible that a meeting could have commenced under more favourable auspices: the weather was fine, the fields unusually large, the sport excellent, and speculation brisk. The list showed a vast improvement, averaging five races per diem, with £997 added money. The attendance (including many of the leading supporters of the turf, was good, and in numbers about an average for a first day. The ground, notwithstanding the late rains, was hard. A capital race for the Heathcote Plate brought the sports to a close shortly after five o'clock. The following is a return:—

The CRAVEN STAKES of 10 sovs each, and 25 added.—Lord Stanley's Uriel (F. Butler), 1. Mr. H. G. Thompson's Gholab Singh (Osborne), 2

The HORTON STAKES of 3 sovs each, and 25 added.—Mr. Dawson's Reversion (Cartwright), 1. Mr. Shrimpton's Arlette (Gilbert), 2.

The MAIDEN (Handicap) PLATE of £100. Mr. Burgess' Narcissus (Cowley), 1. Mr. Drinkald's Dulcet (Pavis), 2.

The WOODCOTE STAKES of 10 sovs each, with 100 added.—Mr. J. Clark's Elcot (Whitehouse), 1. Mr. Greatwicke's Flirt (Kitchener), 2

The HEATHCOTE PLATE of £50 (Handicap).—Mr. Formby's Tecswater (R. Sherwood), 1. Mr. Drinkald's Thornhill (Rodney), 2

WEDNESDAY.—THE DERBY.

The all-eventful day dawned auspiciously; and, though the sky was a little or more threatening the greater part of the morning, the rain held off. An immense concourse of people, as usual, were upon the ground, indeed we have seldom known a fuller Derby day. Amongst the more distinguished of those present were the Duke and Duchess of Newcastle, Prince Henry of the Netherlands, the Duke of Cambridge, the Prince of Saxe-Weimar, Lords Waterford, Worcester, Stanley, Eglinton, Zetland, Granville, Glasgow, and Enfield March, Lord Alfred Paget, Sir W. Codrington, C. Cardwell, M.P., R. Peel, Col. Peel, &c. [illegible] was stuck, and the number of runners reduced by the [illegible] to 23 horses, including the rank outsiders Theodosius and Hesperian Dove, Newcomer, and some other favourites, being considered a very "open" one. On the other hand, Teddington was still steadily in favour with his party, leaving off at very short odds indeed, being in some few cases backed at evens; and, if he were here this year, he will be a very hard horse to beat. Of the [illegible] (a good 3-year old) 8 lb., his winning appeared to be a certainty, "barring accidents." Marlborough Buck, Prime Minister, Nosham, and Theseus were next in favour, being considered "good things" by their respective friends. The result, however, proved the vanity of their presumptions, and established the supremacy of "the crack," with scarcely the resemblance of a contest. Teddington, having been close in waiting on Bran to the last, led the field at the mile post, and kept it to the end, winning by a clear length, Marlborough Buck—a fine horse, but whose appearance struck us as too finely-made a skin attempt to reach him all the way up from the distance, and come in second; followed in order by Nosham, Hernandez, and Prime Minister. The rest were al. tailed off, with the exception of Theseus, Artiste, and Lanercost, who were pretty well up at the finish. Run in 2 minutes 51 seconds. Value of the stakes, £5625. Sir J. Hawley and his friends win an immense stake—some say £70,000; and most of "the ring" are hit, Mr. Davis having a very bad £100,000 book.

The racing commenced a few minutes after two o'clock with—

The RUDGE STAKES of 3 sovs each, and 40 added. Mr. Hornsby's The Old Fox (C. Hornsby) jun., 1. Mr. Gibaldeston's Jac-o'-Sot (Simpson), 2.

THE DERBY STAKES of 50 sovs each.

Sir J. Hawley's Teddington	..	..	(J. Marson) 1
Mr. J. Clark's Marlborough Buck	..	..	(G. Whitehouse) 2
Mr. Wilkinson's Nosham	..	..	(J. Hernan) 3
Lord Enfield's Hernandez	..	..	(S. Mann) 4

Betting.—3 to 1 against Teddington 7 to 1 against Marlborough Buck—7 to 1 against Hernandez—7 to 1 against Prime Minister—15 to 1 against Theseus—15 to 1 against Nosham—22 to 1 against Hesperian—50 to 1 against Hippodrame—50 to 1 against Bonnie Dundee—50 to 1 against Aristotle—and 100 to 15 against any other [illegible]

[illegible] Lord Stanley's Croupier (Charlton), 1. Mr. [illegible] (A. Pavis), 2.

The GREAT EXHIBITION PLATE of 100 sovs.—Mr. Jones's Ianthe (Preece), 1. Captain Archdall's Badajos (N. Treen) 2

The CAREW STAKES of 3 sovs each, with 40 added.—Mr. Hornsby's The Old Fox (C. Hornsby, jun.), 1. Mr. Burgess's Handsome Doll (Burn), 2.

THURSDAY.

The DURDANS STAKES.—Theorem, 1. Joe o' Sot, 2

The TWO-YEAR OLD STAKES.—Ardrie, 1. Lucy in Waiting, 2

The GRAND STAND PLATE.—Ballet Girl, 1. Narcissus, 2.

The COBHAM PLATE.—Dulcet, 1. Tecswater, 2

CALENDAR FOR THE WEEK.

SUNDAY, May 25.—Princess Helena born. Dr. Paley died, 1805.
MONDAY.—St. Augustin, first Archbishop of Canterbury, died.
TUESDAY.—Trinity Term begins.
WEDNESDAY.—William Pitt born, 1756.
THURSDAY, 29.—Holy Thursday. Restoration of Charles II.
FRIDAY, 30.—Joan of Arc burnt, 1431.
SATURDAY, 31.—Battle of Assaye, 1803.

On and after the 1st of April a Train will leave the Waterloo Station Daily at 12h. 30m. at Night, for Weekly [illegible] at all stations, enabling persons to enjoy the Evening Amusement of the Metropolis to the same extent as if resident in it.
By order of the Directors,
Waterloo Station, March, 1851. CORNELIUS STOVIN, General Manager of Traffic.

NEXT WEEK WILL BE PUBLISHED
A DOUBLE NUMBER
OF
THE ILLUSTRATED LONDON NEWS;
INCLUDING
AN EXHIBITION SUPPLEMENT.
PRICE ONE SHILLING.

*** The LARGE PRINT, of which every copy of the present Number, is intended to form the Frontispiece of the current Volume (XVIII.)

For Replies to Correspondents, see also Page 465 of the Supplement published with the present Number.
The Wotton-under-Edge Illustration will appear next week
The Report from Welshpool did not reach us in time for insertion.
In our Journal of last week it was erroneously stated that Mr Selous was commissioned to paint a "Panorama" of the Great Exhibition; whereas, Mr. Selous's picture will be the inauguration on May 1.

☞ A large Interior View of the Crystal Palace is in the hands of the Engravers, and shortly be announced for publication.

HER MAJESTY'S THEATRE.—DON GIOVANNI.—GRAND EXTRA NIGHT.—It is respectfully announced that a Grand Extra Night will take place on THURSDAY NEXT, MAY 29th, 1851, when will be presented MOZART'S [illegible] of oeuvre, entitled DON GIOVANNI, with the following powerful cast.—Don Giovanni, Sig. Coletti; Don Ottavio, Sig. Calzolari, Maestro, Sig. Pilati; Leporello, Signor Lablache. Donna Anna, Miles Pyne; Donna Elvira, Miles Bosio; Zerlina, Miles Sontag. In the Ball Scene, Miles Carlotta Grisi and Miles Amalia Ferraris will dance Mazurka's celebrated "Mirtos." With various Divertissements in the Ballet Department; in which Miles Carlotta Grisi, Miles Amalia Ferraris, and M'lle Taglioni will appear.—Applications for Boxes, Stalls, and Tickets to be made at the Box-office of the theatre. Doors open at 7, the opera to commence at Half-past 7 o'clock.

HER MAJESTY'S THEATRE.—SOIREES EXTRAORDINAIRES.—Mr. MITCHELL has the honour to announce that the great [illegible] of [illegible] will positively take place on MONDAY NEXT, MAY 26th, and WEDNESDAY, the 28th, when will be performed the whole of the Ballet Divertissements in the Opera of [illegible] Ballet Corps, and the Principal Dancers of the Royal Italian Opera. Tickets, Boxes, Stalls, &c., to be had at the Box-office of the theatre.

FRENCH PLAYS.—ST. JAMES'S THEATRE.—Last week of the present season of Comedie and Vaudeville.—Mons HAVEL will have the honour of appearing, on MONDAY EVENING, MAY 26, on which occasion will be performed a new Comedie-Vaudeville, in 1 act, entitled UN MONSIEUR ET UNE DEMOISELLE; and a new Farce, entitled QUI SE DISPUTE, S'ACCORDE. Mr MITCHELL begs [illegible] that the arrangement of the Box-office will be altered on and after MONDAY, JUNE 2.—Boxes and Stalls, at Mr. MITCHELL'S Royal Library, 33, Old Bond-street; and at the Box Office.

ASTLEY'S ROYAL AMPHITHEATRE.—Proprietor and Manager, Mr W. BATTY.—On MONDAY EVENING, May 26th, and every evening during the week, will be repeated the [illegible] of FARMER IN THE AMAZON, on The Queen of France and England, with all its original effects and magnificent attention. To be followed by the [illegible] and pops as SCENES OF THE ARENA, embracing the celat of Spanish and British talent. The whole concluding with the laughable farce which on each representation elicits roars of laughter, entitled HERCULES, KING OF CLUBS.—Box-office open from 11 till 4 daily.

BATTY'S HIPPODROME, KENSINGTON.—On MONDAY, JUNE 2, in addition to the grand routine of amusement, Mr. HAMPTON, the celebrated clown, will appear in the Circle, in his inimitable Pantomimic Act of Equitation, precisely at 6 o'clock, and the doors will on that day be opened at 4 o'clock, in order to afford the public an opportunity of witnessing the Ascent of the Balloon to the centre of the Arena. THE WORKS OF HEAVEN.
A popular Treatise on the past and present Discoveries of Astronomical Science, by I. O. MICHELL, Professor of Astronomy at the University of Cincinnati, U.S., with upwards of 50 illustrations.

THE ILLUSTRATED LONDON NEWS.

LONDON, SATURDAY, MAY 24, 1851.

THE question of Transportation, brought forward on Tuesday night by Sir William Molesworth, is one that the House of Commons does ill to treat with the discourtesy of a count out. Whether considered in all its bearings, or simply in reference to the particular colony of Van Diemen's Land, to which Sir William Molesworth confined it, the question demanded the most respectful attention. When Van Diemen's Land shall take the settlement of the matter into its own hands, as far as its own interests are concerned, the House of Commons and the Government will doubtless endeavour to make amends for the present neglect with which they have treated the serious grievance and the respectful remonstrance of that colony. Whether it will not then be too late for the discussion, remains to be seen.

The general question of transportation is one that concerns the home Government in the first instance. Hitherto the proper treatment of the criminal population of this country has been the most puzzling of all the puzzling problems of our civilisation. Our forefathers, not a hundred years ago, had a short and easy method with their felons. To get rid of them, they simply hanged them. It was the most obvious and facile process; and shop-breakers, pickpockets, sheep-stealers, coiners, forgers, and murderers were all subjected to the same punishment. They were put out of the way by strangulation, and no further expense or trouble was incurred. Easy as this plan was, it was not without its objections. It was rather too clumsy and barbarous, rather too inhuman and unchristian to be tolerated in a society that claimed to be at the head of civilisation. So an improvement took place. As we could not continue the easy process of killing off our thieves, our lawmakers adopted the next most easy means in their power, and shipped them off to the Antipodes. "We may not strangle you any longer," said the voice of the country, "but we will put fifteen thousand miles between you and us, and trust that we shall see no more of you." This is the system which is still in operation, and which a large number of persons consider the only possible means of dealing with our criminal population. There is, however, a third means. If a father have a bad son, it is not necessary either that he should kill him, or turn him out of his house, to be a burden on his neighbours. There is no reason why he should not try a reformatory process at home. To a certain extent this trial has been made in England, but hitherto without any success, and the great problem still waits for its solution.

There is, it is true, a very large class of earnest philanthropists who have made this question their study, who, while they have little or no hope of ever being able to reform the adult felony of England, have a very strong notion that felony might be very much diminished in the next generation, if greater efforts were made to prevent crime than to punish it, and if the schoolmaster were more extensively taken into the service of the State. They consider that the ranks are continually recruited from the dark regions of ignorance ; and that, with all our experiments and all our efforts, we have continually missed making the one experiment which would have been the most agreeable in itself, and the most likely to be satisfactory—the great experiment of educating in secular knowledge, and in morality and religion, the now utterly neglected children of the hopelessly poor and vicious portions of the community.

Sir George Grey, in his reply to the able speech of Sir William Molesworth, deprecated the opening up of this great question. If the House decided, said the Right Honourable Baronet, "to sanction the general discontinuance of transportation, it would have to decide what should be done with our criminals." Precisely so ; and, although at present it may be inconvenient to enter upon it, there are symptoms of such wide-spread dissatisfaction in our colonies, that the Government and legislature will be compelled to grapple with it, whether they like it or not. We have received one strong warning from the Cape of Good Hope. We now receive another, still stronger, from Van Diemen's Land. Those colonies tell us plainly that the proper treatment of our criminals, population is our business, not theirs ; and that they will not any longer permit their territories to be overrun by our refuse, and to be, as Sir William Molesworth strongly—but not inaptly, phrased it—the "cesspools" of our empire.

As regards Van Diemen's Land, the case of the honest colonists is a very hard one. They have received such shoals and swarms of our most desperate felons, that about two-fifths of the adult male population are estimated to be, or to have been, convicts. At one time the proportion was still greater. "Such," said Sir William Molesworth, "was the perverse insolence of that class, that they had actually threatened to drive out the free settlers as intruders." The world will then behold a new spectacle—"a criminal republic, with liberty of doing wrong, equality of infamy, and fraternity of guilt." The colony of Van Diemen's Land prays that the influx of this criminality into their territory may be stopped, and insists that the Home Government has broken faith with it, in not stopping the system years ago. The Government denies the breach of faith : the Home Secretary makes a rambling speech, in which he promises nothing, and the House is thereupon counted out. We fear that this unhappy result will create not only a bad feeling against the Home Government, but that it will sow the first seeds of a disaffection of which the fruit will be the independence of more than one of our colonies. Whether we regard it as it concerns this country, or the particular colony that is aggrieved and demoralised by it, we must confess that we look forward to the discussions that must arise upon the whole question of transportation with the feeling that it is far more urgent than the Government seems to consider it, and that an error has already been committed of which the remedy will be difficult, if not perilous.

THE Royal Commissioners and the Executive Committee, and, in fact, all the gentlemen who have been concerned in the arrangements of the Great Exhibition, have achieved their arduous task in a manner the most admirable; it may therefore seem ungracious to find fault with them. But even they, with all their claims to the public gratitude, must nevertheless not expect that every error of judgment which they may commit shall pass unnoticed; and it is because they have deserved so well of their country, that we feel bound to remonstrate with them on what we must consider their ill-judged refusal to comply with the request of the Exhibitors for a free admission to the Crystal Palace. When it is considered, that, without the Exhibitors, there could have been no Exhibition, it seems a little too hard that manufacturers and others, who have expended, many of them, thousands of pounds towards the Exhibition, should have been denied a privilege, which any indifferent person can command for three guineas. Even in the case of those whose contributions to the success of the Exhibition are comparatively trifling, and not worth in money value the price of a season ticket, the Commissioners might be generous enough to take the will for the deed. The Exhibition is so prosperous a concern, that the Commissioners may well afford to look at the request made to them in some other point of view than the vulgar one of money. We notice that, in consequence of the refusal of the Commissioners to grant this simple favour, several hundreds of the exhibitors have been held, to bring the case before the public ; and we sincerely trust, that, even at this late period, the Royal Commissioners will reconsider the matter. The Exhibition is so popular, that it is a pity that any grievance should be alleged, or any annoyance felt with regard to it, especially by those who have done so much for it as the Exhibitors.

COURT AND HAUT TON.

THE COURT AT BUCKINGHAM PALACE.

The past week has lacked nothing of the courtly hospitality distinguishing that which preceded it. Her Majesty and the Prince Consort, who, we rejoice to learn, continue in the enjoyment of excellent health, have received a large accession of illustrious guests from the Continent since our last publication. Their Royal Highnesses the Duke and Duchess of Saxe-Coburg-Gotha (brother and sister-in-law of Prince Albert), accompanied by his Royal Highness the Duke Ernest of Wurtemberg, arrived at Buckingham Palace, at a quarter-past twelve o'clock on Saturday, on a visit to the Queen. His Serene Highness the Prince of Leiningen accompanied their Royal highnesses to Buckingham Palace, and afterwards proceeded to Clarence-house, St. James's, on a visit to her Royal Highness the Duchess of Kent.

On Saturday evening, the Queen, accompanied by the whole of the illustrious visitors at present enjoying the Royal hospitality, honoured the performance at the Royal Italian Opera with their presence.

Her Majesty and the Prince Consort have paid daily visits to the Great Exhibition, and continue the inspection of its contents with increasing interest.

On Monday the Queen gave a state ball at Buckingham Palace.

On Tuesday the Queen held a court at Buckingham Palace, when his Excellency Count Schimmelpenninck, Envoy Extraordinary and Minister Plenipotentiary of his Majesty the King of the Netherlands, had an audience of the Queen to present his letters of recal. On the same day, her Majesty and his Royal Highness Prince Albert, with his Royal Highness the Prince of Prussia, inspected the historical picture of the meeting of Field-Marshal Prince Blucher and the Duke of Wellington on the evening of the victory of Waterloo, at La Belle Alliance, which was submitted by the artist, Mr. Barker.

On Wednesday their Royal Highnesses the Prince and Princess of Prussia, Prince Frederick William of Prussia, the Duke and Duchess of Saxe-Coburg-Gotha, and the Duke Ernest of Wurtemberg, and his Serene Highness Prince Edward of Saxe-Weimar, left Buckingham Palace, at eleven o'clock, to witness the Epsom Races. In attendance on the illustrious party were Countess A. de Hacke, Countess Oriolla, Lord Alfred Paget, Count Pückler, Colonel Fischer, M. B. de Treskow, and Lieut. von Heinz. The Royal party travelled in three open barouches and four, and returned to Buckingham Palace at half-past seven o'clock.

THE QUEEN'S BALL.

On Monday the Queen gave a State Ball at Buckingham Palace, to a most brilliant Court, the invitations exceeding 2100. The arrangements were similar to the first reception this season, the entire suite of state saloons being opened, and brilliantly illuminated with handsome crystal lustres and gilt chandeliers. The Garter-room and ante-room at the south end of the Picture Gallery were also opened for the accommodation of the supper-tables. The grounds were exotics and fragrant flowers were tastefully arranged in the alcove behind the elevated seats reserved for her Majesty and her Royal guests, both in the Ball-room and also in the Throne-room ; groups of flowers also adorned the Picture Gallery and the Grand Hall. The company began to arrive soon after nine o'clock.

Her Majesty the Queen and his Royal Highness Prince Albert entered the grand saloon at a quarter before ten o'clock, accompanied by her Royal Highness the Duchess of Kent, their Royal Highnesses the Prince and Princess of Prussia, his Royal Highness Prince Frederick William of Prussia, their Royal Highness Prince Henry of the Netherlands, his Royal Highness the Duke of Cambridge, their Royal Highnesses the Duke and Duchess of Saxe-Coburg-Gotha, his Royal Highness the Duke Ernest of Wurtemberg, his Serene Highness the Prince of Leiningen, and his Serene Highness Prince Edward of Saxe-Weimar.

Her Majesty and her august circle passed through the assembled company in the grand saloon, and were conducted by the Lord Chamberlain to the Ball-room, where Mr. Boosey's quadrille band was in attendance. The Queen was followed the Queen and Prince Albert and the Royal guests into the Ball-room.

Her Majesty opened the ball with his Royal Highness the Prince of Prussia in a quadrille at five minutes before ten, the vis-à-vis being her Majesty and the Duke of Saxe-Coburg-Gotha and the Princess of Sutherland. The other members of the Royal party joined in the quadrille.

After this dance, a number of quadrilles, waltzes, and other dances were performed in the ball by Mr. Boosey's quadrille band.

Dancing afterwards commenced in the Throne-Room, where Julien's band was stationed.

A state supper was served with regal magnificence soon after twelve, in the principal Dinner-room, on long ranges of tables; the splendour of the service being heightened by the consummate taste of the decorations.

After the supper, on the night of the State Ball, her Majesty and Prince Albert, accompanied by their Royal visitors, returned to the Ball-room, when a Highland reel was played by Mr. Mackay, her Majesty's piper, which was danced by the following ladies and gentlemen :—Lord Harrodale and Lady Rachel Russell, Cluny Macpherson and Miss Lister ; Mr. F. Gordon Cumming and Miss Stewart Mackenzie; the Master of Lovat and Miss Russel ; the Hon. Mr. Charteris and Hon. Miss Charteris ; Mr. J. F. Campbell, of Islay, and the Hon Miss Stanley.

Her Majesty and Prince Albert quitted the Ball-room at ten minutes before two o'clock, accompanied by the Prince and Princess of Prussia, Prince Frederick William of Prussia, the Duke and Duchess of Saxe-Coburg-Gotha, and the Duke Ernest of Wurtemberg, and the ball terminated. The whole of the brilliant assembly had quitted the Palace soon after three o'clock.

The Marquis of Londonderry, Gold Stick in Waiting, was in attendance upon her Majesty at the ball.

Her Royal Highness the Duchess of Cambridge, accompanied by the Princess Mary, left London for the Continent on Saturday morning, by express train on the South-Eastern Railway.

The Duke of Wellington gave a grand ball on Friday, the 17th, at Apsley-house, which was honoured with the presence of his Royal Highness the Prince of Prussia, and all the leading members of the *corps diplomatique* and aristocracy at present in London. Above 1200 guests responded to the noble and gallant Duke's invitation, and the festivities were prolonged until an advanced hour.

CHURCH, UNIVERSITIES, &c.

ARCHDIACONAL VISITATION.—SINGULAR OCCURRENCE.

The Rev. Archdeacon Hale held his visitation at St. Sepulchre's Church on Saturday, according to annual custom, on Thursday morning. After service, the Archdeacon proceeded from his pew to the communion-table, and when about to deliver his Charge, discovered that he had not brought it to the communion-table. Having sent some one to fetch it from the pew in which he had been seen by Mr. Horne, and several other gentlemen, to be holding it in his hand, it was discovered that it had been removed. After search for the document proved fruitless. It was remarked by several of the clergy, that immediately upon the Archdeacon leaving the pew, two laymen were seen to go into it, and immediately after abruptly leave the consecrated edifice. Having thought that these individuals had taken the manuscript away. The venerable Archdeacon Hale was much agitated, but, after taking a few minutes to collect his thoughts, he addressed the clergy, saying their kind consideration for the unusual and painful circumstances in which he had been so unexpectedly placed, and stating, although he could not recollect the exact words of his proposed address, he would endeavour to give them the substance, which must necessarily be imperfect, when he assured them that, although at a former period of his life he was in the habit of speaking in public, he had never delivered a like extempore in the performance of his sacred duties. He then proceeded to speak in strong terms of the recent Papal agression, and gave it as his decided conviction that, notwithstanding the strong feeling which had been manifested against the conduct of the Court of Rome, it would be unconstitutional. He then alluded, in energetic and forcible language, to the recent secessions to Rome, the teaching by many of the clergy of Roman Catholic doctrines, the adoration of the Eucharist, which so many were guilty of, the mode of chancel worship, and the intonation of the service in parish churches, all of which he observed were indications of a Romanising spirit, and contrary to the teaching of the English branch of the Catholic Church. He deprecated controversy, and urged the sole authority of the Word of God as the only rule of faith and practice. Having concluded an admirable address, the very rev. gentleman was addressed by the Rev. William Short, rector, of St. George's Bloomsbury, who expressed the deep sympathy which the clergy felt for the venerable Archdeacon under the painful circumstances in which he had been placed ; and to thank him for his uncompromising vindication of the great and leading truths of Christianity, set forth in the doctrines and teaching of the Church of England.

OXFORD.

THE ROYAL COMMISSION OF INQUIRY.—In a convocation held on Wednesday in the Sheldonian Theatre, a proposal to petition her Majesty to revoke the Royal commission for inquiring into the studies and discipline of the University of Oxford ; or that, if necessary, the petition may be taken into consideration before the Queen in Council, the representatives of the University being permitted to attend and be heard, was carried by a majority of 144 ; the number being—Placets, 249 ; non-placets, 105.

The following preferments and appointments have recently been made: *Deaneries Rural.* The Rev. H. Corfe to be rural dean of the Archdeaconry of Exeter. The Rev. William Collins Lukis to a deanery rural in the diocese of Salisbury. *Rectory :* The Rev. Edward Barker Freer to the rectory of Horsham, Suffolk. *Vicarages:* The Rev. T. Tunstal. Smith to be vicar of Wirksworth, and rural dean. The Rev. John Harward to the vicarage of Wrappleke, Lincolnshire. The Rev. Charles Henry Swann to the vicarage of Horninghold, Leicestershire. The Rev. George Beardsworth to the vicarage of Selling, Kent. The Rev. Oswald Marriott to the vicarage of Goxhill, Lincolnshire.

TESTIMONIALS.—The following clergymen have recently been presented with testimonials of esteem and affection :—The Rev. Thomas Hodgens, late curate of Milborne Port, Dorset, from the congregation ; the Rev. Frederick Wilson Kittermaster, late of Bangor-Isycoed, Denbighshire, from the congregation ; the Rev. J. Lindsey, on his resigning the curacy of St. Mary Magdalen, Taunton, from the congregation ; the Rev. John Sebastian Wilkins, late assistant minister of St. Saviour's, Chelsea, Middlesex, from the congregation ; the Rev. John Henry Arnold Walsh, perpetual curate of Christ Church, Warminster, and its first incumbent, on the twentieth anniversary of its consecration, from the communicants ; the Rev. William Davies, late curate of Glyncorrwg and of Blaengwawr ; the Rev. W. Milburn, on his resigning the curacy of Harrington, in the parish of Houghton-le-Spring, from the parishioners ; the Rev. John Swete, D.D., from the governor, surgeon, matrons, and officers of the gaol of Bristol.

SEQUESTRATIONS OF BENEFICES.—The bill brought in by Mr. Frewen and Mr. Child to amend the law relating to the sequestration of benefices for debt, states in the preamble, that writs are in many cases where the powers of the act 1st and 2nd Vict., c. 106, are not in force, and also in other cases and in cases of sequestration of benefices by creditors, no due provision is made for the maintenance and support of the curates or other persons duly and lawfully licensed or authorised for the cure of souls, it is desirable to provide a remedy. The bill proposes that in cases of sequestration of benefices, the bishop of the diocese shall be required to set aside a portion of the income of such benefice sufficient to provide for the needful support of the cure of souls. The bishop must give a certificate of what he considers a sufficient sum for the purpose, which certificate will be a complete authority against creditors.

CHURCH EXTENSION.—The committee of the Incorporated Society for Promoting the Enlargement, Building, and Repairing of Churches and Chapels, met on Monday last; his Grace the Archbishop of Canterbury took the chair. Among the members present were his Grace the Archbishop of York, the Bishops of Winchester, Bangor, Lichfield, and St. Asaph ; Earl Howe, Sir E. Inglis Bart., M.P. ; the Rev. Sir Charles Farnaby, Bart, &c. Grants of money were made for the erection of new churches at Pullgwnlly, near Newport, Monmouthshire ; Walcott, near Seaford, Lincolnshire ; a district in the city of Winchester ; and Sutton-cum-Pyrn, a district of the town of Plymouth ; also for rebuilding the churches at Ackworth, near Wakefield, and Salford, near Bath ; for enlarging the churches at Steeple Barton, near Woodstock ; St. Peter, Northampton ; Glasbury, near Wolverhampton ; and for re-arranging the seats in the churches at Figheidean, near Amesbury, and Llangristiolus, near Bangor. All these alterations of existing churches include very extensive repairs of the several buildings.

ST. STEPHEN'S, WALBROOK.—This beautiful edifice is, by order of the parochial authorities, thrown open for the inspection of the public free of cost, with an especial view to the gratification of strangers visiting our metropolis this year.

St. Saviour's Church, near Birkenhead, was consecrated on Tuesday by the Lord Bishop of Chester on Monday.

THE MUSEUM OF PRACTICAL GEOLOGY.

In our Journal of last week we described the ceremony of opening this new Museum, and engraved the Jermyn-street front, with the Portrait of Sir Henry De la Beche, the Director of the Institution

The Museum of Practical Geology was established in 1835, at the instance of Sir Henry De la Beche, who was then engaged on the geological survey of Devon and Cornwall ; during the progress of which he had collected a large number of specimens, illustrating the mineral formations of the western districts of the kingdom. A few rooms in a house in Craig's-court were all that was at first appropriated to this purpose ; but, like all good thoughts, the progress has been steadily onward, until eventually the fine structure in Jermyn-street was built purposely for the collection.

The objects are, to present, in an intelligible manner, complete illustrations of the mineral wealth of the United Kingdom and the colonies ; to show the modes of the occurrence of mineral deposits ; to exhibit, as far as it is practicable, the modes of working the mines ; this being effected by well executed models of the machinery, and collection of the tools employed ; and to display the metallurgical processes by which the metal is obtained, and the uses in art and manufacture to which the metals are respectively applied. The collections are not merely confined to the productions of mines and their products. The earthy minerals which are of any industrial value are embraced, and thus the clays and sands employed in the manufacture of glass and china appropriately find a place. The economy of manufactures is intended, and the illustrations of the ceramic art of our own country have already been noticed in the collection of British pottery, from the early earthenware productions of Staffordshire, to the most recent productions in porcelain and parian, being included. In the same manner the history of glass manufacture is illustrated ; and we find the most interesting series from Roman glass, proceeding with very fine examples of Venetian and early German, and continuing onward to the best examples of modern glass.

The lower hall of the Museum is devoted to the building and ornamental stones of the kingdom ; and here will be found examples of British marbles, which show that for ornamental purposes we need not pass beyond our own shores, the granites, serpentines, porphyries, and limestones of our own land furnishing a great variety in colour and character. Ascending the stairs, we reach the main portion of the collection. Here, in a noble apartment, are accumulated the illustrations to which we have alluded, and in the galleries are arranged a unique collection of British fossil remains. At the end of this apartment is the Model-Room, filled with models of machinery and with mining tools, &c. The upper story of the building is devoted, on the side next Piccadilly, to a well-furnished laboratory ; and on the Jermyn-street end, to the Mining Record Office, where are deposited such plans and sections of the mines of the United Kingdom as may have been presented, or such as have been collected by the officers in charge of this department.

The following is a list of the officers connected with this institution :—

Sir Henry De la Beche, C.B., Director of the Museum, and Geological Survey of the United Kingdom
Professor A. C. Ramsay, Local Director of the Geological Survey of Great Britain
Mr Bete Jukes, Local Director of the Geological Survey of Ireland
Professor Edward Forbes, Palæontologist
Dr. Lyon Playfair, Chemist
Mr. Warington Smyth, Mining Geologist
Mr. Robert Hunt, Keeper of Mining Records
Mr. Trenham Reeks, Secretary and Librarian

In addition to these, a staff of geological surveyors are constantly employed in the field on the business of the survey.

A very admirable Theatre is provided, and a Library peculiarly adapted to the studies of this establishment. These will, in a short time, be devoted to their proper purposes ; the organisation of the educational staff and objects being in progress.

We have this week engraved the Great Hall. We have already represented the Piccadilly *façade* of the Museum in the ILLUSTRATED LONDON NEWS, No. 311.

THE LATE HOUR SYSTEM.—An able sermon on the spiritual and other evils arising from protracted labour in houses of business, was preached on the evening of Sunday last, at St. Olave's Church, Southwark, by the Rev. L. M. Humbert, curate of the parish. The text was taken from the 1st chapter of Exodus, and the 8th to the 14th verse. He reminded his congregation that for all of us "the time is short"—" They that buy will soon be as though they possessed not, and they that sell as though they profited not, for the fashion of this world passeth away."

IRISH ENCUMBERED ESTATES.—We may state that it is not likely that any bill for extending the duration of the Encumbered Estates Commission will be introduced in the present session of Parliament. Should such a measure be deemed hereafter expedient, there will be ample time for introducing it in the next session, as the right to present petitions for sales may be exercised up to July, 1852. We may avail ourselves of the present opportunity to contradict a report circulated, we understand, very generally amongst the legal profession in Ireland, that it is intended to extend the Commissioners' jurisdiction to the Irish Court of Chancery. *Globe* of Thursday

We are sorry to learn that the Marquis of Huntley is suffering from severe indisposition.

THE MARBLE ARCH, CUMBERLAND-GATE.

AMIDST the vituperative shower which fell so plentifully upon the Marble Arch, a short time since, this costly toy of Royalty found a resting-place, which, if we remember rightly, neither of the flock of "Correspondents" had suggested; and, while the public were debating upon the matter, the First Commissioner of her Majesty's office of Woods and Forests quietly disposed of the Arch, by placing it upon the site of Cumberland-Gate, the north-eastern entrance to Hyde-Park. We do not object to the new location, and only wish the Commissioner had evinced a like amount of judgment in the Rotten-row and Kensington Gardens question.

The Arch is best seen from the Park, but has still, as it had at Buck-

THE MARBLE ARCH CUMBERLAND-GATE HYDE-PARK.

ngham Palace, a pedestal-like effect: this is not to be wondered at, seeing that the attic was originally intended to bear a colossal bronze emblematic group of Victory in a three or four-horsed car, which portion of the design was eventually changed to an equestrian statue of George IV.: this was executed by Chantrey, at a cost of 9000 guineas, but now occupies the pedestal at the north-east angle of Trafalgar-square. Again, there were to have been whole-length figures in the attic in place of which we have inverted trusses, of anything but decorative character. However, here is the Arch, scraped and cleaned, and freed of its dirty-spar-like appearance. To make way for it, the handsome iron gates have been removed and placed on each side the Arch, which has a sort of anomalous appearance from the centre gate being mostly kept shut; but the side-arches are open for foot-passengers. These iron gates, by the way, were erected in 1822, at the expense of the late Henry Philip Hope, Esq.: they cost £2000, and are fine specimens of iron-work. It was considered, at the time of their removal, somewhat ungrateful, thus unceremoniously to set aside so handsome a present to the public, more especially to make room for what at best is but a poor work of art.

The Arch was originally erected in front of the court-yard of Buckingham Palace, St. James's-park, and was reserved for the especial entrance of the Sovereign and the Royal family. It is the largest work of mere ornament ever attempted in Great Britain. It was adopted by Nash from the arch of Constantine at Rome: the larger archway, as first designed, was not sufficiently wide to admit the Royal state-coach; fortunately the blunder was discovered in time to be remedied. The material is Carrara marble, which soon became discoloured by smoke and damp. Some of the blocks are extraordinarily large. In each face are four Corinthian columns; the other sculpture being a keystone to the centre archway, and a pair of figures in the spandrils; a panel of figures over each side entrance, and wreaths at each end: these are by Flaxman, Westmacott, and Rossi The centre gates, designed and cast by Samuel Parker, of Argyll-street, are the largest and most superb in Europe, not excepting those of the Ducal Palace at Venice, and of the Louvre at Paris. They are of a beautiful alloy, the base refined copper, bronzed; design, scroll-work, with six circular openings, two filled with St. George and the Dragon, two with G. R., and above, two lions *passant gardant*, height to the top of Arch, 21 feet; width, 18 feet; weight, 5 tons 6 cwt: cost, 3000 guineas, including a frieze and semicircle, to fill up the archway, the most beautiful portion of the design, but irreparably mutilated in removal from the foundry.

The cost of the Arch, statue, gates, and railing has exceeded £70,000 yet this is but a trifle in comparison with the cost of the Arc de l'Etoile at Paris—£416,666.

Cumberland-gate was opened about 1774-75, when Cumberland Place was built. The gate was erected by subscription of the neighbouring inhabitants, and was meanly built of brick. Here Richard Honey was killed by the firing of the military, at the funeral of Queen Caroline, August 15, 1821; in the following year the gate was taken down, and Mr. Hope's iron-work set up in its place. The gate at this spot was originally called Tyburn-gate; and Park-lane, Tyburn-lane.

THE MUSEUM OF PRACTICAL GEOLOGY.—THE GREAT HALL.—(SEE PRECEDING PAGE.)

LAUNCH OF THE "ORINOCO," WEST INDIA MAIL STEAMER AT NORTHFLEET DOCKYARD.

LAUNCH OF THE ROYAL MAIL STEAM-SHIP "ORINOCO."

On Saturday last, the ship-building yard of Mr. William Pitcher, at Northfleet, presented an animated spectacle, it being the day fixed for launching the *Orinoco*, the first of the five large steamers now building for the Royal Mail Steam-Packet Company, to enable them to carry out the arrangements made with the Government under their renewed contract. The *Orinoco* has occupied about eight months in building; and her sister ship, the *Magdalena*, which was commenced shortly after, is fast approaching completion.

The principal dimensions of the *Orinoco* are as follows:—

Length between the perpendiculars	..	..	269 feet 3½ inches.
Length of spar deck over all	..	..	276 „ 6 „
Breadth, extreme	..	..	41 „ 10 „
Ditto, for tonnage	..	..	41 „ 6 „
Depth in hold	..	..	26 „ 1 „

Burthen in tons, 2245 31-94, builder's measurement.

The weather was exceedingly propitious, and a very large concourse assembled to witness the proceedings. Both the yard and the vessel were pleasingly decorated; and the *Great Western* being in dry dock at the time, and displaying all her colours, added not a little to the liveliness of the scene.

About half-past two, the dog-shores were withdrawn, and the vessel was instantly in motion. The ceremony of naming was performed by Lady Anne Tufnell, who was accompanied by the Right Hon. Henry Tufnell; and amongst the company present we were pleased to observe M. Jules Janin, the celebrated *feuilletoniste*, and several other foreigners of distinction. Two steamers were in readiness to take the vessel in tow, and convey her to the East India Docks, where she is to be fitted with double-cylinder engines, of the collective power of 800 horses, by the eminent firm of Messrs. Maudslay, Sons, and Field.

The draught of the *Orinoco*, when launched, was 8 feet 9 inches forward, and 10 feet 10 inches abaft: the light displacement, with that draught of water, is 1050 tons; and if 2000 tons be added for the freight to be taken on board in the shape of engines, coals, equipment, passengers, and luggage, it is estimated that she will go to sea, about four months from this period, with a mean draught of water of about 19 feet 6 inches. The *Orinoco* looks well on the water, and is considered by competent judges a beautiful and well-built ship; and, there being no slip over her when built, the launch had a fine effect.

After the launch, the visitors who had received invitations from the builder adjourned to the Rosherville Hotel, where a handsome collation had been provided for them, and the party separated at an early hour expressing themselves highly gratified with the day's proceedings.

GRAND ENTERTAINMENT GIVEN AT THE CASTLE HOTEL, RICHMOND, BY THE METROPOLITAN LOCAL COMMISSIONERS OF THE GREAT EXHIBITION TO THE FOREIGN COMMISSIONERS.—(SEE NEXT PAGE.)

BANQUET TO THE FOREIGN COMMISSIONERS.

On Tuesday the chairman of the Metropolitan Local Commissioners gave a grand entertainment to the foreign Commissioners charged with the care of the various contributions of their respective countries to the great Exhibition. The dinner took place at the Castle Hotel, Richmond, and was most sumptuously provided in every respect. The cooking was the best appointed for months; and when at the close of the week arrived, the whole population appeared to be astir, and the streets, and flags of all nations floated with unusual gaiety and animation. Everywhere, covering a space of many miles in every way, and was hailed the general [illegible] the Commissioners [illegible] the crowd when the carriages [illegible] Hotel, as was announced, had been pro[illegible] a few minutes, with a contingent of mounted police [illegible] the Commissioners [illegible] Ash[illegible] Park, [illegible] Richmond, [illegible] Hill, [illegible] Hotel, [illegible] Mr. Cubitt, [illegible] Mr. Wilkinson, [illegible] Mr. Scott Russell, [illegible] Mr. Wyatt, [illegible] Mr. Owen Jones, [illegible] Mr. Digby Wyatt, [illegible] Mr. Fowke, [illegible] Mr. Penrose, [illegible] Mr. Donaldson, [illegible] Mr. Hayter, [illegible] Mr. Cowper, [illegible] Mr. Hawes, [illegible] Mr. Tite, [illegible] Mr. Grace, Mr. Alderman [illegible] Mr. Alderman Sir John Key, Mr. Alderman Sir James Duke, Mr. Alderman Wire, Mr. Alderman Sir Peter Laurie, Mr. Alderman Sir Chaloner Dixon, Mr. Alderman Sir Thomas Farrer, Mr. Alderman Sir Thomas Wilson, Mr. Alderman Sir Robert Walter, Mr. Alderman Sir Francis Graham Moon, Mr. Alderman Sir John Musgrove, Mr. Alderman Sir Chapman Marshall, Mr. Alderman Sir James Duke

Duke Ernest of Wurtemberg, the Prince and Princess of Prussia, honouring the performance with their presence. The execution of this fine opera was rendered remarkable by the splendid singing of Tamberlik, who appeared for the first time as *Guido* (*Marc*). He depicted, in the grand scena, the desolation of *Guido* at his blighted hopes with such surpassing excellence as to call from a portion of the audience for the slow movement: a mere purist's example of refined vocalism in which he was never heard. Equally striking was his share of the trio, prior to the incantation scene. Mdlle. Bertrandi, the *débutante*, who was the *Annetta*, promises to be a very valuable acquisition: she has a nicely toned mezzo soprano voice, a fine articulation, and is a lively actress. Tagliafico *Alidoro* was also an exemplar of quality in the cast; he is an admirable artist, always safe and effective in whatever he undertakes. Formis' *Cosmo*, so mystic and powerful in one of the grandest pieces of acting ever witnessed, his declamation is truly appalling. The *Agatha* of Madame Castellan is a great improvement from last season, especially in the grand scena, which won universal plaudits; but, in the first act, her reading of the cavatina requires a re-study, and Gerry Lind's style of singing it may be safely recommended as a model. The parts of *Cuno* and *Oscar*, and the *Hermit*, are sunnop; bie of amelioration, but on the whole the *ensemble* was gratifying. The ballet overture was played to perfection, and with much vigour. The orchestral accompaniments were a great treat throughout the opera, but the choral singing was more boisterous than refin d.

On Tuesday night, Rossini's "Donna del Lago," sustained by Madame Castellan, Mdlle. Angri (whose *Malcolm* is superbly sung), Mario, Bianchi, and Tamberlik, was repeated. Two "Lucrezia's" seem to have been given, but, owing to Grisi's cold, the "Donna del Lago" was substituted.

On Thursday, for the extra night, Beethoven's "Fidelio," which for the last three years has been meritoriously reserved for the termination of each season, with the following cast:—*Leonora-Fidelio*, Madame Castellan; *Marcellina*, Mdlle. Bertrandi; *Florestano*, Signor Tamberlik; *Pizzi (Carpano)*, Signor Stigelli; *Don Pizarro*, Signor Tagliafico; *Ministro*, Signor Angelini; and *Rocco* (the gaoler), Herr Formes; but, owing to an attack of inflammation in the throat, Herr Formes was *hors de combat*, and "Fidelio" was again postponed. Auber's "Masaniello" being substituted, Tagliafico taking Formis's part of *Pietro*.

MR. THACKERAY'S LECTURES ON THE ENGLISH HUMOURISTS OF THE EIGHTEENTH CENTURY.

The first of these lectures was delivered at Willis's Rooms, on Thursday. The audience was fashionable and numerous. The subject of the lecture was the life of Dean Swift. Mr. Thackeray started with the statement—that his lectures would rather pertain to the men and their lives, than to their works. These, he would, therefore, be rather grave than comic, though not the less humorous, which comprehended more than laughter. The humorist paints all classes of life and individuals, though, in particular, their peculiarities. Mr Thackeray then gave a biographical outline of the events, with their dates, of Swift's career, dwelling somewhat on his early intimacy with Sir William Temple, and his acquaintance with Esther Johnson; and, after some remarks on Dr. John on's Life of the Dean, inquired, whether we should like to have been the friend of Swift? "I should have liked," the lecturer said, "to have been Shakspeare's call-boy—but the friend of Swift! a man touched to the finest issues, rewarded by his equals, and only a delightful companion to a lord; and for the service thus rendered, repaying himself by keeping on his hat in the presence of the lady and her daughters. He was a tremendous fellow to read, like *Rochefort*. A man made society stand and deliver. Public society, however, in his day was strangely disordered, and in part justified such conduct on the part of ambitious spirits, with talent to make good their claims. But such men wanted but little motive; there would be always some excuse ready for men of an aggressive turn: they were diplomatic warlike and predatory. Swift was an Irishman only by birth his heart, his style, were English—cold, neat, and despising the usual ornaments of Hibernian eloquence. It was during his ten years' residence with Temple that the Dean picked up his knowledge of life, in whose service, as chaplain, he was considered by his Lordship's valets as no better than themselves—his self indulgent Lordship the sole object of reverence, who knew not or new much greater Swift was himself. Swift knew it, but to repent it: and there was nothing more melancholy than his letter to Temple, asking to be taken again into the favour he had surrendered. Abasement could not go lower. What a contrast twenty years later! Then we find him bowed to by all, and at Court constituting the patronage of the great for the good and the clever. But Swift was insincere in religion. The "Tale of the Tub" left no doubt upon that point. A vast and dazzling genius was displayed in that book. How Swift suffered from the consequences of his scepticism, and let out his apostacy for hire! His suffering was awful, and he deserved to suffer. He lived alone in the world—the most unhappy man on earth." On the story of Stella, Mr. Thackeray made some melancholy remarks, and observed, that, all his experience of sentimental writing, he had met nothing more touching than Swift's letters to Stella. In the matter between Stella and Vanessa Mr. Thackeray sympathised with the former. Though not fond of conversation, he found generally sided with the other. He apprehended much tenderness in Swift's inscription—"Only a Woman's Hair"—not the indifference ascribed by Sir Walter Scott. It was a lamentable thing—only that record of his remorse should be all that was left of the beloved and the wronged. The lecturer was frequently applauded, though not always audible, from his elocution not being polished in a sufficiently high key.

CREMORNE GARDENS.

This popular resort was opened to the public on Monday evening. The enterprising director, Mr T. B. Simpson, has added a host of attractions to the excellent list of last season. The grounds are by no means of small compass: they extend over seven acres and even before the painter and decorator had exercised their arts on them, they were tasteful and park like, and as they would hardly be looked for within so short a distance of the brick-and-mortar town. However, after Cremorne, after whom it named this, and for whom he was a man of taste, and assembled here a fine collection of Flemish and Italian pictures. The artistic character of the place has now been extended throughout the grounds, which are a charming specimen of landscape gardening. We have a leafy avenue, with its guardian statues; the walk overarched with glittering lamps; the bewildering maze: with a *pleasaunce* borrowed from the Elizabethan times; and an enviable retreat from the more exciting *dance* and *spectacle*. From the *théâtre du ballet* you cross to a cleverly-decorated pavilion, with a stage for the exhibition of a party of Ojibbeway from South. Africa: and there are archery and gymnastics, and other out-door feats. But the centre of this "florial system" is the new platform, enclosed, and lighted with gas in candelabra, all of elegant design; whilst the orchestra is of gay Chinese design, elaborately painted and illuminated; and here play the great band of eighty instrumentalists for concerts and dances. The performances during the week have been a "Feast of the Rose" and a *ballet d'action*, named the "Star of Beauty; or, the Imp of Fire:" the evening's amusements concluding with fireworks at the Polychrome Palace. Altogether, Mr. Simpson has greatly improved the manner and character of the Cremorne delights, which will, doubtless, be appreciated in this great season of sights. We should not omit to mention, that among the *tableaux vivans* are most appropriately given the groups from the six principal medals of the Great Exhibition. The amusements are to end here; for a circus is in course of erection, in which Francomi's celebrated *troupe* will shortly perform. By the way, those whom the glare and glitter of gas delight not, may enjoy a quiet morning stroll at Cremorne.

MECHANICS' INSTITUTION.—MISS GLYN.—This lady, who has so lately succeeded in Edinburgh, in several highly profitable readings of Shakspeare's great tragedy of "Antony and Cleopatra," gave great delight to the members and friends of the above institution, on Thursday evening, by an exceedingly powerful and graceful rendering of the same sad tragedy. The characters which she most aimed at developing were those of *Enobarbus* and *Enobarbus*; and these she discriminated with surprising skill and effect. Her *Cleopatra* had all the voluptuousness of the Egyptian Queen; her *Antony* all the heroic devotion of the Roman lover; while to *Enobarbus* was given a tenderness which unclad every heart with its pathos. The theatre was crowded to overflowing with a highly respectable audience, by whom this great scene, in the new trial of her extraordinary powers, was frequently and unanimously applauded.

PROTECTIONIST DINNER TO MR. W. B. FERRAND.—The Protectionists of Aylesbury and its neighbourhood entertained Mr. W. B. Ferrand, who was defeated by Mr Hethel at the election which recently took place there, at a public dinner, which took place at Montgomery's Assembly Rooms, on the 13th, 300 persons attended. Mr. W. Lowndes, Chairman of the Buckinghamshire Conservative Club, presided, and was supported by Major-General Sir James Watson, Captain Tyrie, R. N., Mr. J. Mackie, Mr. J. Darvill, Mr. Gale, Mr. Cole, the vicar of S one, the Rev. W. E. Partridge, rector of Horsenden, and other gentlemen of influence in the neighbourhood. The toasts and speeches were of the usual Protectionist character.

SHOCKING OCCURRENCE.—The Madrid *Epoca* of the 15th instant, quotes a letter from Seville, announcing that a frightful catastrophe had occurred in the gardens of the Duke of Montpensier, at Alcala. The Prince had caused a steam-engine to be placed in it for its irrigation, and the 10th inst. was fixed for its trial. His Royal Highness fortunately could not assist at the operation, as he intended, but the Infanta Luisa, wife of Don Enrique Montpensier. As the boiler to be used for the experiment was not new, it was agreed that it should be slowly heated; but, either from neglect or imprudence on the part of the engineer, the boiler exploded, and overwhelmed the house, burying under its ruins 60 or 70 persons assisting at the experiment as operatives or mere spectators. M. Latour, secretary of the commands of the Duke, on hearing of the accident, immediately repaired to the spot, accompanied by a physician in attendance at the Palace. On their arrival, 3 dead bodies and 16 wounded (all been removed from under the rubbish.

The population of Belfast has increased, since the census of 1841, from 75,000 to 112,000, its present amount. In 1831 the number was 53,000, and in 1821 only 37,000, so that in thirty years the metropolis of Ulster has considerably more than trebled its population.

MR. E. G. Halliwell, who formerly contested the election of Stroud, with Lord J. Russell, has offered himself as a candidate for the representation of Newry, rendered vacant by the death of the late Lord Newry, on Protectionist principles.

A vessel arrived in the Thames, from Marseilles, has brought the very large number of 2353 packages of flour, comprising the entire cargo, the production of France. The arrival of flour from the French ports have been quite remarkable from their number and extent.

CHESS.

TO CORRESPONDENTS.

W. t. Beverley.—No 2nd strikes us as amusingly pretty beautiful, but you have put us to great unnecessary trouble by sending such blurred and illegible diagrams.

VERITY, G. F., Kensington.—S N K—in eight.

CURTIS and J. S., Ashford.—It shall appear shortly among our Chess Fragment

R. H. Ashford.—No 1 will do on the first occasion, and No 3 improbable.

R. F. D.—T., Lisbon.—No 1 is incorrect. No 2 is clever, and No 3 shall appear as an Enigma

JUVENILE.—The *Chess-Player's Chronicle* now numbers twelve volumes, and has devoted an incredible expenditure of ten years. For a complete set of this magazine you must apply to Hastings, publisher, 13, George-yard, Lombard-street.

THE CHESS TOURNAMENT.—The Committee to fix the General Prizes are peculiarly desirous to hear in mind that the whole of the Committee would be required to be present at the St George's Chess Club on Friday next the 23 inst, from two o'clock to six P M.

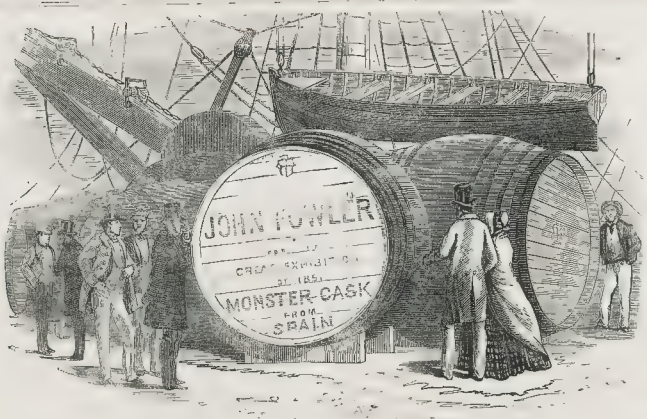
FLEET.—The Problem in question, No 98, is printed with perfect accuracy, and is as beautiful as it is accurate. Your attempted solution is childish.

ALDEY.—Send your subscription, however small, to Mr Robert Longbottom, 4, Cavendish-square. *Subscriptions / four guineas and upwards will be entitled to a copy of the work now in the press, the whole of the games played*

FREE-HIRE.—You may always rely on a game of Chess, when in Bath, at the Royal Union Library, where, under restriction of half-an-hour's call-over in the Club-room, we have at No 8 in the Isle of Wight a note addressed to the hon. secretary, Captain Harborne, Spring Vale, W. I should suppose table money afterwards to the Committee.

SILVER VEIL.—We again ask, wherein the joke of sending an obvious mate of one move as a Problem to *four* consents

SULTAN.—A palpable misprint of "Sonnenty" for "Sweetzoff."



MONSTER CASKS OF SHERRY IN THE LONDON Ddocks.

the work had not been commenced. The one that broke, and produced the fearful consequences so much lamented, was the uppermost on the fourth floor. It had been fixed some days, and the walls had been carried up to the height required to receive the roof. According to Mr. Bell's statement to the City surveyors, he saw it perfect on Saturday morning, when he went over the works with Mr King, the superintendent, and found everything apparently safe and progressing to his satisfaction.

An attempt was made to discover the cause of the girder breaking. This was found impracticable, as the broken fragments lay embedded in the ruins. The people employed on the works say they are confident there was no weight on the girder to cause it to break, and express an opinion that it must have arisen from a flaw in the casting. It seems that Messrs. Bell and Corbett possess certificates, showing that the whole of the iron joists and girders employed in the building were properly tested and warranted.

The following list of the sufferers has been published:—

Peter Horrigan, dug out of the ruins.
Jeremiah Connor, dug out of the ruins.
Michael Cronin, dug out of the ruins.
Joseph Henley, aged about thirty-two, a compound fracture of the base of the skull, and both legs broken. Taken to St. Thomas's Hospital. Since dead.
Timothy Donohue, aged 42, dead. He was supposed by his comrades not to have been on the building at the time of the accident, but it appears he was on the top, and was one of the unfortunate creatures who were precipitated to the ground with the walls and floor, when they fell. He was got out by some strangers, and taken to St. Bartholomew's Hospital, where he died almost immediately.
Timothy Sullivan, aged about 30, both legs fractured, severe contusions on the body and head. Remains in a dangerous condition in the same hospital.
W. Ransom, aged 24, right leg fractured, and body much bruised. Supposed to have received many severe internal injuries.
W. Whiting, aged 31, scalp serious; fractured, with divers wounds and contusions over the body. Not expected to recover.
Thomas Clark, aged 30, scalp lacerated, and ribs supposed to be fractured. In a very dangerous condition.
John Cooper, aged 39, laceration of the scalp, and several severe contusions on the body. Expected to recover.
George Barham, aged 29, fracture of the legs, and severe injury to the scalp. Hopes of recovery.
David Foley, aged 31, numerous wounds and bruises over the body, and head much injured. Expected to recover.
James Kirby, aged 28, head much cut, and lower part of the body seriously injured. Recovery doubtful.
Henry Perry, aged 38, slightly contused over the body and head. Nothing fatal apprehended.
James Jenkins, slightly injured.

MONSTER CASKS OF SHERRY IN THE LONDON DOCKS.

In connexion with the Great Exhibition incidents, we have to notice the importation of four Monster Casks of remarkably fine Sherry, by Mr. John Fowler, wine-merchant, Wells-street, Cripplegate, by the ship *Traveller*, Captain A. R. Henderson, from Cadiz. These casks are larger than hitherto known to have been imported from Spain, and their shipment caused some sensation in that country. The larger casks contain 2900 gallons, and the two smaller ones half that quantity. They have been branded, by the express command of the Queen of Spain, with the Royal arms. The casks are of English manufacture, and were shipped to Spain, where they have been for seasoning since the Great Exhibition of 1851 was first broached, in anticipation that they would have been admitted, and the wines sold for refreshment; but the object of the importer is more particularly, we understand, to shew the connoisseur and the trade, that wines of this high order, and purely free from brandy, cannot be shipped to this country in small quantities without great deterioration in quality.

The London Dock Company have had great difficulty in receiving these casks, and have been compelled to fix up shears for delivering them from the lighter; also some additional apparatus for raising the same. The dimensions of the larger casks are—round the bouge, 10½ yards; diameter of the head, 2½ yards.

The peculiar order of these wines are as follows:—The wine marked YYYY is comprised of a very old stock of the palest wines, and possesses great flavour, great aroma, with age, and delicacy of extraordinary description.

Fi, Fino Fino.—This wine is extremely delicate, of the very highest order of wines of this peculiarity.

Ole Roso.—This wine possesses the finest flavour, and the most elegant aroma of its class.

Solerus.—This wine is of the oldest stock that Spain can produce.

THE "FAIRY QUEEN."

Among the many interesting sights of this wonder-fraught season is "the Fairy Queen," who has recently changed her place of exhibition from Leicester-square to the corner of Hall-street, Goswell-road. This interesting and diminutive little girl, when born, weighed only one pound and a half. She is now fourteen months old, weighs five pounds, and

THE "FAIRY QUEEN."

measures sixteen inches in height; her feet are but two inches in length and she possesses the utmost regularity of limb and feature.

THE CHINESE FAMILY.

A pleasing addition has been made to the Chinese Collection, consisting of a Chinese lady, named Pwan-ye-Koo, with small lotus-feet only 2½ inches in length, a Chinese professor of music, his two children (a boy and a girl), the *femme de chambre* of the lady, and an interpreter. The children are gay, lively, and intelligent, the lady herself agreeable and interesting, and the gentlemen civil and obliging. A Chinese concert forms part of the entertainment; the lady Pwan-ye-Koo singing a Chinese air or two, accompanied by the professor, who likewise treats the public with an exhibition of his vocal powers. The group is one that has much to commend it: it is picturesque and peculiar, and presents an image in high relief of the native manners of a Chinese family. The conduct of the domestic blended the humble and the familiar in a significant manner; and there was an air of freedom, and a sense of mutual obligation manifested in the whole party, calculated to make a favourable impression on the spectator.

REMAINS OF THE FALLEN PREMISES IN GRACECHURCH-STREET.—SKETCHED FROM THE ROOF OF AN ADJOINING HOUSE.

THE CHINESE FAMILY, IN THE EXHIBITION AT ALFRED GATE, FROM A PHOTOGRAPH BY BEARD.

ST. PETER'S HOSPITAL, EAST-HILL, WANDSWORTH.—FROM THE RAILWAY.—(SEE NEXT PAGE.)

SPEAKING TO THE EYE.

(From the "Economist.")

Those whose office it is to dispense instruction are practising a new art. Our great authors are now artists. They speak to the eye, and their language is fascinating and impressive. The events of the day or the week are illustrated or described by the pencil, and so popular is this mode of communication, that illustrated newspapers are becoming common over all Europe. If they do not supersede other journals, they surpass them in public favour. Any one passing along the Strand, between Friday and Tuesday, except on Sunday, must have seen, opposite the church of St. Clement Danes, and at the corner of Milford-lane, a crowd of men and lads shoving and struggling, and heard them joking and bawling as they fought their way up to a side door, and every now and then a man or a lad emerging from the crowd bearing aloft in triumph, as if snatched from some rival, a quire or two of newspapers. Around the front of the house, too, the passer-by would observe people stopping to gaze into the windows of the shop hung round with pictures. This is the publishing office of the Illustrated London News, which is said to send out weekly, on ordinary occasions, the extraordinary number of between 70,000 and 100,000 copies, and, on such an occasion as the opening of the Exhibition, to issue nearly 200,000 copies; and thus keeps, for half the week, that part of the Strand in a tumult, while the operation of distributing the papers is going on. Such a sale is, we believe, wholly unexampled either in England or any other country, and it is due to the pictures by which each Saturday the events of the week are illustrated. A similar and successful, though not equally successful, journal, in imitation of the London paper, is published in Paris, Madrid, Leipsic, and a great many other towns on the Continent. *Punch* owed much of its success to its illustrations; and it is the same with many other publications. Artists now dispute the palm with the most popular authors; and however greatly some of the latter are favoured, they stand below skilful wood-engravers.

The causes and consequences of this dawning and important change are worthy of notice.

The causes, though many have combined within the last few years to effect improvements in engraving and printing, may all be summed up in the facility with which these are now accomplished, and the comparative cheapness in consequence of illustrations. In the Illustrated London News of the week before last, which, with a Supplement, sold for a shilling, there were thirty-four wood-cut embellishments, some of them filling two pages of the Journal, representing the opening of the Exhibition, the Building itself, some of its contents, some of the pictures in the Royal Academy, and some of the events or interesting occurrence.

of the week. Twenty years ago, the smallest of these ornaments would have been considered, with a due proportion of letterpress, cheap at a shilling. It is scarcely too much to say, therefore, that, by means of improvement in the art of engraving, giving facilities for publishing rapidly large editions, illustrative engravings can be given to the public at one-fortieth of their cost a few years ago. Not now to advert to the several steps by which the art has advanced to its present state, we shall merely observe that since we learned how to make the sun paint for us, attention has been directed to the subject in all the countries of Europe; and in no art have greater improvements been made than in the arts of engraving and printing engravings. The result is a facility of illustrating passing events truly and graphically, which makes the artist, as much or more than the writer, the historian of our time.

The probable consequences deserve more notice from reflecting politicians than the causes of the change. Written or spoken language merely suggests thought; and the thing suggested, or the several parts of it for which the words stand, must have been, as it were, in the mind before. The new thought suggested is merely putting together in a new form some scraps of old knowledge. But pictorial representation may at once convey totally different and totally new ideas to the mind. The artist speaks a universal language. A Turk or a Chinese understands him at once, though to make either of them understand a written or spoken description, would require a long time and much instruction. Hitherto it has become practicable to establish in London French and German journals, which, by means of illustrations, speak at once to the natives of France and Germany. Pictures, then, have the great advantage over words, that they convey immediately much new knowledge to the mind: they are equivalent, in proportion as they approach perfection, to seeing the objects themselves; and they are universally comprehended. They may make every one part-cipate in the gathered knowledge of all. Artists cannot yet catch and portray spiritual abstractions; many of the thoughts of the great historian, of the philosopher, and the poet can only have symbolical and suggestive signs; but all that can be seen all the material world—may be represented by the artist; and now that his skill can, by the improvements in art, be made cheaply available, it will in future be more and more employed to spread knowledge through every society.

The great extent, also, to which the art may be applied is evident from the monuments of Egypt and Assyria, which, after a lapse of three thousand years, have restored to us a knowledge of the inhabitants of those countries, and of their manners and customs. The artist has handed down to us the information that there were then different races of men—that one race conquered the other; he has preserved records of battles won, and the number of prisoners taken, the number of scalps carried off, with something like an account of the Royal prize-money. It is pretty clear, from these monuments, that even statistics may be made impressive to the eye. After a long deviation necessary, no doubt, that we may prove all things, and hold fast only the good—we are carried back to the principles of the art with which mankind were first inspired. We again have recourse to the mode of recording events in use amongst the earliest people; and now find the method of communication employed by the Mexicans to describe Cortes and his ships, to be the best for diffusing knowledge amongst mankind. The art is, indeed, wonderfully improved, and the rapidity and cheapness with which an object can now be sketched, engraved, and printed, suggests the possibility of obtaining an instrument for forwarding the improvement of mankind more powerful than the press for printing words.

When Guttenberg set his first type, and Caxton began printing in England, nobody foresaw or dreamed of the many changes of which their humble art was to be the parent. Nor did any person imagine, when gunpowder was first applied to the purposes of destruction, that its ultimate destiny was to moderate the horrors of war, deprive individual strength of ferocity, and help forward a period of continual peace that should make an universal exhibition of the products of art and industry possible. Steam, too, without the foreknowledge of its gifted mind, will reduced its expansive spirit to our servitude, is changing the face of society. Thus it is, material changes, improvements in art, discoveries and inventions that are almost unnoted at their origin, and not any wise political contrivance, which give civilization, and bring about those great changes in society, to conform to which is the highest wisdom, as well as the duty of legislators. If the modern improvements in the art of transmitting knowledge by the press are not of such marvellous efficacious in diffusing knowledge than the art of printing words, may we not expect it to be the forerunner of changes greater than printing has hitherto brought forward? Will not the modern art of speaking to the eye, confined to representing the material World, be followed by the abstract and spiritual conceptions, increase the influence of that world, and give the knowledge derived from it a vast preponderance over the mind?

The Great Exhibition itself, which is a representation to the eye, is a part of the same progress. It is performing the office of the illustrated newspaper. It is the history of modern art and invention taught by their actual products. Like sun painting, it speaks all tongues. It wants the facility of spreading that history over the world; and the illustrated paper, without which it is doubtful if it could itself have ever existed, comes to its aid, dispenses the knowledge so scientifically gathered and arranged, and so graphically displayed in Hyde Park over all the nations of the earth. The Exhibition can spread the whole knowledge by inviting persons from all quarters to come and see it at a great charge and great inconvenience; but its own classified and illustrated catalogues, and the illustrated newspaper, spread the gathered knowledge, for the charge of a few shillings, over distant lands and divided nations. The Exhibition would be a comparatively feeble instrument for helping forward improvement, without the assistance of illustration and letterpress to convey a knowledge of its wonderful palace and its contents to the many millions who cannot possibly visit it.

Representations of the material world and of common life do not constitute what is called high art; and it cannot escape observation, that the Exhibition, though it contains a few statues, is much more a collection of products of the arts that minister to the comforts and enjoyment of the millions, than of the products of high art. Instruments, from a steam-engine to a bodkin, house furniture of all descriptions, and materials for clothing, from the most comfortable woollen to a gossamer web of lace, make up a large part of its contents. The common and the useful predominate far above fine and high art. In like manner, it is with common events, with subjects that interest the multitude, that illustrated newspapers fill their columns. To give illustrations they must have many customers, and the arts they cultivate must attract the multitude. Historical painting, grand compositions, even fine groups, and, above all, allegorical groups of sculpture, constituting high and fine art, have no market for the people, and will not be encouraged. When those make large fortunes who carefully minister to the common wants, men of genius and talents will not long pursue any of the higher walks of art. Instances for the truth of hitherto, though much talent has been engaged in illustrating passing events, the art has not had done for it all of which it is susceptible. Now that it is becoming so extensively popular, it must attract to it the highest talents, and effect a revolution in art itself, making it more than ever subservient to the uses of the multitude, and in improving them by all the talents and genius that are now wasted on many profitless and improving pursuits.

[With the above quotation from our able contemporary we give an Illustration for such of our readers as have not the opportunity of seeing our Office. We may add, that the *Economist* has considerably underrated the circulation of our Journal, the statistics of which we intend to publish.]

ST. PETER'S HOSPITAL, WANDSWORTH.

AT length the inmates of St. Peter's Hospital, or the Fishmongers' Almshouses," have removed to the new hospital, built by the Fishmongers' Company, at East Hill, Wandsworth, on the north side of the London road. In a former Number of our Journal we gave a view of a portion of the old foundation at Newington, with a glance at its history; and within the last few days, the taking down of the quaint building has been commenced. The unroofed walls, and windowless frames, and desolate courts, presented a strange contrast to the appearance of trim neatness and domestic quiet which the entire place within our recollection possessed. The plot of land originally cost the company £110 its improved value for building purposes may, in a measure, be attributed to the change of the hospital site; but, be this as it may the inmates will be the gainers in health, the site at Newington being now surrounded with houses; whereas the position of the new hospital is as open and airy a spot as any in the environs of the metropolis

The first stone of the new Asylum, designed by Mr. Richard Suter, the company's architect, was laid June 25, 1849, by Mr. W. Flexman Vowler, the prime warden.

"The buildings occupy three sides of a quadrangle, about 255 feet by 235 feet; the fourth side opening towards the south, and upon the Highroad, whereby the whole are distinctly seen. The back, or north front, has been designed to present a *façade* towards the Richmond and Windsor Railway, from which it is distant but a few hundred yards There are forty-two buildings, each comprising three rooms, with complete and distinct offices, the two rooms for the medical officer, clergyman, paymaster, and pensioners, and a chapel in the centre. The style is Tudor; the chimney-shafts are large and lofty, and form a prominent feature in the design. The lower story of the chapel is appropriated to the payment of the pensioners. The whole premises, with garden, lawn, and shrubbery, occupy nearly seven acres. The principal material is white Suffolk brick. For the dressings, Caen stone is used, which has received several coats of cold-drawn linseed oil as a preservative."—*The Builder.*

The cost of the new hospital is stated at £25,000; and this, conjoined with the large sums which the foundation costs, proves how greatly the company have extended the benevolence of their ancestors. "The amount we annually expend in support of the hospital" (said Mr Vowler, on laying the first stone) "is not less than £1700 (formerly it was not more than £360); and whereas the entire cost of the old hospital did not exceed more than £3000, the entire cost of the new one will probably be £25,000."

THE GREAT EXHIBITION.

THE Exhibition still lords it over all other attractions. One hears, sees, speaks, thinks of little else; and to all appearances it must have run "a dead heat" with the "Derby," for on that memorable day the numbers appeared as undiminished as ever. How far the larger crowds of next week will diminish the interest of the present crowds, remains to be seen; but the probabilities are, that the two days devoted to *crowns* and *half crowns* will not be eclipsed in numbers by those devoted to *shillings*, since the curiosity of *season tickets* alone is anything but satisfied. With Russia just out of the ice of the Baltic, and about to make its display in the space so long vacant; with unpacked silks and velvets from Lyons, and plate, bronzes, and *bijouterie* from Paris, and another importation into the almost vacant space of the United States, there seems quite enough of novelty to come, to make pleasure-seekers, loungers, and gossips of all sorts, as intent upon the forthcoming as they have been on the present, quite of display

Royalty is as regular and as punctual to early hours as in the beginning, perhaps more so; and unless the Queen should command a matinée, we may anticipate that the matutinal appearance of her Majesty will take place even earlier than hitherto, in order to avoid the annoyances to which, on two or three occasions during the past week, the Royal party have been subjected.

Financially, the Exhibition promises to be a triumph of no ordinary character, and its Chancellor of the Exchequer may calculate upon an almost alarming surplus. The receipts have reached £400,000 already. The daily admissions generally net some £2000 at the lowest point, and in some instances much more. On Tuesday, the 20th, the receipts reached the sum of £4960 10s for single day admissions, whilst the season tickets realised £350 14s; thus making the day's receipts a little of £5311 4s. As to the season tickets, the demand within this few days has been almost as great as ever; but at last symptoms of a falling off have manifested themselves, yet some circumstance may again arise to give them another "run" in the market

The exciting topic amongst the exhibitors during the past fortnight has been the constitution and decisions of the juries. There is an intensity about this which shows how earnest the inventors, manufacturers, and workers have entered into the spirit of the contest of excellency in which they have been engaged After much careful consideration and selection, the juries have been fairly constituted; and it is not too much to say, that, in all probability, they are composed of the best men of their respective departments in Europe, both as regards knowledge and standing. A council of chairmen has been formed. These report ent the thirty classes into which the Exhibition is divided, a jury being appointed for each class. The meetings of the juries for the purpose of the award of the several juries and modes of action and principles of award were settled thereat.

On Monday, the 12th inst., the general body of the jurors met in the Royal Commissi n Room, at the Building; and, probably, a similar body of men were never gathered together in one spot at the same time. certainly not with the same purpose. The object on this occasion collected that of doing honour to the talent, to the skill and industry, not merely of one country, but of the whole world. Since that day they have been actively, but very quietly, engaged in pursuing their labours under the direction, and with the assistance of the gentlemen appointed to this special and highly important and honourable service. The juries being divided into groups, according to the nature of the productions upon which they are called to adjudicate, a deputy-commissioner is appointed to each group, with a special commissioner and secretary to attend to the general working. The thirty classes are divided into five groups, thus:—Group A, raw materials; Group B, manufactures; Group B, six juries for machinery; Group C, ten juries for textile fabrics; Groups D and E, eight juries for hardware, furniture, &c.; Group F, two juries for mechanical contrivances and the fine arts

These are placed in charge of the following gentlemen :—

Dr Lyon Playfair, F R S	Special Commissioner
	ASSISTANT.
Professor Wilson, F R S E	for Group A—Raw Materials
Colonel Lloyd, F R S	for Group B—Machinery
Mr George Wallis	for Group C—Textile Manufactures
Captain Donnelly, R E	for Group D—Metallic and fibrous substances
Mr Scott Russell, F R S	for Group E—Miscellaneous manufactures and fine arts
Lieutenant Owen, R N	Secretary to the Department

The juries are to be "private and confidential." Here and there in the Building may be seen groups of gentlemen carefully examining the articles exhibited, spreading broad-cloth on tables, holding fabrics up to the light; and, doubtless, in the ladies' courts, which, by-the-by, amongst other evidences of the place, the gentlemen have taken to "shopping" on their own account. All this goes on silently, and without bustle. Police present the too near intrusion of the visitors; and, when the whole record of the awards is prepared, that magistrates of certain burghs may comm t prisoners to any gaol within the county, and that juvenile offenders may be punished by private whipping

The Customs duties received in Dublin for the week ending on Monday last, amounted to £17,861 9s. 1d.

Mr. Hutt and Mr. Adderley have prepared and brought in a bill in the House of Commons to enable certain property duties in the British colonies to be sent in Parliament. The bill provides, that, from and after the passing of the act, a life interest in property, of which not less than thirteen years shall be unexpired, in any of the colonies or territories of the East India Company, of the annual value of £600 per annum, shall be a good qualification for a county, and the same of the value of £300 for a borough. The respective sums are, of course, to be free of all charge and incumbrance

A package has arrived at Dover by the packet *Chemin de Fer*, from Ostend, and been forwarded to Buckingham Palace, containing a portrait of her late Majesty Louise Queen of the Belgians, which has been sent by King Leopold to her Majesty the Queen.

The *Derby Reporter* states that it is the intention of the gentlemen of Derby and its vicinity to invite Mr. Charles Fox, the builder of the Crystal Palace, to visit that town, previous to his proceeding to Dublin in Derby a few weeks hence.

On Tuesday afternoon, one of the finest sturgeons ever captured in the Tweed was taken at Cairnie fishing-station. This splendid fish, which is about to be stuffed, measures in length 7 feet 2 inches, in girth 21 inches, and weighs 140 lb. It is as remarkable for its symmetry as its size.

The quantity of foreign wheat imported into Liverpool, for the fortnight ending 7th May, 1851, was 139,472 bushels wheat, 1233 sacks flour; 92,330 barrels ditto, 80,487 bushels Indian corn, 3283 sacks ditto, 2400 bushels rye, 10,352 bushels beans, 9744 bushels peas, 6928 bushels barley, 3823 barrels barley, 3892 barrels meal, 2020 boxes cheese, 111 casks ditto, 50 cases ditto.

On Friday (last week) an inquest was held at the Red Dog, High Halston, before Mr. Thomas Entwisle, county coroner for West Kent, on view of the body of a person unknown to the jurors, but which proved to be that of Mr. Todd, a barrister, who was accidently drowned on Easter Sunday, whilst cruising with some friends in the Thames, below Gravesend. The jury returned a verdict that the deceased was accidentally drowned.

Sir Andrew Stockenstrom, who has so long been mixed up in the government of Africa, and who, as commissioner to the Cape, while the affairs of African were under the well-conducted, arrived at Plymouth on Friday evening week, by the *Mon tezuma* East India trader. Sir Andries, shortly after his arrival, left by r a for

The enrolled Pensioners of Chelsea are to be reviewed in Hyde-park on the 31st of June.

On last Saturday a meeting was held at the Corn Exchange, Cambridge, to present a requisition to Mr. G. F. Young to stand for the county at the next election. The actual number of signatures is not stated, but it was said that there were more than an actual majority of the voters on the register. There was a banquet at the Red Lion at the conclusion of the proceedings, to which about 160 sat down, Mr. S. Quintin occupying the chair. The object of the movement is to oust Mr. Townley from the representation. His crime being that, having voted for protection, he afterwards voted in favour of the present Government.

EPITOME OF NEWS—FOREIGN AND DOMESTIC.

At a meeting of merchants and manufacturers, held in the committee-room of the Town-hall of Birmingham, on Wednesday, the Lord Mayor in the chair, it was unanimously resolved to invite his Royal Highness Prince Albert, the Royal Commissioners, and Executive Committee of the Great Industrial Exhibition to a public dinner in the Town hall there, at an early day, in testimony of their high sense of the efficient and impartial manner in which the labours of the Exhibition have been carried on so far, and a successful issue. A committee was appointed to carry out the objects of the meeting. It is intended that the entertainment shall be upon an extensive and magnificent scale.

The usual preparations are being made for the holding of the triennial festival of the three choirs of Worcester, Hereford, and Gloucester, in the summer, at Worcester. The festival has been definitively fixed to be held at Worcester Cathedral and the College Hall, on the 26th, 27th, 28th, and 29th of August.

The *Pacific* steamer, Captain Nye, reached Liverpool on Tuesday afternoon at two o'clock, with 176,000 dols. in specie on freight from New York, which port she left on the 10th inst., completing her voyage in the short space of 9 days, 19 hours, and 25 minutes, thus beating the run of the *Asia* (the quickest ever previously made) by six hours.

Major Hogg and Mr. Owen have been appointed commissioners to proceed to the Cape, for the purpose of inquiring into the recent disturbances in Kaffraria. The intimate acquaintance with the affairs of the colony acquired by Major Hogg during his per od of service there under Sir Peregrine Maitland, and the perfect knowledge of the Kaffir language which Mr. Owen possesses, will, no doubt, conduce much to render the inquiry advantageous.

The Society for Promoting Christian Knowledge have this year determined upon closing their depository altogether on Thursday next, and keeping the Feast of Ascension a close holiday

The Rev. Mr. Ewing, and four other members of the American Congress have arrived at Killarney, to view the beautiful scenery of that locality.

The Minister of Agriculture and Commerce of France has decided that the great hall of the Conservatoire des Arts et Metiers, Paris, shall be appropriated to the exhibition of the objects which that establishment may purchase at the Exhibition of London.

Mr. Bedford, the coroner for the Westminster district, has held five inquests on newly-born infants during the past week, the bodies of which were found by the police in the streets, each case presenting more or less suspicion as to the manner they had been murdered. A sixth body was found on Wednesday morning, at Newington Butts.

While some men were cleaning out the canal opposite the Swan Inn, in Colwell, near Bristol, a few days since, they were fortunate enough to strike upon a dress-sword of the reign of Queen Elizabeth

On the 13th inst. a band of thirteen robbers were captured and brought to Cosenza, for having committed, and afterwards set fire to a village inn. The remarkable part of the affair is, that they proved to be peasants, possessing land and in good circumstances, from four neighbouring villages, so that, unless the deed originated in motives of revenge or political enmity, the condition of society in those parts must have come to a strange pass.

Two females were discovered in barrels on board a vessel bound to Charleston, from Liverpool, a short time since, after being out en days at sea. Several others, since airy concealed, were subsequently discovered

The Board of Directors of the Atlas Assurance Company have determined to give to each of the clerks of their establishment, in rotation, four days' leave of absence, for the purpose of enabling them to view the Great Exhibition, the company paying for the admissions. A like favour has been granted to the assistants of the Post Office, and the Provident Clerks' Life Association. It will afford us great satisfaction to be enabled to record in our next Number that this liberal example has been followed by all the offices and banks in London.

It is stated that the vacancy in the representation of Cockermouth and Kinross, caused by the death of Major-General Sir William Morison, will, in all probability, be filled up by the election of Mr. Adam, son of Admiral Sir William Adam, who acted with the party of the electors on Liberal principles.

During the last thirteen weeks there have been but two cases of felony in Burnley (Lancashire), which has a population of nearly 27,000 persons. This speaks well for the honesty of the people

Mr. J. R. Hind has this week discovered another new planet in the constellation Scorpio, about eight degrees north of the ecliptic, and forming at the time an equilateral triangle with the stars ξ Scorpii and ψ Librae. It is of a pale bluish colour, and its light is about equal to that of a star of the ninth magnitude.

The returns of persons who have emigrated from the port of Liverpool, since January last exhibit a gradual increase upon the returns for the corresponding year. The number of passengers who sailed from that port in the month of April was 25,447 persons, against 17,858 in April last year; making the number of emigrants from Liverpool in 1851—already 47,607.

A vacancy is created in the representation of Argyleshire, as well as in the distinguished office of leader of the Scottish bar, by the promotion of Mr. Duncan M'Neill. It is generally understood that Mr. Adam Anderson, who formerly held the office of principal clerk of session, and dean of Faculty; and that Sir A. Islay Campbell, Bart., of Succoth, will become a candidate for the representation of the county of Argyle, on Conservative and Protectionist principles.

The statement of the appointment of Mr. Tindal to the office of Clerk of the Crown, vacant by the Earl of Cottenham's accession to the peerage, which appeared in several of the London newspapers, is at least premature.

One of the principal prizes for Greek, at a recent examination in the University of Edinburgh, was carried off by a blind student, a native of Jamaica. He had used in his studies the Greek Bible which he was examined in, printed in raised characters, which he traced with his fingers

The bill brought in by the Secretary at War and the Lord Advocate, to amend certain acts relating to the enlistment and discipline of the army in Scotland," has been amended in committee, and three clauses have been added to it. These clauses provide that assessments are not to be levied on property for the purposes of the militia, unless a ballot be first enacted; that magistrates of certain burghs may commit prisoners to any gaol within the county, and that juvenile offenders may be punished by private whipping

The Customs duties received in Dublin for the week ending on Monday last, amounted to £17,861 9s. 1d.

Mr. Hutt and Mr. Adderley have prepared and brought in a bill in the House of Commons to enable certain property duties in the British colonies to be sent in Parliament. The bill provides, that, from and after the passing of the act, a life interest in property, of which not less than thirteen years shall be unexpired, in any of the colonies or territories of the East India Company, of the annual value of £600 per annum, shall be a good qualification for a county, and the same of the value of £300 for a borough. The respective sums are, of course, to be free of all charge and incumbrance

A package has arrived at Dover by the packet *Chemin de Fer*, from Ostend, and been forwarded to Buckingham Palace, containing a portrait of her late Majesty Louise Queen of the Belgians, which has been sent by King Leopold to her Majesty the Queen.

The *Derby Reporter* states that it is the intention of the gentlemen of Derby and its vicinity to invite Mr. Charles Fox, the builder of the Crystal Palace, to visit that town, previous to his proceeding to Dublin in Derby a few weeks hence.

On Tuesday afternoon, one of the finest sturgeons ever captured in the Tweed was taken at Cairnie fishing-station. This splendid fish, which is about to be stuffed, measures in length 7 feet 2 inches, in girth 21 inches, and weighs 140 lb. It is as remarkable for its symmetry as its size.

The enrolled Pensioners of Chelsea are to be reviewed in Hyde-park on the 31st of June.

On last Saturday a meeting was held at the Corn Exchange, Cambridge, to present a requisition to Mr. G. F. Young to stand for the county at the next election. The actual number of signatures is not stated, but it was said that there were more than an actual majority of the voters on the register. There was a banquet at the Red Lion at the conclusion of the proceedings, to which about 160 sat down, Mr. S. Quintin occupying the chair. The object of the movement is to oust Mr. Townley from the representation. His crime being that, having voted for protection, he afterwards voted in favour of the present Government.

EXHIBITION.—The town of UTTOXETER is full of consternation in consequence of the non-appearance of the gentleman who undertook the taking with him a sum of £200, belonging to the widow and orphans' fund of the Old Fellows. Weston was a local preacher in the Wesleyan connexion; he also took out an act to put himself under the

THE STIPENDIARY MAGISTRATE FOR LIVERPOOL.—Mr. Mansfield, who formerly was attached to this circuit, has accepted the office rendered vacant by the death of Mr. Rushton, at a salary of £1000 per annum. The learned gentleman has been warmly recommended by Barons Parke and Alderson, and several of the other judges. It is the intention to have two courts, one of which will be presided over by the honorary magistracy.

THE LATE RIOT AT BIRKENHEAD.—Peter Fitzsimons, one of the prisoners tried and convicted at the Chester assizes of taking part in the riot at Birkenhead, was discharged from custody last week, Mr Justice Williams, who tried the prisoner, having certified to Sir George Grey that the conviction was against evidence.

METROPOLITAN NEWS.

ABORIGINES PROTECTION SOCIETY.—THE KAFFIRS.

The seventeenth annual meeting of the friends of this society was held on Monday, at Crosby-Hall, Bishopsgate-street; Dr. Lee in the chair. The chairman observed that this society was founded chiefly through the exertions of the late Sir T. F. Buxton, in the year 1836, and that its influence had already been powerfully and beneficially felt in New Zealand, Borneo, at the Cape, in the northern parts of America, and in the Red River settlements. The secretary, Mr. L. A. Chamerovzow, then read the report, which announced a considerable increase in the energetic policy pursued by the representatives of the British Government in many of its colonies, in their dealings with the uncivilised native tribes. The report also urged the necessity, and the calling a halting of £40 from last year, amounted to £324 12s. 6d., while the expenses had been £398 10s. 3d., showing an excess of expenditure over income of £74 2s. 4d.

Mr. Key gave an interesting account of the Kaffir chiefs, with whom he had resided nearly ten years, travelling through the whole length of their country unarmed, and attended only by a native interpreter. He expressed his belief, that, could the numerous letters and papers published relative to the causes which had led to the recent war, the Kaffirs and their cause would show to much greater advantage than when seen through the medium of Parliamentary blue-books and military despatches. The meeting was afterwards briefly addressed by the Rev. J. Fairbairn, the Rev. R. N. Fowler, and other gentlemen, and the following resolution was unanimously agreed to:—

That the measures and principles of action pursued by the society for exceptions, adopted in relation to uncivilised tribes is a blot on the practical character of the civilisation of our age and country; and that policy, justice, and, above all, Christianity demand a prompt change for the better

LONDON DISTRICT UNITARIAN SOCIETY.—The first annual meeting of this society was held on Tuesday last, at the London Tavern. About 300 members were present, including Drs. Hutton, Bateman, Cromwell, and Harrison; Messrs. Madge, Marston, Squier, &c.; Mr. Alderman Lawrence, formerly Lord Mayor, and Mr. Alderman Sidney, M.P., were also present. The report of the secretary, it appears that forty-six lectures explanatory of the Unitarian principles of the Christian religion have been delivered in the metropolis during the past year, and that the society appears to be in a flourishing condition. Upwards of 50 additional subscribers to the fund have been added for the following year.

SEATING TO THE SIR ROBERT PEEL.—A meeting was held on Tuesday at the Alliance Life Assurance Office, for the purpose of entering into resolutions for the erection of a memorial in honour of the late Sir R. Peel, Bart., Sir Moses Montefiore, Bart., in the chair. There were present Mr. Shepherd, chairman of the East India Company, Sir James Hogg, deputy chairman of the East India Company; Baron Goldsmid, Baron Rothschild, M.P.; Mr. Hume, M.P.; Sir Peter Laurie, Captain Harvey, Sir S. Baxter, Bart.; Alderman Salomons. Alderman Wire, Mr. John Dixon, Mr. Bonnoch, &c. After some discussion, it was determined that a committee should be appointed, consisting of twelve united body upon the occasion; that the memorial should be a bronze statue 10 feet in height, that the amount to be paid for it should be £2000, and that the committee should have the appointment of a sculptor. With the permission of the Lord Mayor the models are to be sent to the Mansion House, and to be considered on the 16th of June. The site, it is believed, will be either at the west end of Cheapside, or in the space at the east end of the Royal Exchange; but that question will also be decided on the 16th of June.

SOCIETY OF ARTS.—The third *conversazione* given to the foreign commissioners and their families, and to the members of the society and their ladies, was held on Wednesday evening, and was very largely attended. The evening was devoted to English glees, as the last evening to German instrumental music. The singers were Messrs. Francis, Hobbs, Land, Hatton, and Henry Phillips, who were much applauded.

FIRE IN SHOE-LANE.—On Wednesday night, about ten o'clock, a fire broke out in the premises of Messrs. Foulkes and Wood, lead merchants and copper smiths, in Shoe lane. The fire originated in the room where they tained, ranged for two hours, and consumed the greater part of the lead and brass casting effects, as well as the moulds. The premises were insured.

DISCHARGE OF CAPTAIN FAULEY SOMERSET.—On Wednesday morning, Captain Paulet Somerset, having completed the term of his sentence of imprisonment, or his assault on the posse in Hyde Park, last week, was discharged from the House of Correction, Coldbath Fields. A number of persons had assembled at the usual hour for the discharge of prisoners, to witness his departure, but they were doomed to be disappointed, for he had left the pr son about an hour before that time.

TULIP SHOW.—A remarkably fine collection of tulips, in full bloom, is now exhibiting in the rooms, at Clapham Rise. The grand bed of tulips, which is under an awning of 100 feet in length, and 10 feet in width, contains about 2000 roots of the finest varieties. Some of the most esteemed are *Victoria Regina*, the Duke of Devonshire, Duchess of Sutherland, Duke of Devonshire, Noah Effendi, Addison, Catalani, *Imperatrix Rorum*, Medea, Angelo, Marshal Soult, Po typhemus, Dr. Horner, Strong's King (a new bizarre), Countess of Chester, and Strong's Queen (a new bizarre).

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.—On Thursday the May meeting of this society was held, at the offices, in Hanover-square (late Grace the Duke of Richmond's rooms). The report said that since the last meeting 65 members had died, and 216 had been removed from the list, while 163 new members had been elected, making the r number now 5121. After slight re d alterations made in the by-laws, &c., the report drew the attention of the society to the approaching exhibition in the Home Park, at Windsor. The revenue for the year, including the balance from the previous account, was £7095 12s. 11d., and the expenditure £5176 9s. 7d., leaving a balance in hand of £1749 11s. 9d. The report was adopted, and Earl Ducie appointed president for the ensuing year

MEETING OF EXHIBITORS.—A meeting of the exhibitors in the Crystal Palace was held on Thursday evening, at Crosby Hall, for the purpose of receiving the report of the committee appointed at the last meeting to wait on the Royal Commissioners of the Great Exhibition, and to urge on them the expediency of the Commission, Mr. H. Winton, of Birmingham, in the chair. After a few preliminary remarks from the chairman, the report was read. It stated, that, in obedience to their instructions, they had obtained an interview not earlier than Thursday with the Royal Commissioners. The claims that were urged on behalf of the exhibitors were listened to with the utmost attention by the illustrious president, and by the members present when forming the Commission. H.R.H. Prince Albert seemed to intimate that any exhibitor who could show sufficient cause for the presence of himself, or an assistant, in order to explain such articles and inventions which could not be understood without a proper explanation, would receive a card of admission, enabling him to enter the Building at any time of the day; but that, indiscriminately, free admission could on no account be granted. The case of hundreds of ingenious artisans who had long laboured to produce works worthy of being admitted to the great show, was then strongly urged, but with no avail. During the proceedings a communication was received from the Royal Commissioners, consenting admissions under certain restrictions to those exhibitors only who could show that their inventions were such that they should be present. After some discussion, it was unanimously agreed to that the committee appointed at the meeting of the 15th of May should prepare for the signature of the exhibitors a petition against the refusal of the Royal Commissioners, and that the whole of the exhibitors be requested to sign the same, and that subscriptions be entered into for the purpose of defraying necessary expenses. The meeting then separated.

ATTACK UPON A CLERGYMAN DURING DIVINE SERVICE.—An assault of an extraordinary character was made upon the Rev. Mr Pollock, minister of St. Mark's Church, in Liverpool, whilst administering the sacrament on Sunday evening. At the commencement of the service two men entered the church and took seats. Just an hour the service proceeded quietly, but at the expiration of that time the individuals in question suddenly started up, and ordered annoyingly up and down the aisle. Mr Boyd, the clerk, in order to preserve decorum, ordered them either to sit down or leave the church. Instantly, one of the men rushed to the pulpit, and, opening the door, with a stick at his hand, struck Mr. Pollock twice on the back. Mr. Pollock, on observing the man ascending the pulpit barricr, inquired what he was. The man replied, with violence, that he was "God Almighty." Great excitement instantly pervaded the congregation. Gentlemen rose to their feet, ladies screamed, and seldom perhaps has such a scene been witnessed in any church or chapel in the country. Mr. Pollock, of course, received instant assistance from the congregation, and, after a violent struggle, the madman was carried forcibly from the pulpit, and conveyed to the exterior of the building. Mr. Pollock remained in the church, and in fact calmness and composure. A police officer shortly arrived, and the assailant was pinioned and conducted to the station in High-street, where the prisoner, during the journey, was very violent. On arriving at the station room violence, handcuffs being placed round his wrists and ropes round his feet. Although at first insanity was suspected, it is believed the act of violence may be traced to brain fever. Previous to the occurrence, whose movements and general habits were of a quiet character, gave his name, but it was not thought necessary to detain him. Mr. Pollock is not in any manner injured.

THE BRIDGWATER GALLERY.

Who is there, at all conversant with art, who has not heard of the famous Bridgewater Gallery—of the collection of pictures formed by the Duke of Bridgewater, and enlarged by his great-nephew and heir, the Earl of Ellesmere? Yet, how few have seen the collection!—and this not from any unwillingness on the part of Lord Ellesmere to exhibit his treasures, but from the fact, that, for the last six or seven years, his Lordship has had no place (to say nothing of a gallery) in which they could be seen to any kind of advantage. Now his Lordship is providing himself with a gallery; and though his house (of which we have already engraved an exterior view) is still very unfinished, he has liberally but that the works, especially those connected with the public rooms, are more than the collections at Windsor and Dulwich are open—and application to any one of the great printsellers of London

The collection contains 47 of the finest of the Orleans pictures, some 1047 Italian, Spanish, and French pictures, some 188 Flemish, Dutch, and German pictures, and some 33 English and German pictures. At the Duke's death, in 1803, the collection was valued at £140,000; but it would sell for a larger sum, and may now, with Lord Ellesmere's own additions, be estimated at something like £200,000. There is a deficiency of example of the older Italian and German schools, but from the taste of Duchess Elizabeth, the more complete that in a private gallery, not excepting, we believe, the Lichtenstein gallery at Vienna The Carracci school can nowhere be studied to more advantage.

The famous collection is arranged in three rooms on one floor—in a gallery 130 feet long, in the State Drawingroom, facing the Green Park, and in the State Dining-room immediately adjoining. But three worse-lighted rooms it would be difficult to devise. The gallery is as badly lighted as the Pitzwilliam Museum at Cambridge, and the State Dining-room is darker than the Octagon-room at the Royal Academy. What can Mr Barry have been about? He has always been notorious for making small windows, and here, in Bridgewater House, he has carried out his predilection in a most marvellous manner. The fine "Gate at Sea" by J. M. W. Turner, one of the noblest pictures of the English school, is really *not* to be seen; while the glorious Guido, "the Assumption of the Virgin," is hung in a place of great honour, but not in a place where it be seen even to ordinary advantage.

The treasures of the collection are the three Raphaels "La Vierge au Feldmier" (one of two Madonnas painted at Florence, in 1506, for his friend Taddeo Gaddi), "La plus belle des Vierges," and "La Madonna del Passeggio," two fine Titians, "Danaë and Actæon" and "Diana and Callisto;" a glorious full-length portrait by Velasquez; the "Seven Sacraments" by N. Poussin; the "Burning Bush," by Claude; the "Landing of Prince Maurice, at Dort"—the finest picture of Cuyp; the "Rising of the Gale," by Vanderveide; the "Dutch Kermis, or Village Fair," by Teniers; the "Schoolmaster," by Jan Steen; the "Infante Don Nicholas Mass—a girl playing on a needle; the large "Wouvermans," and viewed not as a work of art, but with other feelings, the Charles portrait of "Shakspeare," bought by the Earl of Ellesmere, at the sale at Stow, for 255 guineas.

There is a brief catalogue of the collection, printed by the Messrs. Smith, 137, New Bond-street.

LORD WARD'S COLLECTION OF PICTURES.

The collection of pictures, formed by the present Lord Ward, with great good taste and at great cost, has been placed by his Lordship in a large and well-lighted room in the Egyptian Hall, for the express purpose of their being seen by the public. On Tuesdays, Wednesdays, and Thursdays, the collection will be open to every person applying for admission through the principal printsellers of London. On Saturday it will be open to artists, and on Mondays and Fridays to his Lordship's own friends.

The collection is chiefly remarkable for the fine specimens it contains of early Italian art. The pictures of Crivelli are most admirable examples of art, from which every student may learn something. Then there is large and early Raphael — "The Crucifixion" — painted in the manner of Perugino; a Francia — the "Virgin and Child" all divinity of look. A good Giorgione—a choice example of Garofolo—and Fra Angelico's "Coronation" that many will covet. The Van Eyck, "St. Thomas Aquinas celebrating Mass before Louis IX.," deserves this minutest examination. Among the choice pictures we would also name a large Cuyp and a fine example of Paul Potter; the latter from Stow, and very fine. "A Burgomaster" by Rembrandt, also from Stow. The "Fall of Troy" by Gaspar Poussin, and its companion—a "Coast Scene" by Vernet—the fire, when preaching, by Domenichino; "Venus seeing her face reflected in a glass held before her," by or after Titian; the "Fastening the crown of thorns on the head of our Saviour," by Teniers; "St. Peter," by Spagnoletto; a small and good "Cenotaph;" and the only example of the English school in the collection, a choice and sunny landscape (a river scene), by Richard Wilson. We cannot engrave a specimen now, but hope to devote one, including a "Venus," by Canova; a duplicate of the "Greek Slave-girl," by Powers; and two or three favourable specimens of Lawrence Macdonald, a Scottish artist, and one, like Gibson, long resident in Rome.

THE PASSPORT SYSTEM BETWEEN ENGLAND AND FRANCE

The *Boulogne Gazette* contains the following important announcement:—

The French Government has come to the decision of partially abolishing the nuisance of the permit system, inasmuch as that they are no longer needed by persons possessing passports. The convenience of this measure to the traveller is obvious. Our Sous-Préfet has received the following communication on the subject from the Minister of the Interior:—

"TO THE SOUS-PREFET OF BOULOGNE-SUR-MER.

"Monsieur Sous-Préfet.—You have already been invited to take every measure in order that travellers on their way to England may not be subjected to delay at their embarking. I have, therefore, decided that all persons arriving at Boulogne in gbt be allowed to depart for England on the simple exhibition of their passports. I now confirm and renew those instructions; it is, therefore, to be well understood, that travellers furnished with regular passports are not compel ed to provide themselves with a special permit of embarkation This formality, which already must have been multiplied so long, is henceforth abolished. It is likewise expedient for the future to exempt travellers on their way to England from having their passports revised and registered. A simple examination of those papers, for the purpose of verifying the identity required, without obliging the bearers of the same to give them up. These formalities occasion great loss of time, and may be abolished. I beg of you to see that the agents and servants of the Administration charged with the surveillance of navigation conform strictly to these instructions.—Receive, Monsieur le Sous-Préfet, the assurance of my sincere consideration. (Signed) LEON FAUCHER."

FABRICATED TEA AND TOBACCO.

At the Liverpool police court, on Tuesday, two important cases in informations were heard before Messrs. Rathbone and Rowlly, the presiding magistrates The first case was against Mr. John Stevens, who carries on the business of a manufacturer of tobacco and snuff, in Beaumont-street, to that town; and the charge was that of having manufactured, at the above premises, a quantity of the plane-tree, bush-tree, and other trees. The case had been brought before the court through the instrumentality of the Excise officers.

The defendant formerly carried on, conjointly with his brother, a business, that of a chicory and cocoa manufactory, the two latter of which he resigned to a Mr Clay, and the former to that of a Mr Hall. Since last the Excise officers visited the premises, and found in a room over the counting-house of Mr. Stevens 53 lb of tea in a completely finished state. On proceeding into a higher room, 216 lb of adulterated tea, ready for sale, in small packages for manufacture, were discovered, making in the whole 290 lbs. The defendant was present on the premises, and in answer to questions, said he was aware some such manufacture was going on, but he was not responsible, as the rooms were in the occupation of Mr Clay.

Mr. Phillips, analytical examiner to the Board of Excise in London, deposed that he had made an analysis of the leaves produced by the Excise officers, and found that they were those of the plane and birch tree, the former being in the preponderation of 80 or 90 per cent. He had also been shown a substance called catechu, which was used for the purpose of giving the tea its peculiar astringent taste common to tea. Mr. Simon addressed the Court for the defendant, and contended that the case amounted to nothing more than one of suspicion against his client. He called Mr. Clay to give evidence in the case; and the witness deposed that he who a responsibility of the case rested on himself. Mr. Hall, the gentleman, having given the information, he proceeded to consider their decision, and on their return inflicted a penalty of £250, on account of the 53 lb. of leaves found in a completely manufactured state

The next information was against Denis Flaherty, for carrying on an unlicensed manufactory for tobacco, at 21, Jamaica-street. The information was not resisted. On the 15th of March the Excise officers visited the premises, and found a quantity of rhubarb and chicory leaves, preparatory to being manufactured as tobacco; also a quantity of snuff work, consisting principally of oatmeal, saw dust, dock seed, &c.; and these were in progress of being made to resemble snuff. The penalty of £200 was imposed.

MONETARY TRANSACTIONS FOR THE WEEK.

(From our City Correspondent.)

There has been little to affect prices in the English market during the week with the exception of the oft-repeated belief in the probability of the Directors of the Bank of England raising the rate of interest. Consols have declined for a belief period to 97; but the current quotation of the week has been 97⅛ to ⅜ for Money, and 97⅜ ⅝ for the June Account However towards the close of business on Thursday, after the separation of the Bank Consuls—the market became buoyant, and Consols quoted 97⅜ ½ for Money, and 97⅜ ⅝ for Account. The unfunded debt continues to recede, affording evidence that a belief in an increased value of money is strongly felt; in fact, among the banking and monied interest. It is regarded as nearly certain Business in the New Three-and-a-Quarter and Reduced has been very limited, the last official quotations leaving prices as follows:—Bank Stock, 210⅛; Reduced, 99⅛; Consols, 97⅛; New Three-and-a-Quarter per Cent. Annuities, 98; Long Annuities [illegible] January, [illegible]; 16, Ditto, 30 years, January 5 [illegible]; India Bonds, £1000, 53 pm.; Consols for Account, 97⅛; Exchequer Bills, £1000, 44 pm.; Ditto, £500, 41 pm.; Ditto, Small, 41 pm.

Foreign securities have been fair during the week, the speculators under Ingersoll as agreeable a field for speculation as the Foreign Market. Mexican, on Monday, receded to 34⅜ to 35⅜, rallying a little towards the close of the day. These prices have since prevailed. Spanish Active Bonds have also been steady, declining on Wednesday to 21⅝ and on Thursday to 19⅝. Chilian advanced 1 per cent on Tuesday, and Russian 4½ per Cents have improved another ½ per cent, this week, quoting 100½ to 5/8. In Portuguese the transactions are unusually small, but Belgian stock is a trifle heavier, in consequence of the resignation of the Ministry. At the close of business for the week prices were, for Bonds Ayres Bonds, Six per Cent. Deferred, 25; Equador Bonds, 4; Grenada Bonds, Deferred, 4; Mexican, Five per Cent., 1846, ex January Coupons, 34⅝; ditto, Account, 35; Peruvian Bonds, Five per Cent. Account, 81⅛; Portuguese, Four per Cent., 32½; Spanish, Five per Cent., 1840, Account, 19⅛; Ditto, Passive, 5⅛; Ditto, Three per Cent., Account, 35⅛; Venezuela Bonds, Two-and-a-Quarter per Cent, 13⅜; Ditto, Deferred, 1⅞; Dutch, Two-and-a-Half per Cent., 62 Guilds., 59⅛; Ditto, Four per Cent., Certificates, 89⅛.

Extensive fluctuations have taken place in the Share market during the past week. The pressure for money at Liverpool, in consequence of the cotton failures, has induced forced sales there, which has again acted upon the market here. This, added to the disappointment in the traffic returns, and the large demands made upon every account day for "continuations," together caused on Wednesday a temporary panic, fluctuations to the extent of £5 per share having occurred in the course of the day. The *bear* party of course made the most of the opportunity, and, although a better feeling has since set in, and prices have in many instances considerably rallied, still the annexed list will show that quotations are much lower than at the close of business last week

ORDINARY SHARES AND STOCKS.—Aberdeen, 11⅛; Ambergate, Nottingham, Boston, and Eastern Junction, 3⅜; Caledonian, 12⅜; Chester and Holyhead, 20⅜; East Anglian (£35 paid), 3⅜; Eastern Counties, 6⅜; East Lancashire, 19⅜; Great Northern, 19⅜; Ditto, A Stock, 20⅜; Great Western, 65; Lancashire and Yorkshire, 56; Ditto, Fifths, 4⅜; Leeds and Thirsk, 19⅜; London and Blackwall, 7⅜; London, Brighton, and South Coast, 80, 1; London and North-Western, 102⅜; Ditto, Quarters, 50⅜; Ditto, A, 94 and B, 93⅜; Manchester, Sheffield, and Lincolnshire, 28; Midland, 85⅜; Ditto, £50, 15⅜; Newcastle and Darlington, 45⅜; North British, 8⅜; North Staffordshire, 9⅜; Oxford, Worcester, and Wolverhampton, 14⅜; Shrewsbury and Birmingham, Class A, 4⅜ dis.; Ditto, B, 1⅜ dis.; Shropshire Union, 3⅜; Southeastern, 8⅜; South Wales, 7⅜; York, Newcastle, and Berwick, 19⅜; Ditto, Extension, 14⅜; Ditto, G NE, Purchase, 6⅜; York and North Midland, 24⅜.

LOANS LEASED AT FIXED RENTALS Buckinghamshire, 17⅛; East Lincolnshire, 84; Reading, Guildford, and Reigate, 3⅜.

PREFERENCE SHARES.—Caledonian, 6⅜; Great Northern, 13⅜; Manchester, Sheffield, and Lincolnshire, New, £10, 12; Ditto, £5, 3⅜; Midland Consolidated, British, £50 paid, 6⅜; Ditto, Birmingham and Gloucester, 5⅜; Ditto, Extension, 5; Northern of France, 14⅜; Paris and Rouen, 24⅜; Paris and Strasbourg, 10⅜; Sambre and Meuse, 3⅜.

THE MARKETS.

CORN-EXCHANGE.—Notwithstanding that the supply of English wheat on sale this week has been very moderate, we have to report a slow inquiry for all descriptions, at about stationary prices Fine foreign wheats have changed hands at full currencies, but the ordinary and inferior qualities have commanded very little attention. Barley and Beans have also been forward. Foreign qualities have sold steadily, at late rates. For malt, the inquiry has been confined to retail parcels. The trade has continued firm, and former top-price on value is per quarter Peas, Indian corn, and flour unaltered. The supply of the latter from Yankee land is good; yet the stocks on hand are large.

English: Wheat, Essex and Kent, red, 38s to 42s; ditto, white, 42s to 44s; Norfolk and Lincoln, red, 37s to 39s; ditto, white, 42s to 44s; rye, 25s to 26s; grinding barley, 22s to 24s; distilling, ditto, 22s to 24s; malting, 24s to 26s; Chevalier, 26s to 28s; Lincoln and Norfolk, ditto to 30s; brown, ditto, 20s to 21s; Kingston and Ware, 26s to 28s; Chevalier, ditto to 30s; Yorkshire and Lincolnshire feed oats, 15s to 16s; potato ditto, 16s to 18s; Youghal and Cork, ditto, 17s to 18s; grey peas, 24s to 26s; maple, 26s to 28s; white, 28s to 30s; boilers, new, 30s to 32s; ditto, old, 27s to 28s; grey beans, 24s to 26s; tick, 26s to 28s; harrow, ditto, 28s to 30s; red clover, 36s to 38s per cwt.; white ditto, 40s to 45s; trefoil, 20s to 30s per cwt.; Scotch and Yorkshire, 28s to 32s per 280 lbs.; Dantzig rod wheat, —s to —; white, —s to —; barley, —s to —; oats, —s to —; beans, —s to —; peas, —s to —; flour, —s to —per quarter. American flour, 19s to 19s per barrel. Canada, —s to —.

Foreign: Wheat—the supply is small; prices unchanged. Barley, 20s to 21s; Egyptian, 20s to 21s; Odessa, 20s to 21s; Danish and Swedish, 20s to 21s; Pomeranian and Prussian, 20s to 21s; Mecklenburgh, 20s to 21s; Holstein, 20s to 21s; Russian, 20s to 21s; Taganrog, 20s to 21s; Marianopoli, 20s to 21s; Egyptian, 20s to 21s; Salonica, 20s to 21s; Smyrna, 20s to 21s; Trieste, 20s to 21s; Genoa, 20s to 21s; Leghorn, 20s to 21s; Naples, 20s to 21s; Sicily, 20s to 21s; Spanish, 20s to 21s; Portuguese, 20s to 21s; Canary, 20s to 21s; Morocco, 20s to 21s; Rye, 25s to 26s; Peas, 24s to 26s; Beans, 24s to 26s; Oats, 15s to 16s; Flour, 18s to 19s per barrel.

Bread—The prices of wheaten bread in the metropolis are from 6½d to 7½d of household bread, 6d to 6½d per 5lb loaf.

Imperial Weekly Average—Wheat, 35s 10d; barley, 24s 2d; oats, 16s 1d; rye, 30s 8d; beans, 34s 10d; peas, 37s 2d.

The 3ss. Weeks' Average—Wheat, 36s 10d; barley, 24s 3d, oats, 16s 1d; rye, 31s 7d; beans, 34s 10d; peas, 37s 2d.

Duties—Wheat, per quarter, 1s; oats, 1s; rye, 1s; beans, 1s; peas, 1s.

FLOUR.—Public sales of 7200 packages have taken place. About 1000 sold at barely stationary prices. The present market is heavy, and good ordinary ranges low to hail at 11 per bbl. The stock is increasing. The exports from China have been unusually large

Shipping—The wheat trade has been very limited to-day, at a decline in the quotations of 6d per cwt. Refused goods—the supply of which is increasing—sold big at 34s to 36s per qr. Flour, £23 to £24 per last of 20 sacks.

Coffee—The demand for all kinds at Monday, at barely last week's rates. Of 1200 bags of Ceylon on offering about 400 were sold.

Cocoa—This article has given way 2s to 3s per cwt. Good red Trinidad has sold at 44s to 45s; and ordinary grey, 34s to 36s per cwt.

Rice—Prices are quite 2d per cwt lower than last week, with a very inactive inquiry.

Provisions—This is a dull Irish provision market, with further declines. Lower. Bacon has declined 2s to 3s per cwt. Hams and middles are quoted at 68s per cwt. Foreign dull, at 72s for Dutch and 74s for Hamburgh. Fine weekly Irish, 72s to 76s; middling, 68s to 70s; mild cures, 74s to 76s per cwt. Hams, 74s to 76s per dozen lb. In beef very little is doing, at 54s to 65s for Waterford, and 56s for Limerick. Lard, steady, at 60s to 62s for fine bladdered, and 54s to 52s for fine kegs.

Tallow—The market is heavy, at further depressed rates. P. Y. C. on the spot, is selling at 37s per cwt, town, 3-s 6d net cash

Oils—Generally speaking the demand is heavy; and, in some instances, we have sellers on lower terms. Linseed, £27 10s per last.

Spirits—The market for rum is very dull, at further decreased rates. Leewards, 1s 5d to 1s 6d; and Demerara, 1s 6d to 1s 6d per gallon. Fine Geneva, 1s 2½d; and first Jamaica spirits, 2s 8d to 2s 9d. Brandy very dull

Hay, per load—Smithfield, Monday, May, 57s to 64s; clover do. 63 0s to 74 10s; and straw, £1 to £1 4s per load.

Coals—Bank's West Hartley, 14s; Cox's Hartley, 14s 6d Chester Main, 12s 9d; Hylawell, 13s 6d; New Tanfield, 12s 6d; Wylam, 13s 6d; Hilda, 12s Stewart's, 13s 6d per t

Hops—The country hops are in for new crops, and in fair request, at full prices. Sussex 80s to 90s; and 5 cwt bags 4 cwt bags

Wool—The public sales are passing off steadily, yet the quotations are from 1d to 1d per lb low r than the Fe bruary sa les

Potatoes—The supplies being considerably in excess of the demand prices have given way fully 5s per ton.

Smithfield—The market has ruled steady this week, at an advance in the quotations of quite 6d per 8 lb

Beef, from 3s 6d to 3s 8d.; mutton, 3s 10d to 4s 0d.; lamb, 4s 8d to 5s 10d; veal, 3s 8d to 4s 4d.; pork, 2s 8d to 3s 8d per 8 lb, to sink the offals

Newgate and Leadenhall—Prime beef and mutton are in steady request, at full prices. In oth r kinds of meat only a moderate business is doing.

Beef, from 3s 6d to 3s 8d; mutton 3s 6d to 3s 10d; lamb, 4s 6d to 5s 10d; veal, 3s 8d to 4s 10d; and pork, 3s 0d to 3s 6d per 8 lb by the carcase.

THE LONDON GAZETTE.

FRIDAY, MAY 16.

BANKRUPTS.

J. CERRITO, Mincing-lane, City, merchant. [illegible] GRINSTED Brighton, victualler. [illegible] CLARK, Clarence-place, Camberwell, auctioneer. [illegible] TARRANT, High St. Bloomsbury, bookseller. [illegible] EALES, Gloucester-street, Queen-square, Bloomsbury, tailor. [illegible] DUNCOMB, Great Coram-street, Russell-square, painter. [illegible] BOND, Thrutton and Bath, tanner. [illegible] A. Y. BARRET, Hornsea, Lincolnshire, engineer. [illegible] HOLDEN, Salendine, Nook, Yorkshire, tinman and worsted spinner.

SCOTCH SEQUESTRATIONS.

W. THOMSON Aberdeenshire, Haddingtonshire, grocer. R. DICKSON, Crawford-John, Lanarkshire, carrier. R. LEES, Aberdeen, cartwright and merchant. T. and A. OLIVER, Falkirk, seedsmen.

TUESDAY, MAY 20.

COMMISSION SIGNED BY THE LORD LIEUTENANT

The Hon Hen y William Liddell, to be Deputy Lieutenant.

BANKRUPTS

W. PAGE, of Great Yarmouth, [illegible] J. G. CASSALON of 17a, Salisbury-street, strand, wine merchant. [illegible] of [illegible] Hereford, victualler. H GIBSON, of the Old Kent-road, [illegible] DOWSON of 123, Oxford-street, furnishing ironmon. [illegible] [illegible] Lewis, Wandsworth, lithographic printer. [illegible] [illegible] [illegible]

ADVERTISEMENTS.

MADAME DE LOZANO has arrived in London, at 11, Burton-street, Euston-square, and will still continue to give 31 guy Lessons both in the English and Spanish styles.

SINGING and PIANOFORTE.—Mr. HENRY J. BAUMER, Associate of the Royal Academy of Music, and Member of the Conservatoire in Leipsic, has the honour to announce his arrival in town for the season, and will be happy to receive Pupils. 34, Queen-square, Regent's-park.

IMPROVED PIANOFORTES.—DUFF and HODGSON, Manufacturers, No. 3, Berners-street, and No. 65, Oxford-street, have the honour to announce that they have effected a reduction in the price of their Pianofortes of 25 guineas, 20 guineas, and 15 guineas in Rosewood. These instruments are of superior tone and touch, are made of the best-seasoned materials, have all the recent improvements, and are warranted. Merchants and the Trade supplied. Instruments lent on hire.

PIANOFORTES EXTRAORDINARY.—A MESSRS. COCKBURN'S PIANO with a improvements to be put up in each, full compass, full fine expression of tone, 35 guineas; others, 23 guineas and 21 guineas. JOHN and HENRY MOORE and CO., Practical Makers, 104, Bishopsgate-street Within.

TOLKIEN'S 25-GUINEA ROYAL MINUTO PIANOFORTES nearly 7 octaves, G G full, metallic plate, with all the recent improvements, in solid rosewood or mahogany cases, are pronounced by the profession to be the best they will stand any climate without injuring the delicacy of their original beautiful tone and touch. TOLKIEN, Manufacturer, 27, 28, and 29, King William-street, London-bridge; and at 90, Regent-street, Waterloo-place, two doors from Piccadilly.—Established 1830.

ANCIENT COINS, MEDALS, ANTIQUES, GEMS.—Mr. PETER WHELAN, dealer in the above, 43, opposite the British Museum, London, has a very large selection on sale at very moderate prices. Plans of copy the address. Coins, &c. purchased at a liberal price.

LADIES VISITING THE EXHIBITION are invited to refresh themselves with the Sparkling Waters of RIMMEL'S FOUNTAIN, which pours forth a continual stream of Perfume in Class III. No. 3, north-east Gallery.—E. RIMMEL, Perfumer, 39, Gerrard-street, Soho, London.

GREAT EXHIBITION.—To HOLDERS of SEASON TICKETS.—CALLAGHAN'S PORTABLE PERASPECTIVE GLASSES the size of a small opera glass, possessing great power, are recommended to all visitors of the Great Exhibition who have not provided themselves with one out of the building to it. Sold by Messrs. CALLAGHAN, Opticians, 63, Cornhill, 2, Princes-street Bloomsbury, and at Mr. Sams Royal Library, 1, St. James's-street.

H. WALKER'S NEEDLES, by Authority of Her Queen Victoria, are universally thanked, the Eye is polished, and have improved points temper, and finish. The labels are a correct likeness of the Queen and H. R. H. Prince Albert in relief on colour. H. WALKER is one of the Pensioners, and other Improved Brothers, and is specially appointed Maker to the Queen. 1, Gresham-street West, London. Sold almost everywhere.

ROYAL PAPIER MACHE WORKS and SHOW-ROOMS, JENNENS and BETTRIDGE, Manufacturers by distinct appointment to Her Majesty the Queen Prince Albert, and the Royal Family, whose five minutes' walk of the Great Exhibition, 6, Hart-street, Bloomsbury-square, and 26, Constitution-hill, Birmingham. Tea Trays, Tables, Chairs, &c.

RIMMEL'S GREAT EXHIBITION PORTRAIT MADE, a registered 5-oz. glass jars, price 1s. Rimmel's Great Exhibition BOUQUET, for the Handkerchief, in an elegant 5s. bottles price 1s 6d. Both ornamented with a view of the Crystal Palace. For all Perfumers and Chemists, and by E. RIMMEL, 39, Gerrard-street, Soho.

IF you require your FAMILY ARMS, send the Name and County to LINCOLN'S HERALDIC OFFICE. Great Tur ist s, London-lane-Ends Fee for Sea sking and Sketch, 5s 6; or postage stamps. Single Arms, or Name, Motto, Crest 5s. 6d. Crest on Plate, Seals, Rings, &c. 6s 6d per dozen Arms on Plate, with Name, for Books, £1 is 6d; Arms of Deceased Cities Corporate Bodies Supplied. Sketch Monumental Brasses for Churches Illus. Official Seals, &c. Address to the HERALDIC SALT

NEW HATS.—ALFRED TOWNEND, HATTER, 180, Regent-street, Inventor of the Patent Ventilating Grease Proof Hats, which, for economy in wear, complete resistance to perspiration and grease, as well as for lightness and symmetry of shape and appearance are unrivalled. The prices are very moderate.—Also Patent Elastic Hats for Travelling.

THE NOBILITY and GENTRY FURNISHING Guests Perchas Looking-Glasses, Picture and Print Frames, Chess Tables Cornices, Brackets, and Decorations, are best and most durable. They will last a life time. Guests Perchas Establishment, 38 New Bond-street. Decorators by Appointment. A. THORN and Co. Every article manufactured by the Gutta Percha Company, 18, Wharf-road, City-road London.

MECHI'S MAGNIFICENT STOCK OF RAZORS, Penknives, Scissors, and other Cutlery Manufactures at the GREAT EXHIBITION will be found in the Gallery at the north east corner of the Transept.

4, Leadenhall-street, London.

PURE in order to afford room for the great accession of Stock which Mechi has provided for the present season, he has open to the unlimited public of visitors to London during the season, he has fitted up additional Show-rooms, one of great splendour, and made other improvements in his old to afford a further public convenience.

FRESH GERMAN SELTZER WATER.—CHWEPPE and CO. have completed arrangements with the Agents at the Springs, which enable us to offer this invaluable Water in a remarkably pure state. Consumers can now be supplied with Quarts at 9s. and Pints at 6s per dozen. Soda Potass Water also in fine condition. Schwepp and Co., 51, Berners-street, and 10, Bedford-street, Strand.

GREAT EXHIBITION.—CAUTION.—The Very high quality which EVERETT'S BLACKING has attained has induced many dishonest persons to send out spurious imitations of the EVERETT and Co. wrapper supplied to respectable retailers in their address. 31, Poland-street, London, and their name on the bottle. Everett's Blacking, Everett's Blacking, "Polish for Brass Boots," and "Waterproof Varnish" may be inspected in section 30, Avenue of Great Exhibition.

FLOOR-CLOTHS.—Warranted the best quality and well seasoned, can be any size, at 2s 3d per square yard, passage cloths, at 1s 9d per yard, in the same pattern, drugget cloths, 1s 1d per yard, counterpane bread cloths, 9d inches wide, 4s 6d per piece. E. BURNET and Co.'s Floor-cloth Manufactory, Warehouse, 8, Finsbury, Cornhill-garden.

GRIFFIN'S CHEMICAL LABORATORY.—A PORTABLE COLLECTION of APPARATUS, PREPARATIONS, and TESTS, for performing an easy and agreeable course of chemical experiments; arranged by J. J. GRIFFIN, in accordance with the desire expressed by many of his friends to obtain at the Chemical Laboratory, Nos. 1, 10s, No. 2, 15s, No. 3, 20s, No. 4, 30s, No. 5, 40s, No. 6, 50s, No. 7, 60s. May be had also at the CHEMICAL MUSEUM, 33 Baker-street, Portman-square.

GOVERNMENT ANNUITIES. SAINT CLEMENT DANE'S BANK for SAVINGS and GOVERNMENT ANNUITY INSTITUTION, 59, Chancery-lane, Strand.

The Trustees and Managers of this Bank continue, as Agents for the Government, to grant Annuities, Immediate and Deferred, for sums of £4 to £30, to person not possessed of an annual income of £150.

Persons making a saving of the United Kingdom may purchase Annuities without their personal assistance.

The public, regard thy Bank offers great advantage in purchasing Annuities through the medium of this office.

Prospectuses and tables of the same may be had upon application at the office of the Institution, 40, Norfolk-street, Strand; or by letter, post paid

Open for granting Annuities daily from ten till three.

The attention paid to the Government by the purchase of Annuities granted through this office during the quarter ending 5th April is 1851 the total amount paid to the Government exceeds £627 978.

Pass-Book open for the Receipt of Deposits. Sum day and Monday excepted, from ten to three.

Interest payable to Depositors in £3 per cent per annum.

April 26 1851. W. T. WOOLCOTT Actuary.

NUMBER ONE, ST. PAUL'S CHURCH-YARD. GREAT REDUCTION in the PRICE of COFFEE.

Few people know that have been made of late years by Committees of the Legislature and many others, to prove beyond doubt that coffee did to the proposition made on the 17 f. February last by sir Henry Parnell, by which the duty on Coffee has been reduced nearly one fifth.

Hitherto the Duties on Coffee have been as under:—

In the year	On Foreign	On E. Indian.	On Colonial.
Up to 1824 the duty was	1s 6d	1s 6d	1s 6d
1825 to 1834	1s 2d	0s 9d	0s 6d
		Not produce of British India.	British India.
1835 to 1841	1s 0d	0s 6d	0s 6d
1842	0s 6d	0s 6d	0s 6d
1843 to 1850	0s 6d	0s 3d	0s 3d
1851	0s 6d	0s 3d	0s 3d

On produce of British possessions.

Now reduced to £ d.

Foreign Plantation Coffee	1 0	0 10 per lb.
Plantation do do	1 0	1 1 "
Finest Costa Rica do	1 0	1 3 "
Most ordinary Costa do	0 9	0 10 "

DARK and COMPANY feel great pleasure in again being the means of affording a participation in the liberal intentions of the Chancellor of the Exchequer in reducing the duty on Coffee.

DARK and COMPANY.

FOR MERCHANTS and FARMERS.

FOR FAMILIES—COFFEE in its GREATEST PERFECTION, NUMBER ONE, SAINT PAUL'S CHURCHYARD.

April 19, 1851

THE ILLUSTRATED LONDON NEWS.

SUPPLEMENT.

No. 488.—VOL. XVIII.] SATURDAY, MAY 24, 1851. [TWO NUMBERS, 1s. { WITH LARGE PRINT, GRATIS.

THE GREAT EXHIBITION.

THE journals which report the proceedings at the Crystal Palace have, perhaps, a difficult task to convey to the most distant parts of the world a full, true, and particular account of the wonders of art and industry exhibited within; but they have no difficulty in reporting its success. The Exhibition continues to grow in favour. Upon that point there can be no mistake. As its popularity increases, the views of its founders and of the more enlightened portions of the public, as to its future usefulness, extend. Day by day the circle widens. The money pours in at the rate of nearly £20,000 per week; so that the Executive Committee, instead of being in any difficulty for the ways and means of making themselves straight with the world, will shortly be in possession of a very handsome surplus. We notice with pleasure, among the first developments of plans which have suggested themselves, that a series of lectures within the Building have been announced. Professor Cowper will lecture on the section of machinery; Professor Anated will treat of minerals and raw produce; and Mr. O'Brien, who has taken charge of the philosophical instruments, will lecture on that department. Arrangements will doubtless be made at a more advanced period of the season, to enable the working men of the provinces not only to see these wonders of human ingenuity, but to hear the lectures of those competent teachers on the application of the arts to the service of humanity. Furthermore, we expect that colleges and schools will be enabled to give their students a similar advantage. In fact, the manifold uses of the Exhibition in a national point of view are only beginning to be discovered; so that the more the subject is considered, the greater and more beneficent appear the purposes to which it may be directed. Nationally and internationally, it is equally interesting. What the ultimate result may be, we will not presume even to hint; but the present results must be allowed to be in the highest degree gratifying both to the clear-sighted energy and perseverance in a good object of those who founded the Exhibition, and to the national character.

In resuming our account of the several sections, the first notice is due to the productions of our French neighbours.

The French department is at length beginning to make a display worthy of the nation which assumes, not without reason, to set an example of taste in all manufactures susceptible of artistic treatment.

A great deal still remains to be done. The galleries are only half furnished, and the hammer and saw are still at work in the bays leading from the grand avenue; but enough has been arranged to attract and rivet the attention of crowds who had begun to fear that France had retired from the contest.

The fact is, that the French, who have been accustomed to teach all the cities of Europe how to get up exhibitions of industry, accepted our invitation without being prepared either for our punctuality or powers of display. They expected to find a convenient, even a magnificent building, filled with solid and useful articles of commerce, fine machinery, strong calico, plenty of polished needles, locks, bars, and bolts; but, as regarded the ornamentation of the Palace, that task they fully believed was reserved for them; and many of the Parisian manufacturers calculated, that, as the Exhibition could have neither beauty nor interest without the beautiful contributions from the workshops of Paris, if they were not ready for England, why England must wait for them. The result has been the exact opposite of their expectations. The 1st of May presented a long series of beautiful, combined with useful, manufactures, and would have been just as successful if a temporary curtain had been drawn over the space assigned to France; yet now that the French manufactures are coming out in great force, presenting each day some new attraction, we receive it with all the satisfaction of an unexpected discovery—we feel that we have hit upon a new vein of pleasure, when we thought ourselves already overflowingly rich.

On turning toward the French department, after passing the exquisite carvings in white and red wood exhibited by Switzerland, our attention is arrested by a case containing the treasures of the Queen of Spain's jewellery. They amply justify the reputation that Parisian artists in precious stones have so long enjoyed. The leading objects are a suite of diamonds and pearls, arranged with green enamel into a representation of acorns and oak-leaves. The coronal for a head ornament seems to us more beautiful, more a work of true art, than anything in the gorgeous display in the British jewellery. Next to these stand the crowns, sceptre, state-sword, and other Royal insignia belonging to the gentlemen who manufactured the coronation jewels for the Emperor of Hayti.

What triumph of art manufacture the French may next unpack, it is impossible to guess; but, at present, the crowning glory of the French collection is the case of Froment-Meurice. Among a crowd of exquisitely beautiful articles is a toilet-table (presented to the Duchess of Parma) of buhl, silver, and enamel, supported by silver figures, with a looking-glass surrounded by a frame of enamels of the arms of the two families. Every part of this extraordinary piece of furniture is a marvel of carving, engraving, and sculpture. With the toilet-table are costly sacramental vessels, jewel-boxes, flowers in precious stones, hunting swords, and such a series of exquisite and fantastic designs worked out in precious metals as we never remember to have seen collected together as the property of one person before. The times of Benvenuto Cellini seem revived in this display. On a future occasion we shall give illustrations and detailed descriptions.

French jewellery is all stamped with a mark which denotes to those initiated the exact value of the gold employed. There is a first-class, second-class, and third-class stamp, which the manufacturers are obliged to obtain before offering their wares for sale. The advantage to the manufacturers of first-class articles is great. They are secure against the competition of those who could imitate their latest productions in an inferior kind of gold.

We have no such regulation. Pure gold, which is seldom used for ordinary jewellery, bears the Hall-mark; but in what is commonly called "jeweller's gold," there is between one maker and another a difference of value, without any perceptible difference in appearance, equal to at least fifty per cent. No doubt, the French regulation is a great protection and encouragement to the manufacturer of good articles in tasteful shapes; but our manufacturers of cheap jewellery at Birmingham and elsewhere carry on their operations on so large and so rapid a scale, that it would be impossible to introduce such a restriction without seriously impeding their trade.

The imitation jewellery displayed by the French in the South Bay is

THE TRANSEPT OF THE CRYSTAL PALACE ON THE 1ST OF MAY

very tasteful: the imitations of pearls and precious stones are extremely clever. In the metal workmanship of false jewellery since the introduction of electrotype, we probably excel them; and, altogether, this department is better known to us through the shops of Regent-street and of our principal watering-places, than the first-class work, like the Queen of Spain's diamonds, which have excited so much attention ever since they were unpacked.

In the centre of the room, the sides of which are principally occupied by jewellery, a good deal of plate is set out. Plate is not so much used in France as in England, and, with few exceptions, the workmanship is inferior; but there are several articles which art of a high order has been employed to embellish. We would note a small silver ornament for perfume, chased elaborately with grotesques, and surmounted by a figure, which stands opposite the imitation diamonds on the east side of the room. On a table in the centre is a large tea-urn, in oxydized silver, with very handsome tea services around it; and close to it a perfect gem, in the shape of a Turkish coffee-pot, in oxydized silver inlaid with gold, surrounded by a cluster of tiny china cups, in stands of the same metal, on a salver elaborately engraved. It is just the thing for a bull table in a beauty's boudoir.

The French manufacturers, in all these works, have a great advantage in the demand which exists among the wealthy classes, who are their customers, for original designs, whether in plate or in bronze. A class of artists in Paris devote themselves to supplying these designs; and a class of manufacturers make a reputation by continually publishing new designs. In England, until very lately (with the exception of the period when Rundell and Bridge employed Flaxman), we were content with repeating stereotyped conventionalities.

A short time since, one of our engineering firms wanted an original design made and executed in bronze, for a compass of an expensive kind. He was unable to find, in London, any artist and bronze-caster accustomed to work in unison. He went over to Paris, and obtained what he required in twenty-four hours. This compass, supported on two bronze dolphins, may be seen in the North-west Gallery, among the philosophical instruments.

The manufacturers of such articles as the silver toilette-table of the Duchess of Parma have the use of the talent trained by the demand for Paris bronzes, of which a large collection is displayed.

In other ornamental metal-work the French exhibit a number of very rich lamps, chandeliers, grates, dogs for burning wood, and church ornaments. The lamps are chiefly on the carcel principle, where clockwork or a spring continually pumps up oil to a due level. The bulbous form of this contrivance affords room for a good deal of ornament, of which the art manufacturers have skilfully availed themselves.

We cannot conscientiously say anything in favour of a large case full of cutlery. The forms are not elegant. Of the cutting merit there is no opportunity of judging

In porcelain the strength of the French lies in the finest qualities From the late Royal, now National Manufactory at Sèvres, some splendid specimens of ornamental china, of great size, exquisitely painted, have been contributed, including pairs of very large vases of rich blue and pink, and other difficult colours, painted from designs of the first modern artists, and breakfast services fit for the Queen of the Fairies, more costly than if they had been manufactured in pure gold.

One manufacturer of less costly china has arranged a stall like a small room, with stove chimney ornaments—a well executed statue in parian of Felissier, one of the great improvers of porcelain manufacture in France, of whom it is recorded, that, wanting fuel to complete his experiments, he burned up first all the trees of his garden, and then all his furniture This parian statue is three feet high, of very good colour, and came out of the oven well proportioned.

While we can advantageously study the finest kinds of French porcelain, in the ware needed for every-day use at breakfast and dinner, we have a great superiority over them in quality and in price.

French cups are thick, heavy, and brittle. French plates will not stand fire. The luxury of a hot plate is denied, by an absurd tariff, to a country where cooking has been raised to the rank of a science.

We cannot praise a number of hideous green porcelain snakes and lizards in the Jewellery Room

On leaving metals and porcelain, we may turn down avenues where glass cases on both sides form a sort of little street of shops full of costly shawls. It is extraordinary, that, with the power of designing and executing work of such excellence, the French shawl manufacturers are constantly agitating for additional prohibitive duties excluding shawls on all European and Indian shawls. It is not many years since it was gravely proposed by the French manufacturers, that every lady possessing an Indian shawl should be compelled to wear a Custom-house metal plate on it, to show that the duty had been duly paid.

Beside several of the cases hang the original designs in water-colours, even more beautiful than themselves. In the same manner we can successively pass robes, flounced and unflounced, in silk, in satin, in lace, in muslin, arranged in the most attractive manner. Facing the grand avenue are the choicest productions of the looms of Lyons, in curtains, and brocaded silks for furniture

Except so far as an additional charm is gained by the arrangement, the articles which may be classed under the general term of "soft goods" will excite less attention than any other part of the French collection, because we have been accustomed to see all these things sold in our shops. London is a larger and better customer of Lyons than Paris. Several of our principal retailers are actually partners in Lyons manufactories

From this observation we must except the Gobelins tapestry, to which a room has been devoted. The Gobelins tapestry, like the Sèvres china manufactory, is carried on without regard to profit, at the expense of the Government. By the hands of embroiderers, especially educated for the purpose, and selected for their talent, the works of great ancient and modern painters are copied. At one period, Gobelins tapestry was never sold, but reserved as presents by the French sovereigns to favourites and foreign potentates. At present, it is sold under certain conditions. A set of tapestry, from designs by Paul Delaroche, were lately in course of execution for the Duchess of Sutherland. The cheapest piece of tapestry exhibited is valued at a thousand pounds—a larger piece at three thousand pounds.

There are also specimens of the Aubusson carpets

In carpets, as in porcelain, our strength lies in the quality and price at which we can afford to supply the middle and working classes. With us a carpet is a necessary piece of furniture for a respectable mechanic. In France, except where English abound, it is considered a luxury of the first order. We can remember, that, when travelling through France twenty years ago, a piece of carpet, carried for the use of an invalid, was examined by servants at inns in the south with as much curiosity as a piece of Indian embroidery would be here.

In artificial flowers, the greatest display is made by the celebrated "Constantin," in a case of rare tropical plants, facing the Avenue. The other artificial flowers lie scarcely in the galleries.

The northern bays of the French division are devoted to fire-arms in great numbers, and profusely ornamented; to surgical instruments, anatomical models, to philosophical instruments, and costly scientific clocks, which deserve separate notice and illustrations; and to machinery, which is not yet sufficiently arranged to enable us to do it Justice. We are disappointed at not seeing more Parisian furniture. We think that a room completely furnished up as some Parisian *boudoirs* are, would have rivalled the Austrian suite in attraction, and proved a profitable speculation to the proprietor.

Of course, we do not pretend to have noticed one twentieth part of the French collection, but we have just said enough to indicate the different sources of interest open to the examination of different tastes. From time to time we shall more minutely describe and illustrate separate bits of special beauty and picturesqueness.

THE FOREIGN MINERALS AND METALS.

THE collections of raw material belonging to the mineral kingdom from foreign countries are by no means so considerable as those forwarded from the British Islands, but they are not deficient in interest, though, on the whole, less prominent objects. From our own colonies some of the best and finest specimens have been obtained, and we will endeavour to give in the present article a tolerably complete account of those already placed out for examination

Commencing on the east or transept side of the Fine Arts Court, we find first the productions of those well-known and remarkable mines of SOUTH AUSTRALIA, which have yielded, within a few years, enormous supplies of the richest and most valuable ore of copper. The superb specimens of *malachite*, obtained from this colony, have already come into use for the purpose of inlaying, to such an extent as to affect very seriously the Russian market for this valuable stone; and examples of this kind may be seen in Mr. Vallance's table, in class 27, where, as indeed in the other articles of the same kind by the Derbyshire marble workers, the Australian malachite is used indifferently with the Russian, and is equal in quality, though, perhaps, not capable of being cut into slabs of such large dimensions. The blue carbonate of copper (azurite) is also occasionally found with the green, and forms a beautiful variety in tables and other ornamental inlaid work.

The BURRA BURRA mines—the most remarkable of these lately opened in South Australia, are situated near the rising town of Adelaide, amongst hills of from 2000 to 2500 feet high, running north and south. They have already yielded nearly 60,000 tons of copper in about five years of working, and the mines now employ upwards of 1000 persons. The result has been enormously profitable to the first adventurers; and the nature of the workings as well as the produce may be well understood by the diagrams and collections in the part of the Exhibition to which we are now referring The Australian mining companies have also taken advantage of the mineral wealth of the colony of South Australia, among which the South Australian Mining Company is, we believe, the largest landholder. The collections exhibited by and on account of this company will be found to possess great interest. In addition to copper, the district contains also vast mineral recesses, as the ores of iron are abundant and very rich; and good indications of lead, and even of the precious metals, have also been found. We would direct especial attention to the magnetic and micaceous iron ore, as promising great advantage in working.

Various parts of NEW SOUTH WALES and VAN DIEMEN'S LAND yield stone of great beauty and of much value for ornamental purposes The Opals are especially worthy of notice, and the white topazes may also be referred to. A magnificent specimen of opalized wood is exhibited in the nave on the east side of the Colonial trophy In addition to other articles, may be noticed some promising hone-stones from Van Diemen's Land.

From NEW ZEALAND, whose products are placed near those of Australia, in the Colonial Court, we have samples of titaniferous iron ore, said to exist in vast quantities as sand; other ores of iron, of various kinds; considerable specimens of coal and lignite; some samples of sulphur, and specimens of pumice. Of these indications of mineral wealth, perhaps the most interesting at present is the coal. The quality, judging from appearance, is not such as to enter into competition with that obtained from England; but this may be partly owing to the fact, that, hitherto, it is only the top of the bed, where it has been long exposed to the weather, that is sent for examination. Still the quality is rather that of lignite than true coal; it is light, hardly soils the fingers, and in some parts resembles jet. With these products from the South Sea Archipelago, we may rank, also, the grits stones forwarded from NORFOLK ISLAND.

The Island of TRINIDAD has furnished a series of very great interest, obtained from the remarkable lake of pitch existing in the island; and the collection includes, also, a number of products, such as clay coal, naphtha, &c., derived from the same mineral. The pitch lake is about a mile and a half in circumference. The pitch at the sides of the lake is perfectly hard and cold; but, as one walks towards the middle, with the shoes off, in order to wade through the wet, the heat gradually increases, the pitch becomes softer and softer, until at last it is seen boiling up in a liquid state. The air is then strongly impregnated with bitumen and sulphur, and the impression is left upon the auditory nerves of a hissing pitch. During the rainy season it is possible to walk over nearly the whole lake, but in the hot season a great part is not to be approached. The pitch has been employed to repair the roads in the colony. In addition to the pitch and its products, some good ochres have also been sent from Trinidad

The island of BOURBON (Mauritius) sends coal, to tempt our steamers to trust for supply to the countries by which they pass. ST. HELENA sends rock salt; and other small dependencies, in different parts of the world, have furnished, in like manner, their quota to the collection of mineral substances, illustrating, in the most practical and useful way, the real resources they possess

We next come to CANADA, and the British possessions of North America. In the same Colonial Court as that in which we see the productions already referred to, will be found specimens of asphaite, from New Brunswick, and a quantity of plumbago, or black-lead, from St. John's, in the same colony. The latter is not of such a quality as to possess value for the higher purposes for which the material is required, but is quite sufficient for machinery and for household use. It is flaky and of good colour, but wants compactness, Not far from these specimens will be found some interesting minerals from NOVA SCOTIA, including a series of iron ores of the very finest quality; some ores of manganese, sulphate of barytes, ochres—both red and yellow, and various building materials. These are supplied by Mr. Archibald, a gentleman whose large interest in the colony justifies the prominent position he holds among the contributors. In addition to these objects, some coal is sent from SYDNEY (Cape Breton), a district estimated to contain 250 square miles of workable coal of excellent quality, already much used for domestic purposes, and worked from pits 250 feet deep. This coal is highly bituminous, igniting readily, and leaving but little ash. There are fourteen seams upwards of a yard thick, one of them being eleven and another nine feet

From CANADA itself the minerals are numerous, and of the highest interest. They include geological specimens in series, illustrating the structure of particular districts; numerous and most valuable ores of iron, of excellent quality, including the magnetic oxide. Copper ore, also of excellent quality, together with native copper and native silver, and various other metals, including gold, some of which have been worked profitably. In addition to the metals may also be observed several interesting specimens of limestone and sandstone, for purposes of construction and ornament, and some slates not of the very excellent quality. There are also several other specimens, of remarkable beauty and magnitude, consisting of crystalline phosphate of lime (apatite), capable, it would seem, from their abundance, of being rendered available for agricultural purposes when the large supply of the phosphate present in the virgin soils of the country shall be exhausted by frequent crops of food plants. Several interesting specimens of lithographic stone should also be mentioned, as affording means of obtaining, at a moderate price, so important an adjunct to the intellectual advance of a country.

The last of our Colonies whose mineral productions we shall refer to is the EAST INDIES—that rich and gigantic territory which alone might rival in its vast population and numerous productions any other country in the world. From their various dependencies in the East, the Directors of the East India Company have succeeded in obtaining and have forwarded specimens of almost every object of nature or art that could render their collection useful and instructive; and although at present these riches are not altogether laid open for investigation, there is still enough to justify careful study. We have already, in a former article on the gems, alluded to the more remarkable precious stones from India, but there are also many other minerals, hardly less valuable if we regard the true source of riches to a country.

Thus, the iron ore, from which is made the celebrated Wootz steel, with many manufactured specimens; the corundrum, not only in its pure and transparent state as ruby and sapphire, but in its rougher form, as the material from which all the best kinds of emery are obtained; mica, used for various purposes; these and many other minerals will be found; but it may, perhaps, be advisable to refer again to them when the arrangement of the collection is more perfect.

We may, however, here direct attention to the series of slabs of various kinds of East Indian marbles, and also to an interesting specimen of Indian inland-work, exhibited by Mr. Stewart, in class 27.

Besides the objects from the East, exhibited by the East India Company, there are also some of considerable interest from CHINA. Of these we may especially refer to the series of materials used in the manufacture of porcelain, contributed through the Board of Trade, and forwarded by H. M. Consul, Shanghae. These include not only the china-clay, or kaolin, but also the china-stone, and the different earths and pigments used for various purposes, whether mixing, glazing, or colouring, in the great porcelain works of the East. No less than 70 packets are exhibited, containing samples of colours and colouring material employed in producing the various tints.

Next to China are exhibited the products of various countries of South America. Of these, CHILI has sent a lump of gold ore weighing 3 cwt., and a mass of native silver—one of the largest hitherto seen in this country, the value of which amounts to £500 sterling. The condition of this mass of native silver is peculiar and interesting, the whole consisting of numerous plates or layers, not apparently connected with each other, except by simple contact. It appears to have been part of a large mass. The rich copper ores from Chili are also well worthy of notice

Of the various Continental countries, SWITZERLAND, which is first passed in journeying eastward through the Building, has contributed but little to the collection of mineral substances. SPAIN and PORTUGAL, especially the former, are far richer, and include many series of great interest. Ores of all the principal metals will here be found: specimens of building material, marbles of great beauty, china-clay, salt, sulphur, phosphorite (of Estremadura), mineral asphalte, glauberite, gypsum, alum, and many others, are exhibited. Amongst these, the ores of mercury, those of iron and copper, and the samples of native silver and gold, will be found of interest, and, with the others, will serve well to illustrate the great natural riches of the Peninsula, and the utter inadequacy of any products, however important, in rendering a country rich and prosperous, if the habits and feelings of the people, or political disadvantages, are in direct opposition to the neglect of that first of all essentials to prosperity—free communication at small cost from one part of a country to another, and cheap means of conveyance to a port. The produce of Spain is in this respect especially remarkable, as at present these sources of unbounded wealth are completely and hopelessly locked up. Amongst the various earthy minerals from the Peninsula, we would refer more particularly to the coal from the province of Leon, and the collection of 87 different marbles from the Royal Library at Madrid. The marbles (chiefly slabs) from Portugal, and lithographic stones from the same country, should also be examined; and while speaking of these materials, we would refer to the most exquisite slab exhibited among the British goods, in class 1, by Mr. Montero (No. 150), presenting a rare instance of stalactitic carbonate of lime, almost transparent, and colour (with a soft tint of greenish blue. This slab is from Granada (incorrectly marked "Canada," in the first edition of the Catalogue).

PERSIA, ARABIA, and GREECE, with TURKEY and EGYPT, all present their stores within a short distance of the objects we have been just describing. These, with the exception of Greece, appear at first to exhibit few or no mineral products; but we shall often find, classed among British goods, various series properly belonging to foreign countries. Thus, we may here refer to an extremely beautiful and most valuable set of turquoises, some in the matrix, and others cut, and formed into ornaments, exhibited by Major Macdonald, in class 1 They are from Arabia, and should be examined carefully, as being a collection not rivalled in any museum in Europe.

The minerals from GREECE are very interesting, as they include samples from various quarries which have in former times supplied the finest marbles of antiquity There will be found amongst these both white and coloured varieties, and some objects sculptured from them. Greece also supplies some of the finest emery used in manufactures (from the isle of NAXOS); the celebrated meerschaum, so valuable in the manufacture of pipes; pozzuolana of excellent quality; carbonate of magnesia, most both for magnesia and Epsom salts, and also for making bricks, and several valuable millstones. The best bone-stones are obtained from Greece and Turkey; but these are exhibited in the large collection shown by Mr. Meinig, in class 1, British Goods.

ITALY comes next in order of position. Like Greece, it exhibits some beautiful marbles and objects sculptured from them: and we find also many exquisite specimens of that remarkable mosaic or inlaid stone work for which both ROME and FLORENCE have long been famous. The specimens exhibited are of various kinds, but almost all of great excellence. Some of them might easily be mistaken for pictures, and would do no discredit to the first artist, while in others we have imitations of mosaic marble manufactured of a peculiar and very beautiful kind.

The mineral products of FRANCE are hardly yet in a state to justify our giving any detailed account of them, or mention which are most deserving of interest. The Catalogue, as at present arranged, is hopeless state; and we must await the completion of the arrangements in the Building, and some means of discovering objects described in the Catalogue, before we can venture to do more than state that there are collections of this kind (numerous rather than of any very high value) in the Building.

Belgium succeeds France, and, perhaps, should have been expected, a large and most interesting series of minerals. First in importance are iron and coal, both of which are fairly represented. The formeris chiefly shown in a manufactured state, and the iron of Liege and other parts of Belgium is too well known to require that attention should be especially called to it. The lead and zinc, but especially the latter, are also well exemplified; and we might have mentioned in speaking of France the excellent and remarkable products of the Vieille Montagne Company, the seat of whose operations is to a certain extent in Paris, though Liege is the more usual reference. A very large part of the zinc of commerce is obtained from Belgium, not indeed from the variety of the ores in other countries, but owing to the fact that the better and more useful ores being there so infinitely abundant and easily worked, the ores of other countries are frequently neglected as not worth making use of

The coal of Belgium is of different kinds, and is very much used both for manufacturing and other purposes in the country and for exportation, chiefly to France. The samples of it sent to London are therefore particularly interesting. They are chiefly bituminous and rather tender. One kind (the Fience coal) is unlike any found in the British Islands.

In addition to its coal and iron, Belgium is also remarkable for the large quantity and excellence of the marbles obtainable from various districts and of different colours. Of these there are several examples of these, though none, perhaps, that are especially remarkable for excellence of quality. Cheapness of production is, however, attained to a very great extent. Besides these, there are several varieties of mill-stones, some of admirable quality and of considerable size. The whetstones and hone-stones are also of importance; and the china and pottery, brick and fire-clays, are worthy of notice. Several interesting specimens of this material may be mentioned, also from Belgium

AUSTRIA has exerted herself greatly, in all respects, to send such objects as might best illustrate the nature and extent of her natural resources. These include coal (chiefly from Bohemia and Silesia), and lignite or brown coal (from Styria), the former in particular of great extent, and of extreme importance to the advance of the country. A large proportion both of the coal and lignite is used in the production of iron, by which metal the ores as found in various parts of Austria are practically inexhaustible, and the quality excellent. In Styria, especially, there are enormous masses of the ore called spathic iron (a crystalline carbonate, much used in preparing a peculiar kind of steel manufacture) into scythes and other agricultural implements). The Austrian scythe and sickle reach not only across Europe and into Asia, but are even imported into America; and it is calculated that not less than seven millions of these instruments are produced annually, chiefly from Styria and the Tyrol, and almost entirely of that particular ore of iron, which is well represented by numerous specimens, and is the more worthy of notice as it is comparatively rare in England, and is quite free from many of those impurities that impair the usefulness of some of our ores.

Next to the coal and iron may be mentioned, as one of the most important products of Austria, the various kinds of clay used for the manufacture of bricks. A picture, showing the process adopted at Vienna, and the use of the largest establishment of the kind known, will be interesting and useful as illustrating this subject. The sands used in Bohemia for the manufacture of glass; garnets, also Bohemian, of which vast numbers are used for ornamental purposes; salt, obtained in enormous quantities from the great mines of Wieliczka, in Poland; various metallic substances, and ores used more or less directly in obtaining colour for the artist and the porcelain manufacturer; a number of building and paving stones; a considerable variety of imitative marbles, stones, and artificial pumice-stone, used in grinding and polishing, may be pointed out as adding to the interest and value of the Austrian series, and show how carefully the selection has been made. Lastly, in mentioning the Austrian minerals, we must refer to the produce of the remarkable and well-known quick-

[THIS SHEET WAS PRINTED IN THE GREAT EXHIBITION BUILDING.]

silver mines of Idria. These, with some ores of copper and tin, are sent by the Director of the Imperial mines, Vienna.

Passing beyond the frontier of Austria, we come next, following the geography of the Exhibition, to the products of WURTEMBERG, and discover some grindstones from the neighbourhood of Stuttgard, and some specimens of limestones for hydraulic cements, which are good and interesting: these, and some samples of polishing powder, offer the chief interest amongst the minerals, and they are succeeded by lava millstones from Rhenish Prussia, and some marbles of much beauty from near Coblentz. Specimens of *Ignite*, from the same district, but of the nature of paper coal, and better adapted for alum than fuel, next occur; and these are succeeded by the ores and other mineral wealth of the Duchy of Nassau, where large works exist for the manufacture of iron, ores of which metal abound in the immediate neighbourhood. Copper, cobalt, nickel, manganese, and other metals are also here represented; while slates from Dillenburg, marbles from Diez, mercury and cinnabar from Ludwig, near Wetzlar (only recently discovered), and vast supplies of lignite, at least as good as that of Austria, attest the great mineral riches of that small district on the right bank of the Rhine, which has hitherto attracted the notice of the geologist rather than the capitalist, but which must before long take rank as rivalling in real importance some of those that have been long worked in Germany, and elsewhere on the Continent.

RUSSIA supplies several minerals of great interest, though not, perhaps, very attractive to the general visitor. Among these may be enumerated, as especially worthy of notice, some large masses of malachite (green carbonate of copper), one of which is of unusual size, beauty, and value; some specimens of native copper and red oxide of copper, of great beauty; and also some anthracite coal from Odessa. There are also some ores containing cadmium in considerable quantities, and which are important in the present interesting use of this metal, both directly as an improved material for casting iron, and indirectly as the base of some valuable pigments, &c. In addition to these, are some ochres and specimens of clay, with fire-bricks manufactured of them. Ores of iron and manufactured iron are exhibited, which possess good interest.

From SCANDINAVIA, the collectors of mineral substances are not large, but the silver ores are peculiarly interesting. The iron ores, especially from Dannemore—so celebrated for the steel made from them; the cobalts, in various stages of preparation; the lead ores; and manufactured iron of various kinds, nearly complete the series. There are also specimens of chromic iron.

Last in the series, and occupying the extreme east end of the Building, are the productions of the UNITED STATES of North America—at present rather scanty in every department, and not especially remarkable for the series of unmanufactured minerals. Placed in the nave, where it occupies a prominent position, Dove-tail may be seen a very fine specimen of zinc ore—one of the largest ever of zinc and iron ores from New Jersey. Together with the zinc ore are certain preparations of zinc intended to replace those at present derived from white lead, and far less injurious to health. Iron ores of great beauty and extremely rich, consisting of blocks of the carbonate from Connecticut and oxides from New Jersey, are placed for examination, and both native copper and copperore are also to be found of large size and some value. We may also direct attention to some fine beryls; some remarkably fine specimens of mica, talc, and steatite; some pure felspar, which has been occasionally imported into this country as china-stone; some fine blocks of anthracite; and, lastly, a large quantity of plumbago of sound quality, well adapted for various purposes, and the use of which is illustrated by a number of casting-pots or crucibles manufactured from it. Perhaps the most remarkable specimen from North America is a block of Californian gold (in the south central gallery), weighing upwards of 18 lb.

Such is a brief and very general account of the foreign minerals as at present to be seen in the Exhibition. It cannot be necessary to repeat that this will include many of extreme interest and importance; and it should be thought that a mere enumeration, such as we have given, is but a bald and tame account of so brilliant a series. It must be remembered, on the other hand, that the objects themselves are attractive in a relative rather than a positive sense, and rather as materials for the intellect and talents of man to work upon and render decorative, than as themselves adapted to please or astonish. To the student and the practical man these materials recommend themselves sufficiently, and will be examined with sufficient care; but we hope to induce some others to avail themselves of so unusual a source of information by thus laying before them a brief outline of this part of the great Exhibition.

A WALK IN THE WEST GALLERY.

AFTER hours spent in the blaze and bustle of the main avenues, it is a relief to turn into one of the galleries which the curious crowd have not yet discovered—galleries in which the oddest things have been thrust almost out of sight. The galleries looking down on the nave, or some of the variegated courts, attract a fair share of attention, considering that there are no seats wherever the weary can rest, and no flower-beds of bright-coloured flowers to invite the *flâneur*.

Ascending the first stairs from the transept of the North-west Gallery, we find ourselves in the midst of the Potteries: Copeland and Minton, and Wedgwood, and Staffordshire, Worcestershire, and Derbyshire, are around us. Overhead the Berlin wool worked carpet (executed by fifty loyal ladies, for the Queen), with the best productions of Kidderminster, give effect to the splendid chandeliers as they hang side by side.

We will begin with the silent back avenue which overlooks the canvass covered roof of the machine-room.

At Sussex-man has found place for a set of baskets made of staves in a sort of boat shape, of all sizes, from a clothes-basket to a reticule, which he recommends for many purposes, among others for "toys" or "*coal-scuttles*."

A little further on we come upon bonnets manufactured from rye straw in the Orkney Islands, a very pretty plait and texture. They are the result of instruction given by a philanthropic family, who were anxious to provide a new employment for the winter evenings of our northernmost countrywomen. The specimens exhibited will bear comparison with those sent from places famous for Leghorn plait. We hope this attempt may prove a permanent and profitable amusement to the Misses and Brendas round Stromness and Kirkwall.

Next we pause before a bedstead, which must really be invaluable to heavy sleepers, if the exhibitor can only perform his printed promise. He undertakes, that, at any hour fixed on a watch provided, a part of the bedstead rising up, shall cast the slumberer clean out, in fact, empty him into the middle of the floor. This may be called "a real blessing to Boots." But the inventor should go a little further, and combine with this turnover bedstead the contrivance of a Manchester mechanic, reported in a round of country papers twelve months ago, by which, at a given hour, not only did the bed-clothes rise up to the ceiling, but a lamp was lighted, and a kettle of water boiled, with a couple of eggs, in the course of ten minutes.

A little further on, emigrants are enabled to inspect a cottage of patent felt; another with a double wall of corrugated iron, and a portable tent, in the form of a huge umbrella. The patent felt, if it be waterproof and fire-proof, is a valuable article. The iron cottages are much too cumbrous and costly for any colonist, unless it be a Canterbury colonist; for where there are no houses, there are no roads, few draught cattle, and no cheap porterage; so that, between the expense of landing from the ship, and through the mud, sand, or over the hills of a new country, a large capital is consumed before the unfortunate owner is housed, and he vainly wishes he had been content with a piece of tarpaulin hung over the bough of a tree, like his less genteel neighbour.

The umbrella tent is really ingenious; it would probably require to be carefully pegged down to stand a high wind; but still it is a contrivance that may be very useful, especially if it could be manufactured at a cheap rate.

We wish the French would exhibit the little portable tents which each soldier carried on his back, and set up when bivouacking, in the early days of the Roman expedition. They might be very useful to both sportsmen and emigrants.

The Board of Northern Lights claim our thanks for a model of all the machinery employed, and of the progress of building a lighthouse on the Bell Rock, with a representation of the wooden island, or cage, in which the workmen lived during the progress of an undertaking as extraordinary as the erection of Eddystone. They have also sent specimens of the lamps, prisms, and reflectors they use.

In the same line of march we come upon a small tank, containing model of Mr. Robert Napier's steamboat for floating a railway train across a river too broad to be bridged; and then there is a case of models of yachts exhibited by the Thames Yacht Club.

A Mr. Greener, of Birmingham, makes a very formidable display of guns, the more prominent being devoted to commercial and philanthropic purposes; one being intended to fire a rocket with a line from a lifeboat to a ship in distress, and the other to discharge a barbed harpoon into the body of one of those sperm whales which yield the oil so indispensable to the lubrication of our finest machinery. A tremendous punt gun may also be considered more a matter of trade than sport, as it is of the kind used to supply our winter markets with all manner of wild fowl.

We cannot help noting, that, while every other country puts its death-dealing weapons in the most conspicuous position of their space, we seem to hide them away as much as possible. The chief collection is to be found at the extremity of the southernmost western gallery.

Retracing our steps by the gallery overlooking the nave, we find ourselves in a crowd of curious people which had not ventured into the back ways. Maps, globes, and other geographical helps are drawn up in rank and file. About them come philosophical instruments, dissolving views, Daguerreotype, Talbotype, and calotype apparatus, with specimens from Kilburn, Beard, and others; a pair of magnets, with power to support a ton; an electric telegraph, in which magnets are used, instead of galvanic batteries.

Leaving philosophy we reach sport, in the shape of a grand battery of music, which is discharged at appointed hours as from grand, semi-grand, cabinet, piccolo, and all manner of newly named instruments, by Broadwood, Erard, Collard, and others, perhaps equal in merit, but not so well known, whose respective qualities are duly discussed in another article by a competent professor. From pianos a step takes us to the translucent manufactures of Osler and Apsley Pellatt: chandeliers, cups, vases, and decanters, of diamond-like brightness and clearness.

And here, for the present, we rest, only observing, for the benefit of the persevering, that, in the opposite gallery, in the case of Messrs. Garrard, the silversmiths, a lump of Californian water-worn gold is to be seen which is enough to realise one's dreams of El Dorado. It is as large as the top of an ordinary tumbler, about an inch and a half thick, worn and rounded like a blue stone of the same size that may be often picked up in a trout stream, or any rushing torrent where the stones are constantly in motion.

In the same department, Mr. Collis, of Birmingham, exhibits a set of models in glass of the exact size and shape of the most celebrated diamonds. From these models, it seems that the Koh-i-noor is exceeded in size by many other diamonds.

MUSICAL INSTRUMENTS IN THE GREAT EXHIBITION.

FIRST ARTICLE.—PIANOFORTES.

AMONG the objects of interest and curiosity which form the contents of the Crystal Palace, a prominent place is held by Musical Instruments. Of these the pianoforte is the most important, whether we consider its capabilities (being almost an orchestra in itself), its adaptation to all purposes of musical representation, its universal use in every family as an indispensable requisite for amusement and instruction, or its consequence as a branch of manufacture, employing a large amount of capital and skilled labour. Fifty or sixty years back there were scarcely a dozen pianoforte-makers in England; there are at present between 200 and 300 in London alone, while there are makers in most of the capital towns in the United Kingdom. It is calculated that there are not less than 1500 pianofortes made every week in Great Britain and Ireland, employing, when trade is good, full 15,000 workmen of a superior class, and receiving wages accordingly. From these facts the great magnitude and importance of pianoforte-making as a department of our national industry are at once apparent.

It is curious to contemplate the transition from the old harpsichord, with its tinkling lute-like tones, to the power and richness of the present grand pianoforte. To do this, we must refer to some of the old firms of eminence, such as Broadwood's, Kirkman's, &c., who were originally harpsichord makers. The harpsichord was the original model for the grand piano; the shape, the scale, the strings, sounding-board, &c., were all the same: the principal alteration was in the mechanism—in the adoption of percussion as a mode of putting the string in vibration, in preference to pulling it by means of a little piece of crow's quill inserted in a piece of wood, moved by the key. This alteration made, the progress of the instrument was very rapid. There is scarcely an eminent firm in the trade who have not contributed to its improvement. It is not, however, to any one house, but to the exertions of a number of individuals, each acting upon, and taking advantage of the labours of the other, that the present perfection of the instrument is due.

In this department the leading house take the first rank, while the display by makers of less eminence is exceedingly creditable. The manufacturers seem as desirous of pleasing the eye as delighting the ear, and, accordingly, we notice some very beautiful instruments, in which the art of the carver, inlayer, and gilder is lavishly employed; but we miss any attempt to give a more elegant and uniform shape to the grand pianoforte, which is so much to be desired. Messrs. Broadwood exhibit four grand pianofortes (one in a magnificent case designed by Barry), in which the beauty of the wood and the excellence of the workmanship is conspicuous.

The house of Erard sends several splendid harps and a number of pianofortes, among which we perceive a revival of the old method of attaching pedals to an instrument. This calls to our mind having seen, long ago, an instrument with an octave and a half of pedals, by Kirkman, belonging to the celebrated Bartleman, and which he considered a great curiosity. Messrs. Erard, among their instruments, send specimens of their square and cabinet pianos, for which they are so famous. But the greatest attraction in this department appears to be the miniature model grand of Messrs Kirkman. The art and science of pianoforte-making seems to be concentrated in this little instrument; and were it not there to speak for itself, no one would believe it possible to produce such clear, full, and sparkling tones in so small a compass, while no difficulty seems to be avoided, having all recent and all the modern improvements. We have had our attention directed to the new repetition mechanism introduced into the concert grand pianoforte exhibited by the same firm, which, while it is as effective as that patented by the late Mr. Erard, is of a totally different construction; and the tendency of these actions to get deranged and to become noisy is here removed, and with a perfect repetition the touch is as smooth and light as can be desired. Another improvement, also by Messrs. Kirkman, is the addition of metal bracings to their oblique pianofortes, and the introduction of drilled metal studs and the harmonic bar for the improvement of the upper notes, so often defective in this class of instruments.

In regard to the foreign pianofortes, we may safely say, without any undue assumption of national superiority, that they by no means rival the productions of English skill and industry. The Paris pianofortes, next to our own, are the best; and the best of them are those of Erard, also an English manufacturer. Good instruments, too, are made at Vienna, and largely supply the demand of Germany; but even in France and Germany, the pianofortes of the great English makers have not lost the pre-eminence they have so long enjoyed. The American instruments are merely copies of our own. The only original construction among those exhibited is a double pianoforte (in other words, two pianofortes), each with its own set of strings and key-board (the sounding board being common to both), so placed that two performers can play together sitting opposite to each other, or four if two are at each key-board. There is some ingenuity in this, but its ability in a musical point of view is very limited.

In another article we shall make a few observations on the other species of instruments, especially organs, of which there are a considerable number.

THE PRODUCTIONS OF ABORIGINES IN THE EXHIBITION.

THE first, and perhaps the most powerful and lasting impression received by an attentive visitor at the Exhibition, when looking through its vast collection of articles from every region on earth, is this—that all men, differ as they may in other important points, more especially the uncivilised from the civilised, nevertheless obey at least one law in common: they all, without exception, but in very different degrees of intensity, *labour*. The judgment, that man shall live by the sweat of his brow, is here exemplified to the full, although a consolatory experience also proves that the curse may largely bring out its own relief. Industry, therefore, and its higher powers of science and art, have been wisely adopted by the founder of the World's Exhibition now holding in England, for the pivot of the greatest interest of this Exhibition, and a very important, however far from being the sole means of social improvement.

The most careless glance, however, at the multitudinous display of the material results of all men's industry, establishes some striking distinction in quality among them, even whilst unity in the one respect of effort is recognised; and it cannot but be useful to examine the several masses of products in detail, in order to search out the causes of the obvious difference in their respective values.

The articles indicated in the title of this paper, for example the productions of those who are commonly called Aborigines, or the less civilised races—are substantially the inferior fruits of human industry. Yet good reasons will lead us to devote careful and special attention to these Aboriginal products. They illustrate the primitive elements out of which the most advanced nations have elaborated the gorgeous and graceful, the eminently useful, and almost intellectual things, of which this noble assemblage mainly consists. The most polished nations may in them trace their own perfection backwards to its source.

Then, these Aboriginal productions suggest, in their rude aptitude of purpose, sometimes in their skilfulness, irresistible arguments to the more refined, to look with greater indulgence upon their struggling fellows, by whom such interesting productions are made. In this point of view, one of the most beautiful subjects in the Exhibition. Mr. Thomas's "Spirit of Science unveiling Ignorance and Prejudice," may have an unexpected application. The highly civilised man, reared beyond science familiar with the works of uncivilised people, will subdue his own prejudices in regard to their incapacity, and soon come practically to aid them to acquire the superior qualifications that shall rightfully place them on his level.

The Aborigines in the Exhibition are not distinguished in the general plan, as workmen of a separate class. All contributions having been invited from separate nations (not from separate denominations of men in each nation), all the producers of those contributions are confounded together. So, again, in a great mass of instances, no line can be drawn clearly between the productions of civilised and those of uncivilised workmen. There is, however, a general understanding as to what fairly belongs to the people called Aborigines, so that it will not be difficult to mark their share in the contents of the Exhibition.

China and India have so much in common with us, in their manufactures, their arts, and their agriculture, and they have made so much progress already in many respects, that purely *Aboriginal* products are comparatively few in those countries, but both possess some worthy of notice. Ceylon and the Indian Archipelago have sent us more; and Africa still more, from all its quarters—east, north, west, and south Turkey, although still too resplendent in "barbaric gold," instead of cultivating the best taste, is fast assuming the great forms of our civilisation, and Russia will bring from its remoter tribes only anything of a purely Aboriginal character. North America, in its prodigious new wealth of raw products of art and industry, offers some scanty memorials of deep interest from its Aboriginal tribes. Central and South America could have presented most curious combinations of civilised and uncivilised manners as now existing, and have sent us remarkable means of comparing the civilisation that existed before the New World was revealed to Europe, with the improvements introduced by Christians at a frightful cost of human life. Both regions, distracted with civil discord, have contributed a little—very little; but one South American British colony, Guiana, in the best way of zealous response to the call from home. Nor, probably, will the frozen North, with its princely company of merchants, refuse its most curious Esquimaux contributions. Besides their vast domain from Hudson's Bay to Vancouver's Island, similar exhibitions may come from Greenland and Lapland, as the ice breaks up; whilst New Zealand and the South Sea Islands, new as they are to the civilised world, are already found not absolutely wanting in this glorious race of humanity.

A rapid survey of these poor treasures of the primitive man's ingenuity still in his own hands, will unquestionally tend to allay the melancholy feeling too prevalent among us, that numerous portions of our race are doomed by Providence to perish at the approach of their more instructed brethren. Facts encourage a nobler and a wiser prospect. A capacity for a safer and better condition of life is clearly established by these productions of industry, exercised in every climate, within the burning Tropic and at the pole, by Negro and by Esquimaux; in the gloomy American forests, and over the bare steppes of Tartary; by the half amphibious islander of the Pacific, equally as by the Kaffir, to whom an ironbound coast and unnavigable mountain streams refuse the use of the simplest boat—each, however, having his peculiar occupation. All this confirms the oft-repeated judgment, that "art is natural to man, and that the skill he acquires after many ages of practice, is only the improvement of a talent he possessed at the first. Destined to cultivate his own nature, and to mend his situation, man finds a continual subject of attention, of ingenuity, and of labour."—*Ferguson's Civil Society* (6th edit.), 1792, p. 261.

The same satisfactory conclusion is supported by analogous materials in the Exhibition, and more abundant ones than the purely Aboriginal products. There are the contributions obtained for our daily use by the combined labours of civilised and Aboriginal men. They are the raw materials of commerce to an enormous amount in quantity and value; the dyes, the gums, the drugs, the oils, the seeds, the woods, the woven and textile plants, the leaves, the roots, the skins, the furs, the feathers, the shells, which promote so largely the comfort and adornment of social life. The several departments of each civilised nation in turn have received these contributions from the barbarian, and sometimes from the savage—the Aborigines—whom in return civilisation has not yet discovered a better way to manage than by almost incessant wars.

It is a capital point, in considering these raw materials of the arts, to know how to obtain them in a *genuine* condition; and on this point it will be found that our interest as manufacturers, and merchants, and consumers coincides happily with our duty as men. Exactly in proportion as the native collectors of nature's stores are well treated and well instructed in the best ways of civilisation, the more expert are they, and the more disposed to be vigilant and honest in their work.

The survey of Aboriginal products in the Exhibition may be conveniently begun with British Guiana, as the collections from this colony are remarkably complete, and it is a country admirably described by Sir Robert H. Schomburgk, one of the most accomplished of modern travellers. It is a portion of South America on the Atlantic, in latitude 6 degrees north of the equator, and contains 485 millions of acres of land. The staple produce is sugar, rum, and coffee, with some cotton. Other produce of less value are its plantains, and various esculents, with timber and other articles approved by the experience of the Aborigines.

The chief food of the natives, the cassava bread, is to be seen here, which it is seriously proposed to export to England, as being superior to the potato in nutritious quality, and so much more abundant than any meal known, that a profit of £50 per acre may be gained by its culture. The greatest skill by the natives in preparing the cassava meal from the root are of the manufacture of particular tribes, famous for this business, as others are especially famous for the manufacture of hammocks—the materials probably in both cases being abundant in their countries, as Manchester owes its ancient celebrity to the streams and coals of its neighbourhood.

The cassava bread is made in an elastic tube, called the *Matappée*, a very ingenious contrivance of the Indians, says Sir R. Schomburgk, to press the juice from the root, which is one of the most violent poisons before being pressed. After the root is scraped it is pressed in this tube plaited of the stems of the *Calathea*. A pole in the tube is used as a powerful lever, and weighed down by two persons sitting on it. The juice escapes through the plaited work; and the dried meal is baked in a pan in a few minutes. A specimen of the machine, as well as of the bread, is in the Exhibition.

Another new article of food is also exhibited—the plantain meal, which the Indians use; and our settlers calculate it may be made to produce a gross return of £11 per acre! Well may Europeans be surprised,

as Humboldt says they are, upon arriving within the tropics, at seeing the small space of ground that keeps an Indian family.

The juice of the cow-tree, sometimes used as a substitute for *milk*, is perhaps more valuable as one of the numerous materials for India-rubber. The physic nut in common use by the natives is one of the hundred vegetable medicines of the American forests, well worth further study. There is here, also, a species of Jesuits' bark, of far greater importance, considering its dearness almost prohibits its proper application in our hospitals; and this, also, is well known to the Indians.

But the most valuable articles exhibited from Guiana are the woods originally made known to us by native experience. For ship-building, they are certainly superior to oak and teak; and the bright colours of the specimens strongly recommend them for furniture. In regard to ship-building, it is a curious fact, attested by Sir R. Schomburgk, that one tribe in particular, the Warruns, have been famous builders of canoes and corrials, the durability and speed of which far surpassed any boats from Europe. They made a class of launches, carrying from 50 to 70 men, celebrated in the late revolutionary wars. The timber they selected, the mora tree, is now acknowledged to be the very best for the purpose. Specimens of it are in the Exhibition.

A more primitive canoe is there, also, made of the bark of a tree, quickly constructed, of extremely light draught, and portable. Its convenient use in this last respect carries us back to the days of our most primitive forefathers, when the wicker and skin boat, to be still seen on the Wye and in Ireland, was easily borne on the shoulders of the adventurous waterman when obstacles impeded his navigation, or he wished to surprise a neighbour at a distant stream.

In this collection, too, may be seen the original *hammock*, which we have so extensively adopted at sea, and which in France is wisely used in crowded rooms, from which it can be removed by day to purify the air of sleeping-rooms or schools. It is interesting to know that the Indians make their hammocks of extraordinarily strong textile materials, new to us, and of excellent cotton. Nor is it less interesting to learn that the sugar of Guiana, of which many specimens are exhibited, has furnished the native people with one comfort from us which they appreciate. They now grow sugar for domestic use; and the cane they cultivate is universally of the kind introduced by us from the French. Cook found it in the South Seas, Bougainville carried it to Mauritius; and thence, by way of the French West India Islands, it has spread, within about seventy years, over the civilised and aboriginal Western World.

These Aborigines, then, can adopt our improvements. They possess, also, the elements of the potter's art, which usually denotes a decided advance from savage life. The mere savage is content with what nature has provided to put liquids in—a sea-shell, a gourd, a part of an egg. The Indian of Guiana manufactures his buck-pots of clay; and a specimen of them may be seen here. In a new edition of Marryatt's beautiful "History of Porcelain," the catalogue of such utensils, from those of Egypt to those of Peru, should be enriched from well-authenticated examples such as these among Aborigines.

In some instances the Aborigines are here proved to have completely adopted our usages. From Nova Scotia samples of wheat grown by Indians are sent of the same respectable weight (64 lb. 11 oz. to the bushel) with the weight of the farmers' wheat. The Sioux saddle and hunter's belt, wrought by an Indian maiden, sent by a citizen of the United States, is entitled to be accounted a work of "honest housewifery," quite as much as the carpet wrought for our gracious Queen by the 300 English women. So the New Zealand chief, Tao Nui, who sends his contributions through his London agent, Mr. Gillman, surely has ceased to be an uncivilised man. These contributions are, however, thoroughly

Aboriginal "specimens of New Zealand woods, gums, and bark, flax and flax manufactures." The same conclusions may be drawn in favour of the capacity of the North American Indian to adopt our usages, from the model of the house of the once wild Carib, the cannibal of Columbus, with every household convenience most minutely represented. The easy chair, the wax tapers, the neat table, the tinder-box, the old man's modern bed, as well as the aboriginal hammock, various musical instruments, various cooking utensils, the sugar-press, cassava-pot, the grind-stone, the neat mat, even the grog-can and a hundred other articles are there, to show the profusion of comforts which civilisation produces. And yet this is the race, thus making progress under a little protection, to which we often refuse common justice, and then we wonder that they flee to the bush. This little Indian picture of civilised barbarism is a lesson that should be perpetuated by such a simple work being, by and by, deposited in the British Museum, if the Exhibition must be broken up.

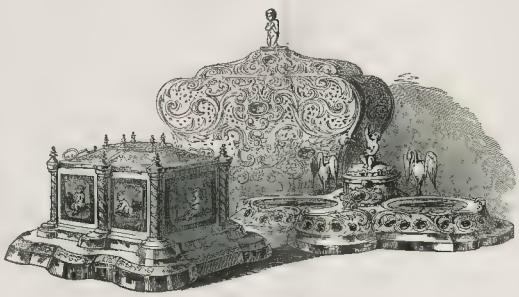
The models of Guiana native dwellings, also, are very interesting, as furnishing, in the abundance of their domestic comforts, some guarantee for their permanence in one place, so that they have clearly arrived at a condition beyond that of nomadic life. Other South American *models* are to be seen in the Exhibition; for instance, there is one of a native raft in the Brazil department, although none, as far as we could find, of the far more curious flying bridges which span the awful abysses of the mountains. Mexico and New Grenada, Chili and Peru, are no longer subject to civil disturbance so continually, whatever may be the case with Central America, but that their engineering wonders of that character, from very old times, might have been produced with advantage.

Western Africa offers articles so various in kind, so abundant, and so valuable in commerce, that, when compared with the barbarism of the people, they irresistibly compel the admission, that trade alone does not solve the problem how men are to be civilised, and if our best sort shall be found worth substituting for the native varieties, the habits of the people are prepared for its adoption.

The pottery works are very various, although calabashes, or vegetable vessels, are common. Dyes and medicines are abundant; and it is to be noted with regret, that poisons are familiar to the natives for the worst purposes. One article of export collected by the rudest people of West Africa is of great value, and it has an interesting history. This is palm oil, the import of which has increased since the abolition of the slave-trade, from a small amount, to more than 20,000 tons a year, worth more than £600,000. That this new African trade in a legitimate commodity is interesting, as a proof of the correctness of judgment in one of the earlier friends of Negro emancipation, whose very name has been forgotten in the long catalogue of the friends of that cause. Mr. Thomas Bentley, of Liverpool, a predecessor of Sharp, and Clarkson, and Wilberforce, was sagacious enough to perceive, and bold enough to maintain, when a merchant in that slave-trading port, that some articles existed in Africa more suited to the conscience and commerce of England than Negroes. He told his fellow-townsmen that they should send their ships, not for slaves, but for *palm oil*; and now it is for Mr. Thomas Bentley's palm oil that the very fleets are sent, which, but for the efforts of such men as he, would still be groaning with human victims. This good man became the partisan of Wedgewood, in the famous potteries, to the beauty of which his excellent taste secured their most successful character.

From Western Africa there has also been sent to the Exhibition the small leathern bottles of dye for the eyelids, which along with other like usages have been cited to prove the assimilation of the Negroes with ancient Egypt. The real aboriginal products of both regions are well worth comparing together, in order to illustrate the question.

But the superior condition of modern Egypt, in point of progress, has led its exhibitors to confine their contributions too much to the results

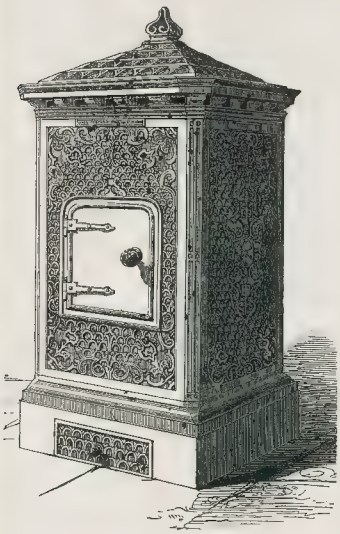


6. GROUP OF OBJECTS OF VERTU.—BY WERTHEIMER.

These Africans, in particular, are most active merchants; and they have one usage which should strongly recommend them, as it furnishes a proof of their respect for honest dealing. If a bale of goods is not found as its place of destination to answer the sample, it may be returned to the broker, who is bound to get compensation from the original seller to the purchaser. The specimens of cotton, both raw and manufactured, from this region, are numerous. The plant grows everywhere;

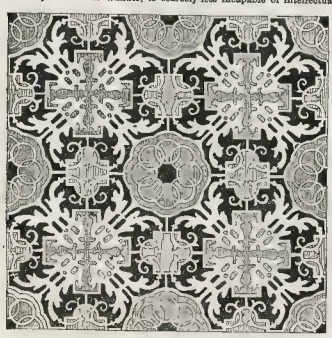
7. BRULE-PARFUM. BY GUEYTON

civilised industry. Indeed, not only Egypt, but Tunis and Algiers, to judge from products thence on this occasion, must be excepted from the class of barbarous states, more absolutely than it is to be feared is consistent with the real conditions of a large portion of their people. Their contributions are chiefly showy silks and woollens; but, as is betrayed in the case of some articles from Algiers, to which the prices are fixed, their dearness really detracts much from their value, paradoxical as this remark may seem. In truth, a barbarous method of manufacture renders cheapness impossible, without in the slightest degree improving quality. The example shows how indiscreet has been the refusal of the Commissioners to let prices be set to all the articles exhibited.



10. HALL STOVE. BY MESSRS. HATWOOD, OF DERBY.

In one Tunisian article, barbarism, and the cause of its duration, are abundantly demonstrated. This is clear in the Arab's tent. Snug enough it is, and by its lowness easily sheltered from the wind, and even the sand-waves of the desert. Its camel's hair roof, too, is doubtless water-tight, but it marks the nomade man; and beyond all doubt the people whose voluntary habit is to wander, is scarcely less incapable of intellectual



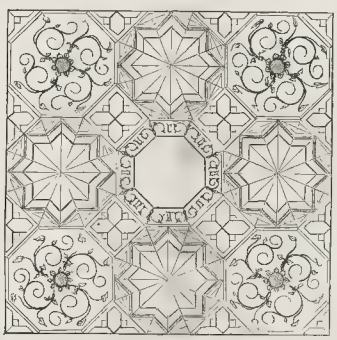
12. DESIGN FOR TILE PAVEMENT. BY J. W. PAPWORTH

and social culture than the more unhappy beings who, like the Indians of North America, are perpetually moved from home to home by the tyranny of their white invaders. It is probable that the principal cause of the unsubdued barbarism of our gipsies is their life of strolling.

The Cape of Good Hope has sent one article deserving special notice—the ivory of an elephant's trunk, of 163 lb., which must be a fine specimen. Ivory is chiefly bought of the natives; and, from Mr. Gordon Cumming's account of his own trading, its mystery may be interpreted to mean extraordinary hard dealing on our part. He had carried into the interior muskets, for twenty of which he had paid £16, and obtained ivory in exchange at a profit of 3000 per cent., which, as he was informed by merchantmen, was "a very fair profit." To be sure, the

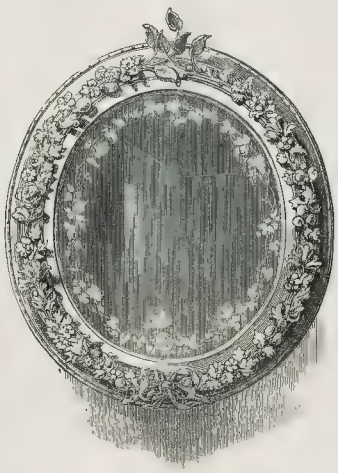
8. GROUP FOR A FOUNTAIN. BY M. ANDRE.

manner in which the black chief, of whom he bought the ivory, had obtained it, by oppression inflicted on the Bushmen who killed the elephants, invites little consideration for that chief; but the whole story furnishes a fresh argument in favour of the civilisation which we consumers of this beautiful product of the desert are bound to use all means to substitute for its existing barbarism. The South African assortment of *karosses*, or cloaks made of the skins of wild animals skilfully dressed, ostrich feathers, and ivory, represent the Aboriginal produce, for which the Cape traders carry into the wilderness to the native tribes, beads of many colours and sizes, brass and copper wire, knives and hatchets, clothing, guns, ammunition, &c.



11. PARQUET FOR FLOORS, FROM RUSSIA.

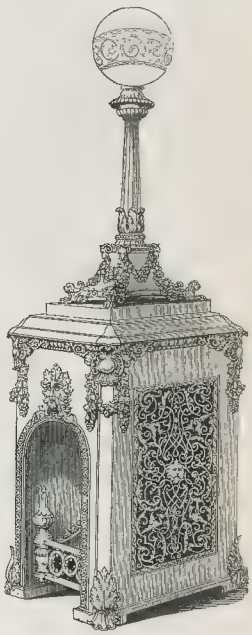
There is a melancholy tribute paid in the Van Diemen's Land contribution to its now extinct Aborigines. In our forty years' possession of that settlement we have utterly destroyed them, by as atrocious a series of oppressions as ever were perpetrated by the unscrupulous strong upon the defenceless feeble. Yet these poor people had tastes and industry too. Their bread appears to be worth reviving as a new truffle for soup by the gourmands of Hobart Town. The specimens of the root exhibited weighed 14 lb. They obtained a brilliant shell necklace by soaking and rubbing off the cuticle, and gaining various tints by hot decoctions of herbs. They procured paint by burning iron ore, and reducing it to



14. PATENT ORNAMENTED GLASS. BY W KIDD

9. CARTON PIERRE ORNAMENT FOR A CEILING. BY JACKSON AND SONS, RATHBONE-PLACE.

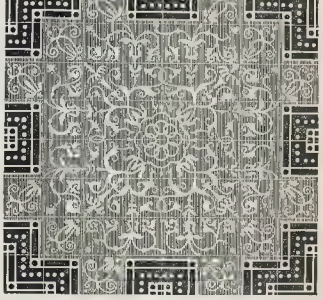
powder by grindstones. They converted sea-shells and sea-weeds into convenient water vessels; they wove baskets, and they constructed boats with safe catamarans. All these things are exhibited. Surely, then, the men whom their greedy supplanters admit to have done this, and whom



12. HALL STOVE. BY MESSRS. BAILY AND SON.

the least possible pains ever bestowed on them proved to be capable of much more, ought not to have been hunted down, as we know they were, and then almost inveigled to be shut up in an island too small for even the few remaining.

The New South Wales contributions offer no sign of the Aborigines' works, and probably the country contains no longer any trace of the



15 DESIGN FOR TILE PAVEMENT. BY W. A. PAPWORTH.

people, as Newfoundland contributors do not pretend to an interest in the works of the lost people who once inhabited it. New Brunswick seems to have nothing to show but the pretty models of an Indian family, the kindness of whose character is attested by having protected two maiden ladies, whose father emigrated from the United States after the Americans war, and settled among the tribe some 70 years ago. The

remnants of the Indians and the remains of the Royalists must have had many subjects of sympathy, and many feelings in common, to have maintained so long a career of mutual respect.

The subject will be resumed, more particularly in reference to some contributions alluded to, which are not yet arranged. The whole amount, however, of Aboriginal articles to be exhibited is likely to be smaller than it would certainly have been, but for circumstances deserving of notice. Of late years the political condition of the Aborigines connected with various civilised nations, has been a subject more than usually interesting to the public. The emancipation of our Negro slaves in 1834 having in a great measure settled that question, the attention of philanthropist was free to be directed to the persecutions suffered by the Aborigines of our colonies. This was an extensive inquiry, and various reforms took place. Then a reaction ensued; until at length the old law of force and oppression extensively recovered its influence. In this state of things the Exhibition was planned, upon the principle of an universal invitation of the nations of the earth, to bring specimens of their industry and art under a common inspection.

The Commissioners made no exceptions; but it was impossible that they should grant a privilege, or any special advantage, even to the least favoured in actual condition. The collection of articles to be exhibited was necessarily left to the zeal and activity of the contributors and their various supporters. France was to take care of her people, Germany of hers, America of hers. The peculiar claims of the less advanced Aborigines for aid were discussed; but all that could be done was carefully to make known in various quarters that the Exhibition would be open to them. The result has been, that the same circumstances which render them inferior to civilised men in accumulated property and in acquired knowledge, have operated to leave their show of industrial development in the Exhibition somewhat meagre, whatever equality of capacity may be conceded to them, and however acute their natural intelligence. It is an occasion, however, upon which the Aborigines' protectors ought to have seized with eagerness, in order to bring evidence of that natural intelligence and equal capabilities in visible array before the world when so favourably disposed to allow all their due.

HEAT, AND ITS APPLICATION.

THE applications of heat, and the adaptation of contrivances for its generation and control, naturally deserve in this variable climate a full attention. In the Building itself, the regulation of heat demands consideration, and extensive contrivances have been used for securing the ingress of cool air, and the egress of that which has become heated. Now, all ventilation is founded upon the simple principle, that cold air is heavy and subsides to the bottom; whilst hot air is light, and rises to the top. At first sight it may appear, that, for the purpose of ventilating any building, it is only necessary that holes should be supplied at the bottom of the apartment for the air to enter, and other holes be placed at the upper part for the hot air to escape. Practically, however, ventilation is far from being so simple an affair; and if there is anything more difficult than another for a scientific man to accomplish, it is that of causing currents of air to obey his will, and take that course through any building, and with any velocity, which he may desire. From experiments which we have instituted, we apprehend that the satisfactory ventilation of the Crystal Palace is a matter of very great difficulty; from the interference which the cooling surface of the glass will naturally have on the heated air as it ascends. In a chill night the chilled air falls sensibly from the roof, and at all times it must seriously interfere with the operations of the scientific ventilator; and hence it may possibly turn out that the mass of openings which Paxton has so admirably placed round the base of the Building, together with those of the upper part, will be insufficient to ventilate without draughts. We advise therefore, our friends not to postpone their visit until the heat of a summer sun shall strike with full force upon the Building. We noticed, a few days since, that the air was entering at the galleries at apertures through which it should have made its exit. Whatever may be the difficulties, there is no doubt that they may be satisfactorily remedied by those who have made the physical forces obedient to their will, and obtained the result which has been shown within the Building.

Many persons believe that they have caught serious colds in the Building; but we attach no importance to this belief, because an epidemic of influenza and sore throat has been very prevalent this spring, and those who have been afflicted at this particular period are quite as likely to have contracted their malady elsewhere as in the Building.

Amongst the ventilating contrivances which are exhibited, the glass pane with small fissures must be noticed. Wherever we have seen it employed it has only favoured the entrance of air, and not promoted its exit, but it must be regarded as a useful appendage in some cases.

We detected one or two of Arnott's ventilators; but their remarkable paucity has much astonished us. The principle by which they act is that of closing with a very slight force acting over a large surface; and it is very amusing to observe how lively they become in south-westerly winds, when there is a tendency to a downward current. We cannot speak too highly of the simple invention of this accomplished physician, and doubtless some modification of this device will be employed for many generations.

The production of heat in this country is almost exclusively accomplished by the use of coals or gas, which are allowed to combine with the oxygen of the air. Wood fires are found in these densely populated countries so expensive, as only to be allowed to be used as a luxury of the rich. It is fortunate that in this climate nature has provided us with an ample stock of coal to cheer us in the dreary winter months, and at several departments some beautiful specimens of coal may be seen. Some blocks of great size are placed outside the western extremity. Coal principally varies in the quantity of volatile matters which it contains. In our mines bituminous coal mostly abounds, and that which is used in London has much volatile matter, which gives a good blaze, makes a cheerful fire for an open grate, but has the disadvantage of giving off copious blacks to form a canopy to overhang the metropolis, and cut off from the inhabitants a large share of that light of day which is due to them. In the United States, on the contrary, the coal contains less gaseous matter; hence it burns with little flame, like coke, and generally requires close grates for its combustion. A very interesting specimen of coal from the Lonaconing mine, in Maryland, is exhibited, which is intermediate between the anthracite and bituminous coal, and contains scarce a trace of sulphur. It is well worthy the attention of all interested in the production of heat. It is known to geologists that this field of coal is very large. The Lonaconing mine, from whence the specimen is taken, belongs to a number of gentlemen of high standing in Paris, London, and America; but our attention has been drawn by one eminent City gentleman to the fact, that Mr. Detmold calls himself proprietor in the Catalogue. We trust this is only a misunderstanding or a misprint.

The production of heat by the combustion of gas is now occupying much attention, and is daily coming into more extensive use. One of the greatest difficulties attending its use is the irregular pressure of the gas; and at night, when the companies think that the majority of the population are safely in their *cubicula*, the pressure is lowered to the lowest possible amount, and we have found, in experiments conducted by gas, that the light has occasionally gone out. The question of economy between the use of gas, coals, and coke, must be determined for the purposes for which they are employed; but, as a general rule, from actual experiments which we have tried, gas is much more expensive than the other materials where long-continued heat is required.

From the nature of the fuel, we are led to consider the contrivances in which the fuel is burnt, and the Exhibition is particularly rich in stoves of various denominations. For ordinary dwelling apartments great advances have been made in modern times, the tendency being to place the fire almost level with the feet, with the unsightly ashpit completely concealed from view. These stoves, whilst they are in the highest degree elegant, are costly in their construction, and great care should be taken that they be not placed sufficiently near any woodwork to cause its ignition. We remember to have seen Sir Robert Peel, within a few days of his death, studying one of these stoves with great interest, at the *soirée* of the Civil Engineers, and he took away one of the papers with him to study it more at ease. We shall certainly recommend no person who can afford it to be without this form of stove; for the heat being applied at the very bottom of the room, is diffused more genially through the apartment; and the lower parts of the body, which, with long sitting, are so particularly liable to feel cold, derive warmth more readily than with the ordinary grates. These stoves are furnished with bright reflecting surfaces, to throw the heat into the room; and in one case we noticed the fire-place to be placed about the focus of a parabolic reflector, which distributed the rays of heat in a parallel manner.

In our opinion, the simple radiating and reflecting stove is incomparably superior to any other form for warming which persons ordinarily dwell. There is a form exhibited by Mr. Pierce which he terms the pyropneumatic stove, which has not only an open fire-place, but which has a contrivance by which air is admitted from without and circulates through the room. The objection we raise to all these stoves is the effect which they have in causing currents of over-dry air to pass through the apartment, and which have somewhat the effect of a blighting easterly wind. The regulation of the moisture of the air by such contrivances is possible, but difficult; and, therefore, upon medical grounds, we do not admire their use in ordinary dwelling apartments. For churches, halls, and other places where extensive areas have to be warmed, and the room is only used for a short time, they may, doubtless, in many cases, be adopted with advantage.

We must consider, for many reasons, that any close stove is perfectly abominable for dwelling-rooms. In the first place, the blazing fire is lost to view; then, the radiant heat, acting upon the skin in a cooler room, has a different and more salutary effect than warmer air without the radiant heat. In public, however, close stoves are most employed; and we were, therefore, curious to observe what our Transatlantic brethren have produced. From conversations which we have had with Americans, it appears that a considerable majority of stoves in America are upon the closed principle; but still those exhibited are not of the kind ordinarily employed in that country.

The chandelier parlour stove, which received the gold medal, is exhibited, and it is principally employed with anthracite coal. To English notions, such stoves would be considered intolerable; but the Americans declare that they would not use our stoves and bituminous coal, with the copious showers of blacks which pour from every chimney, on any account. They state, however, that open fireplaces, with anthracite coal, are now being employed, and that they like the appearance of the burning mass much better than the fires which they have observed in this country. The Americans bitterly complain of the soot which is carried over everything in English cities; and they further state, that the smell emanating from our coals can be immediately recognised by them.

The kitchen-ranges are almost innumerable; and certainly, by their combined action, with a Soyer at each, thousands might be dined from those exhibited. They may be divided into two classes—those which have open fires, and those which have close grates. The latter kind of stove is virtually a furnace, and, upon that account, in our opinion, should only be trusted in the hands of the skilful cook. Of the other kinds, although we gave them a careful examination, we dare not venture any opinion, as their excellence depends upon such niceties, that any person who wants a kitchen stove had better get testimony from the cook than the philosopher, and upon no account trust to the simple statement of the manufacturer, each of whom considers his own child the best.

For culinary purposes, the use of gas is daily increasing, and Mr Defries has carried off the palm for stoves destined for its use. The most complete contrivances which we have ever seen for gas-cooking are those which have been erected for the Marquis of Westminster, at Eaton-hall, by Mr. Potter.

We are not quite convinced about the economy of gas for roasting, but it should be remembered that there is no waste, that the gas could be burned on when wanted, and turned off when the operation is finished; and we feel bound to state that some of our first practical men have the highest opinion of gas ranges. If the gas companies can make hydrogen and carbonic oxide as cheaply as is stated, there is very little question that gas will supersede all other stoves. We wish we could persuade one company to supply the gases for heat, and the other the gas from cannel coal for light. For boiling, stewing, and baking, there can be no question of the economy of gas. Whilst speaking of Mr. Defries, we observe, we had forgotten, to call his gas-bath. It is a useful and economical application of that material, and will enable hot baths to be used extensively in the houses of the middling classes.

With regard to gas-stoves for heating, such as Deane's cylindrical gas-stove, Edwards's atropyre stoves, they admit of being used where others cannot be employed; and, in other cases, where stoves have only occasionally to be employed, they may be conveniently adopted: but in all instances where a high temperature has to be maintained, or the stove has to be kept up for a long period, their employment is too expensive to be generally used. We desired to heat a hot-house by this plan, and the gas company laid down a pipe for that purpose; but we found that the great consumption of gas was such that we were soon glad to return to coke. Mr. Strode has contributed one good gas kitchen-range; and a workman in Mr. Feetham's employ, to the honour of that amiable manufacturer, has been allowed to exhibit a stove adapted for either coke or gas.

We are much pleased with the American cooking-stove, called the Union, as it appeared to us to be a very economical mode of applying heat. With regard to different nations, we should hardly consider that the tropical countries would have furnished specimens of stoves, and none are accordingly sent.

Belgium, whose manufactures of iron are extensive, has communicated several stoves, and Austria has also shewn some cooking apparatus. The Russian manufactures have not yet developed themselves, and we shall look with a great interest upon the contrivances which these people adopt to give warmth in their frigid climate.

In this article we have nothing to do with the designs, and therefore we shall simply mention that they are throughout the English department of surpassing beauty. So society, in fact, have they been in some cases, that an article is said to have entailed an expense of £1000. When the visitor inspects this section, he will doubtless be astonished at the varieties of design, and the astounding number of beautiful articles which are exhibited.

Messrs. Knight have shewn the best gas burners for chemical purposes. In all our London laboratories, the greater part of the operations are conducted by means of gas.

We were glad to observe, that, besides the display of drawing-room stoves, which have been got up in so costly a manner as hardly to fall within the means of the middle classes to acquire, a stove for a cottage has not been forgotten, and a most excellent one has been contributed by Mr. Strode, of Edmonton. It appears that Mr. Leslie, by a patent taken out some time ago, claims all forms of stoves without bars at the bottom, and hence this stove falls under his patent. To those who have been in the habit of visiting the domiciles of the poorer classes, the necessity of a good economical stove will readily be apparent. The stove before us appears to be of this character, for the fire-place is so small as to admit but a limited amount of coal, whilst the existence of an oven and a boiler must greatly tend to the comfort of the industrial classes. If the stove is really as practically good as it looks, we should rejoice to find it in every domicile of the artisan. The stoves now to be found in the homes of the poor are chiefly, according to our experience, old bed-room stoves, and can be purchased at seven or eight shillings. This stove is about two pounds; but we beg the landlord to consider the comfort of the tenant rather than the small extra cost in the first building of the cottage.

Messrs. Deane have exhibited Hazard's heating and ventilating apparatus. It consists of a close stove, with pipes carried backwards and forwards from it till they come to the chimney. In the use of this apparatus the pipes must be joined very truly, or smoke is liable to escape into the apartment. In a philosophical point of view, it is found that for heating air it is very indes.rable to place pipes over each other.

In the model-room there is a contrivance called Green's patent fuel economiser. It consists of a series of tubes, which pass into the chimney; and thus the heat, which would otherwise be carried off, is imparted to the water, which can be used to supply the boiler. Attached to the pipes is a very pretty contrivance for scraping off the soot. The same party shows a means for warming air, by pipes placed in an ordinary chimney, which communicate with the outer air. This scheme is objectionable, because the hot air is let into the upper part of the room, where already too much heat is apt to collect. If any of our readers have never tried the experiment, we should advise them, especially if they burn gas, to mount a pair of steps, and ascertain the state of the air at the top of the room, and they will be astonished at its high temperature and noxious qualities. This plan would answer admirably to warm a room above that in which the fire is.

Amongst the machinery in motion the visitor may see contrivances to warm cylinders in certain parts by steam. All these matters we shall hereafter consider in detail. They may also notice a gasing apparatus, for removing the fine particles which adhere to thread.

The generation of steam from heat becomes an important consideration with engineers. They are, however, pretty generally agreed that the heat should be applied over a large surface. Those of our readers who have never inspected the interior of a locomotive, will now have an opportunity, and there they may observe the numerous tubes which pass completely through the boiler from end to end. The object of the tubes is to allow the heat from the fire to act upon a large surface of water, because the whole draught of the fire is compelled to pass through them before it can reach the chimney.

In apparatus for distillation, the French have contributed by far the largest platina still, for the distillation of sulphuric acid. In this country, where so much of this acid is made, the manufacturers might have sent one of their large stills, and, doubtless, Messrs. Johnson, of Hatton-garden, might have contributed some astonishing ingots of platinum; but, as we have only to do with objects exhibited, we must award to foreigners the first place in this department of manufacture. In earthen worms our potteries have contributed the largest specimens.

We must not omit the mode in which sugar is evaporated in vacuum pans, at a low temperature. It is well known, that, the less the barometric pressure, the lower is the boiling point. On this account, the monks of St. Bernard never make their tea with boiling water, because they reside at so high an altitude. By a beautiful application of science, the sugar-bakers exhaust their evaporating pans; they diminish the barometric pressure, and thus are enabled to boil at a very slight increase of temperature. Messrs. Pontifex and Wood have shown the best apparatus of this kind.

With regard to manufactures dependent upon heat, the Building itself is one of the wonders of the world. When its almost countless rows of iron pillars are observed, the mind cannot fail to think of the tons of coal which have been consumed, and the Pandemonium-looking furnaces which must have issued from the furnaces in the smelting of the iron. Again, when we see the innumerable panes of glass, the furnace again comes to mind; and a model of a glass-house by Hartley, together with the melting-pot in which the glass is fused, is exhibited at the extreme eastern part of the Building. In former Numbers we have already stated that the glass of the Building was made by Chance, of Birmingham. Amongst other applications of heat the visitor may observe huge earthen pots, and the more delicate specimens of porcelain. We have amongst castings the enormous hydraulic press which raised the Britannia Bridge, and the delicate Berlin castings. Perhaps, however, as far as novelties are concerned, the castings of zinc are as remarkable as anything in the Exhibition, as, heretofore, that metal was not thought susceptible of being thus used. There is no brass casting so large as that of the Wellington statue at the top of the marble arch, though there are cannons and other brass castings displayed over the Building.

We do not think it at all necessary to call attention to the various culinary utensils by which heat is applied to our food, and which are exhibited in great profusion. There is one, however, that deserves to be noticed for its name, as it is called the anhydrohepsetherion, and is really a potato-cooker without water. Such a gentle name for a gentle London cook to pronounce tickled our fancy mightily, and we can imagine a page giving instructions to the cook to be sure to put the potatoes into the anhydrohepsetherion in good time for his master's dinner.

We have various examples of contrivances for quenching fire, which, perhaps, are pretty necessary in such a building. From Canada a very showy fire-engine has been brought, and we are very curious to test its powers against our large fire brigade engines, which are of such service in London. In the dry atmospheres of America fires are very common, and, therefore, it affords a good school for engines. Besides many specimens of fire-engines, Philips's fire annihilator is also shown, and is ready for use on any emergency. Instead of pumping water, an incombustible gas is discharged against the flame, which quickly extinguishes it. There is no doubt that it will instantly extinguish flame, but we fear that it would not be sufficient to cool a large bulk of red-hot matter; at any rate, the fire brigade in London continue still to throw their volumes of water whenever a conflagration occurs.

Messrs. Chubb have again abundantly presented; but continuous balconies and a trap door at the top of the house are, to our mind, the best security against the ravages of flames. Mr. Walby has exhibited his escape; there are also dressing-table fire-escapes, sash-bar fire-escapes, and numerous contrivances about the Building, which doubtless, after the sad loss of life last Sunday, will be inspected with great interest.

Various contrivances to protect books, papers, and valuable documents against the ravages of fire are exhibited at the Building. They resolve themselves into two classes—those which resist the action of fire from being non-conductors of heat, and those which give off a gaseous material. The best specimen which we have seen is manufactured by Mr. Chubb, of St. Paul's Churchyard. Its case contains such an extreme thickness of non-conducting matter, that we should not hesitate to trust any document with it, no matter how important, in any moderate fire. We do not imagine that in fires like that of Fenning's-wharf, where the iron girders melted, any iron surface would effectually protect combustible matter. Some iron safes are also shewn in the Foreign department.

Measurers of heat are not particularly well represented. Thermometers, as our readers doubtless know, are principally made in London by the Italians, and very few of them are made so as sufficiently accurate for scientific purposes. With respect to the few which are shown, we do not pretend to speak of their worth, which can only be ascertained by experiment. In the American section Mr. Erichson exhibits the stand of a pyrometer, but the instrument itself has not arrived at present. Of that which is concerned in the dry and wet bulb thermometer made in one stem, by Mr. Negretti, deserves the highest commendation; and, if the accuracy be equal to the excellence of construction, it must be regarded as one of the most wonderful pieces of glass-work in the Exhibition.

Taking a review of the entire applications of heat, we must admit that all its phenomena are not as well represented, in a scientific or educational point of view, as they might have been, with a little management on the part of the Executive. Nevertheless, in its leading practical applications—whether we regard the Building itself, which has had its origin in the furnace, or whether we regard the manufactured articles exhibited—there can be no question that it is the most astounding collection which the world has ever seen. The three great forces, electricity, light, and heat, have contributed their full share to the World's Fair; and, in recording the manner in which these forces have been made obedient to the will of man, there can be no question that the advancement made in this century is truly surprising. The philosopher must continue his labours, the manufacturer must take advantage of the discoveries of philosophy; and, if we only continue at the same rate of progression, fifty years hence the rich may enjoy increased luxuries, the poor, additional necessaries, and all classes will have further means of enjoyment, of which at the present time they have no conception.

THE ENGRAVINGS.

1.—GLASS FOUNTAIN. BY MESSRS. OSLER.

(Engraved on front page.)

This magnificent production, which stands in the midst of the transept, forms a prominent feature in the *coup d'œuil* which meets the eye of the visitor on his first entrance at the south door, besides, on nearer inspection, producing a grateful effect by the brilliant colours radiating from the various angles of its surface, and the bubbling sound of waters continually flowing and playing over it. This fountain rises to the height of 27 feet, and is composed entirely of pure flint crystal, cut into the most elaborate forms. The stalks to the overshading projections are cut in prisms; and the latter, supported by spandril pendants, are represented as the result of crystalline droppings. The superior plinth, which is of marble, is surmounted by a minor one of glass, and adorned with balls, introduced with excellent effect. The water falls in three separate

masses, the upper one springing gracefully over the curved surface or rim of the glass orifice, which crowns the whole structure.

2 ARTICLES OF COTTON-MACHE. BY J. HART.

These are specimens of a most interesting manufacture, the invention of Mr. Hart, wherein waste cotton is applied to the construction of articles of furniture, something after the manner of *papier-maché*. It is equally applicable to articles of utility and ornament, such as boxes, tables, candlesticks, fire-screens, &c. The surface is susceptible of a very grain-like appearance, which is particularly exemplified in the panel on the larger box, which is composed of muslin only. The design for a table-top is novel in appearance.

3 UPPER PORTION OF A NORMAN WINDOW. BY GIBSON

This very beautiful window has been designed and executed by Mr. J. Gibson, of Newcastle. In its arrangement it comprises five circles in the upper one is represented the *Agnus Dei*, within a glory; the others are illustrative of the Nativity. These works are to be followed, and are copied in the principal Engraving and in the two smaller ones; they respectively represent the Annunciation, the Holy Family, and the Adoration of the Magi. The colouring of the whole is very rich and harmonious; the tracery between the circles is principally ruby or blue, and is very beautifully designed.

4 ANOTHER PAINTED WINDOW. BY THE SAME.

This is another highly creditable specimen of design and colour in window painting, by the same. These works are to be followed, and are copied in others similar, by other hands, in the eastern portion of the North Gallery.

5.—FOUNTAIN OF EAU DE COLOGNE.

This little fountain is specially subject to lady visitors, as affording a constant supply of the Maria Farina's eau de Cologne for the handkerchief of all the ages. It stands in one of the Austrian rooms, amongst [illegible] beautiful furniture.

6 GROUP OF OBJECTS OF VERTU. BY WERTHEIMER.

This elegant group comprises, first, an elegant casket, Louis Quartoze style, of or molu with porphyry inlaid; second, a casket, or molu, with six panels painted enamel upon porcelain, from the other similar enamels on the lid; and third, an inkstand and penholder of most elegant shape, also in or molu and porcelain. Nothing of the kind can be conceived more *recherché* and tasteful than these objects, which stand in the sinister department of the main avenue.

7.—A BRULE-PARFUM. BY GUYTON.

An elegant little table ornament in bronze, for the purpose, as its name denotes, of burning perfume.

8 GROUP FOR A FOUNTAIN. BY ANDRE

A very spirited group for a fountain; the design both original and appropriate.

9.—DESIGN FOR A CEILING. BY JACKSON AND SONS

A very pretty device in *carton-pierre*, for ceiling decoration.

10 HALL STOVE. BY HAYWOOD, DERBY

A very handsome stove, combining elegance with substantial appearance; cast by Mr. James Haywood, at the Phœnix Foundry, at Derby, and one among many highly creditable productions exhibited by him.

11.—PARQUET FOR FLOORS, FROM RUSSIA.

Russia seems to excel in the ingenious line of decorative art which concerns the inlaying of floors in various coloured woods, in divers devices. Amongst some very handsome specimens of the kind exhibited, is that which we have copied in our Engraving. The design is extremely rich, and the general flow of the lines, both straight and curved, very harmonious and free. It has the imperfection, however, to represent in the Engraving the almost endless variety of colours in which the design is worked out; the original must be seen to be appreciated.

12.—HALL STOVE. BY BAILY AND SON.

Stands in the main avenue, where it has an extremely ornamental effect. The design is extremely elegant; the panels in open-work or molu; and above, upon a slab of marble, is a handsome lamp.

13 & 15.—DESIGNS FOR PAVEMENT BY J. W. AND W. A. PAPWORTH. Two very pleasing designs, and likely to be highly effective.

14.—PATENT ORNAMENTED GLASS. BY W. KIDD.

A very elegant piece of furniture; the carving of the frame, and the decorative character of the glass, extremely chaste.

THE HISTORY OF INDUSTRIAL EXHIBITIONS

BY WILLIAM BLANCHARD JERROLD.

(Continued from page 436.)

CHAPTER V.—*(Continued.)*

THE EXHIBITIONS OF BELGIUM

THE last Industrial exhibition of Belgium, held in the year 1847, was remarkable for a feature, the importance and wisdom of which it is impossible to overrate. The jury for this exhibition were called upon by the then Minister of the Interior, in addition to the usual labours devolving upon an exhibition conducted on the ordinary plan for the foundation of a new order of rewards, to be specially reserved for working men who distinguished themselves by their lives and their excellence as workmen. In addition, this jury were further instructed to inquire into the means at hand for the formation of societies in which the savings of workmen could be placed to the best advantage. The letter of the Minister of the Interior on this subject well merits place in a history of industrial exhibitions:

FROM THE MINISTER OF THE INTERIOR TO THE JURY.

BRUSSELS, September 9, 1847.

Gentlemen,—The labourers and artisans who work under the direction, and for the profit of masters, have not up to the present time participated in the rewards and honours which the Government have been anxious to award to industry. Working-men—more than other classes—would esteem highly any public reward accorded to them; and their emulation being in this way awakened, would lead them to improve as labourers and citizens. Medals of honour might be distributed to workmen recommended by their masters, as skilful, well-behaved, and devoted to their families. By withholding such distinctions from workmen who were disconcerted, destroyers of discipline, not punctual in their hours, or given to drunken habits, their manners would in all probability be improved, and lessen the necessity for the imposition of those fines which are now serious evils in manufacturing communities. The medals should be manufactured by the mint at the Government cost, and should bear the name of the owner, with the words "*Récompense Nationale.*"

M. ROGIER, Minister of the Interior

M. Rogier's plan was not to strike medals to decorate every good workman in Belgium, but to do an act of justice to those men and women who had realised the conceptions of the manufacturing exhibitors. It was arranged finally, that a thousand medals should be struck, and it was estimated that of these about two hundred would relapse to Government every six years, so that this number could be awarded at every exhibition. The medals given to women differed slightly from those accorded to men, bearing the words "*Habilité, Moralité,*" instead of "*Récompense Nationale.*" At the distribution of rewards to the exhibitors of 1847, nineteen workwomen (of whom nine were lacemakers), and 201 workmen received decorations. The policy or propriety of giving a reward to a man who has brought up an unusually large family upon the smallest possible pittance of wages, is at least questionable: but the just recognition of the workman's relation to the manufacturing condition of his country, cannot be viewed with displeasure by any mind the vision of which is not distorted.

The exhibition of 1847 was opened on the 18th of July in that year; and the price at which the public was admitted was fixed at ten sous on three days of the week. Three days, weekly, the exhibition was opened free; and on the seventh day, was given up entirely to the jury. This exhibition included very few exhibitors of the staple produce of the country—flax; a deficiency which the jury lamented, and for which they could, in no reasonable way, account. Linen manufactures, however, had made rapid and indisputable progress. The Société de St. Leonard, of Liége, rewarded at the exhibition of 1841 by a gold medal, and the Société de la Lys, of Ghent, had, respectively, doubled the extent of their establishments since that time. The progress of these societies was acknowledged by the jury on this occasion with the recal of the medals given in 1841. The depressed condition of the cotton manufacturers of Belgium kept them from this exhibition, as from the last; even printed cottons found only five representatives. In specimens of rich lace, this exhibition also showed a falling off in comparison with that of 1841. Ypres and Courtrai, the great centres of the Valenciennes lace manufacturer were almost without representatives. In the department of metal manufactures, the jury found ample consolation for the deficiencies in that devoted to textile fabrics. Iron manufactures, which in 1841 were in a complete state of stagnation, began to revive in 1844, as railway speculation increased and the price of English iron rose. Over-production, however, and the mania of 1846 were just then beginning to produce their lamentable consequences; but these were not sufficiently developed at the time of the opening of this exhibition to make iron-founders indifferent as to the representation of their great industry. Accordingly we find the metallic wealth of Belgium splendidly developed in every possible way at this exhibition. At the distribution of prizes on this occasion, M. Charles de Brouchere, president of the jury (and whose name should receive honourable mention in any notice of Belgian exhibitors), addressed the Minister of the Interior in terms which revealed a hopeful and happy picture of promise in the future. All who admire an energetic and spiritual nation, will hope to find this promise fully realised.

CAAPTER VI.

THE EXHIBITIONS OF SPAIN

CONTRASTED with the commercial condition of every other European state, Spain presents a doleful picture. A fecund soil, a genial climate, indigenous products of high commercial value belong to this brilliant country; but to Spaniards still cling the old barbarisms of government which every other civilised state has thrown aside. No well-ordered government has yet systematised Spanish industry -no man has yet risen to comprehend and develop the vast resources of Spain. "Spaniards," M. Ramon de la Sagra tells us, "in following out any branch of industry, are incited by immediately local wants, without regard to great productive capacity to be adapted to national and foreign markets. Surrounded by many hopeful fields of action, and strengthened by a noble love of perseverance and independence, they have launched into a diverse branches of trade—each a young man, stimulated by the vigour of his youth to use his strength, capriciously and hotly embraces various fields for action—from the mere necessity of action."

The traveller in Spain is struck with the apparent inactivity of the population. Although in Valencia and Barcelona various celebrated manufacturers still flourish, the general aspect of the Peninsula bears the impress of a disordered, ill-regulated social State. The vast monasteries, from which the lazy monks have retreated, may, in time, realise the hope that the whirr of the shuttle will replace the clatter of monastic feasts; but now, grass shoots in their courtyards, and the mildew thickens in their cells. Even the great and celebrated Ribbon carpet manufactory of Madrid is remarkable only for the history of its past; its vast galleries are almost deserted, and spiders have long been busy in the wrecks of its looms. Here and there only are a few workmen, whose handiwork still attests the excellence of their fallen industry, and serves as a sufficient reproach to a neglectful Government. Heavy duties on raw material, and the consequent existence of a gigantic contraband trade, oppress Spanish manufacturers to such an extent, that they are unable to dispose of their goods at any moderate remunerative price—their value decreasing in a ratio with the increase of the contraband trade. The badness of Spanish roads, and the expense of conveying goods from the seat of manufacture to markets at a distance, are letters which depress trade in various districts. Spanish wit, but, inasmuch as all these depressing causes are removable, and as the rays of knowledge must soon reach to Madrid, in spite of ministerial opposition, it is not unreasonable to hope that the next twenty years will be years of hopeful progress in the commercial annals of the Peninsula. Already, in Barcelona, fifteen hundred pupils attend a public and gratuitous school of design; already great factories are rising in various parts of the country.

The authorities of Spain have gathered together five national exhibitions of native industry. Of these the first was held in 1827, and had 727 exhibitors; the second in 1838, and had 260 exhibitors; the third, in 1831, and had 228 exhibitors; the fourth, in 1841, had 21 exhibitors; and the fifth, in 1845, had 325 exhibitors. These numbers may be received as indicative of the manufacturing disadvantages under which the country has been and is labouring. The difficulty which the Spanish authorities have experienced in persuading even the manufacturers of the great centres of Spanish manufactures to send specimens of their skill to the capital is easily accounted for, when the expense of transit from distant provinces is coupled with the resolution of the Government to pay only part of this expense. The relative proportions of space occupied by the various manufacturing provinces was one-third by Madrid, one-third by Andalusia, and one-third by Catalonia. At the exhibition of 1845 Madrid and Barcelona almost monopolised the space given up in the old Convent of the Trinity for exhibitors of Spanish industry. Bad roads, inefficient organization, and a general conduct of public affairs quite at variance with that enlightened spirit which could make such displays of national service, have debased the industrial exhibitions of Madrid to an insignificance which the manufacturing advantages of the country make the more lamentable.

At these exhibitions many important branches of national manufactures have not found a place; and it was justly remarked at the exhibition of 1845, that a brilliant display might have been made of the products which it did not comprehend. The catalogue of this exhibition was sufficient evidence of the burden of the commercial laws. This document gave opposite each article its retail price, and the high figures compared with those of other countries, showed that the Spanish manufacturer, with all the natural advantages of his country, could not hope to fight foreign manufacturers in the distant and scattered markets of the world. These high prices are the results of two distinct causes the heavy duties upon raw material, and the competition of a gigantic contraband trade.

In taking a glance at the general characteristics of Spanish exhibitions (but more particularly at that of 1845, as the most important of the five), it is easy to separate the great industries of the country from the minor but more showy branches of commercial activity. The cumbrous position accorded to silken, linen, and woollen goods, to leathers and hides, proved a generous, though, as all conversant with the history of manufactures, would expect to find the woollen goods, manufactured from the fleece which France so long coveted, would be of rare excellence. But we are reminded by an eminent French manufacturer, who reported to his government on Spanish exhibitions,[1] that the fleece of Spanish flocks is one of her old glories. After a long and almost hopeless depression, woollen manufactures are again beginning to revive. The five exhibitions which are on record, however, included only a few fleeces sent from Seville. Specimens of cloth, of but indifferent texture, were sent from Catalonia, Segovia, and Alcoy, to the exhibition of 1845, and were marked at very high prices; and the commissioners from France, who visited the convent of the Trinity, sought in vain for some samples of Spanish undressed wool. Not one exhibitor of merino or mousseline-de-laine appeared, nor were the carpet manufactories of the country represented. Silken goods of excellent quality, however, were sent from Valencia and Barcelona, and some coarse specimens from Saragossa, the China crape shawls and blonds being the finest specimens of manufactured silk. The exhibition was destitute of gloves and hosiery. A few dozen coarse pieces of plush, for hats, only served to prove the depressed condition of the manufacture.

The cotton manufactures of Spain, almost exclusively belonging to Catalonia, were represented at the exhibition by threads of various numbers (the highest of which was forty), calicoes, worked counterpanes, and printed goods. Of these varieties of cotton manufacture, the printed goods only claim any notice for excellence, as especially distinguished by the brightness of their dyes, and the neatness of printing and design. They were all manufactured for immediate consumption.

Barcelona, at once the most advanced manufacturing locality in Spain, and the most vehement supporter of high protective duties in Spain, contributed, the most valuable textile specimens seen in the exhibition, showing excellent samples of silk, flax, and cotton mixtures. The coarser of these goods, when compared with the prices of English and French manufactures, explained the anxiety of Catalonian manufacturers to protect themselves from foreign competition.

The exhibition included a few average samples of good cordage and stout sail-cloth, but not one specimen of thread lace, or one piece of lawn. Printed papers occupied a great portion of the principal room. The chief seat of this manufacture is in Madrid, where labour is dear, and where, consequently, the product figures at a high price. The patterns shown were characterised as vulgar, and printed with bad colours.

Dressed leathers were also conspicuous in the exhibition. Morocco and kid, for gloves, were shown in abundance. This department of manufacturing industry showed a more marked vitality than any other. The leathers were strong, supple, and of excellent substance. The morocco only lacked the brilliant dyes of Choisez-le-Roi to make them equal to any in the world: and the kid, which is manufactured in vast quantities, attested the superior excellence of Spain in this production to other countries.

In the department of glass manufactures a falling off from past excellence was clearly visible. The best specimens of glass came from the Royal manufactory of Saint Ildefonse; and these were coarse, ill-coloured, and, according to M. de la Mornaix, only worthy of a barbarous age. In earthenware and porcelain, a falling off was also lamentably visible. Only a few indifferent specimens of chemical products, as mineral salts, &c., were visible; but the exhibition was altogether destitute of alkalis and dyes, and minerals, and this in a country which possesses the richest lead, quicksilver, iron, and even silver mines of the south of Europe. A few bars of iron, a stray ingot or two of silver, cannot be accepted as representing the great works of M. Heredia in Malaga, the iron districts of Biscay, and the important wealth of Asturias.

In goldsmiths' work and in gunsmiths' work, however, the exhibition showed signs of industrial progress, and proved that the excellencies of the past, in matters of taste, was not quite forgotten. Some excellent specimens of clockwork were also exhibited.

Spanish manufacturers contributed nineteen pianos, all manufactured on the English model, and marked at ridiculously high prices—the commonest kind being valued at from fifty to 80 pounds sterling; and square instruments, dry and harsh in their tones, were expected to realise about two hundred pounds sterling. A few guitars necessarily formed part of a Spanish exhibition; and in the list of musical instruments exhibited the Ibid contains figured a wide array of the old Stradivarius model, which is described as an instrument more curious to look at than agreeable to listen to.

Although there was not one specimen of Spanish printing exhibited, not a few excellent samples of bookbinding and lithography appeared. Cabinet makers made but a poor appearance. The fame which the cabinet makers of Spain have so long enjoyed, and proofs of the justice of which decorate the houses of Madrid, sent but few articles to the national exhibition. It would appear that in the resolution to establish periodical exhibitions of native industry, the Spanish authorities formed too high an estimate of their manufacturing countrymen's enlightenment. It is not to be expected that in a country where manufactures have been led to place their trust for commercial success in the strong arm of the law against foreign rivals, rather than in the excellence of their own productions, that they would hail the establishment of an institution which would lay bare to foreigners and to native rivals the inferiority of their accomplishments. It is probably in this light that the provincial manufacturers of Spain generally regarded the exhibition to which they were invited. At this exhibition, ostensibly national, neither the hemps and flax of the Asturias and the Basque provinces, the silk of Murcia, Estremadura, Castile, Aragon, and Andalusia, the fleeces which abound in every province of Spain, the cloths of Segovia, Guadalaxara, Brihuiga, Valencia, and other important manufacturing towns, were to be seen. At the Exhibition these were no specimens of steel, no cutlery, no sample from the Pyrenees. The welcome which Spaniards have given to the labours of the Great Exhibition Commissioners, and the zeal with which they have endeavoured to place their country in an honourable light among the nations represented in the Hyde-Park Palace, justify, however, the hope that the new manufacturing energy which has been given to the industries of Spain will at length vindicate this country in the eyes of the world, as one rich with promise, and teeming with an unsurpassed harvest of mineral and vegetable wealth. Everywhere, manufacturing companies have been formed of late, in Barcelona, Malaga, Valencia, Grenada, Seville. Immense factories are rising in every part of Andalusia; and improvements are now being rapidly introduced into native agriculture. At the exhibition, as an instance of advance, some fine specimens of cochineal were shown—both prepared and in the natural state, crawling upon a leaf. The system of irrigation carried out of old by the Arabs, in the province of Valencia, and which makes this territory even at the present time one of the most fruitful parts of the country, should have attracted the notice of Spanish agriculturists long ago. So perfectly did the Arabs understand this great principle of agriculture, and so soundly did they carry it out, that their administration remains intact to the nineteenth century. Right grand canals, from which others stretch, drain the vast extent of land, and the gentle slope of the surface towards the sea carries the water off rapidly. This system is governed by a rude tribunal, known as the Tribunal of the Waters. The body consists of five judges, elected by the proprietors of the land, described by the irrigation, and vested with special powers. These judges meet in the open air, at the door of the Cathedral of Valencia. Before them a rude bench is placed, at which those persons condemned to pay fines for the infraction of rules, or who have complaints to make, appear in person to plead in mitigation of the fine imposed, or to explain their grievance. The judges decide on the spot, and the execution of this sentence follows instantly, without right of appeal. No notes of the proceedings of this rude tribunal are taken, and the proprietary body submit to its decrees without a murmur. The Captain-General of the province places police at the disposal of this Arab institution, by the simple operation of which a reliable system has been preserved for ages, and sets apart this province from the rest of Spain as the *huerta*—the garden of the country. The exchange of Valencia presents a vivid picture of the wealth of the province, crowded with lightly-clad and bare-footed peasantry, bearing their loads of silk, new from their fruitful patches of land. Here, where the egg ripens to the worm, is the old Arab proverb illustrated: on the spot where the clammy stream of silk oozes from the worm, the brilliant thread is woven into garments—the mulberry leaf is turned to wealth.

Barcelona bids fair to be the Manchester of Spain. Here four great departments of industry are carried on, viz. the construction of machinery, and silk, woollen, and cotton manufactures. All the latest improvements in machinery and processes exist here, under the superintendence of Englishmen or Frenchmen. Spinning-jennies, looms, steam-engines, and other manufacturing powers, are constructed excellently on the spot. The cotton, silk, and woollen factories, many of recent establishment, are constructed generally on a gigantic scale, and give employment to a large population. The factory hands of Barcelona are, however, all paid; and may be seen lounging about the factory doors at one time, eating the very coarsest kind of bread, and a few onions, oranges, or radishes, as their dinner. They labour thirteen hours daily.

From all of an inquiry into the commercial condition of Spain at the present moment would, most probably, result in the conclusion that her manufacturers, with every wish to profit by the ingenuity of foreigners, and to throw themselves into the markets of the world on honourable conditions, are, as yet, enslaved by hostile duties misapplied and restrictive (since raw material—as coals, &c., are heavily taxed); that they will soon come in contact with their Government, and command more enlightened commercial laws; and that this meeting has been much kept up to this time only by the prejudice and narrow-mindedness which follow repeated national reverses, and the terrifying calamities of civil strife.

(To be continued.)

[1] M. Sallandrouze de la Mornaix.

MR. CLEVE'S DRAWINGS.—We have been much gratified with a private view of the drawings of this gentleman, in connexion with Nineveh and its excavations, the Great Arabian Desert, Bagdad, and the Nestorian country. These drawings, about 90 in number, may be seen at 114, Bond-street. Their extent, of course, precludes any design on our part of entering into their merits in detail. We must content ourselves with specifying a few particulars, and expressing our general adherence to the truth of nature. Some of the views, such as those of Pera and the Bosphorus, are indeed very beautiful; and all are recommended by the blended romance and classicality of the scenes. We perceive that Messrs. Dickinson intend to lithograph a selection from these interesting sketches, comprising principally the subjects that lie between the Persian Gulf and the Black Sea.

MILTON RECITATIONS.—The Rev. Charles Eyre, on Thursday week, performed an extraordinary feat of memory, at the Music Hall, Store-street. He recited about a fifth part, *memoriter*, of Milton's "Paradise Lost," comprising the better portions of the early books, including the debate in Pandemonium, the adventures of Satan with Death and Sin, and the temptation of our first parents. We have to complain of the reciter's sometimes corrupting his the text of the divine poet: but in general, his elocution, though not thoroughout well sustained, and sometimes savouring of the conventicle in its tone, sufficiently well demonstrated that the great epic contains many dramatic points which are generally overlooked. Still we think that the recital would have been improved in its effect by the poem having been read rather than declaimed. A superfluity of action would have been restrained by the presence of the book, which the absence of it too much encouraged.

ROTTEN-ROW, HYDE-PARK

ROTTEN-ROW, HYDE-PARK.

HYDE-park, from its "lying high and dry," is, perhaps, the most airy and healthy spot in London. It is an excellent place for walking in, and has a great extent of well-kept paths for pedestrians. Excellent drives, to which only private vehicles are admitted, likewise furnish the means of enjoying carriage exercise; and thus the Park has been fashionable for drives and promenades since the time of Charles II. "It was fenced in with deer fences," says Mr. Cunningham, "from a very early period; was first walled in with brick in the reign of Charles II., and first inclosed with an open iron railing in the reign of George IV. In 1550, the French Ambassador hunted in Hyde-park with the King; in 1578, the Duke Casimir 'killed a barren doe with his piece in Hyde-park from amoungst 300 other deer.' In Charles I.'s reign it became celebrated for its foot and horse races round the ring; in Cromwell's time, for its masters and coach races; in Charles II.'s time, for its drives and promenades, a reputation which it still retains, showing, in the London season, from April to July (between half-past five and half-past six P.M.), all the wealth and fashion, and splendid equipages of nobility of the country."

Nor have the equestrians been forgotten; peculiar accommodation having been provided for them in the roadway, known as Rotten-row, where the fine gravel is always allowed to remain loose, so that horses can gallop over it without the least danger from falling. This famed ride lies on the south side of the Park, and extends from the lodge at Hyde-park Corner to the Kensington-gate; and between Rotten-row and the Serpentine is built the Great Exhibition Palace.

We are not aware of the precise date at which this road was formed; but we find it celebrated in Sheridan's prologue to the play of "PIZARRO," first produced in 1798:—

Horsed in Cheapside, scarce yet the sparse spark
Achieves the Sunday triumph of the Park;
Scarce yet you see him, dreading to be late,
Scour the New-road, and dash through Grosvenor-gate:
Anxious—yet amorous too—his steed to show,
The hack Bucephalus of Rotten-row.
Careless he seems, yet vigilantly shy,
Wooes the stray glance of ladies passing by.
While his off-heel, insidiously aside,
Provokes the caper which he seems to chide.

Lord Byron, in describing the break-up of the London season, thus refers to the locality:—

When its quicksilver's down at zero—
Ice!
Coach, chariot, luggage, baggage, equipage!
Wheels which from Carlton Palace to Soho,
And happiest they who horses can engage,
The turnpikes glow with dust; and Rotten-row
Sleeps from the chivalry of this bright age;
And tradesmen, with long bills, and longer faces.
Sigh as the post-boys fasten on the traces."
"Don Juan," canto xiii., stanza 44.

In May, June, and part of July, between five and seven P.M., Rotten-row is crowded with equestrians and ladies in great numbers, when the scene is very brilliant. It will be recollected that when the site of the Crystal Palace was decided on, it was objected that the frequenters of Rotten-row would be subjected to great inconvenience from the increase of traffic which the Exhibition would bring into the Park. Now that the Palace is built, this inconvenience has not been experienced to any considerable extent; but it has been most unwarrantably taken advantage of "to break up one of the last town encampments of the Dryads, and actually lay open Kensington-gardens for a new ride." This encroachment has very properly taken up by the Marylebone Vestry. At the meeting held on Saturday, Mr. Hume, M.P., stated that "He had inquired what objection there was to the continuation of the drive by the Crystal Palace in Rotten-row, and the only answer was that it was thought the north of the Serpentine would be better. The adoption of Kensington-gardens was an attempt on false pretences. It was no more nor less than a robbery on the rights and recreations of the pedestrian public. (Hear, hear.) In the course of the next two or three months, the metropolis would be visited by tens of thousands of pedestrians from all parts of the kingdom, as well as the Continent, and they were to be deprived of the advantages of this, one of the most beautiful spots in the vicinity of London, merely to gratify a favoured few to gallop and ride about a place, to great danger of the lives of the public. But the question was, whether, in appropriating this drive in Kensington-gardens, the Woods and Forests had not acted illegally. By act of Parliament, Lord Seymour had no right whatever to touch the Royal gardens without the consent of the Treasury; and, if so, the noble Lord and his colleagues must be made responsible. He (Mr. Hume) the other night presented to the House of Commons a large petition from Paddington, signed in three or four hours; and, although he only asked Lord Seymour for forty-eight hours' delay, he was refused. He thought in this matter the Woods and Forests had behaved exceedingly ill; and they might depend upon it he (Mr. Hume) would not fail to press the matter with all the power of which he was capable." (Hear.)

Sir Peter Laurie said this ride in Kensington-gardens had no right to have been opened until a vote of the House had been taken. He wanted to know at whose instigation it was opened. There was no man who rode more in Rotten-row than he did; and he had no hesitation in declaring that there was ample room there without this encroachment.

EXHIBITION OF THE ROYAL ACADEMY.—"THE RETURN OF THE DOVE TO THE ARK."—PAINTED BY J. E. MILLAIS.

ROYAL ACADEMY EXHIBITION.

(THIRD NOTICE.)

STEPPING southward and westward as well, we come to "A Poet's Study" (443), by Redgrave—a deep glen overhung with trees, in which Coleridge and Wordsworth and Southey are said to have sat for hours and gathered inspiration. Mr. Redgrave has wisely refrained from introducing even one of the poets into the scene, as it will be remembered Edwin Landseer signally failed in introducing Sir Walter Scott into the Rhymer's Glen. In what he has attempted, Mr. Redgrave has succeeded. His trees, however, might have a broader touch without losing aught of the truth to nature. The freshness of this picture is indeed admirable—sufficient of itself to inspire a poet.

Beneath Cardinal Wiseman's portrait is hung David Roberts's large picture, "Surprise of the Caravan," a scene in Syria (464), a well-told story; the picture being full of varied incident, and the character of the country given with a most faithful pencil. Further on is a clever scene, "Dover Hovellers," by Mr. Hollins; and immediately above is the subscription portrait of Dr. Conolly, by Sir John Watson Gordon—a most capital likeness, capitally painted. Still more to the right is "Hotspur and the Fop" (487) by Mr. Elmore; a well rendered scene from Shakspeare. The *Fop*, full of civet and disgust at the dead body crossing the wind and his nobility, and *Hotspur* all manly contempt at the perfumed fellow. Near to this clever picture is a Pre-Raphaelite folly, by Charles Collins, son of English-coast Collins; and anything, as a whole, further from nature and his father's works, it would be difficult to produce. He calls it "Convent Thoughts," and gives us a nun in a landscape of green, meditating on the works of nature, on flowers and green leaves—painted with a micro-

EXHIBITION OF THE SOCIETY OF PAINTERS IN WATER-COLOURS.—"VESSELS LEAVING THE HARBOUR OF GREAT YARMOUTH."—PAINTED BY E. DUNCAN.

recipe minuteness perfectly wonderful. But what misapplication of time The man who wrote the Lord's prayer on a silver penny of Maundav money was just as well employed. The same application and skill, better directed, would make Mr. Collins a clever artist, not, as he is now, only an eccentric one.

Quitting Mr. Collins in an angry mood, we come to Mr. Sydney Cooper's largest contribution, "The Evening Drink"—a tranquil scene of Canterbury and Cuyp-like nature, which no English artist has caught with so much felicity as Mr. Cooper. It is true that he sometimes wearies us with his monotonous repetitions of cows in the same attitude, by the same means, and in the very same sunshine; so much so, indeed, that we long, not unfrequently, for the introduction of a jackass, a tinker's hovel, or a gypsy camp. Why will he always give us the same time upon canvass? We admit, willingly and, the merit, simplicity and beauty of his subjects and his scenery, but surely we have too much of it. Mr Cooper will, no doubt, answer that his patrons have not; that he is asked, bothered, and teazed for pictures of this class; that he tries to please, and must please to live; that he cannot afford to offend; and that, when he is rich and less teazed for cows and Cuyp-like distances, he will give us other scenes in nature (as we have no doubt he will) equally true and equally beautiful. Let Mr. Cooper take a hint from the charming little "Gleaner" (103), hanging by the side of his picture, the joint composition of Frith and Creswick The figure is too prosaic for either a Ruth or a Lavinia, but is pastoral and autumnal-looking.

Here we turn into the West Room, and would make the best of our way out were we not willingly detained before "The Return of the Dove to the Ark," by Mr. Millais. In this picture there is very little story. Mr. Millais has painted a sentiment, and conveyed that sentiment after his own fashion—touchingly, if not truly. Our readers can see the sentiment conveyed: we wish they could see the colour—such robes of green and purple and white—so much to admire, and so much to be offended with. His other picture he has three in all) are in the same style. 361 is a scene from Tennyson.

She only said, "My life is dreary"

and while the sentiment is attained, it is conveyed extravagantly in the church-window-like fashion of the thirteenth century. 710, "The Woodman's Daughter," is from Mr. Courtney Fatmore's poems, and represents a boy, in an outrageous red dress, offering some very red strawberries to a very purpley girl, in a very green landscape Yet there is merit in this picture, for the expression on the girl's face, of surprise, satisfaction, and delight, is given with no common perception of character. Mr. Millais is young enough to mend, and has talent to do better things.

We now return to the East Room. Passing two or three attentive gazers admiring more than we do Mr. Cope's "Sisters," we come to Ward's "Marie Antoinette" (already noticed), to Stanfield's tragic picture (facing the Maclise) of the "Battle of Roveredo," more picturesque than poetic, though a wonderful picture; and Frith's very clever representation of Hogarth brought before the Governor of Calais as a Spy." Mr. Frith found his subject in the "Letters of Walpole:"

"Hogarth has run a great risk since the peace. He went to France, accompanied by some friends, and was so imprudent as to be taking a sketch of the drawbridge at Calais. He was seized and carried to the Governor, where he was obliged to prove his vocation by producing several *caricatures*, &c., such as would by no means serve the purpose of an engineer. He was told by the Governor, though he had not the pass been actually signed, he should have hung him immediately on the ramparts."

Critics are found who regret that Mr. Frith has so few female figures in this picture, Mr. Frith excelling in the representation of female loveliness. But he has a contrast in this picture quite equal to the contrast between manly strength and womanly delicacy. "Hogarth and his friend Pine" are magnificent specimens of English character, finely contrasting strongly with French slenderness of figure, and difference of face and costume.

Pleased with what we have seen, we now walk into the centre of the Great Room. Here is Lord Brougham at full length, by Pickersgill; Wordsworth at full length, also by the same artist, but very unpoetic; a portrait of Barry, the architect, by Knight; a portrait of John Henry Robinson, one of the best of our living line engravers, also by Knight, and not very like—altogether too large; a delicately drawn full length of the Duchess of Manchester, by L. W. Desanges; a good portrait of F. A. Lee, the landscape-painter, by Hollins; and other works, to which we shall return on an early occasion

Here we must conclude for the present

EXHIBITION OF THE SOCIETY OF PAINTERS IN WATER-COLOURS

"VESSELS LEAVING THE HARBOUR OF GREAT YARMOUTH." Painted by E. DUNCAN

THIS picture, like every production of Mr. Duncan's pencil, is a scene of truthful nature. The busy waves dashing their white foam against the pier-head, the sails of the vessels filling with fair wind, and the bright light gleaming upon their faces, form a very life-like scene, which is admirably painted throughout

UTAH AND THE MORMONS.

(From the *Great Lone Lady Journal*)

We find in the *Washington National Era* a most interesting correspondence from the Great Salt Lake City, in the territory of Utah, the settlement of the Mormons. We will give our readers a summary of the most interesting facts. The writer sets out by giving a description; and says that the term *desert* may be appropriately applied to all the country included in the great interior basin, and all lying between the great basin and the Missouri and Arkansas rivers, embracing nearly all of our recent purchase from Mexico, and much of our former territory. There is here and there a fertile valley, which is an exception. Perhaps of all this vast country one twentieth part is arable land The largest tract of fertile land lies just within the eastern rim of the great basin, Nobatch mountains, and the Utah and the Great Salt Lakes. This is about 200 miles long, and varies from five to forty miles in breadth; but even in this valley there is much barren land, and much that requires artificial irrigation.

Beside this Great Valley, there are several small valleys and oases in the Great Basin, but they are mostly so small, so far apart, and so badly timbered, that they will never be settled while there is any unoccupied land in the valley of the Mississippi. It is even doubted if the Great Salt Lake Valley would have become settled for many years to come, had not the Mormons been driven there to seek refuge and a home within its desert limits, like the persecution that drove the English Puritans to settle New England in a climate perfectly inhospitable to result a great end. The present population of Deseret is estimated at 20,000, but the emigration of the present year, it is expected, will swell the amount to 40,000. Last year they adopted a constitution, admirably consistent with the constitution of the United States, and as thoroughly republican as the constitution of any state in the Union. They have not legislated on the subject of slavery, but they express their conviction that slavery can have no legal existence where it has never been recognised. Brigham Young is their Governor, President of the Church, High Priest, Revelator, &c. They are devotedly attached to the American Union, and say that it has the best government in the world as it has ever produced or ever will produce until Christ shall come and reign over the earth

The Mormons are industrious, frugal, and temperate, and legal, and are described as very hospitable It is but three years since they set tled in the valley of the Great Salt Lake, and in that time they have opened good farms, built houses, dams, erected mills of various kinds, made bridges across the rivers, built school-houses and established schools, built a State House, church and a temple, and, in fact, they have done more to advance the real prosperity of a State, than most of the colonial thrones They have raised funds to assist their brethren in Europe to emigrate. Last year they sent out 4000 dollars, and this year their subscription amount to 500,000 dollars. Their chief crop is wheat, for which both demand and sale are well adapted. Fifty bushels per acre is about an average crop. Corn is an unproductive crop with them; other grains generally produce very well. Stock of all kinds do well. Sheep in large numbers have been introduced, and the building of a woollen manufactory is contemplated. The letter, which is dated Sept. 2nd, 1850, states that the Mormons manufacture powder, and that they have been compelled to use it. The Snake and Utah tribes of Indians had combined making attacks and committing depreda tions upon the whites, and even upon them to such an extent that in Sept. 24, since the date on the 21st, the Indians made an attack upon the North settlement, but the command under Gen. Eldridge caused them to retreat hastily In the pursuit a Snake chief was killed

The Mormons who went across the plains have been generally successful, and gathered their gold on the eastern side of Sierra Nevada Numbers of the adventurers with them created great excitement among the newly arrived emigrants The prices of labour varies from one dollar up to ten The their trade they adopt Free-trade principles, except in the matter of intoxicating liquors: a duty or fine of one hundred per cent. *at present* is imposed upon liquors introduced into the territory. Mr. Asa A. Gill, who writes the letter, also remarking that boarding is from four to eight dollars per week, flour twenty dollars per barrel and other provisions in proportion, observes

"The settlements feel the want of nothing so much as a railroad, connecting with the Mississippi and the Pacific. Such a road would be a great undertaking, as we all know; but it could be made, and it would pay well; and any road that will pay ought to be built."

Coal has been found in four different places to the west of the Missouri line. Lead or galena has also been found between the Kamas and Platte rivers. Gold deposits exist in several places; and the Sweet-water mountains contain the best marble in the world, and of all colours, from the purest white to the blackest jet.

"This whole region of country possesses one singular feature that is not generally known, or at least it is not generally known that this phenomenon is so common From the mouth of the Platte to the Sierra Nevada mountains, a large portion of all the moist land is in dry weather covered with salt. Below Fort Laramie, it is generally pure crystals of soda-salt, and appears only in small quantities, frequently resembling a heavy hoar-frost. It disappears with every rain, but is held in solution by the water in the earth, till brought to the surface by capillary attraction, and deposited by evaporation in fine white crystals Above Fort Laramie, especially north of the Platte, it was found in large quantities, and usually mingled with other substances, the carbonate of sodium frequently predominating, and sometimes in one-third to one-half the compound, near the Sweet-water, around the margin of which this salt is deposited to the depth of several inches. There are several springs around this lake. It may be small, for aught I know. This is called the Alkali Lake

The most curious animal on the plains is the "horned frog," or "round lizard," or "air frog," as some call it.

The valley of the Great Lake is described as peculiarly healthy; agues and bilious fevers are entirely unknown, and the boys and girls look as fair and fresh as the flowers in May.

The plains abound with the buffalo, elk, deer, and ante'ope, and the bear and gulo, or wild sheep, are found in all parts of the mountains. But next year's emigration will have but few difficulties to encounter, as the roads will be better, ferries and bridges will be established at all the bad crossings, and there are now trading posts established along the whole road, at which supplies of al. kinds may be procured.

Mr. Call expresses his belief that the cause of the large number of deaths among the emigrants has not arisen from the unhealthiness of the climate, but from fear and over dressing. But a great change is about to be made in the Great Desert. A company of men have established themselves upon the Salmon Trout river, for the purpose of turning its waters over the fifty miles Desert, so that its water, instead of falling into Pyramid Lake, will fall into Humboldt or Mary River, the bed of which is 500 feet lower than the former. This will require but little labour, as nature aids the design; so that by this spring there will be a continuous line of water from the Humboldt Mountains to the Sierra Nevada

Within three years the wonders of California have astonished the world; but while the fame and wealth of California have drawn to her people from all nations on the face of the earth, a small persecuted sect, within the same time, have laid the foundations of a mighty State in the deep recesses of our vast wilderness territory, and by their industry and enterprising spirit are destined to turn that desert into fruitful fields. By their art and civilisation they will collect together the civilisation of the east and west of this great continent, and open up a highway of communication for both. Deseret will stand on the pages of history, linked with the history of California, and the record of the rise and progress will be regarded as no less marvellous and unprecedented.

TOWN TALK AND TABLE TALK.

THAT the age of the Howards—or, more strictly speaking, of John Howard, the prison visitor—is not altogether gone; that there is still sterling unaffected philanthropy in the world, notwithstanding the bad name which the poor world now-a-days gets—have been proved by the glory of a voyage in an American emigrant ship, lately published by Mr. Vere Foster. This gentleman, a man of fortune and family, appears endowed with those kindly feelings and purely benevolent wishes towards the poor and the labouring, which have of late so signally characterised many of the upper classes of society. Mr. Foster's practices for those beneath him did not however evaporate in Your England poetry or mediæval aspiration; or even with the foundation of a cricket club. Neither was it satisfied with blazing in the contribution list to fashionable or unfashionable charities; nor by the performance of any of those little good offices which avail the receiver much, and cost the giver little. Mr. Vere Foster took much interest in the question of emigration, and, in order to find out how steerage passengers across the Atlantic were actually treated, he himself assumed the character, performed the voyage, made the third stowed into a cramped sleeping berth, lived upon the ship's rations, and daily with a pair of scales, weighed and measured the deficiencies in the food paid for, and stipulated to be supplied by the calculating Yankee shipowners and their ruffian crew. The portion served out was short by 4 2-7ths lb; the flour by 2-7ths lb; the oatmeal by 1-7th lb; the rice by 4⅔ lb; the peas by 7⅓ lb; the tea by 6½ oz.; the sugar by 13 oz.; molasses 1. 2 lb. 3¾ oz. A tolerable saving this, when the value of these articles is multiplied by some hundreds of persons. No wonder that many emigrant ships bring in good dividends. But the swindling was not the worst part of the business: Mr. Foster's diary is a long register of the basest ruffianisms perpetrated upon the unlucky passengers, by the mates and crew. Application for redress has been made, but the English authorities cannot interfere with what passes on the high seas under the magnanimous "stars and stripes," so that the "middle passage" as applied to the voyage between Liverpool and New York, is likely to proceed in all its horrors, and the "smart" Wall-street merchants to realise very excellent profits

Picture-dealing is a craft which has not the best possible name in the world. There is generally understood to be about as much picture-keeping about painted canvass as about horseflesh, and as many tricks played upon would-be connoisseurs of Raphaels and Claudes as upon *soi-disant* and *soi-pensant* judges of blood, bone, and symmetry. A calculation of the number of acres of alleged Rubenses, Canalettis, Vandykes, and Titians displayed in the private dwellings and public auction rooms of the realm, would be an edifying piece of arithmetic. Notable scots sometimes go the round of London in every quarter of the globe, world from Rome to Camden-town in which *chef d'œuvres* by the old masters are manufactured by wholesale. from which "Holy Families" by the score, and "Madonnas" by the hundred, square furlongs of *renaissance* landscape and Louis Quinze pastorals, are weekly and monthly poured upon the market to adorn as undoubted originals the yet moist walls of wealthy parvenuism. Pictures of this class, too, play a strange part in a certain province of our business and monetary system. The sharp eyed gentleman, who does a bill at 100 or so per cent., stipulates that the advance shall be made one-third in cash, one-third in wine, and one-third in pictures. The liquid and the canvass are, of course, pretty much of a muchness. The south-side Madeira has been brewed in a City cellar, and the glowing Correggio has been knocked up in a Soho garret Picture-dealers, however, I rejoice to say, are not all such drivers of desperately hard bargains. Pic-chapmen of the old school are, I believe, models of liberality, and inspirations of magnanimity. It is wonderful to have to connect a story of a *soi-disant* ancient master with a commercial philanthropy unparalleled in the annals of commerce, but in the days of Tyre dynasties

refreshment man, who came round regularly with his cans and basket. Very few of the poor fellows were in sufficient funds to practise the courtesy of treating their chum with the cool fun was amongst the under the refreshment man was a rare fellow for credit, and the empty pocket could merrily age the coming half-crown as deeply as it pleased.

When the white apron and fur cap of the man were in sight, every one ran to meet him. His beer-can was soon emptied, and the basket marvellously contained

"Now then just leave them loaves alone, Bill," cried the provision merchant, "a-spectin' to eat 'em if they was potty! This makes one, and three, Joe" to another, handing some a huge slice of bread and cheese "Where's the tea-leaves and last pipeses? Don't give that stuff to any more beggars, I tell you, for I'm sure that's the sixth time Common, but no getting a cut for love or money."

"What's the jobbiness to you, I'd like to know?" asked a huge fellow, in a fustian jacket, cross coat and red plush breeches, as if he had been a footman

"Now, don't get delicate, answered the provision man, in a friendly manner, "cocky as well as your last place, a-givin' up the cold chicken as could do for the parlour. Come, no quibbles with fellers, who've to keep count. I shall good-bye you. Mind, Josh, you've near eat up your wages, and you'll be sick in your bed and all."

"Can't help it," returned the man, who with his mouth yet full, seized upon a fresh supply. Without speaking a word, he had been eating as hard as he could, with his eyes fixed on the basket, and afraid that it might be emptied before he was satisfied. "I'll have a fill for once, that's certain, if I has to undergo a week's after meals."

Many of them, among extravagant, at finding the credit so easy, attended, and the provision dealer began to look for a hearty, as they had been long on board and water, and the very sight of the luxuries in the basket almost gave ill produce their hunger increasing, rather than decreasing with each mouthful. How the prospect encouraged one! But the dealer, unmoved and unheeding, ate and drank fast, had the same hearty appetite as the rest, and, as each basketful was emptied, stepped aboard his boat for another. Many a time did he return, his customers, when parties arrived, with a large an amount, that they were glad to escape to bed, to sleep off the effects of the night's debauch. Many a time did the landlord send for the dealer, in the presence of the merchant, with whom he dealt, of basket, on a term allowing food to be used, half-liquor or with supper and small shop-goods, charged at double price; and, as each basket was emptied, they would take a second out of the hold-man. It was curious to see the rivalry of the dealer's boat when leaving, plunging had made them as poor on leaving work as when they began it.

As Dundee kept up little to each day the work at the Docks was brisk and constant. For two weeks Jim had been earning his thirty pence and knew too as punctually as to mould, so that he had kept his word and Mary's, and had actually saved a shilling in it. He could now work against the best men in the place, for his legs had grown used to the motion, and he had constant practice.

So as he worked on and on, the pence, each day when the refreshment man came, mounted to a pound, and at one hundred and sixty he had to bring it to the skipper. But the vessel that night in the whole of the docks, and no cockle he would barter, than to see it a shilling short. Jim was determined to be the first to bring the money, with the exception of the skipper, and he did it. He came out as a wife can who has had many letters when they come in a heap, and writing. Some could not be satisfied although they had the money in their hands, and counted it over and over again, and then counted it again. But neither the skipper nor Jim had any doubt of the money, for the latter thought it was a very large sum, and the former knew it was correct to a penny.

"Well, you're a queer one, that's a fact," said the skipper, "and what's to be done with him I don't know. Here, I'll make you a present of a pound, and you shall have a new jacket and trousers and shoes, and a hat, and all that, and then you'll look like a man."

"And a gentleman," said Jim.

"Then you'd little as the emigrants pass up. A man ever look need to keep company with you, for you'd be a regular gentleman. Here, take this pound, and get yourself some clothes, and don't be a fool."

"No, no, master," answered Jim, "I'll have the money back again, or I'll not have it at all."

THE "JYLLAND," DANISH GOVERNMENT STEAMER

DANISH STEAM-SHIP "JYLLAND."

THE Iron Steam-ship *Jylland* has just completed her first voyage between one of the richest agricultural districts of the kingdom of Denmark and the Port of London, having succeeded in opening up a steam communication where until this time it had been deemed impossible. Several large lakes and an extensive inland water communication have their opening into the sea by means of a shallow bar-entrance, with not more than 7 feet; and it was long supposed that no vessel of sufficiently large size, and, at the same time, possessing the qualities of a good wholesale sea boat, could be constructed, that should, at the same time, possess the small draft of water requisite for entering these waters. The *Jylland*, however, has proved herself to unite all these qualities, and has returned from having performed all that could be desired and more than had been promised: she did the voyage out in 45 hours, and home in 47; and brought to Blackwall a cargo of 130 head of cattle and horses, 70 pigs, besides a large stock of other agricultural produce, all in the most perfect condition, and on a draft of water one inch less than had been contracted. The *Jylland* has been constructed, under a grant of the Danish government for the encouragement of agriculture and commerce, for Mr. Regner Westenholtz, of Mark-lane. She is 450 tons burden, and propelled by engines of 120 horse-power; the ship and engines having been constructed, and the ship wholly fitted out, by Messrs. Robinsons and Russell, of Millwall.

HAMBURG GOLD MEDAL.

WRECK OF THE "HELENA SLOWMAN" STEAMER.

THIS chaste and beautifully-executed Gold Medal has been presented by the Senate of the Free Hanseatic City of Hamburg to Capt. Honey, for his noble conduct in rescuing the passengers and crew of the *Helena Slowman*. This new iron screw steamer, built at Hull, and of 800 tons burden, 180 horse-power, and commanded by Captain Paulsen, left Hamburg for New York in October last, with a valuable mixed cargo and 154 passengers, manned by a crew of 36 men. The vessel was overtaken by a frightful storm, which unshipped the rudder, and rendered the steamer utterly unmanageable; when, providentially, the *Devonshire*, American packet-ship, came in sight, in lat. 42.13, long. 61.30; her commander, Captain Honey, instantly bore down, and, after much trouble and imminent danger, succeeded in bringing the passengers and crew safely on board his own vessel.

The third mate's boat had made two trips, but was stove in when making the third; and the mate, Mr. Johnson, one seaman, and seven passengers, met with a watery grave.

The Senate also presented the first mate with a similar medal, enclosed in a velvet box, ornamented with most beautiful silver open chasing.

This is an example on the part of the Senate of Hamburg, which it would be well if the British Government would occasionally imitate.

HAMBURG GOLD MEDAL.—PRESENTED TO CAPTAIN HONEY.

ERRIS FISHING SETTLEMENT.—LIFE FISHING-BOATS, "ERRETER" AND "HOPE."

THESE Life-boats, which are fitted up as fishing-boats, and built by Messrs. T. and J. White, of Cowes, for the Erris Fishing Settlement and Converts Employment Society, Belmullet, county of Mayo, have just been launched and tried by W. T. Campbell, Esq., the superintendent of the above institution. The above is a Sketch of their recent trial off Osborne House, the marine residence of her Majesty. The large boat is 32 feet long, 10 feet beam, and 4 feet deep, with air compartments in bow and stern, which extend round her gunwale, having twelve divisions, and down to platform, under which is a water-kelson running fore and aft, and capable of holding one ton of water ballast, which can also be used as a well for live fish, being fitted with air valves. The advantage to be derived from the buoyant properties of this boat is, that, having a displacement in her compartments of about four tons, she may, in addition to her water-kelson, carry one ton of iron ballast; and, in case of being filled in a tremendous gale at sea, have three tons of buoyant power, which makes it impossible for her to sink: the boat also being much stiffer with water in than when empty, renders her altogether a most valuable and serviceable boat, for the double purpose of fishing or saving life from wreck, should her services be required for that purpose. During her trial, with all sails set, and only her water-kelson filled as ballast, occasional strong puffs put her lee gunwale under water from one to two feet, and it was found that when water came into the boat it added considerably to her stability.

The Erris Fishing and Industrial Settlement was commenced in September, 1849, with the object of affording instruction to the rising generation, and of stirring up amongst them habits of industry, and an idea of the value of remunerative employment. The plan adopted is to receive the boys of the peasantry who have attained the age of from 10 to 16 years, as apprentices for four or six years, according to their age; to board, lodge, educate, and train them to the improved modes of deep sea fishing, the manufacture of nets and lines, boat-building, &c.

The design of this institution recommends itself strongly to our judgment and approval: it seeks to reach the root of Ireland's disease in the rescue of her youth from the baneful example of indolence and ignorance under which previous generations have grown up; and it seeks to turn to an available account the stores which Divine Providence has planted within the people's reach. The treasures of the earth and sea must be sought for with labour and diligence, and in labour well directed it will be found that there is abundant profit. We hope the promoters of this institution will receive liberal support from a generous and philanthropic public, and that they may thus be enabled efficiently to carry out their plans; many a valuable offspring of benevolence, which might have become of infinite national benefit, has perished in its infancy because it did not obtain an interest in public estimation.

PLATE PRESENTED TO CAPTAIN J. C. DALRYMPLE HAY.

THIS elegant piece of Plate has just been presented to Captain John C.

ERRIS FISHING SETTLEMENT LIFE FISHING-BOATS, "ERRETER" AND "HOPE."

Dalrymple Hay, of her Majesty's brig *Columbine*, by Messrs. Jardine, Matheson, and Co., and the principal merchants in China, for Captain Hay's valuable services while in command of the *Columbine*, in suppressing piracy in the Chinese seas.

The testimonial is a handsome table-ornament. The form of the Vase is round, and divided into four compartments; three of which represent the engagements at the different periods with the pirates; the fourth is allegorical. At the base are three Chinese figures, kneeling in submissive attitude; and on the cover is Britannia and the Sea Horse. The Vase stands on an octagonal ebony base, on which are two plates with the following inscription:—

PLATE PRESENTED TO CAPTAIN J. C. DALRYMPLE HAY, R.N.

Presented to Captain JOHN C. DALRYMPLE HAY, of her Majesty's brig *Columbine*, as a memorial of the important service rendered by him to the commerce in China, in the destruction, by the forces under his command, of the piratical fleet of Shap-ng-Tsai, consisting of 64 junks, mounting 1200 guns, and carrying 3000 men, in the Tongnin River, on the 20th October, 1849, by Jardine, Matheson, and Co., for themselves and insurance offices under their charge; Dent and Co., for themselves and insurance offices under their charge; Macvier and Co.; Gilman and Co.; Jamieson, Edgar, and Co.; George Lyall and Co.; Fletcher and Co.; Dirom Gray and Co.; Preston Jee, Framjee, Cama, and Co.; Cowasjee, Sapoorjee, Lungrana, David Sassoon, Sons, and Co.; and 15 Parsee, Hindoo, and Mahomedan firms, of Canton, Hong-Kong. 20th February, 1850.

The Vase forms part only of the representation, the remainder consisting of a set of silver dishes and covers; the whole being from the establishment of Messrs. Hunt and Roskell, 156, New Bond-street.

MALAYAN TAPIR, IN THE MENAGERIE OF THE ZOOLOGICAL SOCIETY, REGENT'S PARK.

MALAYAN TAPIR,

IN THE GARDENS OF THE ZOOLOGICAL SOCIETY, REGENT'S PARK.

THE list of additions to the managerie, which is now issued monthly to the Fellows of the Zoological Society, is not only a most convenient and instructive arrangement for their benefit, but a most irrefragible proof of the energy and success with which that establishment is conducted. In looking over the lists which were circulated in April and the present month, we find that the novelties which have been obtained since the close of 1850 are so numerous, that they would in themselves alone form a collection sufficient to repay one for a morning spent among them.

At this particular period, when all the world is crowding to our shores, it is fortunate for the Zoological Society that their delightful garden has reached a degree of beauty and reputation which has never been exceeded either in its own history, or by any of the kindred institutions on the Continent. There is no doubt that a most brilliant season will reward the managers for the spirited improvements which they have effected, and afford fresh sinews for still further progress when the excitement of the World's Fair has faded into the past.

The first musical performance of the Life Guards, on Saturday week, attracted a numerous muster of Fellows and visitors, notwithstanding the unfavourable circumstance of a May shower; and we then took an opportunity of looking at most of the novelties to which we have alluded. Among them we discovered the subject of our Illustration, which is, in every respect (after the Elephant calf), the most interesting among them.

The *Saladang Gindol Tenmi*, or Malayan Tapir (*Tapirus Malayanus*), much exceeds the American tapir in size, and is peculiarly remarkable in respect to colour. It is a native of Sumatra, and some of the other islands of the Indian Archipelago, as well as of the Malayan peninsula. The above specimen was obtained from the latter locality, having been captured at the foot of Mount Ophir about the end of last summer, in company with another in the menagerie, which has been obtained for the Society by John Dunbar, Esq., of the Sudder Court, Calcutta.

The Malayan tapir first became known to Sir Stamford Raffles in 1805, a living specimen having been sent to Sir George Leith when Governor of Penang. It was afterwards observed by Major Farquhar, in the vicinity of Malacca. A drawing and description of it was communicated by him to the Asiatic Society, in 1816; and a living subject was afterwards sent to the menagerie at Barrackpore, from Bencoolen. Sir Stamford Raffles presented the first specimen which reached England to the Zoological Society, on his return from Sumatra, but it did not long survive its arrival.

The present animal (said to be about two years old, and, although of large size, is still considerably short of its mature stature, which Sir Stamford Raffles describes as equalling the buffalo in body.

Although differing in many essential characters from the Tapir of America, the Malayan Tapir resembles it in the spotted colouration of the young, which, however, disappears at a much earlier period than in that species.

The Tapir of the Old World is particularly interesting to palæontologists as the nearest existing form to the palæotherium; and it would almost seem as if the restoration of that extinct form in Professor Owen's admirably illustrated work on British Fossil Mammalia had been sketched from the subject now in the Gardens, instead of being constructed from the accurate reasoning upon osteological data for which he is so celebrated.

THE CRYPT OF THE CITY OF LONDON GUILDHALL.

THERE is so little to admire in the present superstructure of the Guildhall, in King-street, that few persons, save those specially devoted to archæological pursuits, are aware that beneath the ill-assorted pile is a rare antiquarian treasure—the vaulting of the ancient Hall, erected in the year 1411, and the only portion of the edifice which escaped the Great Fire of 1666. This interesting relic is rarely shown to visitors; but more than one attempt has been made to restore it architecturally, which has been partially done; and it is by no means creditable to the Corporation that they should allow the place to fall into decay, their attention appearing to have been confined to the festive apartment above.

The Crypt is divided into aisles by clustered columns, from which spring the stone-ribbed groins of the vaulting, composed partly of chalk and bricks, the principal intersections being covered with carved bosses of flowers, or heads and shields.

The north and south aisles had formerly mullioned windows, now walled up. At the eastern end there is a fine Early English arched entrance, in fair preservation; and in the south-eastern angle is an octangular recess, which formerly was ceiled by an elegantly groined roof, some remains of the corbels and springings being discernible on the walls. The height of the Crypt, from the base of the columns to the intersection of the groins, is 13 feet.

The mouldings of the capitals and the ribs of the vaulting are much dilapidated, one of the clustered pillars supporting the vaulting being much decayed. Mr. Bunning, the City architect, caused it to be removed, and a new clustered column of Purbeck marble to be substituted. The whole of the stonework is now being rubbed down and cleaned, and the clustered shafts and capitals repaired.

The large antique bowl standing in the Crypt, opposite the north entrance, is of Egyptian red granite, and was presented to the Corpora-

THE CRYPT OF THE CITY OF LONDON GUILDHALL

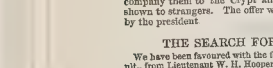
tion of London by Major Cookson, having been sent to England by him in the ship *Anacreon*, from Alexandria, with a letter dated 1st Sept., 1802, requesting the Corporation would do him the honour to accept it, as a testimony of his respect, and a memorial of the British achievements in Egypt.

The Crypt has already been inspected by a great number of our metropolitan visitors, who have been much gratified with Mr. Hunting's restoration of the columns and arches. We should add, that, at the last meeting of the Archæological Association, Mr. Lott (the founder of the museum of City antiquities, at the Guildhall) proposed to devote a day, to be fixed by the council of the Association, to make a visit to the crypt, the many country and foreign members now in London, and to accompany them to the Crypt and other objects of interest not usually shown to strangers. The offer was gladly accepted, and acknowledged by the president

THE SEARCH FOR SIR JOHN FRANKLIN.

We have been favoured with the following extract from a letter, received 23rd ult., from Lieutenant W. H. Hooper, dated Fort Simpson, Mackenzie River, 29th October, 1850:—

"Here we are again, safe and sound, and snugly moored for the winter, a winding only a more genial season for our return to England. My last letter was dated from Fort Good Hope, July 17th, and I shall continue from that time. At eight P.M., on that day, we started, crossed the Arctic Circle in the night, and reaching Island Separation on the morning of the 20th, left that place in the afternoon, after being nearly devoured by mosquitos and sand-flies. We continued our descent of the river, pulling by day, and drifting by night. On the morning of the 22nd, we got sight once more of the Arctic Ocean, and landing on Garry Island, which lies off the north of the river. From a high part our ocean view presented, to our sorrow, ice in profusion, and I could as a rock, which immediately acted as a terrible damper upon our hitherto ardent anticipations of a successful voyage; the temperature also changed terribly, and our cold weather clothes took the place of lighter habiliments. On the 25th, we reached Toker Point, and found a number of Esquimaux with their dwellings, but no person visible; here we deposited a few trinkets, together with a hieroglyphic scratched on a board, of which this is a correct delineation.



"Leaving this spot in the evening, we ran along the coast all night, seeing the sun above the horizon at midnight, but we managed to get embayed in the pack by morning; and now fairly began our troubles, and a series of detentions which utterly frustrated all hopes of success. We were obliged to "take" (i. e. force through) the pack. Finding we could not get on, we were compelled to retrograde for some distance, and then land on a miserable spot, with no other shelter than sleeve-less tents from melting snow and heavy rains, and only rotten wood for fires. Here for three days we remained, with a gale of wind, and temperature frequently below freezing point, but managed to get away on the 29th, spancing the day in following endeavours to force a passage through the ice, seven or eight feet thick, and sometimes more, now rising 20 or 30 feet high, likeso many houses in ruins, and again large flat pieces or fields several acres in extent. It is difficult for you to conceive how greatly chilled the wind becomes in its passage over ice. Here, in the month of July, a south breeze, which came to us from inhabited and warmest exhalation of Æolus, stagnates the blood by its freezing blasts At night, after two hours' very great toil in again forcing through the pack from seaward, we got on shore at point M'Kinley. Here was an Esquimaux village, most of the huts falling to ruins, and apparently long desolate. We were unable to start from this place for two days. We found it a frame of mind and women's tongues, the two of our party, Hanks, or men's boats; some harpoons, with flint heads, lashed on with sinews; double and single-bladed paddles, bones of small whales, wooden scoops, and ladies' pieces of wood drill for producing fire, pile for cooking in; rabbits and also the carcase of a wolf, apparently dead from starvation. The nets were laid out, and a few fish taken; a young seal also got entangled in them. But the man who owned the Canadian dog had never been on the coast not fancying it some monster, let it escape. We also got some swans and geese. We got away from this place in August, the ice having gone off a little, and we landed for the night not far from Cape Brown. On the evening of the 3rd we had to break through the pack from seaward to get to shore. When inside the pack, we made for the shore, and moored on Capes Halhorside for the night. The 4th, being Sunday, we remained there; on the 5th, we reached Nicholson's Island; and on the 6th, proceeded across to Point Pereyma Mainland, and met the first Esquimaux we saw in the open sea on a young woman, who were in a horrid fright, and commenced a loud jabber, apparently signing and entreating us to go away; by reciprocal signs and a few trinkets, we soon reassured them, and the old lady went into the men's tent, and sat down at her ease. They were horrible dirty both in person and dress, which latter was the same as we saw at the westward. Here I began to collect some more words; the few which I collected on the last trip they generally understood and repeated, but with a different pronunciation. We remained all the 7th, detained by bad weather. I send you a representation of the Esquimaux ladies, and the primitive tools we found

near their dwellings; the figure represents the younger woman, with her hair bound up in immense bows at the back of her head, and a huge quantity of reindeer-skin in her left hand, to which there was no accompaniment for the other member. She wore a frock of seal skin, with pointed coats; tight breeches and boots made of the same material. Her interesting baby was in its natural garment, shoved up at her back between her frock and her skin, and there secure by retained by means of a leather or hide girdle. On the morning of the 8th we quitted these charming creatures with a sigh, and steered for Cape Bathurst, not far from which we observed twelve tents of Esquimaux will, a great number of natives around them; soon eighteen kyaks, containing a man each, and four oomiaks filled with women and juveniles, came near us; they approached without the slightest sign of fear, shouting, screaming, and gesticulating merrily. The men laid hold of our boat and towed alongside, throwing in deer meat skins, fish, &c.; while the ladies seemed half mad, running quite across our bows, throwing in wild fowl, boots, and all sorts of things, all of which however we declined and returned. We made the men push off, and encamped at night on one of the Baillie Islands; several men remained with us and were most friendly, but strongly addicted to pilfering. On the 9th, after going to the extreme of the island, we were again stopped by ice and had to land, and found natives encamped on the ice. In the afternoon we saw a bear upon the ice, and gave chase, together with the natives. Our small boat went by sea to cut off his escape, with all, with some of the men and Esquimaux, took the hill above him with a double-barrelled gun; after a hill chase of more than 100 yards distant, drawing first blood, it which he dropped; and then was a loud shout of delight from our friends, but a grizzly bear is not so easily done for, he soon got up again and ran on as if nothing had happened, taking the water with a plunge, and climbing the masses of ice which lay in his path. An Esquimaux now went after him in his kyak, and it was interesting to see how well he managed his tiny craft, and tormented poor bruin. He would go close up, let draw an arrow, and then, as the bear turned to attack him, back water and splash in his face with double-headed paddle. After five or six oomiak chase, and when the poor beast was wounded in three or four places by the guns, and looked like a porcupine for arrows, he was at last shot dead by one of the men in the boats, and brought on board. He was by no means a pony; his entire weight was estimated at 440 lb. The carcass was divided equally between ourselves and friends, and our men feasted for two days off their portion; I tried a steak also, and found it excellent. From this date until the 14th, we were constantly near Cape Bathurst, trying to find a passage past it; but the compact state of the ice resisted our utmost efforts. The natives were constantly with us, and the greatest harmony existed; but they are arrant thieves, and require constant watching. One fellow put my silver spoon up his arm, another buried the frying pan, and our pockets were assiduously, though secretly tried, but all missing articles were generally given up on demand. I was, of course, busy getting words but found it difficult to make them comprehend my desire, being obliged to have recourse to imitations of various kinds, either by voice, gesture, or a sketch on paper, which were generally successful, causing huge bursts of merriment. On the night of the 14th we set sail on our return, being completely stopped from advancing, of which the captain gave up all hopes. On the 21st we landed at Port M'Kinley again, and met one man and three women, Esquimaux, who received a few presents, and were thereby much delighted. I now pass on to the 27th, day of arrival, when we re-entered the river; and, on the 5th of this month, after having touched at all the lower forts, arrived at this place, and were truly delighted, for a more thoroughly disagreeable trip I never made. Nearly the whole period of our sea voyage, that is from exit to entrance of this river, we were engaged with ice in weather, that, in severity, would I think be considered great in England even in winter. Our food was bad enough, consisting of dried deers' meat and pemmican, and our lodging was provocative of rheumatic ills, and so crown all the search was utterly unsuccessful. I do not think it probable we shall renew our search, as there are no remaining means here of equipping, or provisioning us for another season; no, no, I think we shall have a fair chance of returning this time to our homes, for which we shall have been absent four years. We leave this in June, and hope to reach England in October.

[Commander Pullen's lengthy dispatch details heavy work, great hardships and disappointments, and also shows the nullness and dangerous state of the boats for so daring an enterprise; and details a melancholy examination into a massacre of six inoffensive Esquimaux, while engaged in barter, by some Indians near the mouth of the Mackenzie.]

LITTLE'S IMPROVEMENTS IN ELECTRO-TELEGRAPHIC INSTRUMENTS.

One of the most important improvements in the Electric Telegraph has just been effected by Mr. George Little.

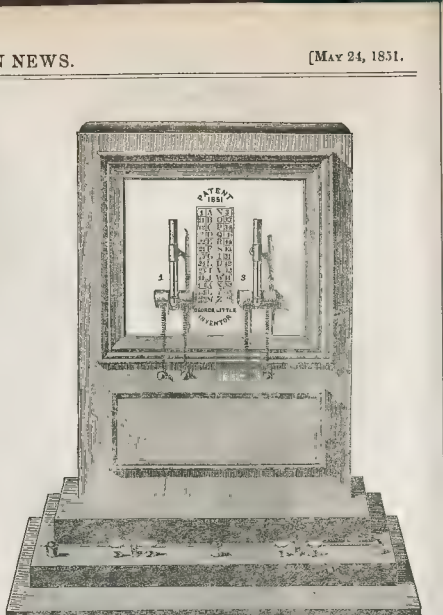
The annoyances to which the operators in Electro-Telegraphic manipulation are subject are very great, and out of the many annoyances which so frequently occur there are five; namely—Imperfect insulation of the line or conducting wires, the vibration of the indicators thereby preventing the communications from being read off clearly; the deflection of the indicators from local causes, such as the passing of currents of atmospheric electricity down wards to the earth, and *vice versâ*; the derangestration of the indicators by lightning, which has the effect of stopping all communications for a time; and great trouble in adjusting the indicators upon their axes.

To those who understand the science of Electro-Telegraphy, it will be seen, on reference to the accompanying Engraving, in what way Mr. Little obviates the difficulties named. On the dial plate is secured two sockets, which is made to hold in its upper part a permanent magnet, which is secured by the inventor a magnetic reservoir. Immediately underneath, and adhering to the same, by attraction, is a sewing-needle, which is surrounded by spirals of wire, contained in a glass tube, which is secured to the bottom part of the socket. Near the bottom of such glass tube is seen the small coil of insulated copper-wire.

The object of the large magnet is to keep up at all times a constant supply of magnetic power in the needle, so that if at any time lightning should make its way into the instrument, and rob the needle of any of its power, it will immediately take up a fresh supply without at all interfering with any communication that may be going on at the time. And as the needle is held up by magnetic attraction, the use of the axis is thereby dispensed with, the spirits in the tube preventing any sudden jarring and vibration. The socket which is jointed to the dial-plate enables the operator to move the whole of the apparatus to the right or to the left, as occasion may require, if the needle should be bent out of its course from local causes.

In indicating letters and words by this Telegraph, never more than two indications are required.

The inventor has not only produced an instrument beautiful in point of arrangement and simplicity, but one that, as regards economy, we do not think can be surpassed.



ROTATION OF THE EARTH.

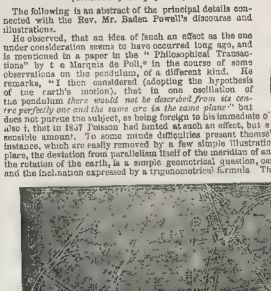
(*Concluded from page 420.*)

The following is an abstract of the principal details connected with the Rev. Mr. Baden Powell's discourse and illustrations.

He observed, that an idea of such an effect as the one under consideration seems to have occurred long ago, and is mentioned in a paper in the "Philosophical Transactions" by the Marquis de Poli, in the course of some observations on the pendulum, of a different kind. He remarks, "I then considered (adopting the hypothesis of the earth's motion), that in one oscillation of the pendulum *there would not be described from its centre perfectly one and the same arc in the same plane*;" but does not pursue the subject, as being foreign to his immediate object. It appears also that, that in 1837 Poisson had hinted at such an effect, but suggested it as of insensible amount. To some minds difficulties present themselves in the first instance, which are really removed by a few simple illustrations. In the first place, the deviation is always in the same direction as that of the original motion of the pendulum, and consequently changes when that direction is changed. The true deviation may be distinguished from this, in that it is always from E. to W. independently of the direction of the original impulse, and the ball always passes accurately through the centre in every oscillation, whereas in the former arc it never does. For great accuracy, a variety of other precautions are requisite as to the perfect freedom of suspension, guarding against currents, &c.; also the elliptic deviation may oppose that due to the earth's rotation, and thus the latter may manifest itself in spite of the former. It is extremely probable that many of the public repetitions may have been affected by these causes of error; yet some of those referred to have been made by men of so much eminence and experience as observers, as to render it highly improbable that they should not have been sufficiently guarded against every source of fallacy. The accordance of many of the results at different places within fair limits of error, is also a strong argument in favour of their accuracy and trustworthiness. The rates of deviation for one hour as determined at different places do not seem to be more discrepant than would accord generally with the differences of latitude. The experiments give:—

At Paris	..	..	about 11° 30′
Bristol	..	..	11 42
Dublin	..	..	12 00
York	..	..	13 00.

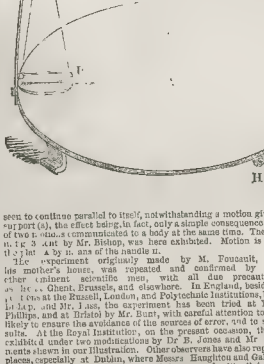
To apprehend the theoretical principle, it is necessary to take into account—1st, the simple inclination of two successive positions of the meridian of a place to each other, after an interval of time; 2nd, the independence of the motion of the base of the pendulum, of the rotation of the point of support; and, 3rdly, that the ball, though free to this extent, is not, however, wholly free, being constantly drawn down by gravity in a direction *continually changing* relatively to the original direction of vibration, as the earth revolves. Hence, though, from the second cause, the ball would have a tendency always to preserve a motion parallel to its original motion, and thus to deviate regularly from the meridian, it will, from the third cause, not preserve this exact parallelism, but will take an intermediate direction. The exact determination of this direction cannot be made on any general considerations; but, according to the Astronomer Royal, Professor Airey, must be the result of detailed mathematical investigation. Thus, in general, in any illustrative analogous case, so long as the axis of vibration will continue parallel to itself, the arc of vibration will continue parallel to itself; but if the axis do not continue parallel, the direction of the arc of vibration will deviate. This distinction has been laid down, and illustrated, recently by Mr. Wheatstone. The investigation, as pursued by Mr. Hunt[1], as well as by Mr. Sylvester[2], and other mathematicians, is principally founded on the method long since proposed by Euler, of resolving the rotatory motion of one point on the earth's surface into two, one about the vertical (that point, the other about an axis at right angles to it, of which the latter is the part effective in determining the direction of gravity on that pendulum, and is proportional to the sine of the latitude of the point. Mr. Hunt makes this general theorem the foundation of an analytical investigation, in which the conditions of the motion of the pendulum generally are expressed by certain differential equations, the integration of which conducts them to certain expressions, which, when simplified by the consideration of limiting the vibration to small arcs, give the azimuthal velocity uniform in its direction from E. to W., and in amount in proportion to the sine of the latitude. Giving, therefore, the deviation for one hour in the latitude of Paris about 11½ degrees, and the time of a complete revolution 23h. 56m. An investigation has also been made, independently, by the Astronomer Royal, leading to the same result. Other mathematical solutions have also been proposed by Dr. Day, of Bristol, and Mr. J. R. Young, late Professor of Mathematics at Belfast. The latter gentleman has obtained, as a consequence of his investigation, the general result, which he states thus:—"The arc of the circular rim of the table, subtended by the angle of deviation at its centre, is always (in one revolution of the earth) *exactly equal* to the difference in *length* of the two parallels of latitude described by the centre and extremities of the meridional diameter of the table"[3]



by two small models (figures 1 and 2) shewing the tangent planes of two meridians, P Q, P Q, meeting in the axis of the earth produced: then, if the inclination of the meridians = θ:—

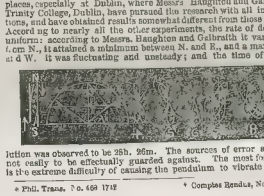
Then cos. θ = cos · λ + sine^2 λ cos. l

In the next place, the independence of the motion of the pendulum, notwithstanding that the point of support is carried with the earth in its rotation, and that the whole, to form a part of the earth, is a point easily elucidated by very simple experiments, in which the vibration of a small pendulum (P, fig. 3) is



seen to continue parallel to itself, notwithstanding a motion given to the point of support (s), the effect being, in fact, only a simple consequence of the co-existence of two motions communicated to a body at the same time. The apparatus shewn in fig. 3 is that by Mr. Bishop, was here exhibited. Motion is communicated to the joint A by means of the handle H.

The experiment originally made by M. Foucault, in the cellar of his mother's house, was repeated and confirmed by M. Arago, and other eminent scientific men, with all due precautions, at Paris, Berlin, Ghent, Brussels, and elsewhere. In England, besides the public repetitions at the Russell, London, and Polytechnic Institutions, by Dr. Rogers, Mr. Bishop, and Mr. Pape, the experiment has been tried at York by Professor Phillips, and at Bristol by Mr. Hunt, with careful attention to all circumstances likely to ensure the avoidance of the sources of error, and to secure precision. At the Royal Institution, on the present occasion, the experiment was exhibited under two modifications by Dr. B. Jones and Mr. Bass, by arrangements shewn in our illustration. Other observers have also repeated it in various places, especially at Dublin, where Messrs. Haughton and Galbraith, Fellows of Trinity College, Dublin, have pursued the research with all imaginable precautions, and have obtained results somewhat different from those of other observers. Accord ng to nearly all the other experiments, the rate of deviation continued uniform: according to Messrs. Haughton and Galbraith it varied; commencing at N. it attained a minimum between N. and E., and a maximum between S. and W. It was fluctuating and unsteady; and the time of a complete revo-

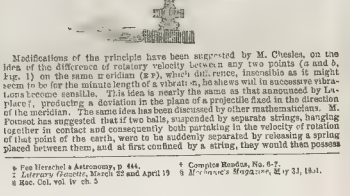


lution was observed to be 25h. 26m. The sources of error are numerous and not easily to be effectually guarded against. The most formidable, perhaps, is the extreme difficulty of causing the pendulum to vibrate *truly in one plane*

(figure 6 giving the curve of its path as shown in an exaggerated manner at Figures 4 and 5), and to prevent its motion in a narrow ellipse. When this takes place, and the arc is considerable, the direction of the major axis is continually changing, as shewn in Figures 7, 8, and 9, owing to a well-known mechanical cause[4]; but this deviation is always in the same direction as that of the original motion of the pendulum, and consequently changes when that direction is changed. The true deviation may be distinguished from this, in that it is always from E. to W. independently of the direction of the original impulse, and the ball always passes accurately through the centre in every oscillation, whereas in the former arc it never does. For great accuracy, a variety of other precautions are requisite as to the perfect freedom of suspension, guarding against currents, &c.; also the elliptic deviation may oppose that due to the earth's rotation, and thus the latter may manifest itself in spite of the former. It is extremely probable that many of the public repetitions may have been affected by these causes of error; yet some of those referred to have been made by men of so much eminence and experience as observers, as to render it highly improbable that they should not have been sufficiently guarded against every source of fallacy. The accordance of many of the results at different places within fair limits of error, is also a strong argument in favour of their accuracy and trustworthiness. The rates of deviation for one hour as determined at different places do not seem to be more discrepant than would accord generally with the differences of latitude. The experiments give:—

At Paris	..	..	about 11° 30′
Bristol	..	..	11 42
Dublin	..	..	12 00
York	..	..	13 00.

To apprehend the theoretical principle, it is necessary to take into account—1st, the simple inclination of two successive positions of the meridian of a place to each other, after an interval of time; 2nd, the independence of the motion of the base of the pendulum, of the rotation of the point of support; and, 3rdly, that the ball, though free to this extent, is not, however, wholly free, being constantly drawn down by gravity in a direction *continually changing* relatively to the original direction of vibration, as the earth revolves. Hence, though, from the second cause, the ball would have a tendency always to preserve a motion parallel to its original motion, and thus to deviate regularly from the meridian, it will, from the third cause, not preserve this exact parallelism, but will take an intermediate direction. The exact determination of this direction cannot be made on any general considerations; but, according to the Astronomer Royal, Professor Airey, must be the result of detailed mathematical investigation. Thus, in general, in any illustrative analogous case, so long as the axis of vibration will continue parallel to itself, the arc of vibration will continue parallel to itself; but if the axis do not continue parallel, the direction of the arc of vibration will deviate. This distinction has been laid down, and illustrated, recently by Mr. Wheatstone. The investigation, as pursued by Mr. Hunt[1], as well as by Mr. Sylvester[2], and other mathematicians, is principally founded on the method long since proposed by Euler, of resolving the rotatory motion of one point on the earth's surface into two, one about the vertical (that point, the other about an axis at right angles to it, of which the latter is the part effective in determining the direction of gravity on that pendulum, and is proportional to the sine of the latitude of the point. Mr. Hunt makes this general theorem the foundation of an analytical investigation, in which the conditions of the motion of the pendulum generally are expressed by certain differential equations, the integration of which conducts them to certain expressions, which, when simplified by the consideration of limiting the vibration to small arcs, give the azimuthal velocity uniform in its direction from E. to W., and in amount in proportion to the sine of the latitude. Giving, therefore, the deviation for one hour in the latitude of Paris about 11½ degrees, and the time of a complete revolution 23h. 56m. An investigation has also been made, independently, by the Astronomer Royal, leading to the same result. Other mathematical solutions have also been proposed by Dr. Day, of Bristol, and Mr. J. R. Young, late Professor of Mathematics at Belfast. The latter gentleman has obtained, as a consequence of his investigation, the general result, which he states thus:—"The arc of the circular rim of the table, subtended by the angle of deviation at its centre, is always (in one revolution of the earth) *exactly equal* to the difference in *length* of the two parallels of latitude described by the centre and extremities of the meridional diameter of the table"[3]



Modifications of the principle have been suggested by M. Chesles, on the idea of the difference of rotatory velocity between any two points (a and b, fig. 10) near the same ordinate (xy), which difference, insensible as it might seem to be for the minute length of a vibration, he shews will in successive vibrations become sensible. This idea is nearly the same as that suggested by Laplace[4], producing a deviation in the plane of a projectile fixed in the direction of the meridian. The same idea has been discussed by other mathematicians. M. Poinsot has suggested that if two balls, suspended by separate strings, hanging together in contact and consequently both partaking in the velocity of rotation of that point of the earth, were to be suddenly separated by releasing a spring placed between them, and at first confined by a string, they would then possess

the difference of velocity belonging to points on the earth at that distance apart, and would, consequently, revolve round the vertical *. A beautiful modification has been suggested by M. Breguet †, in which a perfectly circular motion is communicated to a pendulum; and the time of revolution will be different, according as its direction conspires with or opposes that of the earth. If all torsion in the thread could be got rid of, a ball simply suspended, and furnished with an index at its equator, would be seen to rotate. But the torsion destroys the effect: his is the suggestion of M. Baudrimont ‡. But by far the most complete idea, not only of the general principle but of the law of the sine of the latitude, is obtained from the beautiful apparatus constructed by Mr. Wheatstone (fig. 10), in which the pendulum is replaced by the vibration of a coiled spring (*b d*), the axis of which can be placed in any required inclination or *latitude* with regard to a vertical semicircular frame (*a b c*), which is made to revolve about its vertical radius, and the direction of the vibrations is seen to change in a degree proportional to the sine of the latitude; as, for example, for lat. 30° the sine = ½: and, consequently, if the vibration be originally in the meridian, when the meridian has revolved 180°, the deviation = 180° × ½ = 90°, or is at right angles to the meridian.

Mr. Powell concluded by observing, that upon the whole the experiment is one of high interest and importance. Some discrepancies or difficulties in the different views taken of the theory, as well as in the observed results, seem to indicate that the subject, however apparently simple, has not yet been thoroughly worked out—and by point to the desirableness of further repetitions of the experiments, if possible in vacuo, and with increased precautions, as well as to a revision of the dynamical and analytical processes, by which, possibly, any seeming difficulties may be cleared up.

THE IMPROVED MODE OF TREATING FLAX.

WHETHER wool or Flax were first spun into threads and woven into cloth, is left doubtful by history; but the art of spinning is one of the most ancient, and one of the earliest materials spun, if not the very earliest, was Flax. The mummy-cloth of Egypt, chemically and microscopically examined by Dr. Ure, was ascertained to be wholly composed, both in warp and woof, of Flax, and contained no cotton whatever. Though cotton was probably first spun in Egypt, and was certainly spun at an early period, it was much later used than Flax for the purpose of making cloth. We may indeed infer that the art of spinning must have made considerable progress before cotton was spun. No doubt, the art took its rise from plaiting rushes together, then went to plaiting the finer fibres of the Flax plant, and from plaiting to twisting those together to make a long thread. The downy and almost pulpy nature of cotton, keeping its filaments obscure to unaided vision, would not be likely to occur to the possibility of twisting it into a string, till that art had been learned by twisting together the long visible natural threads of Flax. Similar arguments apply to wool; and while history assures that Flax was spun long before cotton, we may infer from theory that it was also spun before wool.

After being applied to making cloth upwards of three thousand years, the same means of preparing it for this purpose having been in use for the whole time without much change, namely, rotting the plant in water, and separating by the heckle the woody and gluttinous matters with which the fibres of the Flax stalk are united, an improved method of preparing Flax has lately been introduced. Many reasons, such as the unwholesomeness of the rotting process, the offensive qualities it imparted to the water, the weakening of the fibre, and the discoloration of the Flax, induced people years ago to turn their attention to the subject, and though several patents were taken out, it remained to our time to effect any considerable improvement in the process. Lattery's factory for two successive years of the cotton crop in the United Sates, the large increase of our cotton manufacture, and the repugnance felt by some persons to have so much of the national prosperity dependent on the precarious of slave labour, has sharpened the wits of inventors, and Chevalier Claussen, a Belgian, has recently brought before the public a scheme by which Flax, the product of our temperate climate, for the growth of which Ireland and a large part of England are peculiarly adapted, it may be made to a considerable extent to supply the place of cotton.* On the great advantages of extending the cultivation of Flax; of the immense variety of very flattering food it supplies for cattle, and of the daily employment it gives both out of doors and in doors, we need not say one word, those subjects having been fully brought under the notice of our readers in former Numbers of this Journal. We shall now only describe the additional advantages likely to accrue both to agriculturists and manufacturers from the proposed improved method of preparing the Flax for being spun after it has left the hands of the agriculturists

Flax, from the nature of its fibre, is capable of being combined in spinning it by machinery, and the greater facility with which cotton can be spun in this way is the principal reason why cotton cloth has come so much into general use, and has in many cases superseded linen. Its peculiar properties, however, must always make it the most suitable article for warm climates, to a great multitude of people. The problem to be solved in this case was to make Flax as easy to spin by machinery as cotton, and to adapt to the machinery already in use for spinning. It has been ascertained by microscopic observations that the fibre of Flax is a unicellular form, while that of cotton is flat like a ribbon, a little thickened at either edge. It is also shorter than the fibre of Flax. The process, therefore, mainly consists in converting the cellular fibre of Flax into flat ribands, without destroying their texture. To cleanse the Flax thoroughly, it is first boiled for about three hours in water containing half per cent. of common soda. It is then placed in water containing about 1-500th part of sulphuric acid; and this destructive agent being neutralized by the soda remaining in the Flax, merely cleanses the fibre, without injuring it. The process is equally useful whether the Flax be spun by the ordinary processes into linen yarn or be converted into cotton-flax. It requires much less time than the old plan of cleaning, does not impart a bad colour to the Flax, and requires only half the labour required to scutch it. To convert it into cotton-flax, it is cut by a machine into suitable lengths, and is saturated in a solution of bicarbonate of soda (common baking soda). The solution penetrates into every part of the small tubes; and when this is effected, they are immersed in a solution of sulphuric acid, in the proportion of about one part to 1000 parts of water. The acid combines with the soda of the bicarbonate, and liberates the carbonic acid in the form of gas, which, by its expansive force, bursts the Flax tubes, and reduces them to the flat ribbon shape of the cotton fibre. The process is so gentle, yet decisive and rapid, that it has been compared to magic. It is an extremely beautiful application of the power of explosion, as we see it bubbling and forcing its way through soda-water. "The Flax fibre," says Mr. Hyde Clarke, the secretary to the Royal Agricultural Society, who reports the experiment, "soaked in the solution of the bicarbonate of soda, was no sooner immersed in the vessel containing the acidulated water, than the fibre character became at once changed from that of a damp, rigid aggregation of Flax to a light, expansive mass of cottony texture, increasing in size like leavening dough or an expanding sponge." The mass, now become of the consistence of cotton, soft and silky, can be bleached either in the ordinary method, or by being placed in hypochlorite of magnesia; it may be carded in the same manner as cotton, and is as fit for spinning in this condition, it has already been spun on cotton machinery—as an experiment, but with great success—by the Messrs. Bright, at Rochdale; and there is every reason to believe that it may be used, if necessary, as complete substitute for cotton.

There is at present no assignable limit to the cultivation of Flax, and therefore no assignable limit to the quantity which may be obtained. To produce it in large quantities, will be advantageous to farmers. They all ought to grow some Flax. A great merit it is about this that the cultivation of Flax, to be prepared by this method for spinning, yields a very great profit; but, knowing how fallacious such statements often turn out, we must rather warn our agricultural readers, whatever may be the profits of Flax cultivation of this mode of preparing the Flax, that it cannot for any considerable period exceed the ordinary profit of cultivating land with other products, and the ordinary profit of supplying the market cotton. As long as it exceeds the profit obtained by other cultivation, there will be a continual increase of the cultivation, and the profit obtained will in the end be reduced to the ordinary rate by one of those causes from over production which every now and then carry ruin amongst the too active competitors for obtaining shares of any large extra and unusual supply of wealth. Nor can we recommend the scheme in a national point of view, because it substitutes flax for cotton, and tends to make the English, as is said, independent of the Americans or any other people. What is called dependence in trade is always mutual, the seller being as dependent on the buyer as the buyer is on the seller, and trade dependence is thus always mutual service. It unites individuals and nations together in friendship and peace. The

* "The Flax Movement," &c. Pamphlet, by Chevalier Claussen. Effingham Wilson, Royal Exchange.

really civil men are, in almost all cases, the men dependent on others for their living or their fortune; and to promote dependence, therefore, is to promote civilisation. For its own advantages, for the behoof of our own agriculturists and the agriculturists of Ireland, we cannot say too much nor do too much to promote the cultivation of Flax and prepare it for manufacture; but, when that cultivation of civilisation has extended trade and increase mutual dependence, let us not recommend it or engage in the cultivation from the notion that we shall thereby make England independent of other countries. In proportion as we effect that we make them independent of us, and tend to convert friends into strangers, perhaps into foes.

LITERATURE.

ELEMENTS OF ELECTRO-METALLURGY. By ALFRED SMEE, F.R.S. Third Edition Longman and Co.

In the preface to this new edition of Mr. Smee's valuable work, he has contented himself with adding some account of the processes and experiments which have been carried on by others; from which source alone the volume has been increased to about one-sixth in bulk. The author adds:—

"The first and most obvious field for profitable advantages to the manufacturer; the present enables us to take a review of that which electro-metallurgy has absolutely effected. In the former editions, the economical relations of the subject were so carefully considered, that it has given more than pleasure to find that the stimulus of remuneration has been so effective that electro-metallurgy in no way falls short of the sanguine expectations then formed of it, but, on the contrary, has actually advanced in more extended spheres of operation."

We quote the following process and application of the disruptive discharge to the etching of steel, or *Electro-disruptive Etching*:—

"It is well known that when the connecting wires of a battery are brought together, a spark ensues, and portions of that piece of metal communicating with the silver are transferred to that metal communicating with the zinc. To Dr. Pring is due the merit of having first brought this fact into practical use for the purpose of engraving the hardest steel. This gentleman fixes the plate to be engraved in a small hand-vice, such as is used by watch-makers; this plate is then connected with an electro-magnetic coil, which is again connected with the zinc of a thoroughly-charged seven-pint platinized silver battery. To another wire, attached to the platinized silver, is joined a wire of platinum or of gold, which it is found convenient to fix in a crochet needle holder. When this wire is brought into contact with the steel plate, a portion of the latter is thrown bodily off and transferred to the etching tool, and thus by electro-mechanical action a perfect device can be made upon the hardest steel.

"If the plate and graver be attached to the reverse sides of the battery, then the wire is transferred, and a gold or platinum design is affected; but this result only takes place well in the purest steel, and the steel around the deposit is charred and burnt.

Dr. Pring's process is at present a scientific curiosity of high interest; it bears the same relation to the arts as the earliest of the first electric coples of penny-pieces did many years ago; in it is involved, however, a new application of a scientific fact, and on being thoroughly worked out may be, for aught we can tell, applicable to the die-sinker and other branches of the fine arts, and is now applicable to imprint the most beautiful designs on swords and steel instruments of every description made of hardened steel, which would, by any other process, be difficult to engrave

"The electro-disruptive etching is totally distinct from voltaic etching. In the latter, the voltaic force seeks chemical affinity, and the metal is dissolved. In the former, the aggregation of the particles of the metal is destroyed with, and portions are thrown out. In the one case we act, therefore, by interfering with the attraction of chemical affinity; in the latter, by interfering with the attraction of cohesion. This process was submitted to the Royal Society in 1846; and with the peculiar wisdom for which that greatest association of philosophers in Europe are particularly notorious in their scientific character, it was allowed to slumber, and, from the circumstance of the inventor living out of the country, it is even up to the present time but imperfectly known. The specimens which I have seen are extremely beautiful, and I hear that very interesting examples will be shown at the Great Exhibition."

As the Text-book of Electro-metallurgic Science, Mr. Smee's work possesses high value, more especially as the author abstains from theorising on the present knowledge, and has actually witnessed the processes which he details—the highest recommendation which can be accorded to any work of experimental character.

THE LAND STEWARD. By G. \ l—n, Agricultural Architect and Engineer, Atchley and Co.

The title given to this useful work is calculated to give rise to humiliating reflections respecting the knowledge of the major part of persons entrusted with the management of the extensive estates of our English landed proprietors.

A reverser satire on the majority of land-stewards for the occupation which they follow could scarcely be framed, than the fact that an individual in the second half of the nineteenth century should deem it requisite to draw up a book for their especial guidance and intition, on such subjects as "the geological structure, soil, and climate of the United Kingdom, considered in relation to agriculture," "the structure, texture, mineral composition, and physical properties, &c of soils." A person unacquainted with agriculture and the management of estates would naturally suppose that a land-steward had a full knowledge of these subjects prior to entering on such an occupation. Upon a more complete delusion; for, of those holding the office of landsteward, and brought up to the occupation of a farm, how few possess the knowledge anyl) thing of their occupation beyond a knowledge of former precedents, a scientific knowledge of their profession being more commonly despised than esteemed. Having stated this of land-stewards in general, and the deficiency of education in agriculture, how much more does the remark apply to the numerous land-stewards employed by our military and naval officers, &c.—men who scarcely know the right end of a hay-fork! yet to these, and to many who have the management of the most extensive properties in England are entrusted, and on whom depends the very protection to agriculture will generally be found the readiest

The author is, therefore, perfectly correct in addressing his work to the landstewards We may add, however, that it will be found of great benefit to landowners, for the practice of entrusting the management of landed property to incompetent parties is part of solpable ignorance existing on the part of proprietors of what is really required on the part of persons occupying the responsible situation of land-stewards: to small proprietors who look after the management of their own estates this work will be found of the greatest value, conveying, as it does, instruction on all practical points relating to land management; the working farmer will derive advantage also from the study of its contents.

Our author very justly remarks in the introduction to his work: "That landed property may be profitably improved, it is requisite that not only the tenant but the agent should have a thorough knowledge of practical agriculture; for, as the largeness of the majority of estates in this country and the habits of society and the great mass of landowners to entrust the management of their property to their agents, and the cultivation to their tenants, it is most important that the agent be qualified to carry out, on the principles of equity, the terms of occupation; for, otherwise, however well-intentioned he may be, he will inflict an injury upon his employer or his tenant." In the former case, as the author judiciously observes, that, "in deviating from the system of farming generally pursued, a hundred unforeseen circumstances may arise, requiring, in such case, immediate attention, and most important consideration being claimed. In climate which governs the productions of all countries, and he who bestows upon it the greatest consideration will succeed the best."

The articles on drainage and irrigation are illustrated with some instructive sections. The author being already favourably known for his essays on farm buildings and labourers' cottages, it may be imagined that these are not overlooked; in fact, his observations on the former will receive attention from all who peruse his work, characterised as this section is by his clear views on the subject and excellent practical suggestions and plans which he has given in order to purchase property having old dilapidated buildings thereon, we commend the judicious observations of the author

THE DREAMER AND THE WORKER. A Story of the Present Time. By R. H. HORNE. 2 vols. Colburn.

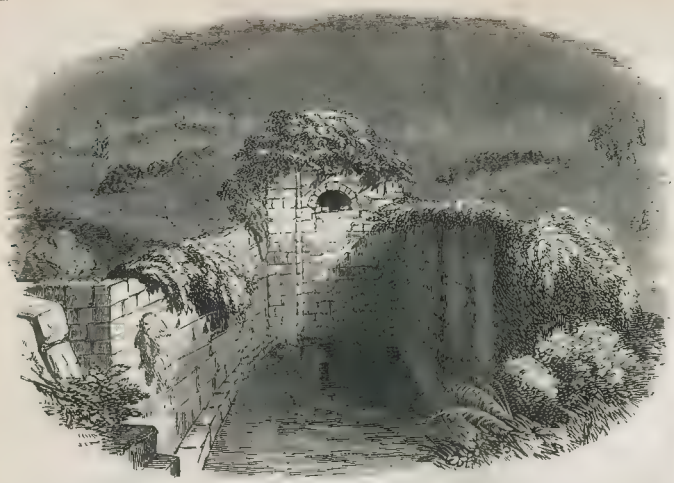
We have here a delightful book, and, notwithstanding the contrary impression conveyed by the title, a reconciling one. Its tendency is not so much to illustrate the antagonism between the Dreamer and the Worker, as the points of contact and agreement. The theme is extremely treasy. Out of the speculations of the Dreamer come the operations of the Worker; the latter being but the embodiment of the idea contained in the former. The dream is adopted by the worldly and the speculative, succeeds or fails in their hands, and is then carried out to its results by those whose industry substitutes capital. With all this is blended a delicious tale of love. How the Dreamer saves the mind of the Worker to the beauty that he is himself idolizing; how the woman in whom is idolized feels the imperfection of herself as its representative; how, with the noblest self-devotion, she seeks a worthier mate in the mechanic, whose mind, elevated by the visionary, is made to approximate to her own, which occupies, as it were, a mid-point between the practical and the ideal; and how, in the circle of friendship, a more than shrine for the beautiful, after the poet's idea of it, is found for the Dreamer himself: all this the story presents with admirable tact. The style of these volumes is light, airy, and sparkling, flowing, easy, and narrative. Mr. Horne, too, shows no mean power of caricature in some of his portraits; and he makes as much as well as thick. The moral is of the noblest—demonstrating the mutual necessity the Dreamer and the Worker have for each other. So far as it enforces the need of poetic taste as an element in the education of the working classes, so that the leisure of the labourer may be capable of devotion to the beautiful, as his industry is in the elaboration of the useful, this production is likely to be of inestimable benefit. At any rate, the work is consecrated to the service of the intelligent artisan; whose condition may it help to improve, to elevate, and to set free from all social discomforts, while it expands the Workman into the Man.

MADAM DORRINGTON of the DENE: the Story of a Life. By WILLIAM HOWITT. 3 vols. Colburn.

This is one of Mr. Howitt's best novels, painting the country life of the wealthy in England some half-century ago with full knowledge and great dramatic skill. It is the romantic made out of the real, and bears evidence of the fact in every line. Mr. Howitt describes from experience. His characters are actual individualities. Madam Dorrington herself is the type of charitable ladies—an angel of blessing to a rural neighbourhood. Mr. Howitt has invested the whole scene with attributes of beauty. The descriptions of the Dene, the nest, and the bee-swarming, at the commencement of the tale, are all charming.

In a certain sense an enthusiast and a mystic, Madam Dorrington presents a zeal for the analysis of her romancer. But Mr. Howitt does not "murder, to dissect." He presents her, a living being, uninjured, and in the very habit in which she must have appeared to his actual vision. The benevolent gentlewoman beams in many fine lines, and makes a "sunshine in the shady places," which she was wont to haunt as their genius and guardian spirit.

"In fact, Mrs. Dorrington was the Eve of Westwood; and though in the retirement of a secluded country, never knew what it was to be in want of occupation. By the sick-bed of the cottage, or the farm-house, by the bed of death, or in the hours of domestic ease and peace, she was a welcome and a cheering visitor, and had generally some thorn of human care to extract, or some ruffled current of life to cast the veil of reconciliation upon. Such were her occupations and pleasures; and an unceasing pleasure to her was the enjoyment of the country herself, with all the changes and developements which the onward roll of the seasons produced. Flowers and the music of birds were to her the most exquisite gratifications. She regarded flowers as revelations of heavenly beauty—she heard in birds' songs the language of a life to us yet but dimly known. She watched the growth, bloom, and decay of every flower, from the earliest primrose to the latest aster, and through gorgeous bloom of autumn. There were little grass and a footpath down the Dene to the very heath in the distant valley, which permitted her, at any hour, to ramble through their own sheltered and beautiful bosom



SCENE FROM THE MOVING DIORAMA OF "JERUSALEM AND THE HOLY LAND."—THE POOL OF SILOAM.—(SEE PRECEDING PAGE.)

In 1754, the polite Chesterfield and the witty Walpole felt it no degradation to the work over which they presided, that it should be joosse about his fraternity, and hold that his profession was more dignified than that of the author:—

"Far be it from me, or any of my brother authors, to intend lowering the dignity of the gentlemen trading in black ball, by naming them with ourselves: we are extremely sensible of the great distance there is between us: and it is with envy that we look up to the occupation of shoe cleaning, while we lament the severity of our fortune in being sentenced to the drudgery of a less respectable employment. But while we are unhappily excluded from the stool and brush, it is surely a very hard case that the contempt of the world should pursue us, only because we are unfortunate."—*The World*, No. 57.

This is pleasant banter, though it may have helped to perpetuate a popular error as to the condition of authors in the present day, but cleverly corrected at the Literary Fund festival on Monday week, when Mr. Thackeray repudiated that pity which so many people, taking their cue from the degraded literary hacks of George II., are so very much disposed to bestow upon them. "The patron and the gaol" have alike ceased to be words of fear in the ears of the literary men of England.

Gay makes his "black youth's" mythological descent from the goddess of mud, and his importance in a muddy city, the subject of the longest episode in his amusing "Trivia." The shoe-boy's mother thus addresses him:—

So thrive: at some frequented corner stand;
This brush I give thee, grasp it in thy hand
Temper the foot within this vase of oil,
And let the little Tripod aid thy toil;
On this methinks I see the walking crew,
At thy request support the miry shoe;
The foot grows black that was with dirt embrown'd,
And in thy pocket jingling halfpence sound.
The goddess plunges swift beneath the flood,
And dashes all around her showers of mud:
The youth straight chose his post; the labour ply'd
Where branching streets from Charing-Cross divide;
His treble voice resounds along the Mews,
And Whitehall echoes—"Clean your honour's shoes!"

The cry is no more heard; but the professional Shoe-black has reappeared in our streets, possibly suggested by the great influx, this season, of visitors from the Continent, where boot-cleaning is carried on in well-appointed shops: the Parisian, for example, occupies a velvet-covered seat, and reads the newspaper, while his vaunted boots are re-polished. In London, the black revival is under different auspices, being, in fact, a measure of the enlarged philanthropy of our times, the common-sense of which consists in employing the unemployed. The Shoe-black Brigade is an offshoot of the Ragged School system, and is a sensible provision for an obvious want in a well-dressed capital. Each of the members of the Brigade wears a number, and is accountable for his conduct: his coat is scarlet, which is characteristic of a brigadier, but may possibly shock the tender nerves of the Peace Society more than would the items of an Ordnance estimate, and may likewise give offence to the sensitive class of politicians who, in every floating feather, see a standing army. Bating this inappropriateness of warlike costume for a very peaceable employment, the Shoe-black Brigade is entitled to our commendation; and the accompanying portrait may serve to direct the reader's attention to one of the many social novelties of the Annus Mirabilis 1851. The charge for cleaning is 1d. each person: there are 24 in the brigade, and to each is given 8d. of every 1s. received.

REVISION OF THE FRENCH CONSTITUTION.

THE days of the unlucky document under which France is at present governed, appear to be fast drawing to a close. Since its fundamental principle of universal suffrage was invaded and destroyed by a Chamber elected by its means, with the avowed object of striking a blow at the position of a President who was supposed to rely upon it for the perpetuation of his power, the Constitution has been a by-word of contempt for all parties in France, except the Republican *doctrinaires*, who have faith in M. Armand Marrast and General Cavaignac. The Legitimists and Orleanists desire to overthrow it, because it is an obstacle to the restoration of the Monarchy. The Bonapartists aim their blows at it, because, unless it be modified, the re-election of Louis Napoleon can only take place by a *coup d'état*, which is a hazardous expedient at all times, and would be more than usually hazardous at present; and the democratic and social Republicans, although they would defend it against the assaults of the Monarchical and Imperial factions, have no great affection for it in itself. They would infinitely prefer a Constitution which should abolish the Presidency altogether, and leave the supreme direction of public affairs to a Committee of Public Safety, as in the days of Robespierre and St. Just. Thus, the Constitution has but few friends, except in the immediate and small circle of its parents and founders, who fashioned it upon a theory regardless of practice, and who imagined that the French understood Republicanism as the Americans do, and that they would live contentedly under a similar system. If, for the time being, the ranks of its friends are augmented by the social and democratic Republicans—the men of the scarlet flag—their alliance is of little value; and their success in defending it against the attacks of the ancient minority of Louis Philippe and the friends of the House of Bonaparte, would be but a prelude to its utter destruction at a future time. All parties have felt the inconvenience of prematurely meddling with it, and by one consent the evil day of its revision has been adjourned to the latest possible moment. But the time rapidly approaches when the subject can no longer be postponed. Willingly or unwillingly, it must be taken up, unless the solution of the difficulty be left to the perilous contingencies of a direct appeal to the people by the actual chief magistrate, or the re-enactment of a new 18th of Brumaire. The Bonapartists themselves would scarcely risk such an alternative as either of these, and the two Monarchical factions are quite as averse from giving the Imperialists the chance. The three parties are, therefore, on the alert to procure the revision by legal means, while the two Republican factions, the *Doctrinaires à la Marrast* and the *Socialists à la Ledru-Rollin*, find themselves, by a strange turn in the great wheel of politics, the sole friends of law and order in France, as far as law and order are represented by the legal, valid, and existing document which the President and every member of the Chamber has sworn to uphold. The perplexity of the situation is, that the document—to which all these gentlemen owe their position and authority—is one that can neither be upheld nor destroyed with safety; that it is so utterly unsuited to the wants and sympathies of the country as to provoke no regret from the whole bulk of the commercial and industrial classes, and so unfit for the purposes of Government as to place the Executive and the Legislative in a permanent dead-lock. However dangerous and difficult its revision may be, it is felt that it is quite impossible to go on with it. The evil day must, therefore, come; and all parties are preparing themselves vigorously for the inevitable struggle which will result, each with the hope of turning the event to its own advantage, and to the discomfiture of its political rivals.

One of the most noticeable facts in the present state of French affairs, with reference to the Constution, is that the movement against it has not been organised in Paris, but has spontaneously arisen from the general feeling of the provinces. The great commercial and industrial towns, and nearly the whole of the departments, have already pronounced for the revision; and their petitions to this effect, all numerously signed, begin to encumber the tables of the Assembly. Some demand the total revision; but no Republicans, of any tint—pale rose or deep red—appear among the number. Others ask for no more than the alteration of the clause which prohibits the re-election of the President. The Monarchists of one section, in their club, founded by Count Molé in the interest of the Orleans family, insist upon the total revision. The Legitimists are equally decided upon that point, with the exception of a small section among them, who incline to the belief that the prolongation of Louis Napoleon's tenure of office would increase the chances of the County de Chambord. The Bonapartists express their satisfaction with the Constitution in all respects save in the one clause which would consign Louis Napoleon to private life in the year 1852, and will hear of no more extensive revision than that which would suit their immediate purpose. The great preponderance of petitions seems to be in favour of this idea; and the French prints teem with lists of the departments, towns, and communes from which petitions have already emanated in one or the other of these two intentions. Without waiting for the *mot d'ordre* from those busy spirits of the metropolis, who were ever the directors of all political movements in France, the inhabitants of the provinces are expressing their own views—for the part with a calm good sense, which augurs well for their political education, and for the future good government of the country. Revolutions will not be of such easy accomplishment in France, if the provinces learn to think for themselves.

The debates in the Legislative Assembly, which for the last few weeks have been of a cooler and more decorous character than usual, begin to be animated by the heats of this great impending controversy. The members grow personal and violent—and the ordinarily cautious and phlegmatic begin to speak out. Even General Cavaignac expresses the readiness of himself and his friends to defend the principles of pure republicanism at the hazard of their lives—a declaration aimed equally against both sections of the Monarchists, and against the Imperialists. But, as the question advances to maturity, and as the full extent of the danger to all parties of a violent solution becomes more and more apparent, it is to be anticipated that these heats will cool down, and that Louis Napoleon—strong in doing nothing, as well as in his great name and undiminished popularity—will ultimately find himself legally re-eligible to the Presidency. The wish of the provinces evidently leans to that solution; and there is no party in Paris beyond the walls of the Legislative Assembly which is strong enough to thwart it. Violent as the Legislative Assembly has been, unjust and traitorous as it has shown itself, it will not, we think, assume so dreadful a responsibility as to leave the question to be settled by force of arms, or by a *coup d'état* amounting to a revolution. Louis Napoleon has hitherto shown himself wiser than his friends. He has never aspired to be anything but the legally elected President of the people; and if he confine himself to that aspiration—and there is nothing in his conduct, past or present, which should lead the world to doubt his good faith—he will continue, as before, the master of the situation, and entitle himself to the gratitude of all those who desire peace and repose as the only foundation upon which true freedom can be built.

The Customs duties received at Dublin for the week ending Monday, were:—Tea, £6162 11s. 11d.; tobacco, £3969 14s. 2d.; sugar, £2343 6s. 4d.; wine, £1878 18s. 4d.; spirits, £450 17s. 7d.; miscellaneous, £1379 12s. 8d.: total, £16,553 9s.

GRAND CONCERT AT BUCKINGHAM PALACE.

(See the Illustration on the preceding page.)

On Wednesday evening, the Queen gave a second State Concert at Buckingham Palace, in the grand saloon. Upwards of 300 invitations were issued, including the Royal Family, foreign Princes, the diplomatic corps, and a large circle of the principal nobility. Her Royal Highness the Duchess of Kent was accompanied by his Serene Highness the Prince of Lehaingen. Prince Edward of Saxe-Weimar was also present. Her Majesty and Prince Albert entered the concert-room, accompanied by their illustrious visitors, and attended by the ladies and gentlemen of the Court in waiting. The performance then commenced, Mr. Costa presiding at the pianoforte, as depicted in our Engraving. The following is the programme:—

PARTE PRIMA.

Quintetto, "Scrivermi ogni giorno," Mesdames Grisi e Castellan, Signor Mario, Herr Formès, e Signor Lablache ("Cosi fan tutti")	Mozart.
Duo, "Se inclinassi à prender moglie," Signori Gardoni e Lablache ("Italiani in Londri")	Rossini.
Air, "Gli la stella vespertina," Signor Mario ("La Canzone del Pellegrino")	Kücken.
Trio, "Fia grata al ciel," Madame Castellan, Signor Gardoni, e Herr Formès ("Fidelio")	Beethoven.
Air and Variations, "Cease your funning," Miss Pyne..	Bochsa.
Duo, "Nella notte," Madame Grisi e Herr Formès ("Gli Ugonotti")	Meyerbeer.
Sestetto, "Sola, sola," Mesdames Grisi e Castellan, Miss Pyne, Signor Mario, Herr Formès, e Signor Lablache ("Don Juan")	Mozart.
Trio, "Ah! che accolto!" Madame Castellan, Miss Pyne, e Sig. Gardoni ("Fealschitti")	Weber.
Air, "Ich möchte wohl," Herr Formès ("Die Schildwache") ..	Heisel.
Air, "Guida un bord ta nacelle," Sig. Mario	Meyerbeer.
Duo, "Signorina ni tanti frutta," Madame Grisi e Sig. Lablache ("Don Pasquale")	Donizetti.
Air, "Ah! se estinto," Madame Castellan ("Donna Caritea") ..	Mercadante.
Trio, "A tre leggo," Madame Castellan, Sig. Mario, e Herr Formès ("Robert il Diavolo")	Meyerbeer.
Finale, "Gl'inmfamma il cor," Miss Pyne, Madame Castellan, Sig. Mario e Gardoni, Herr Formès, e Sig. Lablache ("Il Serraglio")	Mozart.

It is generally known that the Queen and Prince Albert are accomplished amateurs. Her Majesty, when Princess Victoria, was instructed in singing by Mr. Sale, and in the pianoforte by Mrs. Anderson, who is now pianist to the Queen and musical instructress to her Royal Highness the Princess Royal; subsequently her Majesty had lessons in singing from Lablache. The Queen has a sweet-toned soprano voice, sings with taste and feeling, and is an excellent connosseur. The Prince Consort is a thorough musician, and plays the organ with infinite skill. His Royal Highness has composed a full church service, which has been heard at the Chapel Royal, and has also written divers songs and duets. An Italian cantata, "The Invocation to Harmony," was executed with full chorus and orchestra at the Birmingham Musical Festival, and at the last State concert—a work of considerable merit. The Prince has a tenor voice. The Duchess of Kent has also composed several clever pieces, particularly a march. The Duke of Saxe-Coburg-Gotha, brother to Prince Albert, has gained great glory in Germany as the composer of two operas, "Cassalda" and "Zaire" (founded on Voltaire's tragedy) now playing at Gotha.

The Queen has a private orchestra, which plays both at Windsor and Buckingham Palace. Mr. Anderson is the director of her Majesty's private band, of which M. Sainton is first solo violin; Mr. Hill, first viola; Mr. H. Chipp, first violoncello; Herr Schroder, first contrabasso; and Messrs. Nicholl and G. Chipp, and other effective players, are members. In the selection of music executed by this orchestra, there is no exclusiveness in the choice of schools; the finest symphonies and overtures of all masters are selected, and very frequently choice compositions are heard for the first time in this country from her Majesty's private band. It will be remembered that Mendelsohn's "Athalia" and "Œdipus" were first performed here—the former at Windsor Castle, and the latter work at Buckingham Palace; the "Antigone," by the same composer, was also executed at the Palace. Beethoven's Battle Symphony was performed some four or five years since, with wonderful effect, at the Palace: the band of the Coldstream Guards, under Mr. Godfrey, representing the British army, marching from the dining-room up to the door of the saloon, where the drums and trumpets entrance: and the band of the Royal Horse Guards (Blue), depicting the French army, marching through a similar suite of rooms, to the opposite side of the grand saloon; whilst her Majesty's band, with additions from the Philharmonic orchestra, were stationed in the saloon, and, on a signal from the side drums being given, the bands marched up unseen to their places. The crash of the battle, when the three bands were combined, was grand and terrific. The Battle Symphony was done in the Waterloo Gallery last year; and, as there was increased space, the military bands marched in full uniform. Classical quartets and solos are frequently played before the Royal *dilettanti*.

At the State Concert at Buckingham Palace, Mr. Costa is the accompanyist. The singers are selected generally from the celebrities at both the Italian Opera-houses, and every artist of fame coming to this country is heard at the Palace. At the concert on Wednesday evening, it will be seen that Miss Louisa Pyne, the accomplished English vocalist, was included in the scheme, with Grisi and Castellan, Mario and Gardoni, Herr Formès and Lablache. Mrs. Anderson is the accompanyist at the private concerts at the Palace, at Osborne, artists of note are frequently commanded to attend. At the State Concert represented by our Artists, the singers sit in the room with the company until called upon to sing. Her Majesty and the Prince are very gracious to the professors, conversing with them in the most affable manner between the acts and at the end of the concert. Refreshments are handed round, and the programme lasts about an hour and a half.

During the season her Majesty and Prince Albert never fail to be present at a performance of the Philharmonic Society. Since the cessation of the Ancient Concerts, the oratorios at Exeter Hall, executed by the Sacred Harmonic Society, have been patronised by the Queen and Prince Albert, and frequently honoured with their presence. Whenever a national opera-house shall be organised on a basis indicative of a permanent existence, the gracious patronage of Royalty will be extended.

The grand saloon in Buckingham Palace, in which the concerts are held, is a magnificent apartment on the western side of the Palace, and is between the State Ball-room and the White Drawingroom.

The saloon is square in plan, with an elliptical portion on the western side forming a semicircular bay the whole width of the room; the walls are divided by three quarter columns, which carry an enriched architrave, into compartments, three of which are occupied by doorways, those in the bay by windows, and the rest are filled with large looking-glasses. From the architrave, on three sides, spring flattened arches, within which are bas-reliefs of groups of children, with emblems of music; and the ceiling, circular in form, is excessively rich in decoration, being entirely filled with elaborate panels of the rose, shamrocks, and thistles; and in the spandrils at the angles are the Royal arms, with winged globes (Egyptian symbols) around them. The ceiling of the bay is equally rich in decoration, but is divided by bands, the intervening spaces covered with rich acanthus leaves of small size and elaborate detail. The columns are scagliola, in imitation of lapis lazuli; and, from the capitals, architrave, and the whole of the architectural enrichments being gilded, this saloon has a most gorgeous appearance, whilst the massiveness of the chandeliers, and the numerous candelabra of classic design, add greatly to its variety and richness.

THE MARBLE ARCH.—(*To the Editor.*)—Sir—Allow me to correct an error which appeared in the ILLUSTRATED LONDON NEWS of the 24th instant, wherein it is stated that the sculptural embellishments of the marble arch, at Hyde Park, were executed by Flaxman, Westmacott, and Rossi. I believe I am correct in stating that Flaxman was the designer of the basso-relievi, &c., but the late Mr. Rossi had no connexion whatever with it. The north side, overlooking Oxford-street, was entirely executed by Westmacott; the reverse by Bailey, and the masonic portion by Brown, of Camarthen-street, who had the contract for that portion.—I am, sir, your obedient servant, TRUTH.

PROGRESS OF LOWESTOFT.—In the year 1841 the population of this town amounted to 4832. The results of the castings of the seven enumerators' districts, as taken on the 31st March, show the present number to be 6594—giving an increase in 1850, or nearly 28 per cent, during the past ten years. In that portion of our town denominated the Beach, there are—inhabited houses, 218; uninhabited, 2; building, 5. Males, 883; females, 533: total, 1116. This is exclusive of the new town and watering-place, which have sprung up so rapidly on the south side of the harbour within the last few years.—*Norwich Mercury.*

ACCELERATION OF THE MAILS FROM IRELAND.—The postmaster-General purposes carrying into effect, in conjunction with the authorities of the London and North-Western and Chester and Holyhead Railways, an arrangement by which passengers, letters, and newspapers, leaving Dublin at 7.0 P.M. each evening, will reach London at 10.30 A.M. the following day, instead of 1.0 P.M., as at present. This will save a day for the course of post between London and the whole of Ireland.

FOREIGN AND COLONIAL NEWS.

FRANCE.

On Wednesday last the Legislative Assembly entered upon the third and last year of its existence; and, as from that date the Constitution admits of any motion being brought forward for its revision, the question has received renewed attention this week which adds intensity to the struggles of the parties for and against that measure.

The most extraordinary feature of the question is, the different and contradictory results which are expected from this contemplated revision of the Constitution by the various political factions.

From it the Buonapartists are confident that it will maintain the Republic on a more secure footing, by prolonging the tenure of power by Louis Napoleon beyond the term at present fixed by law, until the arrival of a more tranquil period, at which, whenever it may occur, the destinies of the Republic may be entrusted to other hands. The Legitimists, on the contrary, trust that through its means, the Republic may be overthrown, and on its ruins the throne of Henry V. be raised in all the splendour of the old Bourbon *régime*.

The petitions to the Assembly in favour of the measure in the meantime appear in great numbers, a considerable portion of them praying for a revision, as in the Buonapartist sense.

In the Assembly a bill for the organisation of the National Guard has caused much discussion of an angry nature. On Wednesday, during the debate on this bill, General Grammont proposed that all persons delonging to this body should be answering to their names when called, in the event of an *émeute* should be published as cowards. As a reason for this motion, the gallant officer sta ed that at the revolt of Lyons, in 1848, the National Guards slunk away, and threw the whole of the military duty upon the regular troops. Hereupon M. Baune gave Gen. Grammont the "lie direct," and pronounced his statement a gross calumny. Three or four speakers rushed to the tribune, and a great deal of noise was in prospect, when the Assembly called for a division, and Gen. Grammont's motion was lost by a majority of 100.

After the House had adjourned, General Grammont challenged M. Baune to a duel with sabres, which was accepted, but the combat had not taken place when this account left Paris.

On Tuesday M. Cournet, a retired lieutenant of the French navy, and M. de Lasp erre, editor of the *Mode*, were found guilty of fighting a duel, in which both were wounded, on the 16th ult., it being an offence against the law. M. Cournet was sentenced to a month's imp isonment. M de Lapierre was sentenced to imprisonment for three days. The four seconds, who were also tried, were fined 50 Francs each.

M. Pannier, the director of the *Charivari*, and M. Vercier, an artist, were tried and found guilty on Tuesday for lampooning the President of the Republic. The former was sentenced to six months' imprisonment and 2000f., and the latter to two months' imprisonment and 100f. fine.

PORTUGAL.

According to the latest advices from Lisbon, which are dated the 23d inst., the Duke of Saldanha, who had arrived in the capital from Oporto, accompanied by 3000 troops, on the 18th inst., amidst the congratulation and rejoicings of the people, had succeeded in forming an administration, which, from its talent, integrity, and the official experience of its members, seemed likely to last some time. It was composed as follows:—

President of the Council and War Department, Duke of Saldanha; Home Department, Senhor Prestina; Foreign Affairs, Senhor Jervis de Atouguas; Marine, Marquis de Louie; Finance—Senhor Franzina; Justice, Senhor Sousca.

All of these gentlemen had held office under other ministers. The first act of the new Government was to put down the late Minister, the Count de Thomar's press law. The Cortes were to be dissolved, and a new election to take place as soon as possible. Tranquility prevailed throughout the provinces and in Lisbon.

DENMARK.

Accounts from Copenhagen state, that, at a Cabinet Council held on the 23rd inst., it was decided that Prince Christian of Glucksburg, who is to be adopted by his Majesty, is to succeed to the throne at the King's death.

UNITED STATES.

Advices to the 12th, from New York, represent the projected Cuban expedition, which had been somewhat prematurely and wholly broken up, as not entirely abandoned; it was the intention of the leaders not formally to organise the expedition in North America, but to sail unorganised to some point beyond the boundaries of the United States, and there make such arrangements as should be deemed expedient. In connexion with this subject is mentioned the chartering by the United States Government of the *Crescent City* steamer, with 700 troops on board, having orders to coast between New York and Havannah. By many, however, this movement of troops was regarded as a measure of precaution, in case the South Carolina secessionists should urge their opposition to the Central Government, at Washington, to the point of rebellion.

A destructive fire occurred on the 22nd ult. at San Fé (New Mexico), by which the Custom-house Exchange, with all its contents, was burned to the ground. The loss is estimated at upwards of 20,000 dollars. The following curious commentary is appended to the report given in the *New York Tribune*:—"The fire has thrown very injurious to Santa Fé, as the Exchange was the prine ipal gambling and drinking place in town. You are aware, probably, that several murders have taken place in the Exchange, and a thousand fights beside. Mr. Green, of Missouri, one of the proprietors, was a most amiable man, and the public deplores his loss. Gambling still continues unabated."

Colonel Sumner, who was about to take the command of the United States military force in the department of Santa Fé, would take out with him several hundred fresh recruits to fill up the companies now in New Mexico. He had also authority to take a large number of sheep, cattle, hay, corn, stock, farming utensils, and apparatus for irrigating and otherwise developing the capacity of the soil. It is believed the head-quarters of the army, and the principal part of the troops will be stationed there on his arrival. Los Vegas is spoken of as the place for the head-quarters, while a sufficient number of troops will be retained in Santa Fé to protect that city. It is designed to make the journey to New Mexico, as far as possible, settlement.

Something in the nature of a "Royal Progress," by President Fillmore, accompanied by his family, the Secretary of State and other officers, from Washington to New York, to witness the opening of the New York and Erie Railway, was commenced on the 12th inst.

EMIGRATION TO AUSTRALIA.—"Mrs. Chisholm's emigrants," says the *Melbourne Daily News*, just received, "could not have arrived at a more fortunate period, and the only regret is that their number is not tenfold; they will be instantly absorbed, and make as much impression on the labour-market as a snow-flake in the ocean; for it is a well-known fact that in the fifteen months ending March, 1849, *seventeen thousand persons were added to our population*; notwithstanding which, labour continued as high as ever, and wages have gradually risen up to the present hour—risen, in fact, until *the squatters have stopped the increase of their flocks*, every industrial branch checked and 'shortened in sail' by the enormous charge for labour. The Sirius, which left Cork during the same year, were imported 14444 gallons of sweets or made wines, at 7½d per gallon; 53½ gallons of ether, at 12s. 10d. per gallon; 1843½ gallons of sweet spirits of wine, at 7s. 9d. per gallon; and 3½ gallons of tinctures, &c., at 2s. 3d. per gallon.

A correspondence is just published between the Poor-law Commissioners and the guardians of the Thurles Union (Ireland) relative to the encouragement to be given to such pupils of other unions as assemble in the industrial schools of that union. The commissioners object to the proposals of the guardians as tending to hold out inducements to remain in the workhouse, as well as to lead to increased application for relief. The guardians combat the opinion thus given, and maintain that every institution should, if possible, support itself, pointing to the encouragement given to prisoners in similar cases, and asking if "those whom God has smitten with poverty shall be degraded, discouraged, and ill-treated, even below the level of a culprit?"

From 80 to 100 acres of flax have been sown in Caithness on some twenty or thirty different farms, and comprising soil and preparation as varied, in all parts of the country, that a fair trial will be given to it. Some small spots on the mainland, as well as on the island of Sanday, Orkney, have also been sown.

IMPERIAL PARLIAMENT.

HOUSE OF LORDS.—MONDAY.

In the House of Lords, on Monday night, the Earl of BELLENROCOUGH moved for the production of certain papers having reference to the distribution of prize money and officers' batta during and after the campaign in the Punjaub.

A discussion ensued, involving the question whether the Governor-General, as the representative of the East India Company, had authority to distribute the prize money, which, by prescription, belonged to the Crown?

Lord Brougham, the Duke of Wellington, the Lord Chancellor, and the Marquis of Londonderry having spoken, the partial production of the returns was agreed to.

The Select Committee on the Episcopal and Capitular Estates Management Bill was nominated on the motion of the Earl of CARLISLE.

The Salmon Fisheries (Scotland) Bill was read a second time, on the motion of the Duke of ARGYLL.

HOUSE OF COMMONS.—MONDAY.

NEW MEMBER.

Mr. MORE O'FERRALL took his seat as the member for the county of Longford.

ECCLESIASTICAL TITLES ASSUMPTION BILL.

The order of the day having been read for going into committee on the Ecclesiastical Titles Assumption Bill, the House resolved itself into committee, Mr. Serjeant in the chair.

Mr. M'CULLAGH moved, in amendment to the first clause, the omission of the words "unlawful and," thus declaring the Papal rescript void, but not unlawful.

The SOLICITOR-GENERAL opposed the amendment.

Mr. GRATTAN and Mr. FEBL supported it.

On a divis on, the amendment was negatived by 179 to 43.

Mr. KNOX moved, as an amendment, the insertion of the words "in England after 1st July," with the intent of exempting Ireland from the operation of the clause.

Lord JOHN RUSSELL opposed the amendment.

On a division, the amendment was negatived by 84 to 39.

Mr KNOX then moved an amendment, to the effect that nothing contained in the Act should interfere with the ecclesiastical or spiritual functions of the Roman Catholic archbishops and bishops in the United Kingdom.

The ATTORNEY-GENERAL resisted the amendment as ungrounded, the bill not interfering with the exercise of functions properly ecclesiastical or spiritual.

After a lengthened discussion, in which Mr. A. B. Hope, the Earl of Arundel and Surrey, Mr. Anstey, Mr. Napier, Mr. Gibson, Sir H. W. Barron, Captain Taylor, Mr. Reynolds, and Mr. Moore took part, the committee divided, and the amendment was negatived by 344 to 59.

Mr SADLER moved another amendment, embodying the same principle in other words, which, after debate, was negatived by 278 to 47.

Mr KNOX moved a proviso to the effect that no indictment or other criminal proceeding should lie under the first clause.

Mr. HUMPHERY moved that the Chairman report progress.

Lord JOHN RUSSELL expressed his conviction that public opinion would condemn the course taken by honourable members in this discussion as unfair, however and over again, but he would not object to their having some time to reflect upon their conduct.

The House then resumed, the Chairman reported progress, and obtained leave to sit again.—Adjourned at a quarter-past two o'clock.

HOUSE OF LORDS.—TUESDAY.

Their Lordships sat a short time, and forwarded some bills on the table a stage, and then adjourned.

HOUSE OF COMMONS.—TUESDAY.

CEYLON.

Mr. H. BAILLIE called the attention of the House to the occurrences which took place at Ceylon under the government of Lord Torrington, and moved the following resolutions:—

That this House, when into its consideration the evidence addressed before the Select Committee appointed to inquire into the affairs of Ceylon, is of opinion that the punishments inflicted during the late disturbances in that island were excessive and unjustifiable:

That this House is of opinion that the execution of 18 persons, and the imprisonment, transportation, and corporal punishment of 40 other persons, on the occasion of the late outbreak, was the merciful administration of the British penal laws, and is not calculated to secure the future affections and fidelity of her Majesty's colonial subjects:

That this House is of opinion that these severities are the more sincerely to be deprecated as they were exercised after the suppression of the disturbances, during which none of her Majesty's troops or public servants were killed, and only one slightly wounded.

That a copy of this address be transmitted to the late Governor of Ceylon, in keeping in That this House is of opinion that the conduct of the late Governor of Ceylon, in keeping in force martial law for two months after the chief legal adviser had recommended its discontinuance, and during which period the civil courts were open without danger or interference, and also in his refusal to allow a short delay in the execution of a prisoner, at the request of the Queen's Advocate, who wished further investigation into the case, was in the highest degree arbitrary and oppressive.

That this House is therefore of opinion, that the conduct of Earl Grey, in signifying her Majesty's approbation of the conduct of Lord Torrington during and subsequent to the disturbances, was prejudicate and injudicious, tending to setab his precedents of rigour and severity in the government of her Majesty's colonial possessions, and injurious to the character of this country for justice and humanity

The hon. gentleman condemned the conduct of the select committee, which had done all it in its power to screen Earl Grey, and while declining to make any report had privately arranged with the noble Earl that Lord Torrington should be recalled. He then referred to the merits of the case, and strongly urged that there was no necessity for resorting to martial law, and after it had been established it was conducted in a manner as illegal and unjust as it was cruel and sanguinary.

Mr. Serjeant MURPHY, as the friend of Lord Torrington, and having investigated the matter fully, defended the conduct of the noble Lord, and contended that martial law was not martial law under the Mutiny Act, as supposed by Mr. Baillie, but the mere will of the commander of the forces, and that in the case before the House there was sufficient evidence of an extensive insurrectionary character to justify stringent measures for its suppression. As a proof that there had been an insurrection, and that the courts-martial were justified in the convictions they had arrived at, he referred to the fact that no less than 18 persons were convicted and sentenced to death by the Chief Justice, although, on his recommendation to the Governor, their lives had been spared. He denied the cruelties alleged against Lord Torrington, and, after a long and elaborate review of the transactions at Ceylon, said that a verdict adverse to that nobleman would tend to damp the energies of public servants who might have to administer important duties in times of difficulty and danger.

Mr. E. SEYMER did not mean to impute improper motives to Lord Torrington, but he thought he was a man of no experience, and whose chief qualifications for the high post he had held were his having been a railway director and a builder of cowsheds. The real party to blame was the noble Lord at the head of the Colonial office. The rebellion as treated as a trumpery matter, which had been magnified into importance by the severities resorted to after it was put down. He should certainly give his cordial support to the resolutions of Mr. Baillie

Earl GROSVENOR defended Lord Torrington, contending that the course he had pursued was justified by the necessity of the case.

Mr. ROEBUCK said that Ceylon was rather an onerous possession of this country than a colony. It was conquered by the sword, and by the sword must be maintained, and the way in which he should test good government in such a case would not be by the principles of constitutional rules, but rather by the result, and the result in this case proved that security had been established. Good government in Ceylon would not be constitutional government, which would not be applicable to a country which could only be properly ruled by an enlightened despotism. Lord Torrington had acted with firmness and energy in suppressing a wide-spread conspiracy; and now his conduct was made the groundwork of the charges against him; charges, had he been vacillating, the result might have been a lengthened warfare with an immense sacrifice of human life. He felt it necessary to come forward as the representative to defend Lord Torrington, when he saw that the Government, from motives of terror at the strength of the opposition, had abandoned him to his fate. In reference to the assertion of the hon. gentleman the member for Rowes, the hon. and learned gentleman said it could not be heped, for if he had been deprived of his yellow robe, he would only have had nature's garment beneath—he would have been literally naked. He (Mr. Roebuck) would, however, go further, and at once avow that if he caught a priest in rebellion, and if he should be convicted of high treason, he would execute him as a priest, and in his sacerdotal robes. Under all the circumstances of the case, the committee of the thirteen persons a most unusual proceeding, and he also insisted that the Chief Justice was extremely to blame in allowing it to become known that he had recommended the Governor to extend mercy to his guilty parties, as a sufficient number of examples had been made.

Mr. HUME said, that, if the House was to be governed by the evidence before it, the result would be very different from that which his hon. and learned friend had arrived at. He (Mr. Hume) was satisfied to look at the result, without at all looking at the manner in which that result had been obtained. He could not agree to view the matter thus, nor to look upon Ceylon as a possession in which the inhabitants had no rights of any description whatever, and in which the Governor was to be allowed to do just as he pleased with the lives and properties. He had served on many committees, but he was never on a committee yet in which such efforts had been made by the Government to prevent the elucidation of truth. The speeches of Mr. Serjeant Murphy and Mr. Roebuck, he contended, perfectly visionary; for there was not one tittle of evidence in the blue books calculated to sustain their statements. He regretted that his friends around him, who under other circumstances would be so ready to put down oppression, would not in this case support his views; not because they were not correct, but because they feared the result which would follow should the Government be defeated. He was sorry that their votes would be governed by other reasons than the merits of the case. Looking at the whole case, he felt he could conscientiously give his support to every one of the resolutions moved by the hon. member for Inverness-shire. If the House should unfortunately reject the motion, he felt that the inhabitants of our colonies could have no security whatever against their governors acting just as it might please them, for there would be an end to anything like responsibility.

Sir J. W. HOGG moved the adjournment of the debate.

Mr. HAWES asked for the indulgence of the House while replying to the charge of having falsified documents.

Mr. H. BAILLIE said he had only charged the Colonial Department with having done so.

Mr. HAWES said the documents had never passed through the Colonial Office at all. He held the original document in his hand, and it would be seen from that document that the falsification, as he called it, was, in fact, an error of the printer.

In reply to a question from Mr DISRAELI,

Lord J. RUSSELL said that the debate would be resumed on Thursday.—Adjourned at a quarter to two o'clock.

HOUSE OF COMMONS.—WEDNESDAY.

The House sat from noon to six o'clock.

CORONERS BILL.

Lord H. VANE moved the second reading of the Coroners Bill, the chief object of which was to pay coroners by salary instead of by means of fees, as at present.

Mr. FITZROY moved as an amendment, that the whole subject connected with the duties and remuneration of coroners be referred to a select committee.

Mr. HOWARD DE WALDEN seconded the amendment, which was supported by Sir H. GARY and other hon. members.

Mr. WAKLEY complained that the Government was always ready to abandon its friends for the purpose of conciliating its enemies. He supported the bill.

After some discussion, in which several hon. members took part,

Lord H. VANE postponed the second reading of the bill until after the committee should have made its report.

The amendment was then agreed to.

AUDIT OF RAILWAY ACCOUNTS.

The House next went into committee on the Audit of Railway Accounts Bill, and the discussion of the clauses occupied the greater portion of the remainder of the day. At length

Mr. PACKE moved that the chairman do leave the chair.

Upon this motion the committee divided, and it was carried by a majority of 63 to 57.

The bill was therefore defeated.

Upon the motion of Mr. S. COCHRANE, the Farm Buildings Bill passed through committee after a few verbal amendments. Adjourned.

HOUSE OF LORDS.—THURSDAY.

This being Ascension Thursday, their Lordships did not meet.

HOUSE OF COMMONS.—THURSDAY.

NEW MEMBER.

Mr. CRAWFORD, the new member for Harwich, in the room of Mr. Prinsep, whose election was declared void, took the oaths and his seat. The hon. member was introduced by Mr. Bagshaw and Mr. Aglionby.

NATIONAL LAND COMPANY.

On Sir H. Verney bringing up the report of the committee on this bill,

Mr. F. O'Connor entered into a statement of his connexion with the company, and asserted that, though he had paid the directors out of his own pocket, and incurred great losses, and almost ruined himself, he had never touched a penny of the peoples' money. (Hear.) Many of them had not paid a farthing of rent for years, and the company now owed him more than £7000. He defied any one to prove that he had not acted with the greatest integrity and honesty towards the shareholders, who now complained of his conduct.

Sir H. VERNEY observed that the committee had shown every degree of kindness and consideration to the hon. member in the course of the inquiry, which they had conducted with the greatest impartiality. He regretted very much to find that so much delusion had been practised on the unhappy persons who had been induced to invest their hard-earned savings in this delusive speculation (Hear, hear.)

Mr. H. HERBERT said he had thought it his duty to inspect two of the estates which were now under the operation of the bill, and he considered it only just to those unfortunate people who had been attacked by the hon. member for Nottingham, to say that their complaints were perfectly well-founded. They, one and all, complained that they had been induced by false pretences to leave their homes, where they might have supported themselves by honest industry, to go to a situation for which they found themselves totally unfit. Their appearance presented a remarkable contrast to the general body of labourers in the same part of the country. No person could look at the estates without seeing the entire failure of the scheme; and when they complained that they had no rent, he believed it was as much as they could possibly do to live, much less pay rent. (Cries of "Hear, hear.") Both the schools on the estate were perfectly deserted, one of them was full of straw and dirt, and the windows were broken, and through the apertures he saw a number of banners, which had, no doubt, been used on some triumphant occasion, the motto on the one conspicuous one being "Payment of Members." He confessed he felt great commiseration for the deluded people who had been induced to leave their homes, and he was thankful to God that the hon. member was not permitted to experimentalise on the larger scale with the noble people of England. (Hear, hear.)

The report was then received.

CEYLON.—ADJOURNED DEBATE.

Sir J. W. HOGG rose to resume the adjourned debate on the Ceylon question, and in doing so he expressed a hope that the House would grant him its kind indulgence, while he stated the reasons which had induced him to come to a conclusion he felt to be a great responsibility under which he had made this motion. He differed considerably from many members of the committee who investigated this matter, and he was one of the members of the committee who investigated this matter, and he could safely say that he attended every one of its sittings, and gave his best attention to its proceedings. His views upon various subjects that came before the committee were the result of sincere conviction, and he was, therefore, not the more surprised that the honourable chairman and other members of the committee in the manner he did on Tuesday evening. The hon. gentleman on that occasion charged the majority of the committee with combining together evidence of an extraordinary character, which was appointed, but he, for one, and he trusted his colleagues would follow his example, utterly denied the imputation. So far from having combined with the rest, he was purely, he might say, in the dark until he saw its report on the votes of the House he was perfectly ignorant of its contents. He was in terms of intimacy with the noble Lord who drew up the report, but nevertheless he repeated that not the noble Lord who drew up the report, but nevertheless he repeated that not the noble Lord who drew up the report, but nevertheless he repeated that not that or any other course was open to Lord Torrington than to suppress the rebellion in the best way he could.

The debate was continued by Sir F. THESIGER, who strongly supported Mr. Baillie's resolutions.

Mr. HAWES spoke in defence of the conduct of Lord Torrington and the policy pursued both by the local government of Ceylon and the Colonial Office.

Mr. GLADSTONE censured the conduct of Lord Torrington and of the Home Government, in sanctioning his cruel and sanguinary policy, and called upon the House, as they valued the great principles of the British constitution, viz respect for personal freedom and human life, to give a proof of their feelings in that respect, by supporting the resolutions of Mr. Baillie.

The ATTORNEY-GENERAL and Lord J. RUSSELL both defended Lord Torrington's administration, and the Home Government's support of it.

Mr. DISRAELI supported the motion.

The House divided—

For the motion	..	..	..	..	202
Against it	..	..	..	..	282
Majority	..	..	..	..	—80

The motion was accordingly lost.—The House rose at a few minutes before three o'clock.

COURT AND HAUT TON.

THE COURT AT BUCKINGHAM PALACE.

Her Majesty the Queen, accompanied by his Royal Highness Prince Albert, the Prince and Princess of Prussia, Prince Frederick William and the Princess Louisa of Prussia, their Royal Highnesses the Duke and Duchess of Saxe-Coburg-Gotha, and his Royal Highness Duke Ernest of Wurtemburg, left town for Osborne at the close of last week.

On Saturday a *matinée* was performed at an early hour, under the windows of the Queen's apartments, by the band of the Royal Marines, in honour of her Majesty's birthday. In the afternoon, the Queen and the Prince, accompanied by the Duchess of Kent (who had arrived at Osborne), and the whole of the august guests, took a drive into the interior of the island.

The Court returned to Buckingham Palace on Monday.

On Tuesday, the Queen and Prince Albert, with the Princess Royal, accompanied by the Prince and Princess of Prussia, and Prince Frederick William and the Princess Louisa of Prussia, the Duke and Duchess of Saxe-Coburg-Gotha, and Duke Ernest of Wurtemburg, proceeded before the ceremony of the Knights of the Bath, at the Exhibition, arriving at the Building at half-past nine, and remaining till nearly eleven o'clock. In the afternoon of the same day their Royal Highnesses the Prince and Princess of Prussia, Prince Frederick William, and Princess Louisa, attended by the Countess A. de Bocke, the Countess Oriolla, Count Pückler, Major Von Boyen, Count Goltz, Colonel Fischer, and Lieutenant Von Heinz, took leave of the Queen on their departure from England. In the evening her Majesty and his Royal Highness Prince Albert, accompanied by their Royal Highnesses the Duke and Duchess of Saxe-Coburg-Gotha, and Duke Ernest of Wurtemburg, honoured the Royal Italian Opera with their presence.

The Prince of Wales and Prince Alfred, attended by Mr. Birch, visited the Zoological Gardens in the Regent's-park, on Tuesday.

On Wednesday her Majesty held a Levee at St. James's Palace; and in the evening gave a concert to a party of upwards of 300, comprising a large circle of the diplomatic corps and the principal nobility.

Lord Dufferin has relieved the Marquis of Ormonde in his duties as Lord in Waiting to the Queen; and Sir Frederick Stovin has relieved Lieutenant-Colonel the Hon. Robert Boyle in his duties as Groom in Waiting to her Majesty.

THE QUEEN'S LEVEE.

The Queen held a Levee on Wednesday afternoon, in St. James's Palace, which was more numerously attended than any Court for several years past.

His Royal Highness Prince Henry of the Netherlands, attended by the Chevalier van Reppard, the Chevalier de Casembroot, and Captain May, of the Netherlands Royal Navy; his Royal Highness the Duke of Saxe-Coburg-Gotha, attended by M. B. de Treskow; his Royal Highness the Duke of Cambridge, his Royal Highness the Duke Ernest of Wurtemburg, and his Serene Highness the Prince of Leiningen, were present at the Levee

After the presentations, which were exceedingly numerous, both in the diplomatic and general circle, the Earl of Rodeu presented an address, signed by 30,000 Protestant subjects in Ireland, against Papal aggression, and praying that any measure adopted for Great Britain on the subject may be extended to Ireland.

The Earl Nelson also presented a petition, signed by 2000 clergy and 1200 laity of the Church of England, praying that all questions touching doctrine, which gave an appeal, or in her Majesty's temporal courts, may hereafter be referred to the spirituality of the Church of England; and, further, that her Majesty will be pleased to remove the impediments which now obstruct the exercise of the ancient synodical functions of the Church.

After the Levee, Captain Parker Rickford had an audience of the Queen in the Royal Closet, kissed hands on appointment, and received from her Majesty his stick of office as Exon of the Body Guard of the Yeoman Guard.

Her Majesty and Prince Albert returned to Buckingham Palace after the Levee, attended by the Royal suite.

His Excellency Count Schimmelpenninck (the Minister for the Netherlands), accompanied by Mr. Esdaile, Philippus Schimmelpenninck, was left London for the Hague, his Excellency having receiv d his letters of recal expressly to fill a higher post at the desire of his Sovereign. His Excellency, during Friday and Saturday, was engaged in paying P.C.C. visits to the Foreign Ministers and officers of state.

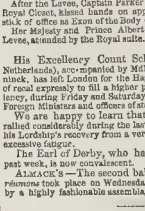
We are happy to learn that the venerable Marquis of Huntley has rallied considerably during the last few days, and there is now every prospect of his Lordship's recovery from a very threatening attack of illness, brought on by excessive fatigue.

The Earl of Derby, who has been seriously indisposed during the past week, is now convalescent.

ALMACK'S.—The second ball of the first series of these aristocratic *réunions* took place on Wednesday night, at Willis's Rooms, and was attended by a highly fashionable assemblage.

OBITUARY OF EMINENT PERSONS RECENTLY DECEASED.

JAMES-ANDREW-JOHN-LAURENCE-CHARLES DRUMMOND, VISCOUNT STRATHALLAN, one of the representative Peers, died on the 14th instant. His Lordship was son of the Hon. William Drummond, second son of William, fourth Viscount Strathallan, who, having espoused the fortunes of Charles Edward in 1745, was slain at the battle at Culloden, and had his name included in the list of Attainder, passed the following year. From that period the honours remained sheathed until 1824, when the noblem an whose death we record, was restored by act of Parliament, the Strathallan Drummonds are a younger branch of the family of the Earls of Perth, and belong to a race chivalrously and devotedly attached, in all emergencies, to the serves of their Sovereign



Lord Strathallan was born 24th March, 1767, and married, 15th January, 1809, Lady Emilia Sophia Murray, daughter of John, fourth Duke of Atholl, by whom (who died 19th June, 1849) he had issue six sons and two daughters. Of the latter the elder only survives, viz Marianne Jane, wife of Major George Drummond Greene, of Inchbrackie. Of the former, the eldest son and successor is William Henry, present Viscount, formerly an officer in the army, born on the 5th of March, 1810, and married, 25th July, 1833, to Christina Maria Herzey, youngest daughter of the late Robert Baird, Esq., of Newbyth, by whom he has several children.

The opulent and influential family of Drummond, so long established as bankers, at Charing-cross, a junior branch of the house of Strathallan.

THE DUCHESS DOWAGER OF LEUCHTENBERG

AUGUSTA AMELIA, Dowager Duchess of Leuchtenberg and Princess of Eichstadt, and late Vice-Queen of Italy, was the widow of one whose name will live in France's greatest story—Eugène Beauharnais. The Duchess was the daughter of Maximilian Joseph, King of Bavaria; she was born on the 21st February, 1788, and was married, the 14th of June, 1806, to Prince Eugène, just at the period when the fortunes of Napoleon were at their summit, and when the Emperor's fiat had made her husband his Vice-General in Italy. The high position of Prince Eugène was lessened by the fall of his Imperial step-father, but prosperity never entirely forsook him or his family. The Congress of Vienna having awarded him a donation from the King of Naples of 2,000,000 francs, he, with the Duchess of Leuchtenberg with H. Eugène died on the 21st February, 1824, and left issue by his Duchess two sons and four daughters. Of the sons, the elder, Augustus, succeeded to his Dukedom, and marrying Donna Maria, Queen of Portugal, died in 1835, two months after his nuptials: his brother, the second son, Maximilian, then inherited the Dukedom of Leuchtenberg, and is the present Duke. Of the daughters of Eugène and Augusta, **Josephine**, is the present Queen of Sweden; the second, **Amelia**, is widow of Don Pedro and Dowager Empress of Brazil; the third, **Theresa**, is wife of Count William of Wurtemburg. The widow of Eugène, the Duchess Dowager Augusta, the subject of this memoir, died recently in Munich, and the state funeral took peace at Munich, on the 17th instant.

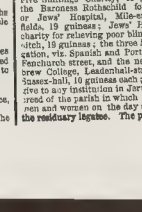
THE HON. FRANCIS CURZON.

THE Hon. Francis James Curzon was the youngest son of Richard Penn, late fifth Earl Howe, by his second wife, Felicité de Wattines, and was half-brother of Nathaniel, the present Baron. He was born on the 24th April, 1803, and was called to the bar by the Hon. Society of the Middle Temple, the 29th of May, 1829. He latterly filled the office of Deputy Registrar of the Court of Bankruptcy at Birmingham. Mr. Curzon died at Torquay on the 24th inst.

EDWARD CLOUGH TAYLOR, ESQ., OF KIRKHAM ABBEY, CO. YORK

THIS gentleman, formerly a magistrate, and Deputy-Lieutenant for the North and East Ridings of Yorkshire, died on the 14th inst., suddenly, of apoplexy, in the sixty-sixth year of his age. He was only child of the late Thomas Clough, Esq., and changed his name to Taylor, under the will of his cousin, the Rev. Henry Goodricke, of Sutton-in-the-Forest, whose first wife was Margaret, youngest daughter and co-heir of John Taylor, Esq., of Beverley.

Mr. Clough Taylor married, 8th January, 1823, Emma-Georgina, daughter of William Batcock, Esq., by whom (his wife, daughter of Richard Cumberland, Esq., and has left issue two sons and two daughters.



LADY ARDEN.

MARGARET ELIZABETH, Dowager Baroness Arden, relict of Sir Robert Arden, second son of the late Sir Thomas Spencer Wilson, Bart., of Charlton, in Kent, and widow of Charles George, the present Baron, established by the second marriage, of the late Earl of Egmont, and the brother of the immediate Percival, who was assassinated by Bellingham Lady Arden was married, 1797, to the said Lord Arden, who died on the 5th of July, 1840, leaving by her, with other issue, a son, George, present Earl of Egmont. The Dowager Baroness Arden, who died a few days ago, was a lady of strong benevolence, and was loved and generally beloved and esteemed.

CHARITABLE BEQUESTS BY THE LATE JOSEPH JOSEPH, ESQ., OF MONTAGUE-PLACE, RUSSELL-SQUARE.—To the Fund for Relief of Decayed Members of Stock Exchange, 19 guineas; and a like sum to London Hospital; to the Great Synagogue, Duke's-place, £50 for the poor of the congregation, and the Great Synagogue, Duke's-place, £50 for the poor of the congregation, and the Great Synagogue, Duke's-place, £50 for the poor of the congregation, and to Asher Goldschmidt Nappioch, a charity for distributing bread, coals, and meat in winter, 19 guineas; Zoncha Shubbeth, or Five Shillings' Charity, 19 guineas; Benevolent Institution, established by the Baroness Rothschild for lying-in women, 19 guineas; Nevah Sindic, or Jews' Hospital, Mile-end, 19 guineas, Jews' Free School, Spitalfields, 19 guineas; Jews' Hospital Society (instituted 5591), 19 guineas; charity for relieving poor blind Jews, 19 guineas; Jews' Infant School, Houndsditch, 19 guineas; the three Synagogues following, for the poor of each congregation, viz. Spanish and Portuguese, Bevis Marks, the Synagogue, Church-lane, Whitechapel, and the new Synagogue, St. Helen's, 19 guineas each; Hebrew Benevolent Loan Society, Finsbury-square; Hebrew Orphan Asylum, Watford, 19 guineas each; and a like sum for Sir Moses Montefiore, Bart., to Isaac-hall, 19 guineas each; and a like sum for Sir Moses Montefiore, Bart., to Spanish and Portuguese, Bevis Marks, the Synagogue, Church-lane, Whitechapel, and the new Synagogue, St. Helen's, 19 guineas each; Hebrew Benevolent Loan Society, Finsbury-square; Hebrew Orphan Asylum, Watford

EMBARKATION OF SIR ANDRIES STOCKENSTROM, AT CAPE TOWN.

EMBARKATION OF SIR ANDRIES STOCKENSTROM, AT CAPE TOWN.

A GREAT majority of the elective local boards of the Cape settlement have lately appointed a Colonial Deputation, to bring to the knowledge of the British Legislature the urgent wants of the colony as regards the reform of its internal government.

One of the most influential members of the deputation, Sir Andries Stockenstrom, left Cape Town in the *Maidstone*, on March 22, under circumstances which must have been highly gratifying to his feelings. He was escorted from Wynberg by a body of carriages and horsemen joined at various parts of the road, and particularly near Roodebloem, by further numbers of highly respectable inhabitants, not only of Cape Town, but of various parts of the country. At about a quarter past one, Sir Andries arrived at the Town House, where he was received by a large assembly with the most enthusiastic cheering, and a congratulatory address, in the Dutch language, was read to him.

Sir Andries briefly thanked Mr Loew and the other subscribers; and then received from Mr. Jarvis, the Chairman of the Municipality, a box, similar to that presented to Mr. Fairbairn, containing the petitions received from various bodies of the colonists since his colleague's departure. Mr Jarvis addressed Sir Andries, referring to Mr. Fairbairn's departure from the colony in October last year, with petitions and memorials to the British Government; and handing to Sir Andries similar documents, wished him a prosperous mission. Sir Andries replied, amidst continued interruption from the cheering in the crowded hall; and in the course of his address, observed: "I consider my worthy colleague, Mr. Fairbairn, fully competent to forward your interests without my assistance. I was, therefore, quite prepared at any time to alter my destination, and to head the Burgher forces against our barbarous enemies, if the colony and the Government had called upon me to do so. I should have done this, in defiance of the opinion of my medical friends, who declared that such conduct would be a species of suicide; and I believe myself better adapted for bush-fighting than constitution-making. But I am equally ready to join my colleague, since the colony desires it; I am proud to do so. I am grateful for the honour which you have conferred upon me." In conclusion, Sir Andries said: "I deem it my duty, on leaving you, to warn my countrymen once more against the danger of disunion. This is the block which has been cast in your way, and over which it is hoped that you will stumble, and shatter your rights and liberties in the fall. We know that this is as loyal a community as any in her Majesty's dominions. We know we are ready at any time to bleed in defence of the Queen's person and crown. We know that separation from that crown would be the death-blow of our prosperity. But we also know that the most loyal amongst us would be foremost in resisting every species of tyranny and corruption in the colonies, as the surest means of preventing the total wreck of Britain's colonial empire. Let, then, our motto be—*unanimity, determination, contempt of every species of intimidation and slander, faith in the Queen, faith in the British nation, faith in the justice of our cause; but, above all, faith in God.*"

The meeting then proceeded to the North Wharf, some accompanying Sir A. Stockenstrom, and the others proceeding forwards to secure a passage in the boats which were to escort him to the *Maidstone*. On board the ship crowds of the most respectable inhabitants of Cape Town thronged to bid Sir Andries farewell, and to offer him their hearty wishes for success in his mission, and his speedy and favourable return.

The *Maidstone* finally got under weigh at twelve o'clock on Sunday

By the aid of our obliging Correspondent at Cape Town, we are enabled to illustrate the Embarkation from North Wharf The departure of Mr. Fairbairn was engraved in the ILLUSTRATED LONDON NEWS for January 18th last.

Sir Andries Stockenstrom arrived at Plymouth on Friday evening by the *Maidstone*; and shortly after left by railway for the metropolis.

SILVER CUP.

THIS handsome piece of plate has recently been presented to the Deputy-Post-Captain of Cape Town, Cape of Good Hope, in testimony of his humane services on various occasions.

The testimonial is an embossed silver cup and cover, enriched with shell and coral-work; the handles of oak-branch design, on which are suspended wreaths of laurel; the whole supported by dolphins entwining an anchor with cables, &c., upon a rocky and shelly plinth. A view of Table Bay mountains and town is embossed on one side, with a stranded vessel, and a life-boat approaching to render assistance. The cover is surmounted by the figure of Hope, the titular and tutelar goddess of the Cape. The reverse bears this inscription:—

Presented, by merchants, shipowners, and others, inhabitants of Cape Town, to Mr. H. WILSON, D.P.C. of Table Bay, Cape of Good Hope, as a slight testimonial of their appreciation of his services in the cause of humanity, in assisting on many occasions to rescue the crews and passengers of stranded vessels. 1850.

SILVER CUP PRESENTED TO THE DEPUTY-POST-CAPTAIN OF CAPE TOWN.

RENEWED BRANCH EXPEDITION IN SEARCH OF SIR JOHN FRANKLIN—SAILING OF THE "PRINCE ALBERT."

THIS vessel sailed from Aberdeen on Thursday, the 22nd instant, at SIX P.M. The design is to proceed direct to Griffith's Island, which is the appointed rendezvous, ann the place where Captain Austin is likely to have deposited any important information of which he may be possessed. Should no such intelligence be found, the *Prince Albert* will proceed to winter ground, as far down Prince Regent's Inlet as can be reached for ice, possibly to Brentford, or Creswell Bay, from which the boat parties will be despatched. It is expected that a passage for a very considerable distance will be obtained for the boats in the channel, along the shore, formed by the flood tide, and which admits of boat, although not of ship navigation. Very much may be expected from the services of the boat parties; indeed, it may be safely affirmed, that by this means alone can success be obtained, if is is attainable. So far as human means can accomplish that result, we believe that, from the efforts of Mr. Kennedy and his men, there is much to hope in the way of, at least, relieving the deep and universal anxiety that prevails as to the fate of the missing Expedition. What adds to the reasonableness of this view is, that Sir John Franklin is most likely to have, if such a course had been practicable, retreated in the direction of Fury Beach, which

CARRIER PIGEONS FOR THE RENEWED BRANCH EXPEDITION IN SEARCH OF SIR JOHN FRANKLIN.

Captain Forsyth nearly approached last year, but without landing, as the only spot where he knew provisions were to be left by Ross, and he would also naturally judge that thither would anxious eyes be turned to seek to effect his discovery. If the *Prince Albert* should not accomplish the object of her search in the course of this year, it is the intention to remain two years, or till the autumn of 1852. It is of course a possible contingency, that, though some measure of success be attained, the vessel may be prevented by the ice from returning this season; so that in either of these cases, namely, detention in the ice, or want of success the first year, we shall have to wait for the return of the Kennedy expedition till the autumn of next year. The *Prince Albert* is amply provided in the way of stores till that period.

It is a somewhat remarkable coincidence, that it is precisely six years on Monday last since the departure of Sir J. Franklin. Mr. Leask, ice-master of the *North Star*, who piloted that vessel in 1849-50 through Baffin's Bay and Barrow's Straits, is in command of the vessel. M. Bellot, Knight of the Legion of Honour, and a distinguished officer of the French naval services, accompanies the Expedition. Lady Franklin, accompanied by her niece and never-failing friend, Miss Calcroft, arrived in Aberdeen, to witness the completion of the arrangements and the departure of the *Prince Albert*

Mr. Kennedy takes out with the Expedition seven carrier pigeons which may probably be found useful as the means of conveying to this country, or to America, any information which he may deem important. Six of these birds have been presented by Mr Hodgson, of Kennington and it is an important particular, deserving of special remembrance, that, in the case of their arrival in this country, means have been taken to ensure that there shall be no mistake as to the birds themselves, and also that the tidings of which they may be the bearers shall not be lost. The first of these objects is secured by the name of the donor—Hodgson—being stamped on the wings with a red solution of an abiding quality

"TEDDINGTON," THE WINNER OF "THE DERBY."

and the other, by the expedient of information being written in similar substance on thin linen, which is to be sewed about the leg. The other pigeon, which bears the name of Lady Ross, was presented by Mrs. Dunlop, of Ayr, and is believed to be the identical one (or one of two) sent home last year by Sir John Ross.

EPSOM RACES.—PORTRAITS OF THE WINNERS OF THE "DERBY" AND THE "OAKS."

'TEDDINGTON," winner of the Derby, is a chesnut horse, and the property of Sir Joseph Hawley. "Teddington" was bred in 1848 by Mr. Tomlinson, sire Orlando, winner of the Derby in 1844. The following are Teddington's performances.

1850. At Newmarket Second Spring Meeting lost start, and was not placed, for the Two Year Old Stakes, won by Coliculs. At Epsom, started for the Woodcote Stakes, but was driven out of his ground in making the turn, and finished third, the Marlborough Buck winning by a length, and the same distance between Buckbound and Teddington Won the Chesterfield Stakes at Newmarket July Meeting by a neck, beating Ariosto, Turtle, Theorem, the Rejected, Phlegra, Prestige, Virago filly, and Miserrima. At Goodwood, carrying 5lb extra, was a bad third for the Eglinton Stakes, won by Phlegra, Buckhound second. At the same meeting, carrying 6lb extra, won the Molecomb Stakes by a head, beating Hippolytus and Hurryscurry.

1851. At the Newmarket Craven Meeting, received 4lb from Midas in Sweepstakes, D.M., and beat him easily by a length. And on Wednesday last won the Derby in a canter, beating Marlborough Buck and 51 others

"Iris," winner of the Oaks, is the property of Lord Stanley. The following are the particulars of the race:—

The OAKS STAKES of 50 sovs each, h. ft., for 3-yr. old fillies, 8st. 7lb. each; the second to receive £100, and the winner to pay 100 sovs. towards the police and regulations of the course, and 50 sovs. to the judge. One mile and a half over the New Course.

Lord Stanley's Iris	(F. Butler)	1
Lord John Scott's Miserrima	(Whitehouse)	2
Mr. Gratwicke's Hesse Homburg	(Flatman)	3
Mr. Ford's Payment	(Bartholomew)	4

The following also started, but were not placed:—

Sir J. Hawley's Breba (J. Marson).
——— ——— Merry Peal (Pearl).
Mr. Hayter's Terpsichore (W. Day).
Mr. Payne's Catalpa (Dockeray).
Mr. Howard's Prestige (A. Day).
Mr. Humphries's Laura Myddelton (Longstaff).
Mr. Ford's Fortuna (Sly).
Lord Waterford's ch. by Birdcatcher out of Perdita (H. Robertson).
Mr. Jones's Ianthe (Thick).
Mr. Gratwicke's Anspach (Templeman).
Mr. Lillie nd. b. by Torryboy, out of Mazzel Ots (W. Abdale).

The moment the flag was lowered, Catalpa rushed to the front, but was immediately passed by a ruck of horses, Merry Peal taking up the running, followed by the Mazzel Ots filly, the Perdita filly, Anspach, and Miserrima, Breba heading the second division. On nearing the mile-post, Miserrima and Breba joined the leading horses, and the former immediately after took her place next Merry Peal, but the favourite was very soon in trouble, and at the turn was out of the race. Miserrima now took the lead, and at the same time Hesse Homburg, Payment, and Iris quitted the centre, following Merry Peal to the distance, where she gave way, leaving Hesse Homburg next Miserrima, Iris third, and Payment fourth. Half way up Iris went up and defeated Hesse Homburg, challenged Miserrima opposite the stand, headed her half a dozen strides from the chair, and won, without much to spare, by three parts of a length, Miserrima finishing two lengths before Hesse Homburg, the latter beating Payment by a length. Prestige had away from her horses to the turn, passed the beaten lot inside the distance, and was fifth past the chair; Terpsichore was sixth. Merry Peal seventh, Breba eighth, and the Perdita filly ninth. Fortuna, who broke down in coming down the hill, and Laura Middleton, were beaten off. Run in 2 min. 52 sec. Value of the stakes, £3500.

ROYAL THAMES YACHT CLUB.

On Monday the first of a series of matches between the yachts of this club came off at Erith. The weather was propitious, and the assemblage great. The wind being favourable, the signal for starting was made by Lord A. Paget, the commodore, at 11h. 32m. 53s. The Nore was rounded in the following order:—

	Hours.	Min.	Secs.
Musquito (50 tons	2	16	1
Cynthia (30 tons)	2	19	26
Tartar (36 tons)	2	22	14
Heroine (34 tons)	2	23	30
Whisper (19 tons)	2	26	22
Secret (25 tons)	2	3	13
Phantom (31 tons)	2	36	50
Mazeppa (19 tons)	2	49	58
Frolic (17 tons)	2	53	30
Sea Nymph (10 tons	2	56	35

About this time the wind was no longer steady, but the *Musquito* fell off as the wind declined, and the *Heroine* passed the *Tartar*, and, with the *Mazeppa*, began to gain upon the leading boat. From Gravesend the struggle between the *Musquito* and *Cynthia*, as far as the weather would permit, was of the most animated character: again and again the *Cynthia* tried to pass her to leeward, but was unable, and the *Musquit* con each occasion stole away from her; both entering St. Clement's, the *Cynthia*, bringing with her a nice capfull o air, luffed to windward of the *Musquito*, the latter, in consequence of being becalmed at the moment, having no power to resist the movement, and once having got the weather gauge of her adversary, when the wind came, which it did in two or three minutes afterwards, the *Cynth* went in advance, and retained that post. The boats came in thus:—

	Min.	Sec.
The Cynthia .. .. (class 7)	37	33
Musquito	31	18
Heroine	51	39
Tartar	9	20
Mazeppa .. .. (class 8)	14	30
Secret	32	40
Phantom	32	56
Whisper	33	30

The yachts were divided into three classes. The first exceeding 30 tons, the second 15 tons, and the third 10 tons. The first class prize, a piece of plate, value 100 guineas, was thus won by the *Cynthia*, the second prize by the *Mazeppa* and the third by the *Whisper*.

IRIS," THE WINNER OF "THE OAKS."

CALENDAR FOR THE WEEK.

SUNDAY, June 1.—Cambridge Term divides.
MONDAY, 2.—The Garden Roots commenced, 1780.
TUESDAY, 3. William Harvey died, 1657.
WEDNESDAY, 4.—Kingdom of the Netherlands divided, 1831.
THURSDAY, 5.—King of Hanover born, 1771.
FRIDAY, 6.—Jeremy Bentham died, 1832.
SATURDAY, 7.—Oxford Term ends. Weber died, 1826.

Tickets (all the seats being reserved), 10s each, to be had of Mr MITCHELL, 33, Old Bond-street, Messrs Ebers, 27 Old Bond-street; Mr Hookham, 15, Old Bond-street, Mr Ambrose, Old Bond-street, Messrs Cramer, Beale, and Chappell, 50, New Bond-street, Mr Keith, 48, Cranbourn-street, Messrs Keith and Prowse, 48, Cheapside; and of the Secretary, at the Office, 3, Serle-street, Lincoln's-inn-fields.

TOLVERE ROYAL, DRURY-LANE.—Lessee, &c., Mr. J. [illegible] SON. On MONDAY, JUNE 2, will be produced an entirely new Play in [illegible] Characters, entitled THE MERCHANT OF VENICE, PRECISELY AS IT IS PERFORMED AT [illegible] Mr Wallack, Mr Charles Kean, Mr Bennett, Mr Cooper, Mr Vandenhoff, Mr Anderson, Mr Howe, Mr Carlton, Mr H Cooper, Mr Ryan, and Mr G F Marshall; Mrs Warner, Mrs Charles Kean, Miss Huddart, Miss Cooper, Miss Reynolds, Miss Phillips, and Mrs Wilkins. After which will be performed a new Farce, entitled MR NIGHTINGALE'S DIARY. To conclude with the new and original Operatic Spectacle of AZAEL, the PRODIGAL.

ROYAL PRINCESS' THEATRE, OXFORD-STREET.—On MONDAY, June 2, THE MERCHANT OF VENICE, APARTMENTS, and the ALHAMBRA. Tuesday, June 3, Love in a Mass, Pauline, and the Alhambra. Wednesday, June 4, A New Play, called [illegible] Love, and the Alhambra. Thursday, June 5, a New Play, Apartments, and the Alhambra. Friday, June 6, a New Play, Apartments, and the Alhambra. Saturday, June 7, Apartments, and the Alhambra.

MDLLE. RACHEL.—FRENCH PLAYS.—Mr. MITCHELL respectfully announces that the Performance of the eminent Tragédienne, Mdlle RACHEL, to commence on MONDAY NEXT, JUNE 2nd; and in consequence of the [illegible] of Mlle Rachel, a present engagement, it is intended to give FOUR REPRESENTATIONS more weekly. The following cast of representants will be at [illegible] MONDAY, June 2nd, PHEDRE. Mdlle Rachel, [illegible] Mdlle Judith, Mdlle Dubois, Mdlle Lia Félix, Mdlle Fix, Mdlle Lia Félix, Mdlle Fix, Mdlle Lia Félix, Mdlle Fix

METROPOLITAN NEWS.

FISHMONGER'S COMPANY.—The first of the great City companies' banquets, to celebrate the opening of the Great Exhibition, was given on Wednesday evening by the Fishmongers' Company, in their hall, near London-bridge. Sir John Easthope, Bart., prime warden of the company, was in the chair. And there were also present—the Right Hon. the Earl Granville, the Right Hon Viscount Palmerston, the Right Hon Viscount Ebrington, the Right Hon. Dr. Lushington, the Hon. Horace Greeley, Lord de Mauley, Baron Charles Dupin, Sir H. de la Beche, C.B., the Hon. Mr. Justice Talfourd, Sir James Brooke, Bart., Sir Robert Ferguson, Bart., M.P.; le Comte von Harrach, le Comte H. de Reguelay, le Comte de Salomon, Chevalier de Wyld, Mr. Penderel, the Right Honourable General, Lieut.-General Sir de Lacy Evans, M.P., &c. Lord John Russell and other members of her Majesty's Government were invited, and had signified their desire to attend, but were prevented in consequence of having to attend the Queen's concert at Buckingham Palace. From the same cause, Lord Palmerston was obliged to leave the company at an early part of the evening. There were several ladies present in the gallery.

THE MERCHANT TAILORS' COMPANY.—This most wealthy and hospitable company has issued cards for a grand entertainment on Wednesday, the 11th of June, at which, in addition to the members of the company, the master has invited the Foreign Commissioners of the Great Exhibition of the Works of Industry of all Nations. We trust that the other companies will at least invite the foreign members of the several guilds which they profess to represent

CHURCH REFORM.—On Wednesday, a meeting of clergymen and laymen from various parts of England was held at the Freemasons' Tavern, to concert measures for the establishment of a metropolitan convocation, having for its object the promotion of a timely and efficient reform of the National Church, so as to effect a closer conformity with the Scripture in its ritual, polity, ministry, and patronage. J. Sullivan, Esq., of Brighton, presided: Mr. H. Leander moved a resolution pledging the meeting to endeavour to restore the Church, reformed to its legitimate development in the spirit of the Reformers of the 16th century, whose aims were checked by the prejudices of the times; also to regard general union more than matters of ceremonial, and the necessity of having to attend to evangelical Christian now non-conforming. Mr. H Ellis seconded the resolution. The Rev. T. Sutton, of Merton, and C. B. Warren, of Hookstead, addressed the meeting, and the resolution was carried. It was further moved, "That the clergy and laity ought to go hand in hand to promote the following Church reforms:—First, a revision of the Prayer-book (and, secondly, a removal of the abuses attaching to property and the Church patronage." After which a committee was appointed to watch over the movement.

COPYRIGHT QUESTION.—In consequence of the late decision in the case of Boosey *v.* Jeffreys, a meeting of publishers, music-sellers, and others interested in the question was held on Tuesday, at No. 28, Soho-square, to consider the best course to be adopted with regard to the conflicting conclusions come to in the courts of law on the copyright in England of foreigners residing abroad. The recent judgment in the case referred to, so far from being viewed as a settlement of the question, leaves it still open to doubts on this point, which the "glorious uncertainty of the law" as laid down in the Court of Queen's Bench and Exchequer, are anything but calculated to remove. Mr. G. H. Bohn, publisher, and Messrs. Addison, Novello, and Chappell, were among those present. After much conversational discussion, it was resolved to appeal to the House of Lords, with a view to a final decision as to the rights of foreigners in relation to copyright; and a subscription was entered into among the parties present to defray the object.

CANTERBURY COLONY, NEW ZEALAND.—A meeting of the members of the Canterbury Association was held on Wednesday, at Sir Francis Adoph Stronge, Captain Bennett in the chair, at which Lord Lyttelton and a numerous body of the members attended, to hear the despatches and private letters read which announced the arrival of the colonists at the new settlement. The vessel which England with the new colonists, the *Charlotte Jane* the *Randolph*, and the *Sir George Seymour*, arrived on the 16th of December, within 13 hours of each other, and the *Cressy* on the 17th. From the despatch of Mr. Godley, the agent of the association, it appeared that Sir George Grey, the Governor of New Zealand, was present on the arrival of the vessel, and received the first of the party reported. The colony had also been visited by the Bishop of New Zealand, in his schooner, who had preached twice, and opened their first school. The chief town it had been determined to establish at Christchurch on the Avon, and not at Port Lyttelton, as originally intended, and every exertion had been made to complete a road into the interior: several of the claimants to the quarter-acre town allotments had let them on lease for 4 years, at the rate of £20, £15, and £12 per annum; four churches were already built, and had been opened for divine service on the previous Sunday. The prices of provisions was not high, meat being 5d per lb.; and flour, 25s. per cwt.; sawn timber was 16s. per 100 feet; whilst wheat, it was expected, would go down after the first pressures; 800 sheep had arrived from New South Wales. A lithographic press was in work. The letters of the colonists were of the most favourable nature, and looking exhilarating for the arrival of boats and horses from the other settlements.

INSTITUTION OF CIVIL ENGINEERS.—The annual conversazione of the president of the Institution of Civil Engineers, took place on Tuesday evening, at the house of the institution. The assemblage in point of numbers and wealth was very large, and, in spite of the monopoly of the Crystal Palace, there was an ample display of choice works of art and of good models of mechanical skill and manufacture, which were distributed with great taste and skill in the well arranged apartments, which were profusely decorated with flowers and hung with fine specimens of tapestry recently produced by the Gobelins manufactory at Paris. The company embraced nearly all the representatives of science and art, foreign and British, now in London, and a large number of rank and fashion. Mr. Cubitt, the president, attended by the members of the council and the secretary, received his guests with his usual urbanity; and on the arrival of his Royal Highness Prince Albert and suite, attended his Royal Highness through the rooms, explaining minutely the merits of the different models exhibited. In the course of the evening his Royal Highness Don Miguel, Duc de Braganza, and suite, arrived, and spent a very considerable period in the inspection of the mechanical models. On Wednesday, the rooms were again to own open in the middle of the day, for the purpose of enabling the ladies to see and admire the collection at their leisure, and the same arrangements were made as on the preceding evening for the opportunity. They were attended by Mr C Manby (secretary), and by Mr Forrest, who explained to them the various models

THE SOCIETY OF ARTS.—The last conversazione of the series was held on Wednesday night, and was very attractive. The object of the society in giving these entertainments has been chiefly in compliment to the foreign visitors, and it is announced that they are to be renewed

DRURY-LANE THEATRICAL FUND.—On Wednesday evening the thirty-fourth anniversary festival in aid of the funds of this institution was celebrated in the Freemason's-hall, Great Queen-street. Mr. S. B. Caldwell, M.P., was in the chair. The company was numerous, and included many theatrical celebrities. The gallery and the lower hall were crowded with ladies. Mr. Harley, as treasurer to the fund, spoke to the report, and the subscription announced to be not less than £300 and £400. There was a plentiful supply of musical entertainments: the names of Misses Dolby, F. Horton, and Eliza Birch, and of Messrs. Donald King, Bennett, Barrett, G. Taylor, and Sedgwick being read in the list of artistes whose services had been secured. Signor Bottesini exhibited great approbation by his performance on the contra-basso

HOLLOWAY.—George Schools.—On Wednesday the new ragged schools of the Holloway district, erected within the past year, under the presidency of Henry Fownall, Esq., in the Hornsey-road, were formally opened with a public meeting, which was attended by a large body of the district. In the absence of Mr. Fownall, the chair was occupied by the Rev. Mr. Hamilton, who was supported by several rev. gentlemen of various persuasions. In the report of the committee it was stated that the number of children in the schools were attended at present by 68 boys and 66 girls, and had imparted valuable scriptural and secular instruction to 260 children between the periods of May 1850 and 1851. It further appears that a debt of £300 remains due for the erection of the schools, remained to be liquidated. Several excellent addresses, in favour of such useful institutions, were delivered by the Rev. Messrs. Aguil and Gilbert, who moved and seconded the adoption of the report, as also by the other gentlemen who took part in the day's proceedings.

THE ROYAL WESTMINSTER OPHTHALMIC HOSPITAL.—The annual meeting of the friends and patrons of this charitable institution was held on Thursday, at the Hospital, Charing cross: the Duke of Richmond in the chair. The report stated that the number of patients admitted during the year amounted to 2054, of which 166 were in-patients, being an increase of eighty-four patients over the preceding year. The amount of stock at present invested was £5850. The receipts for the year were £631 8s. 4d., and the expenditure £963 6s. The report was adopted, and several noblemen and gentlemen, with the Grace the Duke of Richmond at their head, formed a deputation, and waited on Lord Seymour for the purpose of asking for a remission of the debt due to the Woods and Forests, and urging the claims of this institution on his Lordship's notice.

HOSPITAL FOR CONSUMPTION.—On Thursday the annual meeting of this charity was held at the hospital, Brompton. The report stated that during the past year there had been 488 in-patients; 385 were discharge relieved, and 99 remained in the hospital. The number of out-patients during the year amounted to 3061; the average daily number of attendance was by out-patients being about 90. The present number of patients waiting to be received into the hospital was 59. The report was adopted, and the officers elected for the ensuing year.

THE FRIEND OF THE CLERGY.—The first annual meeting of this charity was held at the Hanover-square Rooms, on Thursday: the Rev. Robert Brown in the chair. It was stated that during the past year the committee has granted assistance to 35 clergymen, in small sums, amounting to £172 15s. 0d., and disbursed by way of loan, £155. Four pensioners had died during the year, and the funds of the company. The total receipts had been £1340 12s. 5d., and the expenditure, including £500 invested in the funds, £1261 11s. 5d., leave on a balance of £84 2s. Since the making up of the account, Mr. W. F. Duncan had paid £100 on to their account, and Lord Teynmouth, who was unavoidably prevented presiding that day, £10 10s. The report was adopted, and the officers for the ensuing year appointed.

The deliveries of tea last week in the London markets were 616,768 lb., being 46,000 lb. increase over the previous week. The stock of tea in London on the 14th instant was 36,166,000 lb., and in Liverpool 12,431,00[illegible] lb.; against 36,640,000 lb. and 8,988,000 lb. at the corresponding date of 1850.

GUILD OF LITERATURE AND ART.—On Tuesday evening, Sir Edward Bulwer Lytton's comedy "Not so Bad as We Seem," was repeated to a numerous company, at Devon nire House, to a full and fashionable audience. The comedy was followed by a farce, "Mr. Nightingale's Diary," from the pen of Mr. Charles Dickens. The piece has been constructed to give Mr Stark Lemon and Mr. Dickens opportunities for a series of personations; and both gentlemen acquitted themselves admirably, more especial y Mr. Dickens, whose old woman, in the *Sowing Gossip* style and dialogues, was exquisite in its way.

NATIONAL REFORM ASSOCIATION.—The fourth monthly meeting of this society was held on Monday evening, at the London Tavern: Sir John Walmsley, M.P., in the chair. Mr. J. Bartley, a journeyman printer, of Norwich, delivered a lecture, the subject of which was the objections to the enfranchisement of the working classes. The lecturer commenced by stating, that the attempt to obtain the franchise by 3,000,000 of the working classes was the right direction. It was most curious to see how the franchise question was treated by the various political factions. The first objection to the enfranchisement of the working classes was the want of education, and the unfitness to the rights of property. This objection assumed that the working classes were a class without any property. The fact was, they were made so by taxation, and the present constitution of the House of Commons was a direct violation of the rights of property. Another objection was, that a large proportion of the working classes were too indifferent to the importance of morality to be interested with the franchise, which he considered altogether futile. In conclusion, the lecturer observed that any attempt to re-impose a tax upon food would give the greatest possible impetus to the demand of parliamentary reform. The meeting was then addressed by Messrs. Hume and Cobden in support of resolutions for carrying out the objects of the society; and, after a vote of thanks to the chairman, the meeting separated.

METROPOLITAN DISPENSARY AND CHARITABLE FUND, FORE-STREET, CRIPPLEGATE.—Two sermons were preached on Sunday last at Cripplegate Church, in behalf of the above institution, which has cured or relieved 8000 persons during the past year at their own houses, in the morning by the Bishop of St. Asaph, and in the evening by Archdeacon Hale, the vicar. Both preachers eulogized the humanity of the medical profession. A collection was made on each occasion.

FOREIGN AID SOCIETY.—The annual meeting of this society was held on Tuesday, at the Hanover-square Rooms. The Duke of Argyll presided, observed that the society originated from the circumstance of the attention of Christians in this country having been directed to the condition, in a religious point of view, of the Continent, and was established for the purpose of extending Protestantism on the continent of Europe. He regarded the principle involved in the society as one of paramount importance, as, since the period of the French Revolution, there had been a decrease in the interest and friendly feeling believed by the Protestant Churches. It could not be doubted, that, in many parts, the Roman Catholic religion was making progress, which, however, he had no doubt would be limited by the ramparts of truth; and Protestants should remember, that, whatever minor differences existed between them, they had, at present, a common cause to defend. Being one of those who considered the late edict of the Pope as one of semi-political aggression, he was of opinion (and in his place in the House of Lords he would act accordingly) that it should be most firmly met by Parliament, though, at the same time, he believed that no act of the Legislature could avert from them the dangers that existed from the aggressive spirit of the Roman Catholic religion. He objected, not on the ground of opposition to the papal aggression of territorial possession, which, he contended, was susceptible of being brought against the Protestant missionary efforts in France. There was no wish on the part of the supporters of the society to disseminate any particular form of Protestant ecclesiastical discipline. The noble Duke concluded by an energetic appeal to the Episcopalians to do all in their power to promote the objects of the society, as being calculated to reward internal [illegible] the objects of the society.

SCHOOL FOR THE INDIGENT BLIND, ST. GEORGE'S-FIELDS.—It is not so generally known as it should be, that the school for the indigent blind is open for the inspection of visitors on the third Wednesday in every month, at three o'clock. The examination of the pupils will take place on Friday next, the Bishop of Chichester presiding.

PROVIDENT CLERKS' ASSOCIATION.—The election of annuitants for the benevolent department of the Provident Clerks' Association took place on Wednesday, at the London Tavern, when one clerk was awarded an annuity of £25, and two widows were elected to annuities of £15 each.

ACCIDENT TO THE MARQUIS OF LONDONDERRY.—The absence of this distinguished nobleman from her Majesty's levee, on Wednesday, was occasioned by a bad, and nearly a dangerous, accident, which occurred to his Lordship on Tuesday. In going to mount his horse in the stable yard at Holdenby, Tuesday, he cast in the act of mounting a sometimes unruly and vicious horse, the animal reared so violently as to press the leg and thigh of the noble Marquis with great violence against the corner of the stable, and overturned the groom with great violence against the corner of the stable, and overturned the noble charger. The concussion produced was so great as to occasion the confinement of the noble Marquis to his room. The gallant Lord Combermere officiated as Gold Stick in consequence on Wednesday.

IMPORTATION OF OYSTERS.—The American packet-ship *Prince Albert*, from New York, has brought 30 bosses of oysters as a portion of her cargo, consigned to order.

AFFAIR OF HONOUR.—A meeting took place on Wednesday afternoon in the neighbourhood of Osterly Park, between Mr. W—n and Mr. G—y, in which Sir Robert P—— acted as one of the seconds. The parties, it is said, it is understood, from some disagreement at cards some weeks since at the Turf Club. One of the gentlemen having received his opponent's fire without effect, discharged his own pistol in the air, and the affair terminated.

Thursday last, being the anniversary of the Restoration of King Charles II., the household troops were reviewed by the Duke of Wellington and other distinguished officers, on the parade ground behind the Horse Guards, in presence of a large concourse of persons. A great many ladies and gentlemen, who were admitted by tickets, as usual on such occasions, took inside the general circle, and appeared much delighted with the scene, which was long-lined one of the liveliness of the day.

SOUTH LONDON FLOWER SHOW.—On Wednesday a grand miscellaneous flower show was held at the Surrey Zoological Gardens by the South London Florieultural Society; and, favoured by the fineness of the weather, it had a large number of visitors. Five spacious marquees were erected for the occasion, and these, though by no means filled with specimens, contained sufficient to interest spectators and to afford good materials for prizes. Amongst the competitors were many of the most eminent growers, but the amateurs occupied a respectable position. The display of azaleas and pelargoniums was, perhaps, the best in the collection. A marked improvement since last year was visible in the pansies. The list of prizes was large.

SUPPLY OF WATER TO THE METROPOLIS.—The following is a copy of the scale of water-rates proposed to be inserted in the Schedule B of the Metropolis Water Bill, now before Parliament. It will be seen that the charges are enormously high, and that the rebates, in many cases, will be worse than the malady which the measure proposes to cure:—For water supplied to any house, warehouse, or other building, not being a house, warehouse, or other building, not being a house with any dwelling-houses for domestic purposes, where the house contains not more than one room, 8s. per annum. Where the house contains two rooms, and not more, a rate not exceeding 5s. per annum. Where the house contains more than two rooms, a rate according to the number of rooms in such house, at a rate not exceeding such amount for each room as hereinafter mentioned; that is to say, where the house contains more than two and not more than six rooms, a rate not exceeding 4s. per annum for each room. Where the house contains more than six, and not more than nine rooms, at not exceeding 2s 6d. per annum for each room. And where the house contains more than nine rooms, not exceeding 4s. per annum for each room. If there be a bath in a dwelling-house, then, in addition to the rate above specified in respect of such dwelling-house, the sum of 5s. per annum for each such bath shall be payable. Fifteen gallons per day may be supplied for the water supplied to any dwelling-house shall be charged in respect of any watercloset therein.] For water supplied to any stable, a rate not exceeding 3s. 6d. per annum for each stall. For water supplied to any coach-house, where the same is constructed to contain one carriage only, a rate not exceeding 3s. 6d. per annum; and where the coach-house is constructed to contain more than one carriage, a rate to be charged according to the number of carriages the same is constructed to contain, at not exceeding 3s. 6d. per annum for each carriage. The mean temperature of the week was 53 deg. The wind was variable, but on four days was most in the North-West.

HUDDERSFIELD MONUMENT TO THE LATE SIR ROBERT PEEL.—The commission to execute this monument has been conferred upon Mr. Alfred Browsley, a young and rising sculptor, of Leeds. It will be a Sicilian marble statue, 6 feet 6 inches high, upon an elaborate stone pedestal 18 feet high.

RAILWAY TESTIMONIAL.—A committee of gentlemen in the habit of travelling from the Euston station of the North-Western Railway, have opened a subscription to make some acknowledgment to Mr. Bickley, the station-master, for his uniform civility, alacrity, and attention to the comfort of passengers.

THE GREAT EXHIBITION.

It would appear as if all progressions and even ordinary calculations as to matters connected with the progress of the "World's Fair" are to be falsified, and that the matter is so far out of the pale of ordinary things as to render even a guess at what may happen next almost impossible. On Monday last the doors were to be besieged by an impatient multitude, and such an inroad was to be made upon the hitherto easy-going arrangements of the Exhibition, that a demonic was to be order af the day during two-thirds of the week, a genteel latitude being permitted in the other portion. "King Mob," according to some of our daily contemporaries, was to take possession, and unanimously rule rough-shod over all order. Fusilier jackets and unwashed faces were to take the place of silks and velvets, and dainty red and white. The Executive wisely determined to take Monday as an experimental day; and, though preparations as to barricades and police were made for a crush, they were not needed; and in a short time after the quiet and peaceable entrance of the few well-dressed and intelligent members of the artizan classes who had assembled at the doors, these ominous-looking erections were, with singular good taste, at once removed, and the stream allowed to flow regularly in, without being met at the entrance by the preparations for a siege.

One expectation only has been realised, and that a most pleasing one. It is now a fact that the visitors whose presence was to destroy all comfort really promote it, by moving about to *see the Exhibition*, instead of sitting, as their superiors in station did, blocking up the passages to *see each other*.

The last days of the previous week showed a gradual increase in the number of visitors and the receipts, until on Saturday the latter reached the astounding sum of £5071 in five-shilling admissions. The company on this day was more numerous than select, speaking, of course, in the highest sense of the latter word; for many persons perpetrated the extravagance of paying the high admission fee in order to see the wonders of the place in peace and quiet, and after all could not do so, in consequence of the numbers who were there for the same purpose; whilst on Monday they might have achieved their point with great ease, since nothing could possibly be more pleasant for really examining the Exhibition than that day was. And really the visitors made use of their opportunity, for, having carefully looked after the *commissariat* department before setting out, the various parties into which the crowd of individual settled themselves to a good day's work in the exploration of the beauties around, when once they had recovered from their astonishment on entering

The number of persons present exceeded 23,000, and the money taken at the doors only reached £920 in day admissions, and £40 in season tickets. On Tuesday, the comparative quietude of the place had become known, so that no longer fearing a crush, numbers ventured who otherwise would have stepped away. About 30,000 persons attended, and the receipts were £1347. Her Majesty having returned from Osborne on the previous day, paid her usual early visit, accompanied by Prince Albert, the Princess Royal, and her guests; and, after inspecting a portion of the foreign side, and taking another general view of the leading objects of the Central Avenue, the Royal party proceeded to the first floor before two o'clock to the gallery near the Transept, commanding a view of the interior of the south entrance—her Majesty and the Prince being desirous to see the entrance of the people on this the second day of the less-prized admission. On Wednesday upwards of 37,000 visitors were admitted at the daily fee, and the sum realised reached £1859 4s. This progressive increase is most satisfactory, and it is to be hoped that the floating already displayed, that there is time and opportunity for all, will continue, and that no absurd and inconvenient crowding will take place

Professors Ansted and Cowper have been proceeding with their lectures very successfully, although the arrangements are as yet by no means complete. Oxford sent up a large party on Saturday, preparatory to Professor Maskelyne's lectures; and in a short time we may hope to see the system of instruction thus early begun grow into an integral part of the Exhibition, and be quite as attractive as the Koh-i-noor, and less disappointing in the results.

The Russian department has been closed during the arrangement of the contributions lately arrived. These consist of *paryuetage* of a very elegant character, porcelain, metal castings, gold and silver-work, musical instruments, tapestry, and embroidery; and there can be no doubt that the display will be a highly satisfactory one. It is now generally understood, too, that the United States exposition is to be arranged without another consignment, for which, however, we shall have to wait until it crosses the Atlantic.

The model dwelling-houses for the labouring poor, built near the south entrance, by his Royal Highness Prince Albert, as illustrative of the principles and sanitary arrangements, are now open to visitors, by orders obtainable in the Exhibition, in the Mineral Manufactures Court, No. 124, and will be a source of highly interesting inspection to a vast number of persons during the period of the Exhibition. Of course, due attention will be paid to the arrangements illustrated in these erections in our further notices of the Exhibition.

PRINCE OF WALES' BAZAAR.—The Cosmorama in Regent-street has been recently fitted up as a new, and certainly very elegant, bazaar, the arrangements of which appear to be unexceptionable. The Cosmorama portion of the building still remains, and many new views have been added. The of the city of Edinburgh exhibiting the effects of a conflagration, is certainly striking; nor the Park of Versailles, taken from the gallery of the palace, other than picturesque. The interior of St. Peter's, at Rome, is still retained, and must always continue attractive.

MAXIMILIEN ARMOUR.—At Saville-house, Leicester-square, an extraordinary collection of Maximilian armour of the 15th and 16th centuries is now exhibited. We have never witnessed anything in this way so gratifying as this assemblage of antique mail. There are several complete equestrian suits, for both the man and his charger, which, together with upwards of 150 specimens of engraved, inlaid, and battle-armour. There are also 100 men of the Emperor's body guard, clothed in suits of bright steel, the habits and effects itself came from Germany. The workmanship of all is of the highest quality, and many of them are beautifully engraved. In the apartment we find five groups representing the five quarters of the globe. Napoleon, Wellington, Blucher, named Europe, Asia, and Africa; and the other two representing the war of the Titans and a Bacchanal festival. The exhibition is well worth visiting, as not even the Tower itself can exhibit a more complete collection, rare and valuable.

We are informed that the directors of the Sailors' Home, Well-street, London Docks, with a view of affording facilities to seamen at the out-ports to visit the Great Exhibition, have determined to appropriate for their use, at the lowest possible charge, as many bed-rah as can be spared for that purpose; and the means of reaching it by Blue-Peter below near the institution, it is hoped that many sailors, both of the navy and of the mercantile marine, will be induced to visit the Crystal Palace.

DISCONTINUANCE OF THE DAILY SERVICE AT ST. PAUL'S CATHEDRAL.—The usual morning and afternoon divine services will be discontinued for the present, except on Sundays, so as to enable the workmen to complete the preparations making for the erection of the parochial or charity school children of the metropolis and vicinity, which will be held on Thursday, the 12th of June. In consequence of this splendid edifice having been opened daily to the public gratis, from nine in the morning till six or seven in the evening since the 1st instant (without the so long complained of charge of 2d. entrance), vast numbers of persons have visited it. Westminster Abbey, also, is the daily attraction of thousands; and the approach should not be forgotten by the Dean of Westminster for his liberality in opening the whole sacred edifice to the public free (with the exception of Henry VII.'s Chapel for the present).

"PEACE."

PAINTED BY MR. ARMITAGE.

THIS large and characteristic portrait of the "Bona Dea" of the Great Exhibition, is placed upon the south side of the Fine Arts Court, and is a source of great attraction. The composition is striking: the Goddess of Peace sits placidly upon a colossal animal—the emblem of majesty and power—bearing in her hand the olive branch, indicative of her companion, Plenty, and above is the star of her divinity; in one hand she bears the olive branch, and her other hand rests upon a classic rudder, emblematic of the great increase of civilisation. At her feet lie chased

all quality,

Pride, pomp, and circumstance of glorious war.

The picture has, however, a two-fold interest, it being a specimen of "painting with silica colours," the invention of Mr. Thomas Miller, 56, Long-acre. These colours were introduced by the inventor about ten years since, and have been used by many eminent artists; and Mr. Armitage, who kindly consented to paint a picture in silica, free of charge, Mr. Miller, of course, being at the expense of the materials, &c., and the result is the allegorical companion, Plenty, and above is the star of her divinity; in one hand she bears the olive branch, and her other hand rests upon a classic rudder, emblematic of the great increase of civilisation. At her feet lie chased

all quality,

Pride, pomp, and circumstance of glorious war.

The picture has, however, a two-fold interest, it being a specimen of "painting with silica colours," the invention of Mr. Thomas Miller, 56, Long-acre. These colours were introduced by the inventor about ten years since, and have been used by many eminent artists; and Mr. Armitage, who kindly consented to paint a picture in silica, free of charge, Mr. Miller, of course, being at the expense of the materials, &c., and the result is the allegorical companion, Plenty, and above is the star of her divinity; in one hand she bears the olive branch, and her other hand rests upon a classic rudder, emblematic of the great increase of civilisation. At her feet lie

We may also direct the reader's attention to other specimens of this painting with silica colours. The altarpiece of St. Michael's Church, Basinghall-street, Strand, painted in December, 1844, is executed on an imperishable fresco stucco, and, although having all the appearance and brightness of fresco, is painted in a manner precisely similar to the process of oil painting, with the imperishable colours of the old masters. It has a dead surface, so that it may be satisfactorily viewed from any part of the church.

The Wolsey Hall, Hampton-court Palace, which has lately been renovated with the above colours, is justly admired by all visitors for the brilliancy of its decorations. It was found impossible to produce tints with any other colours that would harmonise with the depth and richness of those of the old stained glass.

"PEACE"—PAINTED BY ARMITAGE.—IN THE FINE ARTS COURT OF THE GREAT EXHIBITION.—(SEE PRECEDING PAGE.)

HUMMING-BIRDS, FROM MR. GOULD'S COLLECTION, IN THE GARDENS OF THE ZOOLOGICAL SOCIETY, REGENT'S-PARK.—(SEE NEXT PAGE.)

MR. GROOM'S EXHIBITION OF TULIPS.

In our Journal of last week we briefly noticed the superb collection of Tulips exhibiting at Clapham Rise, in the grounds of Mr. Henry Groom, who has long been esteemed the most enterprising and successful grower of Tulips in the kingdom. We now engrave three of the most interesting specimens, in describing which it is necessary to begin with No. 3, as it is a figure of the Wild Tulip of the Levant, from which all the beautiful varieties now in cultivation in our gardens are said to have been produced. It is of a rich red colour, with a violet blue at the base of each petal. It was first introduced into England about the year 1577, and is known to botanists under the name of *Tulipa Gesneriana*. If this, indeed, be the parent of our garden varieties, great must have been the patience and perseverance of the first cultivators; and although we may now laugh at the Dutch for the extravagant prices they gave for their Tulips, still to this people is due the credit of having been the first to open up a field of never-ending beauty, by developing the capability to produce varieties of which the plant is subject; and if it is understood that the Tulip does not usually flower when raised from seed under seven years, and after it has flowered frequently remains of a plain uniform colour for years without becoming variegated, it can scarcely be a matter of surprise that on the first production of a variegated Tulip it should have been the wonder of its day. The Dutch continued for many years to be the principal growers of Tulips, and produced many fine kinds now in cultivation. About sixty or seventy years since, some persons in England began to raise them from seed with considerable success, and it has since been practised to such an extent, that we can now boast of having entirely eclipsed the Dutch both in the number and beauty of our varieties.

The engraved specimen No. 2 is a beautifully feathered Bizard Tulip, raised by Mr. Groom, and which he has named "Dr. Horner." It is a perfectly-shaped flower, considered to be the very best in cultivation, and valued at one hundred guineas. No. 1 is also a seedling, raised by Mr. Groom, but not yet named: it is a fine deep-feathered bizard, very perfect, and will be a most valuable flower.

These specimens contrast well with the original species, and show to what an extent not only the colour but the shape of a flower may be improved by steadily developing the latent beauties of nature.

THE VICTORIA REGIA.

A successful attempt has been made by Messrs. John Weeks and Co., King's Road Nursery, Chelsea, to grow this magnificent plant in the open air. For this purpose was prepared a pond 21 feet in diameter and 3½ feet in depth, wherein the lily was planted in loam and river sand, on the 3rd of March, when it had three leaves, the largest being 18 inches in diameter. The plant has since increased in size, and has a robust and healthy appearance: the number of leaves on at present is seven, varying from 3½ feet to 4 feet in diameter; and, as the season increases in warmth, they will attain to a much larger size. The petioles of the leaves are from eight to twelve feet in length, throwing them a considerable distance from the base of the plant.

The first flower partially expanded on the evening of the 16th inst.: for some hours previously it gave out a very rich and powerful fragrance, which could be perceived at a considerable distance. The flower became fully expanded on the following evening, and displayed all its beauties to an admiring company, who had been for a considerable time watching its developement. The colours of the lily are white and pink; the outer rows of petals being white, and the inner a rich pink. The entire flower is from 9 inches to a foot in diameter: it is of short duration, opening only on two successive evenings; but there is a constant display of flowers throughout the season. The plant has a more noble appearance in the open air than when growing in the hot-house aquarium the leaves becoming hypocrateriform, a natural desideratum of much interest.

The pond in which the plant is growing is heated by hot-water pipes, of which there are two rows placed at the bottom communicating with a boiler which heats, besides, a range of houses, the temperature being thereby kept at from 75 to 90 degrees Fahrenheit. There is a constant flow of clear water into the pond, and a waste pipe to carry off the

VICTORIA REGIA," IN FLOWER, AT MESSRS. WEEKS', KING'S-ROAD NURSERY CHELSEA.

ST. MATTHEW'S CHURCH, LOWER-ROAD, ISLINGTON, CONSECRATED ON TUESDAY.—(SEE NEXT PAGE.)

superabundance and keep the surface clear. A margin of blue, yellow, and white water-lilies is placed round the *Victoria Regia*, and tends to show well their lovely and truly regal Sovereign in all her majesty. A temporary covering is placed over the plant at night to protect it from storm and cutting winds.

The *Victoria Regia* has been an object of unceasing interest from the moment of Sir Robert Schomburgk, in 1837, finding this magnificent plant in one of the rivers of British Guiana. In England the *Victoria Regia* first flowered in 1849, and the specimen represented in the ILLUSTRATED LONDON NEWS for Nov. 17. A leaf and flower of the plant, it will be recollected, was presented to her Majesty and Prince Albert, at Windsor, by Mr. Paxton; and the pain of circumscribing within this very plant was mainly contributary to the success of the Great Exhibition as so interesting as to merit recapitulation. We give it in Mr. Paxton's own words:—" Having in contemplation the erection of the great conservatory (at Chatsworth) in its present form, it was determined, in 1836, to erect a new curvilinear hothouse, 60 feet in length and 26 feet in width, with the eliptical roof on the ridge and furrow principle, to be constructed entirely of wood, for the purpose of exhibiting how roofs of the kind could be supported. The plan adopted was this—the curved rafters were composed of several boards securely nailed together on templets of wood cut to the exact curve; by this means a strength and firmness was obtained sufficient to support an enormous weight. This house was subsequently fitted up for the *Victoria Regia*, and it was here I invented a waterwheel to give motion to the water in which the plant grew; and here this singularly beautiful aquatic flowered for the first time in this country on November 9, 1849. You will observe *a pressure was like engine in this case.* If you examine this, and compare it with the drawings and models, you will perceive that nature has provided it with longitudinal and transverse girders and supporters, on the same principle that I, borrowing from it, have adopted in this building."

MR. GOULD'S COLLECTION OF HUMMING-BIRDS AT THE ZOOLOGICAL SOCIETY'S GARDENS, REGENT'S-PARK.

AMONG the new buildings erected during the spring, is a large saloon on the left of the walk which leads from the south entrance of the Society's garden towards their splendid collection of *carnivora*. This room is devoted to an object not more novel than interesting, and we have no doubt that it will become one of the most attractive points in the admirable establishment to which it is a fitting appendage.

The idea which Mr. Gould and the Society have had in view, is the complete illustration of the family of Humming-birds by a series of examples of every species mounted in such a manner as display the peculiarities of their structure, colour, and the changes of plumage which characterise the differences of age and sex. The family of Humming-birds has been well selected for this instructive exhibition, both on account of their peculiar beauty, and the infinite variety of form which occurs among them.

The species of Humming-birds which were known to Linnæus probably did not exceed a dozen. Mr Gould has succeeded in collecting nearly three hundred; and his collectors, who are now actively searching the unexplored regions of Mexico and the Andes, will, without doubt, bring to light many more than have yet become known to us.

The splendour of plumage, which forms so well-distinguished a feature in this group, has probably given rise to the popular error that Humming-birds are found in the East. The truth is, however, that Humming-birds exist only on the continent of America, in the West India Islands, and in two islands of the Pacific. The form, therefore, is essentially American; one beautiful little species is well known in the United States, and passes through the whole extent of that vast territory from its winter quarters in Mexico, until it reaches Canada, which is the extreme northern limit on the eastern side of America. On the western side, a similar species, but much more brilliant in colour—in fact, the most intensely brilliant of the whole group—migrates from Mexico, through California, to Nootka Sound, and probably even as far as Sitka. From Bolivia, on the other side of the Equator, another brilliant species migrates to the south, and penetrates as far as Terra del Fuego, where the officers of her Majesty's ship *Beagle* found them feeding on insects in the blossoms of the fuschia while snow lying upon the ground around them. Humming-birds do not necessarily require a high temperature, and that they can support an intense degree of cold is abundantly proved by the very altitude to which several species are entirely limited in the Andes. On the snow line of Chimborazo, for instance, is found more than one species of very great beauty, at an elevation of from 16,000 to 18,000 feet above the level of the sea; and the neighbouring mountains of Pichincha and Cotopaxi have also species which are peculiar to them.

The temperate regions of the Andes, from 7000 to 10,000 feet of altitude, produce the greatest number of these birds, which for the most part are distributed throughout that mountain range in locally defined limits, within an area marked out for the species by the peculiar features of soil and aspect which control the production of vegetation, and, consequently, of the insects which derive their existence from that source, and form, in their turn, the main sustenance of Humming-birds.

It is a popular, but very erroneous belief, that Humming-birds feed entirely upon honey. Although they occasionally take both honey and pollen, the real object of their search is found in the insects which inhabit them. These insects are frequently so microscopic that they escape the naked eye, and this fact gives apparent probability to the error above mentioned. To enable the Humming-bird to seek successfully for these minute animals in the recesses of flowers, it is evident that the variety of form which abounds throughout the endless genera of plants would require a somewhat commensurate adaptation of the beak of the bird. We find, therefore, among the species already known, the most beautiful provisions of mechanism for the end proposed; and we have selected, as an example of it, the group which is represented. This species (*Doclinastes ensifer*) lives on insects which hide in the blossoms of *Bersamacia*. To enable the bird to penetrate to the extremity of the deep tubular flower of these plants, he is furnished with a development of beak which is at first sight truly astonishing and incomprehensible. The beautiful and instructive manner in which Mr. Gould has illustrated the peculiar form of this species, may be taken as a type of the whole collection, which has been arranged upon the uniform plan of presenting five or six specimens of each species at one view. The manner in which this is effected is simple, but in combination forms the most gorgeous effect of colour which can possibly be imagined, from the diminutive size of the objects which produced it. Plate glass cases, chiefly of octagonal form, are ranged throughout the room, in which the light is carefully modified, with the view of giving effect to the splendid rich glitter in every direction upon the head, the throat, the back, the breast, or the tail of these birds. Each side of the cases, as it is turned towards the spectator, presents a species for his study and his admiration; and it is impossible for any thoughtful person to look upon these objects for the first time, without feeling that there exists in the unknown treasures of nature a profound source of the beautiful of which he here sees a new and wonderful development.

The universal feeling of pleasure created by this remarkable collection at the private view, with which we were favoured, leaves no doubt as to the interest which it will excite among the educated classes, as its true character becomes known; and although the great majority of the species which are contained in it consist of objects of little value to the world, on account of their colour, there are so many which are remarkable for their form, that it is our intention to return to them for future notice.

CONSECRATION OF THE CHURCH OF ST. MATTHEW, LOWER-ROAD, ISLINGTON.

THE new Church of St. Matthew, at the corner of Canonbury-street, Islington, was, on Tuesday, consecrated by the Bishop of London, with the accustomed ceremonial. The Rev. E. F. Alder, A.M. (the incumbent), performed the service with a clearness of intonation which ensured his being thoroughly audible and impressive. We regret that other parts of the service were not equally distinct. The Bishop took for his text, John xvii 3: "This is life eternal, that they might know thee, the only true God, Jesus Christ, whom thou hast sent." This prayer was offered for the Apostles in the first place, and ultimately for the whole body of Christians; asserting, not only the union of Christ with the Father, but his perfection as a man—the faultless example of virtue. According to that example, asceticism was not required, though abstinence from sin was. Nonconformity with the world, in the latter particular, would excite calumny and opposition. It was the prayer of the founder of Christianity that we should *all* be made one. What, then, the use of schism, and how great the use of creeds and propositions of faith. These constituted our privileges, as members of a true branch of the Holy Catholic Church—a Church free from the pantheism and rationalism of continental Churches. The Bishop of Rome is well aware that the main strength of Protestantism lies in the Church of England; his own Church supports super-stition and idolatries from which she is free—propagates heresies and promotes schisms. Papal emissaries insinuate themselves everywhere, exciting warm imaginations and weak judgments. All the more need, therefore, for the multiplication of Protestant churches and schools. The church was numerously and respectably filled; and the collection after the sermon amounted to the large sum of £630, which, we are happy to add, will enable the committee to liquidate the debt on building, and have in hand a balance available for the purchase of an organ.

The first stone of this new district church was laid on the 27th of July last; so that its erection has only occupied ten months.

Its south front is in Canonbury-street, its east end is towards the Lower-road, immediately opposite Rotherhild-street. The style of the church is transitional from Decorated to Perpendicular. It is cruciform in plan, and consists of nave, choir, and transepts. The eastern part of the choir forms the chancel. The tower and spire is at the south-eastern intersection of choir and transept, and a small stair turret occupies a corresponding posit on on the north side. Immediately adjoining is the vestry. A south porch and entrances at west end of nave, and in north transept, give access to the church. Spiral staircases in tower and stair-turret lead to galleries in transepts and staircases at the west end, in rear of the baptistry to the children's gallery. The main body of the church is left free from obstruction of every kind, and the pulpit and desk are so placed as to command every sitting in the church. The position of the organ is on the ground floor, at the south-west junction of the nave and transepts. The seats are all open, with carved bench ends. The choir, in addition, has a row of stalls, seats on either side. The pulpit, desk, and altar rails are of Caen stone. The flooring is of plain red and grey tiles, inlaid with encaustic tiles. The font is at the west end of the church upon a raised dais and plinth. The east window is filled in with stained glass, by Messrs. Powell, of Whitefriars.

The church is lighted with gas, by two large central lamps of ornamental ironwork of mid level character; and, besides, a smaller lamp under the west gallery, and brackets and standards in choir and transepts.

The enclosure of church-ground is by a dwarf wall of rag-stone, with piers, buttresses, and copings of fine dressed stone.

The entire cost of erecting this church is within the amount of the original estimate, £4000—the purchase of site and other contingencies making a total of £4800.

The works have been executed by Mr. W. S. Dove, builder, of Milner-square, Islington, from the design and under the direction of Mr. A. D. Gough, architect, of Lancaster-place.

CHURCH, UNIVERSITIES, &c.

EXETER DIOCLSAN SYNOD.

The following are the matters which will be considered at the Diocesan Synod which is to be held in the Cathedral at Exeter, on Wednesday, 25th June next, and the two following days :—

On the 25th will be proposed—

I. A declaration of adherence to the article of the Nicene Creed. " I acknowledge one baptism for the remission of sins;" and especially to the doctrine of the Catholic Church, and the articles and formularies of our own Church, on the spiritual grace given to infants in the daily Sacrament of Baptism.

II. A declaration of adherence generally to the doctrine and discipline of the Church of England, as now set forth in the Articles of Religion, and in the Book of Common Prayer; and of our firm belief that cessation from our Church, being a sound branch of the Catholic Church, to any other religious community, is an act of schism; and, in particular, that secession to the Church of Rome involves the abandonment of truth for error, and is perilous to salvation.

III. A declaration against the recent schismatical assignment of a Bishopric of Plymouth by the Pope.

On the 26th and 27th the following subjects will be considered, so far as the time shall admit.

1. Education according to the principles of the Church of England. Schools for the poor—middle schools—training colleges of masters at Exeter, of mistresses at Truro. Inspection of schools.

2 Catechising. Best mode of carrying out the requirements of the Church as stated in the rubrics and canons.

3. Continued pastoral superintendence of the young who have left school —especially the encouragement of the living together of young agricultural labourers, on a plan at once economical, and under regulations for self-discipline in agricultural colleges. (See "Parochial Work," by the Rev. C. Monro, p. 194—198.)

4. Increasing the number of authorised teachers and assists nts of ministers by the ordaining of permanent deacons, especially of teachers duly recommended from the Training College at Exeter.

5. Assistance of lay parishioners to the parochial clergy, especially by encouraging voluntary associations for prayer.

6. More frequent divine services in churches on week-days. Due observance of the days appointed by the Church to be kept holy. On Ascension Day the Lord's Supper to be always administered.

7. More frequent celebration of the holy communion.

8. Separation of services, especially in connexion with the two immediately preceding questions.

9. Public performance of public baptism of infants, and right of parents, giving due notice, to require the public baptism of their children on holydays.

10 Care to be taken in the selection of persons in whom the cure of souls, and correcting false notions of that responsibility The encouragement ent of bodies of persons (especially Sunday school teachers, district visitors, and other lay parishioners) agreeing to undertake the office of sponsors in case a worse is not to be found necessary.

11. Churching of women after illegitimate births, under what regulations?

12. Whether the office of burial, contained in the Liturgy, may and ought to be performed over all that are buried—(except the taking the corpse into the church, where there is danger of infection)—advising the min ster, who may doubt whether the party to be buried shall receive any of the exemptions in the Rubrique before the office of burial, to refer his doubt with as little delay as possible to the Bishop, for his guidance, according to the directions contained in the preface " concerning the service of the Church."

13 Selections of metrical versions of psalms and of hymns.

14. Receiving persons from the Church from the Dissenting schism in this country, or from other schismatical communities—after previous refere nce of the several cases to the Bishop for his direction

15. Whether to re-marry those who, having been previously married before the Registrar, may desire the blessing of the Church ?

H. EXETER.

St. Gu rlus, May 22, 1851.

THE SYNOD OF EXETER.—PROTEST.

A protest signed by forty-four clergymen of the diocese of Exeter against the synod proposed to be held by the Bishop on the 25th of June next, h as been published. It is as follows.—

"The Lord Bishop of Exeter having announced to his clergy his intention of holding a 'synod or diocese' on the 25th of June next, to be composed of certain official persons mentioned in his Lordship's pastoral letter, dated ' London, April 9, 1851,' and of representatives to be elected by the clergy of the different deaneries,—

" We, the undersigned presbyters of the diocese, deem it to be our duty to put forth and publish our reasons for declining to attend any ruridecinal meetings for electing such representatives, or otherwise to take any part whatever relating to such assembly of the clergy called ' a synod,' or the proceedings and acts thereof

" We have come to this determination,

" 1. Because, if such assembly, summoned and holden accordi g to the directions, and for the purposes mentioned in the Bishop's pastoral let er, do not contravene the strict letter of the laws at present in force for regulating the action of the Church of England, it is, in our judgment and belief, opposed to the spirit and intention of such laws and constitutions, and altogether unprecedented in the history of the Church.

" 2 Because the primary and avowed object for which such assembly is to be convened is to in-ue a synodical declaration of adherence to the article of the creed,—' I acknowledge one baptism for the remission of sins,' which it is alleged has been virtually denied by a judgment delivered by her Majesty the Queen, as, under God, the only supreme governor of this realm, as well in all spiritual or ecclesiastical things or causes as temporal, on the recommendation of the Judicial Committee of Privy Council, with the concurrence of the two archbishops ; such a declaration being, as we believe, altogether uncalled for, inasmuch as the decision of her Majesty was not intended to impugn, neither does it, in our judgment, in any degree whatever impugn, such article of the creed—an article which we constantly and solemnly repeat before God and in the face of the congregation, with the full ' assent and consent' of our minds

" 3 Because, although it is declared by the bishop that in th s proceedings of such assembly it is his ' desire that there shall be as great consideration as possible for the judgment of all,' and that ' the representatives shall speak and vote therein according to their judgment,' yet it is expressly provided in the pastoral letter calling the assembly, that ' the bishop shall himself decide what matters shall actually be brought under the consideration of the synod,' and ' that decision shall be announced an act of the synod which has not his concurrence.'

" 4. Because, whatever be the object of holding such assembly, it is manifestly powerless in law, not having authority to pass any canon or ordinances which can settle any matter whatever, or be binding even upon those who pass them, whilst it is calculated to produce great evil and mischief, even to the diminution of the Church, being designedly intended to exhibit this diocese as independent in itself, standing out in unbecoming and injurious, if not schismatical, opposition to the archbishop of the province, and the constituted authorities, by which the whole body of the Church of England is governed.

" For these reasons we feel compelled to abstain from taking any part whatever in the proposed assembly; and in putting them forth we deem it to testify our unfeigned respect and honour for the character of the present ar chbishop of the province, as well as for the office which he holds, and at the same time to express our deliberate opinion that his Grace had not ' forfeited his right to Catholic communion.'

" May, 1851." [Here follow the signatures of 44 clergymen.

PETITION TO HER MAJESTY FOR THE REVIVAL OF THE SYNODICAL FUNCTIONS IN THE CHURCH OF ENGLAND.

At the Royal Levee on Wednesday, Earl Nelson presented to her Majesty the following petition for the revival of Convocation, unanimously agreed to and signed at the great meeting held at St. Martin's and Freemasons' Hall on the 23rd of July last year, in consequence of the Gorham judgment:—

" TO THE QUEEN'S MOST EXCELLENT MAJESTY, THE HUMBLE PETITION OF THE UNDERSIGNED CLERGY AND LAITY OF THE CHURCH OF ENGLAND

" Showeth,—That we, your Majesty's faithful and loyal subjects, duly acknowledging your Royal supremacy as supreme governor within these your dominions in all causes, over all persons, as the same is expressed in the articles of the Church of England, humbly entreat your Majesty to grant us redress in a matter which deserves our consideration as members of us as ministers of the said Church.

" That the case of Gorham v. the Bishop of Exeter, lately decided by the Judicial Committee of your Majesty's Privy Council, a very grave point of doctrine touching the foundation of the faith has been treated in such a manner as incidentally, but effectually, to contradict the plain and obvious meaning of the Prayer-book.

" That, in consequence of this decision (whatever be its legal validity) great scandals have arisen, and very many are unsettled and disturbed in conscience, whose only wish is to serve God in peace in the portion of the church wherein they have been called.

" That this has always been allowed by the law of this country, as well as by the custom of the whole Church from the earliest ages, that religious questions of faith and discipline should be settled, according to Scriptural precedent, by Synodical assemblies of the bishops and clergy.

" That Magna Charta begins by declaring ' that the Church of England be free, and shall have all her rights entire, and her liberties inviolate;' and among those it was secured, by an ancient law of this realm, that she should ' have her judgments free.'

" That in the declaration of your Majesty's Royal predecessor, King Charles I., prefixed to the Articles of the Church, her synodical functions are recognised in the promise—" That out of our princely care, that the churchmen may do the work which is proper unto them, the bishops and clergy, from time to time in Convocation upon their humble desire, shall have licence, under our broad seal, to deliberate of and and de all such things as, being made plain by them and assented unto by us, shall concern the settled continuance of the doctrine and discipline of the Church of England now established, from which we will not endure any varying or departing in the least degree.'

" To the intent, therefore, that the grievance aforesaid may be remedied, and the Church herself enjoy full freed om to exercise her inherent and inalienable office of declaring and judging all matters purely spiritual, to the welfare of your Majesty, and the peace of your people,

" Your petitioners humbly implore your Majesty—That all questions touching the doctrines of the Church of England, arising on appeal, or in your Majesty's temporal courts, may hereafter be referred to the spiritually of the Church of England:

" And, further, that your Majesty will be pleased to remove the impediments, which now obstruct the exercise of the ancient synodical functions of the Church, in order to the determination of the aforesaid question of doctrine, as well as of other matters affecting her welfare, to the salvation of souls, and the glory of her divine Head.

" And your petitioners will ever pray," &c.

ST. JOHN'S CHURCH, WOOLWICH.—The noble organ in this church was opened, and dedicated to divine worship, on Sunday last. Mr. Roe, organist of Christ Church, Regent's-Park, officiated; and the organ, though far from complete, gave proof of its future excellence. It was built by Messrs. Gray and Davidson, of the New-road. We understand that the west window, now developed by the dividing of the organ, is forthwith to be filled with stained glass, the minister and wardens having chosen unanimously an exquisite design, submitted to them by Mr. Clutter be ck, of Stratford-le-Bow.

PREFERMENTS AND APPOINTMENTS.—The following appointments and preferments have recently been made:—Rectories: The Rev. R. M. Kinnerd, to Ring-mm-Chilthurst, Sussex; the Rev. J. W. Neal, to Beckington-cum-Standerwick, Somerset; the Rev. John Yridgus Storry, to Great Tey and Chappel, Essex; the Rev. Edward Lowndes, to Aldwincle-cum-Newton, Northamptonshire; the Rev. George Howell, to Llangattock, with Llangenny, Brecknockshire; the Rev. Thomas Horn, to St. Thomas, Haverfordwest; the Rev. Henry Ward, to St. Peter's, Aldwinkle; and the Rev. — Nelson, to St. Peter-le-Poer, with Allhallows, London. *Vicarages*:—The Rev. Brabazon Hallowes to Cilcain, Flintshire; the Rev. Wm. Davies Phillips, to Amroth, Pembrokeshire.

TESTIMONIAL.—The following clergymen have lately received testimonials of esteem and affection:—The Rev. John Eddowes Gladstone, from the members of the Norwich Operative Protestant Association, for his unwearied exertions in the Protestant cause in behalf of the Lay Hops, of Gunton, Suffolk, from his congregation and friends; the Rev. W. Milburn, on his resigning the curacy of Herrington, in the parish of Houghton-le-Spring, from his parishioners; the Rev. Thomas Nelson, from the inhabitants of Acton his parishioners and other friends; and the Rev. B. R. Perkins, master of Wooton-under-Edge Grammar School, from the scholars.

ARCHDEACON HALE.—At the Synod assembled last week the supposed abstraction from the church of the venerable Archdeacon's charge as he was on the point of delivering it. It appears now that the venerable Archdeacon of London, in his transit from home to St. Paul's, discovered in his coat pocket his lost charge, which, it is concluded, he must have deposited there during the service, as soon as he completed the perusal of it.

The contributions received for the year just ended, by the Lay Association in support of the schemes of the Established Church of Scotland, were very nearly £4700.

CHURCH OF ENGLAND SELF-SUPPORTING VILLAGE SOCIETY.—At the annual meeting of this society, held on Monday evening at Exeter-hall, it appeared from the report, that the society, which had been established for promoting the religious, moral, and social improvement of the working classes by forming establishments for various families on the land, and combining agriculture with manufacturing employment, for the mutual benefit of the working classes, has been pretty successful in carrying out its laudable object.

CONFIRMATION AND CONSECRATION BY THE BISHOP OF CHESTER.—On Monday the Lord Bishop of Chester held confirmations in the churches of St. Peter and St. Philip, Liverpool, where a considerable number of young persons were in attendance with their respective pastors. On Sunday his Lordship consecrated the new Chapel in connexion with the School for the Blind, and afterwards preached a sermon in behalf of the charity from the 24th Psalm and 7th verse. Upwards of £125 were collected at the door.

The Rev. Joseph Senior, L.L.D., Head Master of Batley Free Grammar School, and Perpetual Curate Lecturer of Wakefield, has been presented, by the Bishop of Ripon, to the incumbency of St. Mary's, Wakefield.

THE LATE SUICIDE OF MR. J. POWER.—The *Limerick Chronicle* says:—" The late much-regretted Mr. John Power, of Gurteen, has left a fine property of £6000 a year, of which he was the gentlemanly, and, we think we will say the unexampled, proprietor. It is now ascertained that the cause of suicide was the receipt of a solicitor's letter announcing prompt proceedings against him as security for £10,000, which, however, he never signed, and has not exceed £2000. He insured his life for £5000, which he assigned for a valuable consideration some years ago to a bank, and which will be paid by the Royal Exchange Insurance Company in Dublin in a few days. He has left a sizable widow has £1000 a year marriage settlement. He has left seven children."

FATAL DUEL.—The *Colonne* newspaper, published at Boulogne, gives the following particulars of a duel which terminated fatally on the evening of the 23rd instant, about two miles from the town:—" On Wednesday last four Frenchmen, residents of London, landed from the steamer at Boulogne, with the intention of fighting a duel. The parties, both young men, were opposed in quarrel which had arisen between two of them. On Friday afternoon the parties set out for Pont-de-Briques, two travelling per train, and two on foot, and arrived at the appointed place, they entered a carriage in the commune of Condette. The adversaries were placed at a distance of 25 steps; at a given signal the two pistols were discharged, but without result. The seconds consulted together, and the combatants approached five steps nearer. Again neither was struck. Instead of the contest terminating in the ordinary manner, the pistols were charged a third time and the principals brought within only 10 steps of each other. This time one of the two fell, struck by a ball which pierced him through. The unhappy man never spoke a word. The two witnesses of the tragedy and the surviving principal immediately left the spot, and the second of the deceased went to Pont de Briques to seek a surgeon and inform the mayor of what had occurred. Those, who, hearing of the catastrophe, were attracted to the spot, found the body lying on the high road on Sunday, clasped and pressing the breast. The three survivors, fearing the consequence, returned to Boulogne with all speed, and embarked in the night. The deceased is said to have been a native of Ireland, and was acted as foreman to a London tailor."

POST-OFFICE NOTICE—CAPE OF GOOD HOPE.—The following notice has been issued by the Post-office authorities:—The mails to be forwarded by the contract packets to the Cape of Good Hope, Sierra Leone, &c., will continue to be made up in London on the evening of the 14th of each month, and in Plymouth on the morning of the 16th of each month, except when the 14th falls on a Sunday, and on those occasions the mails will be closed in London on the evening of the 15th, and in Plymouth on the morning of the 16th of the month."

ICE.—An enterprising importer of ice has taken the dry arches extending from London-bridge nearly to King William's statue, which receptacles he has filled with pure block ice, for the summer supply.

MR. DAWES, the Free-trade candidate, has been returned M.P. for the Isle of Wight, by a majority of 45 over Captain Hammond, Protectionist, the numbers being 505 and 519 respectively. During the excitement of the parties, a solicitor named Cole, a partisan of Captain Hammond, took refuge from the violence of the mob in a neighbouring house, where he instantly fell down dead.

EPITOME OF NEWS—FOREIGN AND DOMESTIC.

His Royal Highness Prince Albert has signified his intention of performing the ceremony of laying the foundation-stone of the City of London Hospital for Diseases of the Chest, on the 25th of June next. The site of the proposed hospital comprises a spacious area of ground adjacent to the principal entrance to Victoria Park, and the building, when completed, cannot fail to prove ornamental to the neighbourhood, as well as greatly beneficial to the poorer classes afflicted with chest complaints, and resident in the City and surrounding districts.

The office of her Majesty's First Serjeant, vacant by the resignation of Dr. Stock, Judge of the Admiralty Court, in Ireland, has been conferred by the Lord Lieutenant on Serjeant Howley. Mr. O'Brien, Q.C., is now Second Serjeant-at-Law, and the office of Third Serjeant is vacant.

On Tuesday evening the leading members of the medical profession entertained Sir Charles Clarke, who has for so many years held a most exalted position as a member of the faculty, at dinner, at Willis's Rooms, King-street, St. James's. Sir Benjamin Brodie occupied the chair. Upwards of seventy gentlemen sat down to a banquet of the most *recherché* description.

There are no less than nine iron steam-vessels, varying in size and tonnage, now in course of construction at Birkenhead. One is a paddle steamer for the Russian Government, of about 400 tons.

The new planet discovered by Mr. Hind has received the name of Irene (properly Eirene—*Εἰρήνη*—Peace).

From a return obtained by Mr. Hume, and printed by order of the House of Commons, it appears, that, in 1849, the legacy duty was paid in Great Britain on £4,383,070 of capital, and on £45,815 694 in 1850. The total amount paid under each rate since 1797 was £1,861 109,398. In Ireland £171,846 of legacy duty was paid on £2,476,548 of capital in 1849, and £2,538,491 of capital in 1850.

A few days since, a gentleman paid into the Commercial Bank of London, Lothbury, under the assumed name of Charles Smith, the sum of £700, directing that it should be applied to the purposes of the Metropolitan Convalescent Institution. The board of management possess no clue for discovering the person who has thus proved so kind and liberal a benefactor to their useful charity.

A requisition is in course of signature, addressed to John Moore Stevens, Esq., of Winscott House, Torrington, calling upon that gentleman to prevail himself to be nominated as a candidate for representing in Parliament the northern division of Devon, at the next general election, in opposition to Sir Thomas D. Acland.

A curious winding staircase has been discovered on the site of the old castle of Berwick-upon-Tweed. The opening of the staircase, which is admired for its fine appearance, is on a level with and behind the sheds at the railway station, and has been cleared out to a depth of about fourteen feet, the first landing-place being there arrived at, where there is a vault, with the various *débris* of what are probably so many subterranean passages branching from it, choked and filled. This vault has not yet been cleared out, but it is thought the staircase must go a considerable way lower down. At present there is a mass of *débris* in front of the stair, which it is intended to clear away.

The subscriptions for the free public library at Manchester amount to £5875 6s. 8d.

The celebrated collection of pictures at Castle Howard, the seat of the Earl of Carlisle—including the Marys, by Annibale Caracci, one of the most renowned pictures in the world will, it is said, be immediately brought to London to be exhibited by permission of the noble proprietor, at the gallery of the British Institution, during the next six months.

A picture painted by the late Sir David Wilkie has arrived at Liverpool by a vessel from New Orleans. This picture, which is called the "Grace Darling of America," was painted by the great artist to the order of a gentleman in America, in whose possession it has until now remained.

The Earl and Countess of Arundel and Surrey gave an elegant entertainment, on Saturday, to Cardinal Wiseman and a distinguished circle, including several eminent foreign divines of the Church of Rome. The Countess subsequently had a *soirée*, the company numbering upwards of 100 of the *élite* of English society professing the Roman Catholic faith.

At York, last week, John Lyth was fined £25 for selling cigars on the race-ground, during the races, without a license.

The Postmaster-General proposes carrying into effect, in conjunction with the authorities of the London and North Western and Chester and Holyhead Railways, an arrangement by which passengers, through mail-bag papers leaving Dublin at 7 o'clock p.m. each evening, will reach London at 10.30 A.M. the following day, instead of 10 P.M., as at present. This will save a day for the course of post between London and the whole of Ireland.

At San Lorenzo, Callao, South America, her Majesty's flag-ship *Portland*, 50, recently exercised her guns by firing shot and shell. After it was over, a party of men were sent ashore to pick up the shot and shell by hand run home. One man was the act of carrying a shell to the boat, when it burst, and he was literally blown to pieces, and four men who were at a distance were dangerously wounded. The man who was killed was smoking a pipe as he was carrying the shell.

On Monday the directors of the Buckinghamshire railways gave a grand dejeûner, at the Star Hotel, Oxford, in honour of the opening of the line to that city, the public opening to which took place on the 20th instant. A special train, which left Euston station in the morning at a quarter before twelve o'clock, took down the chairman, Sir Harry Verney, the deputy chairman, and several other directors and officers of the London and North-Western Company. About 300 ladies and gentlemen sat down to table, Sir Harry Verney presiding, supported by a large number of the authorities of the universities and the members of the corporation.

It appears by a Parliamentary return, printed at the instance of Mr. Hodges, that the quantity of British corn exported in 1850 was 3,850 qrs.; in Ireland, 467,964 lb.; in 1847, 457,964 lb.; in 1848, 357,059 lb.; in 1849, 274,811 lb.; and in 1850, 270,511 lb. The imports during the same period did not amount to 1000 cwt. per year.

A gravel delivery match between Leeds and York has terminated in favour of the latter.

On Monday week 120 French vessels sought refuge in Sunderland harbour.

Miss Sellon and the Sisters of Mercy have left Plymouth, and have taken a house in Lower-green, Bristol.

The *Leeds Intelligencer* states that "Mr. O'Connor has made out an account showing that the Land Company owe him upwards of £5000!"

A handsome council-room has just been built for the mayor and corporation at Launceston, Devon, by the Duke of Northumberland, and, it is expected, will soon be opened for business.

The East Cumberland Agricultural Society have selected Sir James Graham, Bart., M.P., as their president for the ensuing annual dinner.

W. R. Boxall, of Stopham farm, produced a perfect ear of wheat (Talavera) at Pulborough market, Sussex, last week, which he had gathered in one of his fields.

The imports of foreign grain, cheese, &c., into Liverpool, for the fortnight ending 21st May, 1851, were 90,959 bushels Indian corn, 963 bags ditto, 177,671 bushels wheat, 235 bags ditto, 46,365 barrels flour, 33,192 sacks ditto, 12 barrels farina, 2917 bags sago flour, 5816 bushels peas, 16,929 bushels beans, 284 cases cheese, 425 boxes ditto, 12 casks ditto.

The extent of the coal area in Northumberland and Durham is, in round numbers, 500,000 acres, and consequently, its total contents amount to not less than 10,000,000,000 tons of coal, of which 1,500,000,000 only have been worked. The present annual consumption is estimated at 10,000,000, including the waste; and if consequently follows that, at this rate, it would take above eight centuries to exhaust this single field!

Mr. Temple, of Lee, Bucks, whilst fishing in the Weston Turville reservoir, last week, caught an enormous pike, weighing upwards of 40 lb. It was 40 inches and a half in length, and 10 inches in circumference. It was landed in 15 minutes, without the aid of a landing-net or a gaff-hook.

The following official appointments for Prince Edward's Island have been announced: viz. Mr Charles Young is appointed Attorney-General; Mr William Swabey, Registrar of Deeds; Mr. James Warburton, Colonial Secretary; Mr. Robert Hodgson, Queen's Counsel; and Mr. Desbrisay, Clerk of the Council.

The British and North American Royal Mail Steam-ship Company have decided upon a most important extension of their present limited mail squadron of steam-ships from Liverpool to the United States and Halifax, Heretofore, the weekly departures of the fleet from either side of the Atlantic were confined to the summer months; whilst, during December, January, February, and March, the despatches were restricted to once a fortnight. Under the new arrangement decided upon, however, steam ships will sail regularly once a week throughout the year without interruption; calling, as at present, at Halifax, *en route*, each alternate voyage.

The house in which the celebrated philosopher, Moses Mendelssohn, dwelt, in Berlin, has been purchased by the Hebrew community of that city, for the purpose of founding therein, with the approbation of the Government, a school in which poor orphans may, without distinction of religion, be taught some means of earning their bread.

The Foundling Hospital is open to the inspection of strangers and the public generally every Monday, from ten to four o'clock. No orders for admission are necessary, the servants are permitted to receive fees.

The French Consul at Cairo has presented the national collection of the Louvre with a gigantic marble head found at a considerable depth within the present citadel at Tunis. It represents Astarte, with locks, wrought in the Syrian style, and Phœnician, and which corresponds to Luna or Juno of Roman mythology. Astarte was considered the protecting omen of Carthage, where she had a temple. The proportions of the figure are above two metres. An special ship of the state will bring it to France, and it has been deposited in the garden of the church of St. Louis, in Tunis, in the meantime.

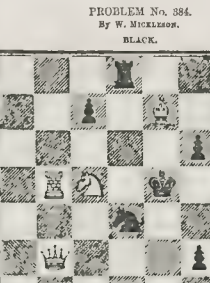
It appears by a Parliamentary paper, printed this week, that the total number of persons employed in the various Custom-houses in the United Kingdom, in 1849, was 9295; viz. 6840 in England and Wales, 1852 in Ireland, and 1103 in Scotland. The amount of salaries paid within the same period was £570 294; viz. £500,236 in England and Wales, £37,903 2s. 6d. in Ireland, and £32 158 in Scotland. The gross revenue receipts were £22,481,359; viz. £18,247,374 in England and Wales, £2,189,659 in Ireland, and £1,959,926 in Scotland.

CHESS.

*** Replies to Correspon ents, &c., are unavoidably postponed

PROBLEM No. 384.
By W. MICKLESON.

BLACK.



WHITE.

White, playing first, to mate in five moves.

THE CHESS TOURNAMENT.

The challenge given by English Chess-players to all others in the world, to meet in tournament this year at the St. George's Chess Club, has been answered to the very day. In the muster-roll of the champions there is hardly one great name missing for the absence of which there was not an unavoidable cause, such as the impossibility of procuring furlough (in the case of some who are in office) or great distance, or disproportionate expense. Hungary has sent its well-known champions, Löwenthal and Szen, players whose fertility of resource in the "wild mathematics" of the oldest and most noble of games has been proved to the admiration of the Chess world in a hundred battles. Germany, in default of Heydebrandt der Lasa, who, to his great regret, was unable to leave his diplomatic duties, is worthily represented by *il rever*, by Mayet, and by Anderssen.

From France—though circumstances have not favoured us by sending St. Amant, the renowned adversary of Mr. Staunton in the great contest of 1843—we have Kieseritzky, a name known and respected wherever Chess itself is known.

From Russia, we are promised the redoubted Jaenisch, and his able brother in arms Shumoff; but at the moment of our writing they have not arrived

At home, to sustain the honour of the English flag, are not wanting strong men; though it is much to be regretted that health or business should have deterred such players as Buckle and Slous from earning fresh laurels in the lists of St. George. As it is, however, there are sufficient champions of high repute to secure us from any apprehensions that our hardly-acquired honours will suffer tarnish in the present strife.

Monday last was the day appointed for the gathering of combatants in the first contest, and by five o'clock the whole, except only the Russian representatives, were in the list.

The process of dividing and pairing the competitors would have been extremely difficult and complicated with any number between sixteen and thirty-two, above or below which respectively it was not desirable that there should be excess or deficiency. By some timely retirements, the number, which could hardly have been raised to thirty-two, was reduced exactly to sixteen. Before proceeding to the ballot for opponents, Mr. Staunton called the attention of the gentlemen assembled to the necessity of re-considering the clause of the programme which limited each contest in the first *match* to a rubber of *three games*. He had originally proposed that the *maximum* should be *three out of five games*, but from an apprehension of the committee, that, in the event of a large number of combatants entering, the tournament would be inconveniently protracted, he had been induced to give way. The objection to a larger number of games, however valid, if thirty-two players or more had entered, was no longer tenable, now that they had reduced their contestants to sixteen; and, in justice to those amateurs who had come from distant parts at great expense to be present at this memorable encounter, and in fairness to the subscribers, who naturally looked for a large collection of fine games from such an assemblage of distinguished names, he earnestly entreated them to agree that the first series should be determined by *three games out of five*, instead of *two games out of three*. Mr. Staunton enforced his proposition by reference to Mr. Lewis, one of the oldest and most experienced players of the age, to a letter he had just received from Mr. Cochrane entreating him to get the decision as to the three games reversed; and, lastly, by referring to an able player at his side, Mr. Löwenthe, who had travelled nearly five thousand miles to take part in the tourney, but who, in common with all good players, objected to risk his repute, his loss of time, and his expenses upon so unsatisfactory a test of relative skill as a rubber of three games afforded. After much discussion, the opinion of the players was taken by ballot, and Mr. Staunton's proposition was unfortunately lost by one vote.

After this came the casting lots for opponents, which was managed thus: eight white tickets and eight yellow ones, numbered respectively 1, 2, 3, 4, 5, 6, 7, and 8, were put into the ballot-box, the white tickets being further marked by choice of chess-men and first move.* Whoever drew No. 1 of the white tickets had to play with the party who drew No. 1 of the yellow. Whoever drew No. 2 of white had to play with No 2 of yellow, and so on throughout. The drawer of the white tickets having the choice as to the colour of the chess-men and the privilege of moving first in the opening game.

The result of this scrutiny gave the following pairs:—

Kieseritzky	against	Andersen	Mayet	against	Capt. Kennedy
Szen	,,	Newham	Lowe	,,	Wyvill
Löwenthal	,,	Williams	E. S. Kennedy*	,,	Micklow
Horwitz	,,	Bird	Brodie*	,,	Staunton

Some of these pairs, determined by the blind goddess for the first match, were regretted as singularly unfortunate, because they brought two distinguished players at once into collision; thus falling out of each pair to be thrown out at the earliest stage of the Tournament, instead of leaving him to match with other combatants and fight out to the last. Such was considered to be especially the case in the instance of Kieseritzky and Anderssen, in that of Szen and Newham, Horwitz and Bird, and Captain Kennedy and Mayet.

Upon the termination of these important preliminaries, the parties adjourned until the next day, when, at eleven o'clock A.M., the whole of the combatants assembled to begin the fray.

FIRST DAY'S PLAY.

The result of the play on this day gave the victory of *one game* each to—

Andersen	over	Kieseritzky.	Captain Kennedy	over	Mayet.
Szen	,,	Newham.	Wyvill	,,	Lowe.
Williams	,,	Löwenthal.	Micklow	,,	E S. Kennedy.
Horwitz	,,	Bird.	Brodie.	,,	Brodie.

SECOND DAY'S PLAY.

The effect of the play at the second sitting illustrated most disastrously the injudiciousness of confining the struggle to the best of three games only. It being found at the end of the day, that, thus early in the tourney, no less than six of the combatants, viz. Kieseritzky, Newham, Mayet, Lowe, E. S. Kennedy, and Brodie, were *hors de combat*, and altogether excluded from further participation in the jousts.

The result of the contests this day gave victory to—

Andersen	over	Kieseritzky.	Wyvill	over	Lowe.
Szen	,,	Newham.	Micklow	,,	E. S Kennedy.
Löwenthal	,,	Williams.	Staunton	,,	Brodie.
Capt. Kennedy	,,	Mayet.			

At the termination of this sitting, hostilities were adjourned until Friday, when some excellent play was anticipated. On Monday next, the competitors from the provinces will enter, and there can be no doubt that the proceedings next week, with so many matches on the *tapis* at once, will be in the highest degree brilliant and interesting. We must not conclude this brief account of the opening of the Chess Tourney without expressing the obligations all present were under to the spirited directors of the Polytechnic Institution, for the admirable arrangements they had made to secure the players from every kind of annoyance and inconvenience.

* These two gentlemen, Mr Brodie and Mr Kennedy, it is fair to mention, kindly permitted themselves to be entered at the last instant, as *proxies* for *competitors*, in the places of Messrs. Jaenisch and Shumoff, who were momentarily expected, and to whom they would have resigned their posts.

PROTECTIONIST DINNER AT TAMWORTH.—SERIOUS RIOT.

On Wednesday last, a dinner, in promotion of Protectionist principles, took place at the Town Hall, Tamworth. Mr. Woolferstan, a landowner of influence, presided; and was supported by Lord Lesdale n, M.P.; Mr. Spooner, M.P.; Mr. Newdegate, M.P.; Mr G. F. Young (candidate for Cambridgeshire), and other gentlemen of the country party.

Throughout the day, but especially from the moment the company assembled, the excitement of the multitude assumed an alarming aspect. At nine o'clock in the evening, amidst shouts and tumult, the mob, who had assembled in large numbers without the hall, commenced breaking the windows, at the moment that the chairman was addressing the company on the early life of the late Sir R. Peel. In less than a quarter of an hour every pane of glass and all the chandeliers were smashed to atoms. The company beat a speedy retreat As the farmers, armed with every weapon with which they had hastily possessed themselves, sallied from the hall, they encountered the mob. A hand-to-hand fight took place, and the Protectionists took possession of the King's Arms. In a few minutes every window there was dashed in, and the excited populace surrounded the place. Severe fighting took place between the besieged and besiegers, and at least twenty persons were led into the hotel beaten in the most serious manner. From nine to eleven o'clock the town remained in possession of the mob, who every moment perpetrated new acts of violence. They beat every person who approached, and at length took vehicles from the inn yard, and threw them into the river. The scene became momentarily more alarming, and, on inquiry for a borough magistrate, the only one to be found was Mr Parsons, the deputy chairman of the dinner. The alarm throughout the town was at last yesterday nearly at its highest point, and at this period Captain Dyott, Mr. Newdegate, and Mr. Spooner did all in their power to induce the company confined in the hotel to adopt offensive and defensive action against the mob without. Only two of the borough police were to be seen, and one of these was disabled by injuries received at an early hour. Mr. Newdegate, Mr. Parsons, and Captain Dyott proceeded to swear in special constables, and at half-past eleven o'clock this body proceeded to clear the streets.

The mob had then nearly fled from the streets, and in an hour's time the thoroughfares were pretty well cleared, and several persons, some of whom were severely treated by their captors, were brought into the hotel. A large amount of damage was done to the buildings of the town, and many persons were severely hurt.

Captain Dyott, a magistrate of the county of Stafford, was about to send for the military from Birmingham, when it was intimated that this step had been already taken by the borough magistrates.

Subsequently, from the appearance of the town, the magistrates countermanded the order, and at two o'clock on Thursday morning all attempt at a renewal of the rioting was apprehended; the neighbourhood, however, continued in a state of great excitement.

The farmers captured about twelve of their assailants.

PORCHESTER CASTLE.—The Stamp and Tax-office Widow or Nominee Society contemplate an economical railway excursion to Porchester Castle on Whit-Tuesday, June 10, the profits of which are to be devoted to the above-named excellent institution. Porchester is one of the most interesting localities in the kingdom; and those persons who avail themselves of this opportunity may gratify their taste for antiquities, and at the same time aid the cause of benevolence.

TESTIMONIAL TO EARL FITZHARDINGE.—The gentlemen who hunt with Lord Fitzhardinge's fox-hounds are about to present his Lordship with a costly testimonial, to mark their sense of the liberality and spirit with which he has maintained the kennel and conducted the hunt for so many years past. The testimonial is to consist of a group in silver, wrought by the Messrs. Garrards, from a design by Mr. Cotterill. The subject chosen illustrates a familiar incident of the chase. Beneath the gnarled roots of an ancient oak—whose knotty and extended arms are thrown grandly upwards to form the centre of the composition—the fox has run to earth, and the foiled pack are baying around or vainly endeavouring to penetrate his stronghold. The noble Earl and the hunsmen come up at this juncture, and the former having dismounted, advances with a favourite terrier towards the earth, whilst the latter whips away the hounds, that they may not offer any interruption to their worthy little companion in the active inquiries which he is obviously upon the point of making as to whether Mr. Fox is really at home or not. The whole scene is described with the most graphic truth. The likeness of the noble Earl is admirably preserved in figure as well as feature, and the form and action of the hounds and horses display spirit and fidelity to nature.

THE IMPROVEMENTS IN THE WEST OF IRELAND.—The *Mayo Constitution* says: "We understand that several Scotch capitalists have taken extensive farms of land on the property of the Marquis of Sligo in the Westport district, upon their respective building residences, and rearing large numbers of stock. Already have hundreds of superior Cheviot sheep been imported into that locality by these gentlemen, as also herds of black cattle. We trust that the improvements these examples must still be extended from every class, as some improvement in the shape of producing stock, and giving employment, is so vitally important to the welfare of this country."

THE CORPORATE MOVEMENTS.—We understand that Sir E. L. B. Lytton, Bart., has so far succeeded in winning the approbation of the freeholders of his native county by the publication of his pamphlet, as to become their candidate at the next election of Mr. Brand, one of the present members), as Protectionist candidate at the next general election

THE BRITANNIA TUBULAR BRIDGE.—The large hotel which it has been resolved to erect at the Britannia Tubular Bridge (until recently known as Conway Suspension Bridge) will contain more than 300 beds, and will be connected with the tubes by a covered walk, and surrounded with appropriate gardens and pleasure-grounds. The works for the hotel are rapidly being built, and a large body of workmen are employed levelling the ground and forming the foundation, and no time will be lost in the completion of the adjunct to the Chester and Holyhead and Canarvon lines.

WINDSOR CASTLE.—The State apartments will be closed from this day to Monday week, June 9.

ACCOMMODATION FOR THIRD-CLASS PASSENGERS.—Petitions have been sent from the town-councils of Newcastle, Sunderland, Tynemouth, South Shields, and other towns in the north, to the House of Commons, praying that a clause in a new bill that the York, Newcastle, and Berwick have before the House, by which the minimum speed of third-class passenger-trains may be reduced from 20 (the present parliamentary rate) to 12 miles an hour. The discovery of these clauses in the bill has caused great agitation in the north, more especially in the maritime towns, as such a reduction of speed would prove very prejudicial to seamen and their wives, and other members of the humbler classes who are obliged to travel by rail

SANDON, STAFFORDSHIRE.—On Monday, the 22d inst., the beautiful village of Sandon was the scene of a most gratifying ceremonial, in the presentation of a superb breakfast-service of plate to the Rev. Edward Harland, on his resignation of the curacy of the parish, in consequence of his appointment, by the Bishop of Lichfield, to the valuable living of Colwich, in the same neighbourhood. The presentation took place at the school-house at Sandon, in the presence of the principal inhabitants, by whom the testimonial had been purchased. The Earl of Harrowby presented the gift, with an appropriate add ess, to which the reverend gentleman feelingly replied. After the ceremonial, the visitors walked in procession, with rustic and garlands of flowers, to the church, to Divine service. They next partook of tea and refreshments on the bowling-green of the parsonage. Mr. Harland is the son of the late Rev. Mr. Harland, left by railway, the parishioners accompanying him to the station, and fervently testifying by cheers their heartfelt regard for their beloved minister.

THE DEFICIENCY OF CLERGYMEN.—The dean Mr. Cornelius O'Loghlin, which took place on Tuesday, at his residence, at the very advanced age of ninety-eight years For many years, and indeed until within a comparatively recent period, Mr. O'Loghlin took a most active part in political movements, in furtherance of the views of the late Mr. O'Connell

The Harwich election terminated on Wednesday, in the return of Mr Crawford, the Protectionist, by a majority of six over Mr. Prinsep (Protectionist); the numbers polled by each respectively being—Crawford, 133; Prinsep, 127.

The deficiency of able-bodied labourers in Ireland, in consequence of the vast emigration during the last twelve months, is now felt very much in many parts of the country.

On Monday morning five persons abjured the Protestant faith, and embraced that of the Church of Rome, at the Roman Catholic Chapel, Brunswick-place, Bath.

THE BRIDGEWATER GALLERY.

THE Bridgewater Gallery owes its foundation to the Duke of Bridgewater, who died in 1803; and its excellence as a collection, to the acquisition by his Grace of the Italian portion of the famous Gallery formed by the infamous Regent Duke of Orleans. The choicest pictures in the collection are those of the Italian school; and in no other gallery in England—not even the National Gallery—can the Italian masters be studied to greater advantage than in the collection which the liberality of the Earl of Ellesmere has this week thrown open to the public.

We this week illustrate one of the *chef d'œuvres* of the Gallery, by Cuyp.

Among masters of whose works the collections in this country have many of the very best examples is Albert Cuyp, a native of Dort, born 1606, died *circa* 1672. His pictures were long neglected, and were first brought into notice by English collectors. His great masterpiece, the "Landing of Prince Maurice, at Dort," now in the Bridgewater Gallery, and one of its greatest attractions, was acquired in 1785 for the insignificant sum of £160; and that choice example of his art which we possess in the National Gallery was obtained by Angerstein in 1794, at Sir Lawrence Dundas's sale, for £204 15s. The Prince Maurice would sell to-morrow for £6000, and the cattle piece in

THE BRIDGEWATER GALLERY.—"MILKING COWS." PAINTED BY CUYP.

the National Gallery, the same day, for at least £8000. Let a collector purchase with what the great Lord Chatham called the prophetic eye and taste, and he will find—or, at least, his children will—that he has laid out his money at very good interest. But how few have that inborn and acquired sense of the beautiful and true in art, so essentially requisite for the formation, even with the longest purse, of a gallery of pictures unquestionably good. Many collectors, sensible of this, protect themselves by buying pictures with genealogies, and the rule is one worthy of adoption. Bargains in pictures are not made now-a-days. All the best works are catalogued, and known, and ticketed; and the collector who comes into the market at Christie's for works of reputation, must come prepared with a purse that will compete with the purses not of home only, but also of Continental collectors.

The Cuyp in the Bridgewater Gallery, engraved in our present Number, is a most pleasing specimen of the master, and tells its own story. Neither word nor words can convey or describe its sunshine beauties.

ROYAL ACADEMY EXHIBITION.

"THE ARCHERS."—PAINTED BY H. LE JEUNE.

Mr. Le Jeune is a young artist of reputation, who works, at times, in the spirit of Sir Charles Eastlake, and not unfrequently thinks and works for himself. In the present Exhibition he has, in all, three works; No. 45, "Anglers," and No. 101, "Archers," two small pictures, in which he thinks for himself, and thinks well; and No. 678, a lunette-like picture, called "The Sermon on the Mount," conceived in the spirit of Eastlake, worked up in his manner, but wanting, in many places, in that completeness and delicacy of finish which Sir Charles is always careful to bestow on even the most hidden portions of his pictures. The small subjects painted by Mr. Le Jeune would have satisfied Izaak Walton and Roger Ascham—the Stockbridge Fishing Club and the Toxopholite Society. He has not been equally successful in his large pictures. But, then, his aim is higher: the subject is Raffaelesque and Miltonic; while in his smaller works he is pastoral and sportive, more like Ambrose Phillips or Mr. Lee than a great painter rendering a great subject, such as Raphael loved, and such as he never failed in presenting successfully to even the critical artist

EXHIBITION [illegible] ROYAL ACADEMY.—"THE [illegible]

LYCEUM THEATRE.

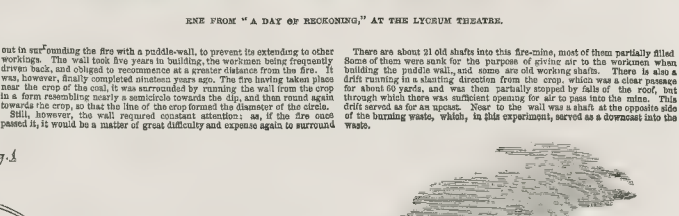
TRANSLATION from the French was produced last week, under the title of "Only a Clod." That of the original is "Un Paysan de nos Jours." Its moral is the assertion of the rights of man in the peasant against the assumptions of the aristocracy. A farmer, lodging two fashionable young gentlemen, suffers the violation of hospitable laws by one of them courting his wife and the other insulting the host. But the rustic gets the better of both by his wit and courage. Mr. Mathews personated *The Clod*, and played in his usual smart and lively style.

"The Day of Reckoning," on its revival, continues attractive. Our Artist has presented herewith the famous scene in the second act, wherein *Grabouloi* wounds *Claude Moreau*.

SCENE FROM "A DAY OF RECKONING," AT THE LYCEUM THEATRE.

PRINCESS' THEATRE.

WE give an Illustration of Mr. Brough's *pièce de circonstance*, "Apartments to Let." The master of the house, returned from his travels, finds it in possession of foreigners. One, "the American," is the tenant of a chair, while the disconsolate owner of all the chairs and tables is compelled to turn one of the latter into a four-post bedstead, and to couch thereunder as he best may. Fain would he sleep, but the go-ahead Yankee smokes, and impudently puffs his cigar under the board into the host's face. Our Artist has capitally caught the audacity of the one, and the annoyance of the other, and the experiment cannot fail of proving a decided hit. Keeley of this little part indeed makes much, and verily raises a trifle into comparative importance.



SCENE FROM "APARTMENTS: VISITORS TO THE EXHIBITION MAY BE ACCOMMODATED," AT THE PRINCESS' THEATRE.

NOOKS AND CORNERS OF OLD ENGLAND.

"THE TABERNACLE," WOTTON-UNDER-EDGE.

THE "Tabernacle" at Wotton-under-Edge, Gloucestershire, of which the annexed is a Sketch, was built by the late Rev. Rowland Hill, shortly after his ordination to deacon's orders in 1773.

For several years prior to that period, Mr. Hill had been engaged in itinerant preaching, and had made some evangelizing tours through Gloucestershire. The hills, woods, and vales had then been the scene of his addresses to the thousands who assembled to hear the "baronet's son," a name by which he was known in the rural districts. His first public service at Wotton is thus mentioned in his diary:—"June 18, 1771, Sunday eve. Wotton-under-Edge: a fresh place: the first sermon amongst them: they behaved with remarkable attention, and stood in great crowds under the market-place, while I spoke to them from Ephes. v. 14."

Mr. Hill having determined to build a country residence, with a chapel for the free use of the poor, chose for their site a vale contiguous to the town of Wotton. The situation of the house is one of singular beauty: facing it is a perfect amphitheatre of hills, for the most part clothed with hanging beech woods. The celebrated Robert Hall, when visiting Mr. Hill there, once said to him, "This is the most Paradisiacal place, sir, I was ever in." The chapel is capable of seating about 700 persons; it is mean in its external appearance, and inconvenient in its internal arrangements, and is now in a somewhat dilapidated condition.

Mr. Hill spent a portion of each year at Wotton for more than half a century, at which times he officiated as the minister of the congregation at the Tabernacle. In 1830 Mrs. Hill died there, and was buried in the family vault in the Tabernacle. In 1833, but a few months prior to his decease, Mr. Hill paid his last visit to Wotton-under-Edge. By his will, the chapel there and minister's residence, with some endowed almshouses, were bequeathed to the Village Itinerant Society. The chapel is now about to be pulled down, for the erection of one of a Gothic design, upon the same site.

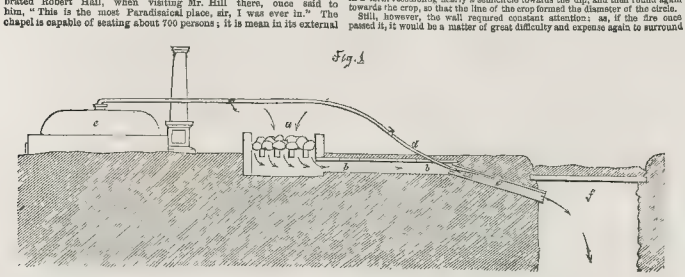


Fig. 1.

a. Open brickwork furnace, containing coke, charcoal, and small coal, the burning of which formed choke-damp.
b. Trench (covered with iron plates and turf, to render it air-tight) for conveying the choke-damp from the furnace.
c. Iron tube for conveying the choke-damp from the trench to the downcast shaft.
d. Steam-jet for drawing the choke-damp into the shaft.
e. Boiler.
f. Downcast shaft.

MR. GURNEY'S MACHINERY FOR THE EXTINCTION OF THE BURNING WASTE OF CLACKMANNAN.—FIG. 1.

EXTINCTION OF "THE BURNING WASTE OF CLACKMANNAN."

MR. E. CATLEY has communicated to the *Times* the details of an experiment on a gigantic scale which has just been brought to a satisfactory conclusion under the superintendence of Mr. Goldsworthy Gurney. The object of the experiment was to extinguish a fire in the South Baurble Colliery, near Alloa, about seven miles from Stirling, which has raged for about thirty years over an area of twenty-six acres, in the waste of the nine-foot seam of coal.

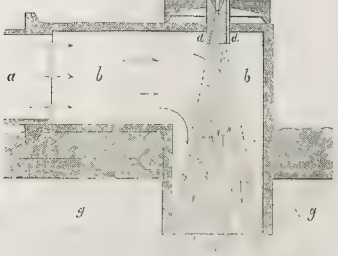

Fig 2.

a. End of tube for conveying the choke-damp from the trench.
b. Bonnet leading from the tube into the upcast shaft.
c. Wooden boxes, containing a number of jets of steam, which are supplied by the pipe *d*.
d. Steam-jet pipe, issuing in the form of a fan-shaped jet on the principle of Watt's wings, between which the water flows into the tube, and is there cut by the steam, and drawn down by it into the bonnet, where it mixes with the choke-damp, and the three together form a heavy mass, which descends and fills the shaft.
e. Pipe for supplying water.
g Downcast shaft.

MR. GURNEY'S MACHINERY.—FIG. 2.

It is supposed to have been set fire to by some persons who had been distilling illicit whisky in it. Shortly after its discovery it rapidly extended itself, and threatened the destruction of the entire coal-field. A sum of £16,000 was laid out in surrounding the fire with a puddle-wall, to prevent its extending to other workings. The wall took five years in building, the workmen being frequently driven back, and obliged to recommence at a greater distance from the fire. It was, however, finally completed nineteen years ago. The fire having taken place near the crop of the coal, it was surrounded by running the wall from the crop in a form resembling nearly a semicircle towards the dip, and then round again towards the crop, so that the line of the crop formed the diameter of the circle.

Still, however, the wall required constant attention: as, if the fire once passed it, it would be a matter of great difficulty and expense again to surround it. In consequence, it has cost the owner of the property (the Earl of Mansfield) about £200 a year in keeping it up and in the payment of overlookers. The extinction of the fire is said to be impossible. It will, nevertheless, readily occur, that, if the fire was thus, as it were, corked and bottled up to itself, it ought to have gone out from want of air. This, however, was not the case, for no part of the fire-mine being deeper than twenty fathoms, and some of it running at no great distance below the surface, it obtained a sufficient supply of air thence, as well as through the leakages in the puddle wall, to maintain a smouldering, sulky, and volcano-like existence sometimes more active, and sometimes less so—which could be traced by occasional falls of the surface: the last of which occurred about five months ago, laying bare the burning waste, and discharging smoke and steam.

There are about 21 old shafts into this fire-mine, most of them partially filled. Some of them were sank for the purpose of giving air to the workmen when building the puddle wall, and some are old working shafts. There is also a drift running in a slanting direction from the crop, which was a clear passage for about 60 yards, and was then partially stopped by falls of the roof, but through which there was sufficient opening for air to pass into the mine. This drift served as for an upcast. Near to the wall was a shaft at the opposite side of the burning waste, which, in this experiment, served as a downcast into the waste.

THE TABERNACLE, AT WOTTON-UNDER-EDGE.

Lord Mansfield's attention was called by the members of the committee of the House of Lords who sat in 1846 to consider the best means of preventing accidents in coal-mines to the evidence then before them of the fact of a burning coal-mine at the Astley Collieries, Lancashire, having been extinguished by the singular process of pouring in choke-damp, suggested and carried out by Mr. Gurney, a report of which appeared, with Engravings, in the ILLUSTRATED LONDON NEWS for June 9th, 1849. Lord Mansfield communicated with Mr. Gurney, who inspected the fire mine, and reported to Lord Mansfield, that, notwithstanding the immense extent of the burning waste, he thought it possible

to extinguish the fire; and, extraordinary as it may appear, this object has been effectually accomplished by a simple and inexpensive process.

Mr. Gurney's method of effecting this object was to force a stream of choke-damp through the mine, by means of the high pressure steam-jet, at such a temperature as would, after putting out the fire, cool down the mine below any degree of heat that would permit it to re-ignite on the admission of atmospheric air, and at such a pressure as to make all the leakages of the waste outwards of choke-damp, so that every inlet might become an outcast, by means of which the atmosphere was perfectly excluded from all contact with the fire.

Before the end of March, Mr. Gurney, accompanied by Mr. Cayley, Mr. Mather, and Mr. Jamieson, commenced operations. The machinery for condensing the steam consisted of a high-pressure steam-boiler, about 50 feet of inch gaspipe, and a small cone for the high-pressure steam-jet at the end of it, which jet was placed at the proper striking distance from a cylinder of sheet-iron one foot in diameter, and about nine feet long. The cylinder was the passage between a coke furnace and the downcast shaft, through which the air was driven by the force of the steam-jet; and by a simple contrivance, the operators were able to blow in either the air passed through the furnace, or fresh, at pleasure. Mr. Mather and Mr. Jamieson descended the shaft, accompanied by three or four workmen, Mr. Gurney blowing them in fresh air from above, and there cleared workmen, Mr. Gurney blowing them in fresh air from above, and there cleared away two old iron doors lying on the waste, and knocked a hole through an old puddle-wall; and then, hearing a good deal of rumbling and rushing as if the roof were falling, they thought it no more than prudent to retreat, as they had effected their object of opening a passage for the gases into the burning waste. They, however, had spent some time in close proximity to the fire. The heat at the bottom of this shaft was 100° at this time. Those obstacles having been cleared away, and a free passage obtained, the shaft was covered with iron plates and clayed over, so as to render it air tight, and the choke-damp was turned on. That extinguishing gas was made by passing the atmosphere air through an intense coke fire in a brick furnace, which deprived it of all its oxygen, or rather the oxygen combined with the carbon of the coke, and formed carbonic acid, the oxygen combined with the carbon of the coke, and formed carbonic acid, the nitrogen, in mixture with the nitrogen left, was forced through the furnace along the iron cylinder down the shaft and into the burning waste; the quantity of coke consumed being a sufficiently accurate measure of the quantity of air passed.

After blowing in about 8 000,000 of cubic feet of choke-damp (at the rate of 100,000 cubic feet per minute), which was calculated to be about the contents of the waste (allowance having been made for falls of the roof), it was found that the upcast or high level shaft or drift was full of it to the mouth, flowed over, and ran along the ground, extinguishing all fires it held near the surface of the earth at some distance from the spot. It was then found, on ceasing to blow in gas, that after a time the choke-damp receded in the upcast; and that whenever it was blown in to the downcast, it poured out of the upcast in the volumes, being thus a perfect measure of the quantity of choke-damp in the mine, and giving proof that it had passed completely through it.

After keeping the mine full for upwards of three weeks, it was thought advisable to blow in choke-damp at a lower temperature than had previously been done—believed to have been about the temperature of 350°. In order to effect this, Mr. Gurney used a very beautiful contrivance, by which, by the power of the steam-jet, water was driven into the shaft along with the choke-damp in the form of the finest spray. Indeed, the heat idea that it to be given of it is, that it is like a second Scotch mist, a medium universally admitted to have very rapid and powerful cooling properties. This process Mr. Gurney thought very important, as he considered the difficulty of cooling the immense magazine of heat after the fire was extinguished, to prevent re-ignition on the admission of fresh air, to be the most uncertain part of the whole experiment.

When the temperature was sufficiently reduced, as indicated by the thermometer, so as to leave no fear of re-ignition, fresh air was blown in by the spray jet, so as to pass through the mine charged with water, in order to cool it enough to allow of its being entered. After a time the action of the jet was reversed, and the air drawn through the mine in a contrary direction, so drawing out the air blown in charged with mist; and this drawing out mist or vapour was continued for several days, which showed that it had filled every part of the waste and had remained suspended. The temperature of the air that was drawn out gradually decreased at the rate of about six degrees a day. After about one month's operations, the downcast shaft was unscrewed and descended, and found to be of a temperature of about 88 degrees. The waste was examined by Mr. Mather, who reported that falls had taken place so as to leave no passage to enable the operators to get through. A shaft was then sunk into the middle of the burning waste at the 18th fl. A shaft was then sunk into the middle of the burning waste at the point where the fire was supposed to have been the most fierce at the commencement of the operations. A roof was here found to have fallen, so that it was impossible to enter. The fire, however, was extinct. Several bore holes have been driven into the waste at different periods, and no fire can be discovered; and this mighty volcano is extinct.

The vast amount of property endangered (in this case of the value of near £200,000), and the frequency of the occurrence of these kind of accidents, gave a great public interest to this operation.

We have been favoured with the following testimony to the benefit derived from the previous illustration of this fire-quelling process:—"Testimonial from the proprietors of the Balcarres Colliery, in Ayrshire, belonging to the Right Hon. T. F. Kennedy, spoken of above as being under the same process. This was constructed from drawings published in the ILLUSTRATED LONDON NEWS, and from Mr. Gurney's own explanations read at the Astley Colliery, near Manchester, where this process was first tried.

In explanation, we should observe that Mr. Gurney is not a mining agent, or has anything to do with coal-mine property. He is a considerable landowner in Cornwall, residing on his estate. He is a magistrate, acting both for this county and Devonshire; has many official duties there and elsewhere, a d is much engaged in farming pursuits, in which he takes an active interest. He could not be expected to leave his engagements long; therefore, to save time, he wrote instruction to Mr. Kennedy's agent to proceed to the experiment at his colliery while he was in Scotland, and referred him, in explanation of his detail, to the drawings in the ILLUSTRATED LONDON NEWS, to get it ready for the time arrived. Mr. M'Murtrie, a referee in the proceedings, erected the apparatus, set it to work, and singular enough as it may appear, when Mr. Gurney came and examined into the existing conditions, he said "he believed Mr. M'Murtrie had put out the fire," and which seems most likely true.

NATIONAL SPORTS.

The settling on the two great Epsom events has so completely absorbed the attention of the racing public during the current week, that Harpenden, the only meeting at all calculated to interest the metropolitans, proved comparatively unattractive; the provincial gatherings were also few and far between, and consequently with a list only moderately good for the first three days, undeniably bad for the fourth, and the whole decidedly below par. Her Majesty is expected to be present on the Cup Day.

The cricketer's calendar is confined to the following matches:—Monday, matches at Lord's and Wisbeach; Tuesday, at the Oval, Kennington, and Copenhagen House; Thursday, at Oxford and at the Oval; on Friday, at Oxford, and on Saturday, at Windsor.

The aquatic calendar is blank.

TATTERSALL'S.

MONDAY.—Owing to the settling for the Epsom events, scarcely anything was done on the Ascot Stakes; we can therefore only submit the nominal prices:

ASCOT STAKES.	
5 to 1 agst Emperess colt	5 to 1 agst Ballet Girl
10 to 1 — Pleasant	8 to 1 — Vatican

ROMEO.

25 to 1 agst King of Trumps	100 to 8 agst Elcot

TUESDAY.—A few bets were also at the following prices:—

THE EMPEROR'S PLATE.

5 to 1 agst Woolwich	8 to 4 agst Nutshell
	No figure is declared not to start

DERBY.—25 to 1 agst Mr Merrick's bay colt (taken freely)

The Epsom settling (one of the heaviest known for many years) passed off quietly. It is supposed that at least £200,000 was won by the Derby.

THURSDAY. His latter transacted admits of only the following nominal quotations.

HAM STAKES.—3 to 2 agst Brother to Ethiron.

ASCOT STAKES.	
7 to 1 agst Vampire	7 to 1 agst Ballet Girl
10 to 1 — Alderbastan	8 to 1 — Kaiserine

EMPEROR'S PLATE.

8 to 1 agst Nutshell (friendless)	8 to 2 agst Trumpeter

DERBY.

50 to 1 agst Ambrose	40 to 1 agst Daniel O'Rourke
50 to 1 — Wathergrape	40 to 1 — Queen Anne colt

HARPENDEN RACES.—WEDNESDAY.

TWO-YEAR OLD STAKES of 5 sovs each and 30 added.—Mr. Elby's Hamiltonian (S. Rogers), 1. Mr. Gulliver's Lady Blanche (Yates), 2.

LADIES' PURSE of £30, added to a Sweepstakes of 10 sovs each.—Mr. Mosser's Gramagrin (Mr. Bertie), 1. Mr. Leigh's Athelstane (Mr. Elwes), 2.

HARPENDEN HANDICAP of 5 sovs each and 40 added.—Mr. G. Drew's Combatant, 1. Mr Farr's Clothworker (G. Hall), 2.

HUNDRED STAKES of 5 sovs each, and 30 added.—Mr. Mosser's Malmesbury (Rackley), 1. Mr. Knowles's Vesta (Wakefield), 2.

HURST SCURRY STAKES of 2 sovs each, and 30 added.—Grasshopper (Planner), 1. Zibka (Yates), 2.

By the will of the late Mrs. Sayer, Old Cavendish-street, there is left to the Church Missionary Society, £50; the British and Foreign Bible Society, £50; the Society for Promoting Christianity among the Jews, £30; Religious Tract Society, £30, and to the general fund of the Ragged School Union, £30.

The gross amount of the declared value of all the articles exported from the port of London in the year 1850 amounted to £14,137,567. The principal articles of export, and the value, was as follows:—Beer and ale, £410,529; brass and copper, £865,081; cotton manufactures, £2,007,183; cotton yarn, £16,835; haberdashery and millinery, £368,000, wrought and unwrought iron and steel, £730,913; hardware and cutlery, £462,964; leather, &c., £264,711; saddlery and harness, £81,092; silk manufactures, £438,043; linen yarn, £247,534; machinery of all sorts, £384,806; silk manufactures, £491,530; tin unwrought and in plates, £315,584; wool (sheep's), £315,257; woollen manufactures, £1,308,214; woollen yarn, £99,338. All other articles collectively, £4,070,854.

MUSIC

PHILHARMONIC SOCIETY.

The symphonies in the sixth scheme were Mozart's E flat, and Beethoven's B flat, No. 4—two intensely fascinating inspirations, which were executed with unparalleled perfection by the band, under Costa's direction, the piquant and accurately minuetto in the former work receiving its usual encore. The adagio in E flat, in No. 4, was exquisitely coloured, and the exhilarating finale was played with the highest animation and precision. The overtures were Mendelssohn's "Ruy Blas," and Spohr's "Pietro von Albano;" the former, although it is not one of the composer's greatest conceptions, and is somewhat noisily scored, contains some beautiful writing; the delicious subject all-tied to the coda is too soon abandoned by the writer for more boisterous themes. The solo items were Hausmann and Bottesini. The former is the famed Belgian violinist, who gained great glory in Paris some twenty years since; he played at the Philharmonic concerts in London, in 1839, but subsequently returned to his original profession as a lawyer, and took his degree at the Louvain University of Doctor of Laws. In 1849 he came out again, in Paris, as a violinist, with immense success, and then visited Germany and Russia, where his playing was equally admired. Hausmann's mechanism is certainly marvellous, and his style is large and bold; but the andante and rondo selected by him was such a singular composition, so replete with breaks, cadenzas, and concertation, that it looked as if the executant had proposed to exemplify the intricacies of the modern school, by playing a pianoforte mazurka of Chopin backwards. Bottesini, in his contrabasso concertino, electrified the assemblage; the pace was accelerated, struggling and incoherent, but it was calculated to develope his magnificent tone and grace of style in flowing cantabile and his wondrous dexterity in those feasible difficulties over the finger-board. Since the days of Paganini, in licence made differentiates over the finger-board. Since the days of Paganini, no artist has created such a prodigious sensation, the band itself being infected with the excitement of the audience. He is the wonder of the day; and, what adds such charm to his astounding *tours de force* in the most unique instrument, is that it is so thoroughly musician-like and ear-haunting: it is not the grunting and growling of the ordinary double bass but the tone is pure and resonant, and he sings the cantabile as easily as a violinist. Herr Pischek was the vocalist, and gave the cavatina, "Cujus animam," from Rossini's "Stabat Mater," with great power of voice, very artistically, and the polacca from "Linda," "O luce," with the utmost brilliancy. The German baritone does not possess the fine voice of five years since, when he was first heard in this country, and his method has become more exaggerated, using his *falsetto* to excess; he sang his favorite *canzone*, Spohr's "Liebeslust," and in the hackneyed duo from Mehul's "Joseph," "Sole stay." The next concert will be on the 9th of June.

MATINEE MUSICALE AT STAFFORD-HOUSE.

M. Jacques Blumenthal, the pianist and composer, by the kind permission of her Grace the Duchess of Sutherland, gave a *Matinée Musicale*, on Saturday last, in the Picture-Gallery of Stafford-House. The aristocratic patronage bestowed on the fortunate *bénéficiaire* was proved by the presence of nearly 400 of the most distinguished families in the person, amongst whom were members of the most distinguished families in the country. A more beautiful appearance than the noble Gallery presented, filled as it was with noble dames of rare beauty, with toilettes of the acmite taste and variety, cannot be conceived. The Gallery is rich in pictures of the higher class, absolute standards of perfection; and such was the charming influence on the vocalists, Miss Dolby's Orphean-like tones seemed to enrich the saloon, that we almost fancied some of the Titian-like living beings had stepped from the frames of the gems of art, to listen to the divine strains. "Stars beach as well as skies," sings the poet, and contrarily the orbit in which Mario was revolving was eminently calculated to extract his vocal eloquence, emulating the mortal and celestial models that were around him. The Italian maestro was the only artist engaged in the programme besides the pianist; the ear was, therefore, not assailed and fatigued with the fantastic changes and never-ending schemes of modern concerts. Blumenthal performed a scene of his own, and Signor Mario sang an air; and thus each of the two artists relieved each other, until a couple of hours slided away in unalloyed enjoyment, the dreamy moments of melodious imagery being only interrupted by the sparkling of Stars beach as well as skies," sings the poet, and contrarily the orbit in which Mario was revolving was eminently calculated to extract his vocal eloquence, emulating the mortal and celestial models that were around him. The Italian maestro was the only artist engaged in the programme besides the pianist; the ear was, therefore, not assailed and fatigued with the fantastic changes and never-ending schemes of modern concerts. Blumenthal performed a scene of his own, and Signor Mario sang an air; and thus each of the two artists relieved each other, until a couple of hours slided away in unalloyed enjoyment, the dreamy moments of melodious imagery being only interrupted by the sparkling of Herr Pauer's fairy fingers, and the harmonic tendency, resolving to unite material loveliness with immateriality—to combine mind with matter, ordered refreshments to be profusely distributed to the company. Certain was a modest remembrance of the charm of the music heard through means of ideal and pictorial abstractions; and unsusceptible and unrefined must the intellect have been—mortal indeed must have been the taste, that could have been unmoved by such associations.

MADAME PUZZI'S CONCERT.

The annual grand morning concert of this favourite vocalist was given last Monday in the great concert-room of Her Majesty's Theatre, a full and fashionable assemblage being present. Signor Puzzi played a solo on the horn, with that charm of tone which has been the characteristic of the performer; Piatti, in short performances, played violoncello and violin pieces to perfection. The vocalists were Madame Sontag, Madlle Sophie Cruvelli, Mdlle. Cruvelli the contralto; Mdlle. Dupree, Madame Fiorentini, Madame Caradori Allan, Madame Bishop, Mdlle. Bertrand, Madame Castellan, Mdlle. Ida Bertrand, Signora Alaymo, Signori Gardoni, Calzolari, Perdini, Lablache, F. Lablache, Lorenzo, Ferranti, Coletti, Herr Carl Wolf, Herr Reichardt, and Signor Puzzi. The concerted and occasional cantata, the "Hymn of Nations," to the honour of Great Britain," the poetry by Signor Torre and the music by Balfe, was the finale. The composer has thoroughly comprehended the ambition of and Puzzi. The composer has thoroughly comprehended the ambition of and Puzzi. The composer has thoroughly comprehended the ambition of Sinn Revers, Misses Dolby, Birch, Ransford, Lant, Eyles, and A Dolby; Messrs. Land and [illegible] Mr. Lucas conducted the opera; the orchestral and choral forces being numerous as well as effective. Members of the Royal Academy of Music pupils being permitted, as Mr. Holmes is one of the ablest professors. Between the acts of the opera Mr J. B. Chatterton played a harp solo, and Mr. Macgarety's "Don Quixote" overture was executed. We shall reserve our analysis of the opera until it is heard on the stage, but we request that Mr Holmes did not perform pianoforte music, and give a miscellaneous selection for his morning entertainment.

MR. AGUILAR'S CONCERT.

This pianist and composer gave a morning concert on Wednesday, at the Hanover Rooms with the assistance of which Mr Willis was leader. The conductors were Messrs. Anschutz and Schimon. The vocalists were Mdlle. Graumann, Misses Birch, Dolby, and Lucombe; Herr Reichardt, Mr. Marchesi, and Mr. Aguilar. The instrumentalists were Ernst and Bottesini. The general interest of the scheme was, consequent by, great; and Mr. Aguilar's pianoforte performances, and his symphonies for the full string forces calculated to display his abilities as a musician in a highly favourable light.

THE BEETHOVEN QUARTET SOCIETY.

The seventh meeting took place on the morning of the 22nd ult., at the Hanover Rooms, which was styled a Mendelssohnian *matinée*, his quartets Nos. 3 and 5 being executed by Ernst, Cooper, Hill, and Remenéde. Mdlle. Krumbz, a *pupille* of German and Parisian fame, made her first appearance in Beethoven's sonata in C minor, with Ernst; her execution is admirable, and her classic judgment and taste unimpeachable. Selections from Mendelssohn's opera, "The Son and the Stranger," were sung by Mdlle. Graumann, Herr Wolf and Haltz. The eighth performance was on Wednesday night, at the Queen Anne-street Rooms, the scheme being—No. 1 in D, Op. 18 (1798), in G, Op. 18 (1797), No. 16 (1797), No. 17 in F, Op. 135 (1825), and the quintet in C, Op. 29. Sivori and Sainton alternated the first and second violin parts. The next meeting will be on the 11th of June.

ST. MARTIN'S HALL.

At the seventh of the Monday Concerts, on the 21st instant, the programme began with a musical curiosity, Carissime's oratorio "Jeputha," composed in 1650. Considering the infancy of art in this Roman composer's days, "Jephtha" is a remarkable work. The scheme includes—No. 1 in D, Op. 18 (1798), the only accompaniments are the organ and basses; and Mr Hullah did right to present the oratorio in its primitive state. Edward Fitzwilliam's cantata, "O incomprehensible Creator" fully confirmed previous impressions of the artist's great abilities; there are admirable points of originality of idea in the instrumental and harmonic imagery is instinct with intelligence and ingenuity. The chorus, "Vouchsafe to us," and soldiers' concluded the scheme. The vocalists at this concert were Mrs. Endersohn, Misses Deakin, Gill, Elliott, and Kent; Messrs Manvers, Williams, and Weiss. The eighth and last concert will be on the 18th of June.

MUSICAL EVENTS.

Mr. John Parry presented his "Notes, Vocal and Instrumental," at the Music-Hall, Store-street, last Monday evening.

Herr Witt, the violinist, gave his second concert last Tuesday, at the Queen Anne-street Rooms, assisted by Madame Clauss, Miss Lucombe, Herr Reichardt, and Mr. Aguilar. Herr Reichardt, Messrs. Lucas and Aguilar were also the pianists. Mr. Hausmann (violoncello), and Don R. Ciebra (guitar).

Miss Chandler, the vocalist, had a morning concert last Tuesday, at the Music-Hall, which, on the occasion of Miss Eyles, Colls, Law, Leslie, Madame Zimmerman, Messrs. H. Haigh, Wadworth, J. Haigh, M. Tourneur (violin), M. Camus (flute), M. Guil-ume (cornet-à-piston), Mr. Pennun (concertina), and Miss Chandler (piano).

Mrs. W. Sinclair's second evening with the Scottish Bards took place on Friday, at the Music-Hall, assisted by Miss Sinclair (pianist), and Mr. A. Mackenzie, (violinist) Mrs. W. Sinclair fills a void left by the death of Wilson, as an eloquent exponent of Scotch melodies; her style of rendering the "Flowers of the Forest," "John Anderson, my Jo," "Highland Mary," "Auld Robin Gray," "Flora Macdonald's Lament," and other attractive songs, is excellent.

The Sacred Harmonic Society will perform Handel's "Messiah" at night, at Exeter Hall, under Costa's direction, on Friday next, with the attraction of this oratorio, as well as of "Tl'ijah," since the opening of the Ex ibition. The vocalists were Miss Catherine Hayes, Miss E. Birch, Miss Dolby, Miss Williams, Mr. Sims Reeves, and Herr Reichardt.

Miss Ellen Day (pianist) and Mr. John Day (violinist) gave the first of a series of three *matinées musicales* last Wednesday, at the Queen Anne-street Rooms, assisted by Mr. Egremont (violoncello), Mr. Miller (contra-basso), Mr. Gernard Taylor (Harp), M. Zerbini (vocalist), Mr. Hill (viola), and Mdlle. Magner, Miss Macdonald's Lament," and other attractive songs, is excellent

The Sacred Harmonic Society will perform Handel's "Messiah" at night, at Exeter Hall, under Costa's direction, on Friday next, with the attraction of this oratorio, as well as of "Tl'ijah," since the opening of the Ex ibition. The vocalists were Miss Catherine Hayes, Miss E. Birch, Miss Dolby, Miss Williams, Mr. Sims Reeves, and Herr Reichardt.

The vocalists were Miss Catherine Hayes, Miss E. Birch, Miss Dolby, Miss Williams, Mr. Sims Reeves, and Herr Reichardt.

Miss Augusta Purcell, a vocalist, gave an evening concert on Wednesday, at the Mnve Hall, aided by Misses Bassano, Messent, Eyles, Poole, E. Macmahon, Messrs. Land, Lavina, Messrs. Herr Witt, T. Williams, F. Bodda, and Signor Marchesi, as singers, and Messrs. Richardson, J. Thomas, Herr Ros itzky (violin), and Mr. Lucas (piano), as solo instrumentalists: Mr. Louis Lee and Sig. Carlo Madame Griffin (piano), as solo instrumentalists: Mr. Louis Lee and Sig. Carlo Minasi were the conductors.

M. and Madame Ourry had a *matinée musicale* at their residence, in Great Marlborough-street, on Thursday, assisted by Herr Reichardt and Bottesini. Madame

tar in B flat, in praise of gold. The trio in F, between Castellan, Bertrandi, and Formès, was excellently sung and acted, particularly by the bass; it was greatly applauded. Tagliafico's *aria d'entrata* was powerfully given: he dressed the Spanish governor to the life, and looked like a Velasquez head, cut and stepped from a frame. He has raised his reputation as a musician greatly by this impersonation. The subsequent duo between him and Formès was a masterly display of vocal and histrionic ability from both artists: the by-play of Castellan, where *Fidelio* overhears the arrangements for the execution of the mysterious prisoner in the subterranean vaults during this duo, was most expressive. Her delivery of the recitative and *scena* which followed gave scope for which she was superb, and it thoroughly enlisted the sympathies of the auditory, but in this allegro she lacked the physical means to carry out her conceptions. The *finale* of this act, beginning with the chorus of the release of prisoners, was hearty; the conductor was evidently feeling his way, not being able to be sure that the artists were perfect in their parts. As regards the chorus of prisoners, our choral singers are so little accustomed to act, like the Germans, that their delivery was undecided, but after a night or two this unapprehensiveness in the debut will, no doubt, wear off.

Between the first and second acts, the "Leonora" overture in C, Op. 86, was played by the band with such wonderful effect that the signal for the *encore* was given from the Royal box. The trumpet passage, placed behind the scenes, quite excited the auditory; and when Sainton led off the famous rush of the violas, it was difficult to retain one's seat, so amazingly impulsive were the sensations created by the unparalleled execution of this author's overtures. Sainton, Hill, and Piatti are the grandest of the four works composed by Beethoven for "Fidelio." There was no reaction after this orchestral achievement in the *finale*, excitement, as Lamartine maintained it as his full breath by a splendid reading of the air in the dungeon of *Florestan*: this great tenor rises in estimation at every new delineation, no matter what the school may be: his artistic attainments and thrilling chest-voice are certain to fix the attention and command the admiration of his auditory. The recitatives and adagio were sung with profound pathos. In the allegro in which *Florestan* has the presentiment of an angel's visitation, in the person of his lost *Leonora*, to restore him to freedom, Tamberlik took the house by storm by his thrilling bursts in the high notes, executing the G, A, and B, and finally throwing out a chest O with electrical force: he was compelled to repeat the air, which was given with more effect to the poet, near his bed of straw—for, in all the details of the *mise en scène*, the delight in nature was strikingly conspicuous. The grave digging duo, in A minor, with its wondrous under-current of instrumentation, in the most impressive —Formès' acting developing fresh points of interest at every moment. The trio in E A flat not so successful: but the concerted piece in D, after *Pizarro's* entrance, could not have been depicted in a more picturesque and startling manner; the group formed by Castellan shielding *Florestan* from the uplifted dagger of the governor, with the naked pickaxes of the guard, rather slackened the time in the duo of rejoicing, upon which it was wise not to drop the curtain, and to restore the original text, the gaoler entering to free *Florestan*, and carry her off to the dungeon to the presence of the Monarch, who thus ascertains the villany of *Pizarro*. The magnificent *finale* was sung to perfection both by principals and chorus; there was an observance of light and shade, a clearness and quality of support in the ensemble beyond all praise, and the applause at the fall of the curtain was enthusiastic, and long continued, orations being rendered twice, not only to the leading artists, but also very justly to Costa, under whose magic baton this noble *ensemble* had been attained, and such an *ensemble* will always carry "Fidelio" through triumphantly, even if it had not such a powerful cast as it now possesses.

Mdme. Castellan will materially increase her fame by her *Fidelio*; it is her own reading of the part, and is finished, original, and most impassioned, but not stand, terrible, and overpowering, like the delineations of Malibran or Schroder Devrient, who certainly, as first, have left the traditions of their subsequently approached; for Mdme. Castellan is a singer of the highest order, who not deem it necessary to enter into any invidious comparisons between the *Fidelios* of the two houses, as each representative of the day led wife has special points of attraction, Cruvelli being more dramatic and exaggerated, and Castellan being more musician-like and less vivid.

Beethoven's "Fidelio" will doubtless retain a place in the *répertoire*, but general audiences will still require a greater infusion of the Italian element before they can thoroughly appreciate the composer's marvellous fancy, imagination, and science. He has so completely disregarded the art of voicing in "Fidelio," that its representation is unattractive to the ear, while dramatic and emotionous, only relieved by those casual flashes of genius which penetrate every ordinary barrier, be questioned, however jarring may be the alternations of spoken dialogue and singing in the present Beethoven *Fidelio*, the production does not suffer from the abandonment of the speaking for the recitatives. The music of "Fidelio" would have been more practicable and interesting, if those portions whilst *Leonora* is in boy's attire, been more purely vocal for a contralto. However, the opera must be accepted with its conditions of mixed parts and all: and the orchestral writing is so beautiful in each, is too sublime, are the emotions of certain scenes too strong, not to include "Fidelio" amongst lyric masterpieces worthy of the careful execution of every great operatic establishment, whatever may be the language employed in the interpretation.

Donizetti's "Lucrezia Borgia" was repeated last Saturday night, to an overflowing house—Signor Bianchi, at a moment's notice, undertaking the part of *Duke*, for which change the subscribers are grateful; but, as Tamburini is in Paris during the inclining, it is a pity the directors did not send for him at the first break-down of Salvatori. Gris and Mario were as fine as ever in *Genaro* and *Gennaro*; and Mdlle. Angri created quite a sensation by her *Orsini*, as much in the scene as in the scandal." Mdlle. Castellan appeared as *Alice*, and after the "Larcrezia." The fame of Castellan, at Berlin, as the Norman peasant girl, will prove to have been fairly earned.

On Tuesday, for the extra night, Meyerbeer's "Huguenots" was given for the the fifth time. Her Majesty and Prince Albert, accompanied by the Duke and Duchess of Saxe-Coburg-Gotha, being present. The house was crammed in every part. Donizetti's "Favorita," with Grisi, Mario, Tamberlik, and Ronconi, will be revived next Tuesday. "Fidelio" will be repeated to-night (Saturday). Tamberlik is engaged, and will appear in "Don Giovanni."

ST. JAMES'.

On Monday, the one-act vaudeville, "Bonneo et Marrielle," was produced, for the purpose of enabling M. Levasseur to make his first appearance. The character of *Marrielle* is performed by Mdlle. Schwaneck. The piece, though the production of three authors (MM. Dumanoir, Strandin, and Moreau), is very slight. Both the hero and heroine are disguised in order to deceive; as an authentic sexagenarian, and the latter as her own aunt. These shiftings of costumes and apparent personalities make the humour of the piece, and serve for its situations, which depend much upon the manner in which the parts are plaked for their amusing attributes. This little drama was followed by another of decidedly farcical interest, by MM. Lubiche and Lefranc, entitled "Embrassez-Moi-Sans, Poliville," in which the *rôles* are sustained by MM. Amant, Derval, Lacourciere, and Mdlle. Schwaneck—all of them extravagant parts, requiring eccentric acting, and implying violent practical effects. Both vaudevilles are from the Montasian.

On Wednesday three new pieces were given:—"Une Femme qui a une Jambe de Bois," "Si Jeunesse savait," and "Madame Bertrand at Mademoiselle Eaton." These are respectively the works of MM. Lubiche and Lefranc, Dumanoir, and MM. Dumanoir and Lafargue. Of "Une Femme qui une Jambe de Bois" little need be said. Its title suggests a comparison with the cork-legged lady in the farce of "Perfection," and its argument is not dissimilar; only in the French piece the gentleman is disposed to show his affection to the lady with the wooden leg by proposing to have his own leg cut off and similarly substituted. Like utterly French is the sentiment in "Si Jeunesse Savait," the hero of which is the gallant *Duc de Rochelaux*, who, for the sake of a dotting nephew, undertakes some *passages d'amour*, and acts in the double, as it were. Thus, when an interview is granted by the *Marchioness*, whom the uncle would have the young *étourdi* marry, the nephew assists the latter knave in personating, in a dual, the former disarms the rival, but leaves to the favoured youth the credit of the victory by slipping away. These characters are well contrasted, and their differences are broadly out in the acting of MM. Derval and Levasseur. Of a much broader nature is the piece entitled "Madame Bertrand et Mademoiselle Eaton," treating of the wiles of a staymaker and a dramatic author, who shaves himself thrice a day at his solicite to compound him to his opposite neighbour. The lady, however, cannot spell, and when the affair takes an epistolary shape, is compelled to call in the aid of her *cavalier*, who finds the writer is a former lover of her own. The scene of his amorous caresses is highly amusing. But the self-educated *cavaliers* is rewarded for her accomplishments. The workwoman, who can spell, is preferred to her mistress, who cannot.

All these pieces also are from the Montasier.

This week two new pieces have been added, M. Leon Laya's "Deux Vieux Papillons," and a sort of monodrama, entitled "Un à la Représentation de Robert le Diable." In both M Levassor is the leading feature—in the first performing both a father and a son, with appropriate changes of costume; and, in the latter, a stage-struck youth, who describes in a sort of song the actions of Meyerbeer's opera, including reminiscences of its music. M. Raval was to have appeared on Monday, but some accident seems to have prevented his arrival.

PUNCH'S PLAYHOUSE.

On Thursday evening, a piece by Mr. Augustus Mayhew and Mr. Sutherland Edwards, entitled "The Poor Relation," was produced. The story is briefly told. In the first, the poor relation, *Sam Warren* (Mr. J. Rogers), is reduced to black shoes, on his return from the Brazils, and solicits assistance from his cousin *Hobson* (Mr. Romer), who puts him off with a fiver, which he gives to Mr. Tilbury), an old acquaintance, and as ill to do as himself, proposes a partnership in their distress, to practise, not only on the cousin already mentioned, but on two others, *Dobson* and *Jobson* (Mr. White and Mr. Atwood). The D-ctor gets possession of *Hobson's* trunk of clothes in exchange for one of his own, containing grass and other rubbish; and, newly accoutred from its contents, he ingratiates himself the medical adviser of *Sam Warren*, whom he puffs off as a rich nabob, about to die and make his will, and counsels his cousins to atone for the insults to which they have subjected him by making him presents of silver spoons, gold repeaters, and a landed estate. A nobleman's housekeeper assists them in their plan, by letting to them her master's mansion for eighteenpence a day during his absence. On his Lordship's return, the plot explodes, but the rogues escape with their booty. Their evil, however, is not without a good, for their tricks avail *Julia* (Miss F. Romer), *Hobson's* daughter, to secure a lover. The dialogue is smart, full of unexpected points and verbal perversions, and the characters were carefully acted, Mr. Tilbury making the most of his. The piece was perfectly successful.

MR. THACKERAY'S SECOND LECTURE.

Mr. Thackeray delivered his second lecture at Willis's Rooms, on Thursday, to a numerous and distinguished audience. It was more better arranged than the former, and the matter was of a more miscellaneous character. The subject was two-fold—William Congreve and Joseph Addison. In those days, such men as these, and Steele, were rewarded for their literary tendencies out of the public purse. They began at College with laying all the deities of Olympus under contribution to praise some man of rank in power, and got pensions and places in return. Of such a sort were Congreve's "Pindaric Ode" and his reward for one comedy was a place in the now mythical Pipe-office, and other sinecures. His scene began to be considered the "most eminent literary man" he was applauded by everybody—equally believed to be worthy of it, in the side boxes, or on the stage. Mr. Thackeray here entered into some metaphysical reflections on life and death, truth and lies entering into everything, and applied them to Congreve's comedy, which he likened to the *Vicar of Wakefield* and compared to a dance commencing wit; a well-known *pas* and ending with a grandpa whose interference was always deprecated. The great moral, indeed, was "Obey with old people." It taught but one lesson—"Enjoy! enjoy! enjoy! Death and fate are at the gate, and will come in." The *Mariolets* were always splendid and triumphant, and the young *Betweens* make fools of the old husbands. Congreve aimed at being the fine gentleman rather than the author.

Addison was different from this. Like other lords of intellect, he lived alone; and, feeling how much better his genius was than others, could admire much. Yet he praised all. Even so Scott and Goethe received young literary aspirants with a smile. Addison praised indiscriminately, before one could see a little genius, when he praised the genius of Pope, the ingenious Mr. this and the ingenious Mr. that. He also praised Milton; but he did not like Pope to supersede him. Addi on, by Latin verses, secured £300 a year at the beginning of his career; and, even while in power, had the manners of the finest gentleman in the world. Having lost his pension, he proved himself philosophically courageous; and, as a character, might be almost considered faultless, but for his "Campaign" and "Cato." The simile of the angel who

> Rides on the whirlwind and controls the storm.

in his poem of the "Campaign," redeemed his f rtunes; it procured him a pension. Also, he married Lady Warwick. But it is not for this or these things that we admire Addison, but for his "Tatler" and "Spectator." In which he has dealt with little matters, where he excelled with the pleasantest penalties. In Addison's writings there was no trace of suffering or of deep sentiment: he was a resolute clubman, and saw only the public life of women. Moreover, he was an invincible dreamer. The cry women whom he did know he never wrote about—others he did. Addison's essays were better than sermons. In proof of his religious character, Mr. Thackeray quoted his celebrated hymn in rapture, and concluded a lecture of rare interest, with some illustrative citations and moral remarks. He was much applauded.

Mr. Vandermeerach and his daughter, whose ingenious and elegant exhibition of birds we last year had the pleasure to introduce to the notice of our readers, have, encouraged by the success they have met with, returned to London for this season. M. Vander Meer has shown us an album, in which numbers of persons of rank and distinction have recorded their opinions of his exhibition. Etienne Arago occupies a page or two with some charming verses, whose points would suffer from any endeavour to give them action, as it is exactly as best followed by Jules Janin and several other *litterateurs*. A portrait of Mdlle. Vandermeerach was engraved in the ILLUSTRATED LONDON NEWS for July 6, 1850

ASCOT RACES.—The arrangements of the Great Western Railway for the coming Ascot Races (3rd, 4th, 5th, and 6th of June) promise great additional convenience and pleasure. Tickets will be issued at the Paddington Station for the race days upon any previous evening, the holders of which, upon showing them, will be at once admitted to the platform; such tickets to be obtained at the several railway offices in London. Carriages will also be provided for passengers from Paddington to Windsor will be provided on the 3rd and on the 5th (Gold Cup day); and there will be early special trains on those days for carriages and horses, to ensure their arrival at Windsor. Omnibuses, &c., will start from Windsor to Ascot on the arrival of the trains and after the races; and no doubt have been made between the Great Western Railway Company and the Post-Office and Money-order Offices; at the various Docks, St. Katharine's, London, West and East India, &c., and public schools.

DOCTOR GUGGENBÜHL'S CURE.—It is published, in our Journal of May 5th, 1850, a brief account of the Institution for the Cure of Cretinism, established by Dr. Guggenbühl, on the Abendberg, at Interlacken, Switzerland, and we gave a sketch of his humane and interesting establishment. This excellent gentleman, having been in England, has published a letter to Lord Ashley on some points of public welfare and Christian legislation (Sendschreiben an Lord Ashley, die Armen und die Kinder betreffend, nebst einem Vorwort von Dr. Guggenbühl. Gesteisgrung: Basle, 1851). The learned gentleman adverts, with good feeling and good taste, to several of our institutions for promoting the public welfare, and acknowledges the services rendered by Lord Ashley in that and other part; and to some of our customs, such as the immoderate use of spirituous liquors, which yet require amendment. He gives, too, some information about cretinism, which to some places he has visited, and compliments our country now happily abounds

The successful candidate for the Great Exhibition Prize Essay, given by the Rev. Ernest Hawkins, Principal of Queen's College, is the Rev. I. C. Whish, incumbent of East Peckham, Kent, son of General Sir W. S. Whish, K.C.B., of the Bengal Army, the hero of Moultan.

The inaugural of the Five Hundred and Twenty-first Leipsic Book Fair, held in the Easter of this year, presents a variety of some importance on the five hundred and twenty catalogues which have preceded it. The books are classed not alphabetically according to the names of authors, but systematically, in the order of the subjects. According to this catalogue, the number of books printed in Germany in the six months since the last fair amounts to 4044, and 1138 more are in the press.

The Prussian authorities on the Belgian confines rigidly persist in admitting nobody coming from England whose passport is not countersigned by the Prussian ambassador or consul. Numbers of travellers are stopped, to the great inconvenience. It is very necessary that travellers should be warned of this circumstance.

By the decease of the Hon. Francis James Curzon, barrister-at-law, the registrarship of the Bankruptcy Court at Birmingham has become vacant.

MONETARY TRANSACTIONS FOR THE WEEK.

(From our City Correspondent.)

Considerable buoyancy prevailed in the English Market on Monday, and the rise marked on Saturday's prices was not only maintained, but further augmented an improvement of one-quarter per cent, compared with the close of the week. The last prices quoted were 97¾ 98 for Money, and 98 98¼ for Account. But on Tuesday the market opened rather heavily; and a reaction to 97⅝ ⅞ for Money, and 97¾ 98 for Time, were the last quotations. A further decli e of ¼ to ⅜ per cent. occurred on Wednesday; the demand for money in the Share Market being more active, added to a feeling that money will gradually become dearer. At the close of the day Consols quoted 97⅛ ⅜ for transfer, and 97⅜ ½ for Account. As no advance was made on the rate of interest by the Directors of the Bank of England, on Thursday the market became gradually firmer, and bargains were done at 97½ to ⅝ for money, and 97⅞ for time. Exchequer Bills have declined 5s 10s during the week, but a more rachet bleton has been the result. Some sales from sales, the general value of money being now 2⅝ to 3 per cent., while Exchequer Bills pay only 2½ per cent. India Bonds have not been much dealt in, but when sales are made a depression in prices is the result. At the close of the week's business some firmness prevailed, the last prices being, for Bank Stock, 211½; Reduced 97; Consols, 97⅞; New 3½ per Cent Annuities 98⅛; Long Annuities, expiring in January, 1860, 7 5-16ths; India Bonds, under £1000, 52 p: South Sea Stock, New Annuities, 98⅛; Consols for Account, 97⅛; Exchequer Bills, £1000, 43 p; Ditto, £500, 44 p; Ditto, Small, 41 p; Ditto, Advertised, 60 p.

Business in the Foreign Market has been rather more limited during the past week, and prices are, with few exceptions, a shade lower. Mexican receded from Monday's prices of 35¾ to 34¾; but afterwards rallied to 34⅞. Peruvian quoted 83¾ 83. Buenos Ayres Stocks has advanced, upon the understood intention to pay a proportion of a dividend next January. Dutch Certificates of Messrs. Baring Brothers and Company. The last quotation is 58¾. Portuguese Four per Cents are quoted at 92¼, affording no indication of any feeling in favour of the recently appointed Ministry. In the various low-priced stocks there have been no changes of interest. the last quotations generally being for Buenos Ayres Bonds, 6 per Cent., Account, 58½; Danish Bonds, 1825, 3 per Cent., 76½; Ditto, 5 per Cent., 103¾; Mexican, 5 per Cent., 34⅝, 35; Peruvian, 5 per Cent., 84¾; Ditto, Account, 84½; Peruvian Bonds, 5 per Cent., 83¾; Ditto, Deferred, 39½; Portuguese 4 per Cents, 39½; Russian Bonds, 4½ per Cent, 101½; Spanish, 5 per Cent., 1840, 30⅝; Dutch, 4 per Cent, Certificates, 90.

Shares have fluctuated extensively, sales being pressed from Liverpool, besides the speculators here being still unable to meet the heavy demands for "continuations." On Wednesday, for a short period, a panic reigned, the failure of an individual inspiring fears that may yet be realized before the present Account is settled. Towards the close of the week, however, as the settlement of the account proceeded, a better feeling seemed to prevail, and prices have consequently, in some degree ral ied The last quotations are for—

ORDINARY SHARES AND STOCKS.—Aberdeen, 11½; Ambergate, Nottingham, Boston, and Eastern Junction, 3⅝; Caledonian, 13½; Chester and Holyhead, 20½; East Anglian (£50 paid), 3½; Eastern Counties, 6½; Eastern Union, 3½; East Lancashire, 9½; Edinburgh and Glasgow, 9½; Edinburgh, Perth, and Dundee, 64; Great Northern, 18; Great Western, 84½; Lancashire and Yorkshire, 87½; Ditto, Fifths, 4¼; London and North-Western, 124½; Ditto, Quarter shares, 31¼; Ditto, Fifths, 6¼; London and South-Western, 83; Manchester, Buxton, and Matlock, 2½; Midland, 35¾; Ditto, £ 0, 18¾, Newmarket, 7½; North Staffordshire, 6½; Oxford, Worcester, and Wolverhampton, 15½; Shrewsbury and Birmingham, Class A, 5⅛ dis.; Ditto, Class B, 4¼ dis.; Shropshire Union, 3½; South-Eastern, 24½; South Wales, 27½; York, N.ewastle, and Berwick, 21; Ditto, Extension, 13½; Ditto, G N R purchase, 6½; York and North Midland, 23¾

LINES LEASED AT FIXED RENTALS.—Birmingham and Oxford Junction, 29; Reading, Guildford, and Reigate, 9¼

PREFERENCE SHARES.—Aberdeen, 1 dis.; Great Northern, 13½; Lancashire and Yorkshire, Six per Cent, 100; Manchester, Sheffield, and Lincolnshire, New, £10, 19; Shrewsbury and Birmingham, New, Guar., 10½; York and North Midland, 5¼.

FOREIGN.—Boulogne and Amiens, 9; Central of France, 17; Dutch Rhenish, 2¾; East Indian (£4 paid), 1⅝; Namur and Liege, 6¾; Northern of France, 14½; Orleans and Bordeaux, 28; Rouen and Havre, 9.

THE MARKETS.

CORN-EXCHANGE. After average supply of English wheat last week fresh shandi his week in retail trade, and Saturday's prices were 1s to 2s per qr. lower. Barley and malt were 1s to 2s cheaper, and previous rates have been well supported. Fine foreign wheats have moved off freely at full quotations; but inferior sorts have commanded very little attention. Fine malting barley continues to realize extremely high prices, and fine grinding qualities have maintained their value. Beans and peas are 1s per qr. cheaper. Oats and oatmeal have declined 6d per qr. Indian corn and flour, the imports of the latter article being large,

English.—Wheat [illegible] Barley [illegible] Malt [illegible] Oats [illegible] Beans [illegible] Peas [illegible] Flour [illegible]

Irish.—Wheat [illegible] Barley [illegible] Oats [illegible] Beans [illegible] Peas [illegible] Flour [illegible]

Foreign.—Wheat [illegible] Barley [illegible] Oats [illegible] Beans [illegible] Peas [illegible] Flour [illegible]

Wheat—The prices of wheaten bread in the metropolis are from 6d to 6½d per 8lb loaf of household and 6½d to 7d for fine.

Imperial Weekly Average.—Wheat, 39s 1d; barley, 31s 1d; oats, 19s 2d; rye, 30s 7d; beans, 36s 8d; peas, 36s 0d.

The Six Weeks Average.—Wheat, 38s 10d; barley, 31s 2d; oats, 19s 3d; rye, 30s 7d; beans, 37s 10d; peas, 36s 10d.

Duties.—Wheat, is.; barley, 1s; oats, 1s; rye, 1s; beans, 1s; peas, 1s.

Tea—Nothing to the large sales on hand: 58,102 pkgs. against 36,614,389 lb at the corresponding period in 1850—our market is exceedingly inactive, and prices are somewhat lower than last week's quotations.

Coffee—There is a very dull inquiry this week, at a decline in the quotations of 1s per cwt. Mocha is neither wanted nor offered. Plantations in warehouse are moderately small. In prices of currencies. Brown Jumps are freely offered, at 47s 6d to 48s per cwt. No change.

Sugar—[illegible] native [illegible] the [illegible] barrel [illegible] prices [illegible] Refined [illegible] a very dull inquiry this week, at a decline in the quotations of 1s per cwt. Lumps are in moderate request, at [illegible] per cwt. Last supplies late from [illegible] and [illegible] currencies. Brown Jumps are freely offered, at 47s 6d to 48s per cwt. No change.

Spices—[illegible] native [illegible] the [illegible] barrel [illegible] prices [illegible] Refined [illegible] a very dull inquiry this week, at a decline in the quotations of 1s per cwt. Lumps are in moderate request, at [illegible] per cwt. Last supplies late from [illegible] and [illegible] currencies. Brown Jumps are freely offered, at 47s 6d to 48s per cwt. No change.

Provisions—Only a limited [illegible] during the [illegible] Waterford are quoted at 69s to 72s; and Limericks, 70s to 72s per cwt. Prime Cork [illegible] 80s to 82s; and middle ditto, 76s to 78s. There is to-day a fair

EXHIBITION SUPPLEMENT TO THE ILLUSTRATED LONDON NEWS

No. 490.—VOL. XVIII.] SATURDAY, MAY 31, 1851. [TWO NUMBERS, 1s.

THE GREAT EXHIBITION.

COTTON MANUFACTURES.

UNINTERESTING as many persons—and those, too, best acquainted with the routine of the cotton trade—may think an exhibition of the various productions of skill and ingenuity in this department of our national industry, yet he would be a very superficial thinker who merely looked at the question from this point of view. The immense advantages accruing to this country from the position to which the cotton manufactures have progressed—the employment it gives to so many hundred thousand of our population—the comfort diffused by its agency throughout the whole habitable globe—renders it an object of more than ordinary interest since the commerce of which it usually forms the first staple in its many Protean forms is generally the harbinger of that colonisation to which all reflective minds look as the great work of the men of the present day.

In our former notice of the leading features of the examples of cotton trade displayed in the Great Exhibition, attention was called to the fact, that the immense advantages we possessed in the rapid and economical manufacture of this material were such as to be well worthy of attentive consideration, and that it must be remembered that every ounce of the material to be worked into the various forms required by our commerce had to be brought across the Atlantic, manufactured by the various processes of spinning, weaving, printing, and dyeing, and in many instances taken back to the very place whence it came. In our notice of the iron manufactures, an allusion was made to the fact that the mineral treasures of this country were the true basis of our national industry, wealth, and prosperity; and certainly nothing proves this more than the cotton trade. For, though the enormous development given to the mechanical genius of the country by the inventions of Watt and Arkwright, and the facilities for obtaining and readily working the material by which that mechanical genius has been realised—from the ponderous steam-engine and hydraulic press on the one hand, to the most delicate spinning machinery on the other—we have been enabled to take a position as a manufacturing nation which is being daily and hourly enhanced by the wide extension given to our commerce through the cotton trade as the means of supplying the second great want of man, clothing; and that, too, in such a manner as to be eminently diffusive, since the cost is reduced to the minimum by the mechanical agencies so constantly at work, whilst the maximum power of production is obtained by those improvements in machinery, and the discoveries of science which it appears to be the peculiar mission of this country to promote. Not that we believe there is nothing worth living for except the production of an unlimited quantity of calico, which Sydney Smith sarcastically declared to be the opinion of the great body of our cotton manufacturers; but because there is inherently attached to the commerce connected therewith an opportunity for the diffusion of the blessings of civilisation, which has been felt wherever the Saxon race has found its way, and will continue to

1.—LEISTLER'S SIDEBOARD.

be felt in a greater degree in proportion as men see the real purposes of commercial unity and freedom, and understand the power they possess for good or for evil, even as they use the opportunities given to them.

We have, then, in the cotton manufacture, a double power for good: first, in the employment of our own population; and, secondly, in the promotion of that social intercourse of nations to which hopeful men have looked in all ages; and this, too, in an increased degree, as compared with any other of our manufactures, since it is more adapted to go to the most distant colonies to obtain the raw material, in the first instance, and hence have a double opportunity, first in buying, and afterwards in selling. Thus, the question now so much agitated in the manufacturing districts of Lancashire, as to the importance of opening new fields for the cultivation of cotton, becomes also a question for the philanthropist, as to the good to arise to the great cause of civilisation out of the variation of the sources from whence we are in future to draw our supply of raw material for the purpose of employing our population and the enormous amount of machinery which we have constructed at such an immense outlay of time, talent, and money. That the southern states of America cannot continue to supply our wants as hitherto with any degree of certainty, seems a settled question to those who best understand the peculiar position of the United States, and at the same time take into consideration the requirements of our manufactures, apart from the fact that it would be unwise to continue to suffer the immense population of our cotton manufacturing districts to depend upon an institution so uncertain in its character as slavery certainly is; for any movement which might take place in the slave states of the American Union, by which its present servile population should temporarily suspend their industrial pursuits as cultivators of cotton, would inevitably tell with frightful effect upon the industry of the north of England and of Scotland in the suspension of trade for want of raw material. This question, therefore, of the source whence our future supply of cotton is to come is of infinitely more importance in a national and social point of view than at first sight appears; for it is a fact which cannot be too often brought forward in the consideration of "the powers that be," both home and colonial, that the great staple trade of probably one-third of the population of England and Scotland is mainly dependent, at the present time, for employment and almost for existence, upon the worst institution of modern times, the slavery of the southern states of America; and, without seeking to become alarmists, it would be a dereliction of duty not to take an opportunity like the present to endeavour to bring this fact more prominently forward than it has been hitherto. With our East India possessions, with Natal and many of our colonies, particularly some of the West India islands, where cotton is indigenous to the soil, whereas it has been neglected for far less profitable and important matters, we may, if those who guide our affairs think fit, do great things towards supplying our own wants; and, whilst contriving to keep up our trade with the United States, to be less dependant upon them, and enable them to supply their own wants in a more satisfactory manner than at present.

It would be quite out of place here to enter into the history of the cotton plant, its growth or manufacture; but to those sufficiently interested in the question we would recommend the careful consideration of the cotton machinery at work in the Exhibition. Here may be traced the progress of the soft down-like substance, from the pod of this tropical plant, whose flowers are as ornamental when seen in all their beauty and beauty, until it becomes wrought into lace, as a means of adornment, or into cloth of varied texture and quality for the pressing requirements of man; and all this, too, by the aid of machinery driven by that worker of modern miracles—steam. Here, whilst the visitor goes amidst the rush of spindles and the flying of shuttles, and watches the almost intelligent action of the Jacquard in the production of artistic forms, in lace and other fabrics, he cannot fail but learn something of that mighty power which has arrayed up during the last sixty or seventy years, which has brought comfort and independence to so many thousand homes, and developed the genius of so many men who might have died in obscurity but for the field presented therein for the exercise of their talent, their energy, and their usefulness.

Tracing up the process through its various complications of cleaning, carding, spinning, and weaving, in the machinery department, the visitor who desires to see the full results arrived at in our cotton manufacture, may find them fully exemplified in a variety of forms in that portion of the British side of the Building set apart for this class of contributions, which will be found on the left of the western entrance between the Central Avenue and the Carriage Court.

Under the heads of the respective towns on the British side, and of countries on the Foreign side, we propose giving a sketch of the most noticeable features of the illustration of the cotton manufactures contributed to the Exhibition, and in courtesy commence with the metropolis of the cotton trade,

MANCHESTER.

Whether it was from a full realisation of the proverb, that "familiarity begets contempt," that the men of Manchester have done so little for the fair representation of their staple trade, is surprising, as might have done, that a matter so common to themselves would be equally well known to others, or from their apathy as to the real purposes of the Exhibition, will be difficult to ascertain; but this is certain, that had Manchester consulted its own honour, and not only half as wisely as it usually does in economic matters, an infinitely better display would have been the result. Not that it was desirable to see whole acres of calico; but a more systematised representation of the state of its trade in this middle year of the nineteenth century would have been a creditable (to the magnitude as the very desultory manner in which its examples are exhibited is discreditable to it as the manufacturing metropolis of Great Britain. Of course these remarks apply to the display as a whole and as representing Manchester, and not to the individual exhibitors, inasmuch as each has made his own arrangements as complete as the circumstances of the case would permit. Quoting, as we have already done, the display of Messrs. Thomas Houldsworth and Co, Mr Bazley, and Messrs. Glover and Dunn, as a fair exemplification of certain branches of the cotton trade, and the processes connected therewith, there can be no doubt that each of these contributions is fully illustrative of all the points underwhich for exemplification, and as such are worthy of more attention than the mode of their exposition is calculated to ensure for them.

In our previous glances at the general features of the Exhibition, the examples of the spinning exhibited by Mr. Bazley (24), and Messrs. Houldsworth (54) were noticed, and certainly, after the successful effort of the former, in producing so great a number as 1600 in competition with the 900 of the latter, the limit appeared to have been reached. We find, however, that calculations as to the limits of mechanical skill and ingenuity are in this case, as in many others, anything but certainties, since in a few days after the last notice in which we endeavoured to do justice to Mr. Bazley, a specimen made its appearance in which Houldsworth's glass case numbered 1400, and subsequently examples of 1800 s and 2150 s have been added; and we hear rumours from Manchester, where the matter has excited a great deal of attention, that even this latter is to be exceeded, and that after a certain number the line as to give 2026 miles to the pound weight, the limit is not yet determined. It must, however, be still borne in mind that all this is more curious than useful, since the 700 s appear the limit of utility. Comparing the specimens, little appreciable difference can be detected. The specimen of 1400 s by Messrs. Houldsworth is by no means so clear and even as that of the 1000 s by Mr. Bazley. The curious visitor may desire to know how this question of length and fineness is ascertained with such certainty as to enable the manufacturer to state it in so positive a manner. This, however, is easily answered. A certain length of fibre being weighed in a delicately constructed apparatus, the relative proportion of the weight of the yarn gives the basis for the calculation. Within the last few days another addition has been made to each of these contributions, and Messrs. Houldsworth now display 800 s. in skein and bobbin, thus showing, so far at least, its practical character; Mr. Bazley exhibiting an additional specimen of 2026.

It is to be regretted that Mr. Bazley's illustrations of the transition progress of the manufacture of cotton from the raw material to the finished state as displayed in the fine and roving frames of the cotton trade, are not spread over a larger space, since they ought to have been arranged in a glass case at least twice the size of the one in which they are exhibited, in order to give them full effect; the specimens being so much crowded together as to render it difficult, except to the initiated, to distinctly separate the specimens in one compartment from the other.

A specimen of New Orleans cotton commences the series of examples illustrative of the course manufacture. A specimen of the same class, shown in the state of first carding, and finished carding. Then comes a specimen of drawing frame sliver; and, following that, three examples of roving—first, second, and finished. Mule yarn, throstle twist, shuttle, mule yarn, stocking yarn, and threefold sewing thread follow, in various numbers; and then specimens of white and finished calico, and brown and printed fustian complete the series of examples so far as the cotton manufacture is concerned.

If the examples of the fine trade, the series commences with Sea Island cotton, a specimen cleaned, then in two states of carding, drawing-frame sliver, and the successive rovings, examples of mule yarn to 600 s; crape yarn, two cord-lace thread; three, six, and nine-cord skeining thread; three specimens of white and printed muslins of very fine texture; figured muslin, white and printed lace, and figured lace.

With the key thus furnished, the visitor will at once see the interest and value of Mr. Bazley's contribution, inasmuch as it leads him up from the raw material to the point at which the combinations are complete, and the machinery is ready to be put in motion. Moreover, in this short but expressive and, when these are studied in connexion with the machinery, a very excellent idea of the cotton manufacture will be obtained. We must, however, repeat our regret that specimens so well selected and arranged for these purposes are not spread over a surface calculated to give more distinctness to each individual example.

As already noticed, Messrs. Glover and Dunn's contributions (50) follow up the illustration thus given by Mr Bazley; and in another case they show a few examples of the progress to the production of power-loom calicoes of various qualities, grey and bleached; India shirtings, of which 5,000,000 yards were sent last year to Calcutta alone; jeconets for printing, and cambrics in a range of qualities; India twill and figured shirtings, complete; a series of examples of the staple of Lancashire, which, insignificant as they may appear to the casual observer, constitute in a large degree the basis of our national prosperity; and we cannot but regret that the Manchester Committee did not think it worth their while to place them before the visitors to the Exhibition in a more attractive form than it was reasonable to expect any individual would undertake to do, inasmuch as he could not, as in most other instances of textile and ready displays, expect to see anything by his efforts. Hence, though the illustrations are certainly given, they are flung down upon a common counter in anything but an inviting form.

The other examples of cotton manufactures from Manchester are chiefly quiltings. The contribution of Messrs. J. Spencer and Son (52) consists of white and coloured woven waistcoatings figured in the loom, and bed quiltings, together with a new application of the fabric to the purpose of hangings for windows and beds—these being all very excellent examples of their class. The specimens of the same class exhibited by Mr. Jabez Johnson (48) are, however, to our mind, more especially, adapted to show the excellence to which the kind of fabric has attained; and the large coloured toilet bed-cover, in which, as we are informed, 1 lbs. cards were used for the pattern, and in the manufacture of which the weaver makes 25,000 strokes of his shuttle, being a noticeable example alike for the design as for the execution. The toilet-covers and waistcoatings, even to the plain wove white diamond quilting, are excellent examples of their class.

Messrs. Major and Gill (49) exhibit a series of examples of double cotton and quilted for ladies' stays, exhibiting the progress of weaving, by which the usual quiltings by the needle are produced at once, and a double cloth formed of a great variety of patterns. The advantage of this process lies in the fact that the cloth thus worked together is much stronger and more even than two pieces placed together and then stitched; whilst the cost of production is the same for the double cloth as the single, except in the comparatively small expense of the silk or cotton used in the stitching process.

Altogether, the examples from Manchester are good of their kind; and, though much more might have been done, both as regards extent and variety, it is quite certain that matters might have been much worse, except, perhaps, in the character of the arrangements, which are crude and unsatisfactory as a whole.

In connexion with cottons, but exhibited in Class 18 with the printed and dyed fabrics, are specimens of cotton cloth prepared by a process discovered by Mr. J. Mercer, of Accrington, and now patented by him. This, in all probability, will produce a great revolution in the cotton trade, not only as regards printed but plain goods. When nothing the printed fabrics we shall again have occasion to refer to this matter in our business now is with the plain cloths. By immersing the cloth in a chemical solution, Mr. Mercer adds one-sixth to its weight; and this weight, unlike the usual preparations for giving substance, or rather an appearance of substance cannot be washed out. It possesses the singular quality of rendering a cloth to greater density; and an open material being manufactured, it is thus rendered equal to a closely woven cloth, both in appearance and in weight, and the result to which it has to be applied is spread over a larger surface for that purpose. This is, in all probability, one of most remarkable discoveries in the Exhibition.

BOLTON

The illustration of the cotton manufacture originally intended to be made by the exhibitors from Bolton, has been injured in its completeness by the unfortunate destruction by fire of fourteen weeks' labour, just at the very period when the goods were about to be sent in; and, though every indulgence was offered, the exhibitors, Messrs. Joseph and Thomas Heaton, of Halliwell, were compelled to forego their intended display.

As quiltings constitute the staple trade of Bolton, the leading features of the exposition of its manufactures are in these fabrics. Messrs. Barlow and Goody, and Jones (38) exhibit figured quiltings for bed-covers, both white and coloured, as also figured vestings and welted quilts. Messrs. W. W. and J. Cook (88), broaded small dress-pieces, plated quilting sheets, and broaded counterpane. Messrs. Thomas and W. Martin and Son's (37) damask furniture dimity are also good examples of their class, and the design of one or two of the striped examples very excellent and appropriate. Messrs. Mycroscough, Steel, and Co. (39) show some quiltings of good value, but very indifferent design. Mr. Ashworth's contribution of a woven bed quilt, as a specimen of a style of work now comparatively neglected for productions of a cheaper kind, is worthy of notice and examination as a meritorious production of its class. The pattern is produced by the weaver pulling up much individual thread which forms the figure on the surface—a tedious and lengthy process in elaborate designs. The result, however, is rich in effect, and highly characteristic of the purpose for which the article is intended to be used a matter of no small importance in point of taste, but too frequently neglected.

LONDON.

Before proceeding further with our notices of the various manufacturing districts, it is desirable that we should call attention to the display made by the London houses, who, either as merchants or manufacturers, or, in some instances, as both, exhibit examples of their wares in the cotton trade. Messrs. Horrocks, Miller, and Co. (60), of Bread-street, Cheapside, and Preston, Lancashire, exhibit specimens of the long cloths and shirtings, for which, as a manufacturing house, they have been so long famous, having commenced manufacturing in 1791; and their fabrics are as well known in the most distant markets of the world as Temple-bar is to the most veritable Londoner. In muslins, Messrs. Muir, Son, and Co. (66), of Friday-street and Glasgow, exhibit very tasteful examples of jaconets figured in the loom. The one over the counter upon which the last-named contributions are arranged is an admirable example of great extent of pattern, and perfect of execution, being a sacred one, and the first new attempt to adapt to the principle of the Jacquard loom, the process being patented. The pattern of this curtain is a bold and effective one, and though a severe taste in textile design will object, and rightly too, to the introduction of the vase containing the flowers, yet the whole arrangement is so massive and effective as to leave little to be desired—the drawing of the flowers and the border being excellent examples of the special adaptation of natural forms to mechanical exigences. We hope to give an illustration of this specimen in an early Number. Messrs. Main also exhibit some plain muslin, manufactured by them, at Glasgow, from No. 540 s, cotton-yarn, spun by Messrs. Thos. Houldsworth and Co., probably the finest ever used for such a purpose. The tamboured and embroidered muslin dresses are good examples of Scottish skill and industry.

Messrs. J. and A. Crocker's (6) specimens of harness woven curtains, arranged in a complete drapery as an example of window decoration, are very excellent. There are, however, some examples amongst the French specimens of the same class which remind us very strongly of these same curtains. Messrs. Bradbury, Greatorex, and Beale's (7) harness muslin window curtains, excellent as they may be in some points, are injured in point of taste by the introduction of representations of buildings, an anachronism in design which none but an ineffective purpose can justify. The general curtain, considered as a window curtain, is a species of "castle building" of which the less we have, in future, the better. In one or two specimens exhibited by Messrs. Robert Johnson and Nephew (55) the same absurdity is to be found, whilst the broad effects of the curtain exhibited by this house of an adaptation of the palm and plantain trees show the true basis of design in this department, though we think it might be better used than in the specimens before us, creditable as they certainly are. The specimens of Lainscoe, lock, tarlatan, and other muslins, exhibited by Messrs. Rogers and Co., of Watling-street (58), do not require anything more than a passing notice of their excellence in manufacture.

Apart from the metropolitan group, and on one of the counters projecting into the central avenue, Messrs. Robert Outram and Co. (62), of Watling-street, exhibit excellent examples of satin brocades and flush sprigged muslins. These fabrics are remarkable specimens of the beauty attainable in the cotton manufacture. The damask effects are charmingly wrought out, and the patterns at once tasteful and appropriate; and we believe they are unique in the Exhibition. Another isolated group in the Bolton division is the contribution of Messrs. Christy and Sons, of Fairfield Mills, near Manchester (42). The exhibitors call the fabric the "Royal Turkish Bath Towel," and the manufacture was suggested by specimens brought from the East by one of the firm, a mode of producing it by machinery having been discovered under Holt's patent. The fabric has a plush or looped face on both sides, and affords a great absorbing surface. Her Majesty has already supplied the Royal nursery with it, as the great softness of the cotton in this form adapts it peculiarly for young children. The linen nap or surface giving equal absorbency, and producing a sharp effect on the skin, whilst the cotton ground gives pleasure to the nurse, as at once takes up and retains the moisture; hence the estimation in which cotton has been so long held in the Eastern baths.

SEWING COTTONS.

Departing in this instance from our intended classification of terms, we desire to notice in a group the various contributions under this head, coming as they do in juxtaposition in the north gallery. Probably the most complete display is that of Messrs. Jonas Brooks and Brothers, of Meltham Mills, Huddersfield (24). The glass case in which the specimens are exhibited contains examples of the various kinds of cotton threads in various numbers, from the raw material through the processes of rovings to throstle yarns on bobbins, mule yarns in cobb and hank, sewing threads in hank, grey and bleached; and then in various numbers of 2, 3, 4, 6, and 9 s; reel thread and crochet cotton wound on spools, as also examples of wire thread. The cotton thread of this house has long been well known for its excellence; and though others doubtlessly possess points for commendation which it would not interest our readers to enter into here, Messrs. Brooks' display appears to be the most complete and satisfactory as a whole.

The specimens exhibited by Mr. J. P. Clarke, with which also the progress of the manufacture of the patent metallic reels, from the rough hank to the finished article, is shown, are interesting; and near these are grouped those of Messrs. Evans and Co., of Derby, Messrs. Thackeray and Son, of Nottingham, and Mr. Harris and Messrs. Raworths, of Leicester; while Mr. J. W. Heythorn's contribution from Burton-on-Trent is also worthy of careful examination, containing as it does examples of thread for so many various purposes, such as sewing, knitting, glove, and hosiery making, lace, and ribbon manufacture. In this group, then, we have before us an important illustration of a department of our national industry in which we have so far stood unrivalled. The small wares of Messrs. Waters, of Manchester, are also worthy of examination, as they possess many points of excellence.

CARLISLE.

The great Border city has long been celebrated for its productions in cotton, and specimens of the cotton trade, and, of course, as representing it on occasion like this. Of the Carlisle cabinets we shall have occasion to speak when examining the printed fabrics; our business now is with the ginghams and other examples, of which to quote their names would be of little interest to our readers. Messrs. Cranston and Hoy produce much Camperdowns or Coromandels, matallas, nicanees, or brioks, which may or may not possess merit and interest for the foreign or colonial buyer, and which it is very proper should be shown as examples of their peculiar class. Messrs. Peter Dixon and Sons make an extensive display in this department, and are supported therein by Messrs. Lowthian and Parker, and Messrs. Pearson and Co., the display of the latter being of the useful rather than the ornamental kind, the colourings and mixtures being all of a subdued, but, withal, clean-looking and pleasant tone. Mr. M'Gibbon, also of Carlisle, exhibits some very tasteful specimens of striped and checked ginghams, principally intended for the American market.

Whilst on the subject of ginghams, it is requisite to direct attention to the Irish specimens exhibited by Mr. J. O'Connell of South Mainstreet, Cork. In these we see examples of a manufacture for which "the beautiful city" was once famous, but which, from neglect, and the active competition of England, had gradually died away, until the few weavers who were left had almost forgotten their former skill in the misery and degradation in which they were reduced. A few spirited individuals have been labouring to revive the banished trade, and with considerable success, the specimens now exhibited being good examples of the resuscitated skill of the Cork weavers.

GLASGOW.

The metropolis of the west of Scotland has not failed to show specimens of the skill of her sons and daughters; and, though not such an one as certainly ought to have been made on this occasion by the manufacturing centre of North Britain, yet in many points there is much to commend, particularly in those departments of trade of which Glasgow is the principal representative.

The sewed and tamboured muslins of Scotland are the means of employing many thousands of females in their own homes; and the importance of this trade in a social point of view is not, therefore, to be overlooked. We must, however, to illustrate this more fully, when treating of the sewed muslin trade of Ireland, and shall, therefore, confine our present notices to the productions of the loom as a primary point for illustration. In this display have been made, harness muslin curtains, ginghams, and coloured muslin cravats, take the lead, and, indeed, form the great staple of the contribution.

Messrs. Patterson, Jamieson, and Co. (31) make a very tasteful display of cravats, ties, dress goods, and light summer shawls; and the specimens shown by Messrs. James and Alexander Anderson (7) are also of very elegant character on close examination, the colours in the cravats being well chosen, and skilfully intermingled in the weaving. Messrs. David and John Anderson (12) also make a creditable display in chequered ginghams of various styles and qualities. In muslins, Messrs. Auld, Berrie, and Matheson, show harness window-curtains, sacchilla, book muslins, and mull muslins; and Messrs. J. H. Young and Co. (12) also show largely, and in great variety, one or two of the curtains being very excellent in workmanship, and tasteful in design. We wish, however, that we could say the same of the whole of the Glasgow specimens in this department. Messrs. R. B. Symington and Co. (—) show one leno curtain amongst others, the design of which is composed of tropical plants and flowers, boldly and effectively arranged. We object, however, to the introduction of the fruit even as a dead weight, at the bottom of the curtain; but, as a leaping ornament, it is quite out of place. Messrs. Lethan, Blythe, and Letham (9), and Messrs. E. Henry and Co. (13), exhibit muslins and examples of tambour work and embroidery by power, as also table-cloths and tartans, the web of which is prepared by Mr. E. Slack, of Renfrew. The dyed cotton yarns exhibited by Messrs. Oswald, Stevenson, and Co. (10) are interesting to the manufacturer, and are sent for the purpose of showing one of the leading features of the trade of Glasgow, in preparing material for final use in other places, both at home and abroad.

Before quitting the cotton department on the British side, it may be well to call attention to an oval application of calico, as exhibited in the metropolitan display by Messrs. Jarrold and Brandt (97). Its use for the body of hats is plainly shown, and its lightness and flexibility (two great qualities) acknowledged at once; but its application to the manufacture of furniture may be doubted for practical purposes, although, as a curiosity, it is worthy of attention.

FOREIGN COTTON MANUFACTURES.

The specimens of the position of our neighbours in this branch of industry are so scattered over the eastern portion of the Building, and appear together in such small quantities, that it is a difficult matter, without special search, to discover their localities, unless by mere accident in the course of visits to the respective countries to which the examples belong. It would appear, however, that, as a whole, comparatively little has been done towards illustrating this kind of industry as pursued on the continent of Europe, except so far as the higher manufestations may be concerned, such as muslin, lace, and embroidery: a few quiltings are to be found here and there, but, with the exception of a few French waistcoatings, nothing of any peculiar excellence is visible. No doubt, our great reputation as manufacturers of cotton has done much to prevent a larger display on the part of our foreign friends whose *amour propre* was considered to be somewhat in danger by the contrast likely to arise between the English examples and those of our guests. We think, however,

that a more extended exposition on both sides would have been valuable to each.

FRANCE.

The French have arranged their examples of raw cotton with other raw materials in the avenue under the North Gallery, near the Foreign Dwellings to the central refreshment rooms. Here, in conjunction with a [illegible] silk, are specimens of cotton from Algiers, the examples varying very considerably in colour and in quality. The best appears to be Rabbi'as cotton (*coton de Kordoua*); and with the specimens are yarns spun from the same—36's single yarns being the highest number, and the mean so spun is of the quality of the above-named. There are also several examples of cotton from the French colony of Louisiana, thus showing that our neighbours are alive to the importance of endeavouring to help themselves in this particular; and the probabilities are, that so far as Algiers is concerned, they may succeed in the lower qualities.

The manufactured specimens at present arranged for display are very few. Specimens of quiltings for waistcoats, exhibited by Messrs. Vacossin, are to be found under the South Gallery. These are very excellent in design and in execution, the coloured effects being well thrown in, and producing a tasteful and satisfactory result. In the South Gallery, in the midst of a display of printed fabrics, Messrs. Hartmann and Son, Munster, Upper Rhine, exhibit yarns ranging to 353's English, with specimens of Mousselines and other cloths of excellent quality.

BELGIUM.

With the exception of specimens of quiltings from the Government workshops at Wetteren, which are of a respectable character and considerable [illegible], there is little to notice from Belgium. M. J. F. De Cuyper, of St. Nicholas, exhibits common checks and tickings; and here, with specimens of cotton blankets by M. A. De Behault du [illegible] of Ternonde, constitute the leading features of the Belgian display in the cotton trade, which is the more remarkable as much attention has been paid to its progress by the Government of the country. The lace and embroidery, Brussels and Valenciennes, will, however, compensate for any deficiencies in the lower textiles.

AUSTRIA.

From Vienna, J. Remedey (200) sends examples of quilted cotton counterpanes, into which figures are introduced in dyed thread. The effect is good, and the designs have much merit in their general intention. Printed fabrics and ginghams are also exhibited from Vienna, by J. [illegible] (296); whilst A. Budinsky, of Reichenburg, Bohemia (393), makes a display of muslins, in addition to hosiery and other articles.

WIRTEMBURG.

Window-curtains, of good design and excellent execution, exhibited by [illegible] Dettlers and Wiest, of Ravensburg (22), give a good idea of the perfection to which this class of manufactures is carried in this industrious and thriving principality. There are also some striped muslins, too, of excellent make, whilst the lace curtains in the manner of *applique* are very beautiful in style and workmanship. As these are placed near the Central Avenue, they will be easily found and recognised.

SAXONY.

The arrangements of the contributions from Saxony are an example to the whole Exhibition; and, in addition to this, the Saxon Commissioners have [illegible] useful information, together with a list of prices. There has been a good understanding amongst the manufacturers, and they have united with good effect for the exposition of their respective trades. The contributions in mull jaconet, cotton gauze, and linen cambric, are generally very good, as also the cotton hosiery. There is, however, a very admirable display of cotton fringes, by G. T. Bach and Son, of Buchole (168), which, though exhibited for cheapness and execution, certainly excel in the latter and in design; and the same may be said of their neighbour, Franz Herzog, also of Buchole (189). Altogether, this specialité of cotton fringes is a most satisfactory one, and will give hints of some value to our manufacturers. These fringes, as also laces, galloons, braids, and tassels, are manufactured in the centre of Saxony, and give employment to many thousand persons. The exhibitors are merchant manufacturers in the towns of Augsburg and Buchole, and the system of distributing the work over the adjacent country seems to be very similar to that pursued in Scotland and the north of Ireland, to which, already promised, we purpose directing attention in a future notice of lace and embroidery. Much of the business carried on in Saxony seems to be done in this way, rather than by our factory system.

UNITED STATES.

As might have been expected from the country whence we get the great mass of our cotton, examples have been sent to show how far the manufacture of the raw material with which it supplies us has been carried; and though not a very extensive display, yet it is as a whole full of interest, and in many points of high commercial importance to the more useful fabrics. The cotton sail-cloth, for instance, exhibited by Messrs. Fox and Polthemus, for the Willimantic Duck Company, state of New York, is an example of the application of an abundant material to a very valuable purpose, and it is scarcely possible to produce a more looking article. In its way there is nothing like it in the Exhibition. The drillings, too, are very good. The Amoskeag Manufacturing Company, Manchester, New Hampshire, also exhibit drillings of various stripes, striped shirtings, tickings, and sheetings all good examples of their class. The Ocean Steam Mills, Newbury-port, Massachusetts, display cloths for printing, sail-cloth, sheetings, and jeans; and extra fine straw twist is shown by the Wamsatta Mills, New Bedford, in the same state. Altogether, the United States cottons are at once creditable to the skill and ingenuity of their manufacturers, and a proof that in the utilities of manufacture they are rapidly learning to help themselves.

We have thus completed our sketch of the state of the cotton manufacture as represented in the Exhibition; and, without discovering any striking novelty, it is certain that on examination it presents many features of high interest, and more than ordinary commercial importance.

EAST INDIAN AGRICULTURISTS AND AGRICULTURE.

NORTH AND SOUTH BAYS WEST OF THE TRANSEPT.

The collection of machines, tools, manufactures, and models of the various trades and callings of the natives, afford a series of illustrations of the condition of that extraordinary country, which cannot be passed over in a few words. Among the manufactures are specimens of purely native work, and of imitations or copies from European models. From an examination of the latter, it is quite plain that the native Indians are as capable of learning improvements in mechanical arts as Europeans; while both in jewellery and in weaving there are specimens which the best European mechanics would have great difficulty in equalling. If then we turn to the agricultural implements and tools used by mechanics, at first sight it seems extraordinary that no advance should have been made for centuries. The Hindoos of the present day seem to have had handed down to them an unbroken agency of the agricultural and manufacturing arts of the ancient Egyptians. A comparison of the models in the East Indian collection with the drawings of the same kind of implements in use among the Egyptians, affords a number of very curious coincidences. But, without tracing back the history of these agricultural tools to such very remote periods, we find, by Abul Fazl's chronicle of the reign of the Mogul Emperor Akbar, that, 300 years ago, rice, wheat, sugar, indigo, hemp, sugar-cane, and cotton were cultivated with at least as much skill as at the present day; as high a rent was paid for land; and the numerous regulations on the subject of irrigation, and the allowances to cultivators under losses, and the estimates of revenue raised given by Abul Fazl, show that a great part of central India was under regular cultivation.

We [illegible] people have made so little progress, why the great bulk of [illegible] in the same condition, moral, social, and intellectual, [illegible] were in 300 years are is a question too large to be discussed [illegible] to point out certain obvious [illegible] rrowness of their wants, [illegible] modelled from life. [illegible] chiefly in Bengal [illegible] Indian collection, and observe [illegible] need, low low as their incentives to exertion [illegible] on domestic servants, like the butler and groom, whose clothes are part of their master's state, it will be seen that the native rural population need scarcely any clothes. The gardener, the shepherd, the village waterman, the carpenter, the blacksmith, the ploughman, the waggoner, and a number of others of the same rank, wear nothing except a cap or turban (the Hindoos have adopted the turban from their Mahommedan conquerors), a small piece of cloth round their loins, which is occasionally used rather as an ornament than as a covering, thrown like a Highlander's plaid over one shoulder. Oil—to obtain which, linseed, sesamum, and palma Christi are largely cultivated—is liberally applied to their naked skins. In the place of those coats, breeches, waistcoats, shirts, and stockings, which so largely absorb the funds, and employ the population, of the inhabitants of colder climates.

What would the Great Exhibition be, in the two great displays of machinery and textile manufactures, if we dressed like the Indian population?

The Zemindars and great Indian gentlemen hold the same feelings with respect to garments as their subjects and tenants. Clothes, with them, are one [illegible] not necessaries. After appearing in public blazing in jewellery, in shawls of countless price, and gold-embroidered silks, on the elephant or a prancing Arab, as represented in the model of an Indian fair, an Indian Prince, Sir Thomas Munro tells us, will pull off everything, and sit semi-nude in a calico wrapper, just in the same [illegible] that two [illegible] in England and America can [illegible] their embroidered shirts and shawls, like those hung up in the Indian tent, are often heirlooms in a native gentleman's family.

Then, again, the system of vegetable food, cooked in the simplest manner, promotes an economy which is very much opposed to the commerce and competition on which improvement rests. But the chief cause of the stagnation of mechanical arts in the interior of India (leaving out the question of religious influences) is to be found in the extraordinary state of isolation in which the rural population live.

There are no made roads in the interior of India; where the natural roads are sufficiently good carts drawn by one, two, up to twelve bullocks, cows, or buffaloes are employed; and excellently well constructed for the purpose are these carts or drays for ascending or descending precipitous hills, with the small weak cattle of the country, as may be seen in the models in the southern bay. But it is only for short distances, or in the neighbourhood of great towns, where roads have been made, that carts can be used at all. The chief mode of conveying produce and merchandise in India is on bullocks' backs. In the north bay, a set of models of loaded pack bullocks will be found. In the rainy season, when for an uncertain number of months the rain pours down in a deluge, travelling with merchandise or produce becomes all but impossible. [illegible] villages can [illegible] to a certain extent alleviated by a system which discourages intercourse between village and village.

The rural population of India is not [illegible] over the country in detached dwellings, but [illegible] small villages or towns, for protection [illegible] and will be [illegible] are each in themselves miniature communities. They are like islands, with very little external commerce and no inland competition. The mechanical arts and several other callings are placed in the hands of parties who are public officials. The blacksmith, the carpenter, the potter, the ropemaker, the shoemaker, as well as the water-carrier, the barber, the butcher, the washerman, the goldsmith, the poet, and the astrologer, receive each a piece of land rent-free, [illegible] grain or money from each villager, in return for which they are bound to perform the duties of their respective vocations, to make ploughs, build houses, dig wells, shave heads, tell tales, [illegible] horoscopes for the community. No system could have been devised better calculated to render mechanical arts stationary, and each little population is perfectly independent of foreigners. Competition is unknown, trades are hereditary, improvements of machinery never displace hand labour. The land is the property of the supreme Government, and every head of a family has a piece of it. Almost all taxes are defrayed by a tax, which is, in effect, the rent of land. In fact, the condition which certain social reformers desire to carry out in Europe [illegible] realised, and has been realised for centuries, [illegible] will see.

But [illegible] tigers, panthers, tigers, and robbers, effectually [illegible] the place of [illegible] and protective duties. Agricultural improvements are useless, where surplus produce would be valueless, because it would never pay to carry it to market.

Under these circumstances, the average crop of wheat is worth from 7s. to 10s.; famines are periodical, and improvements are unknown in the interior, while on the coast ships are built, furniture is manufactured, and English goods of many kinds are executed with very great skill, of which examples have been sent.

Among the agricultural implements, we must note that the Indian plough is not ill adapted for its intended purpose. The shape is nearly the same as that of the Roman plough, less rude than that employed by our Saxon ancestors, which was attached to the tails of their bullocks.

The Indian plough is chiefly used for stirring up and running a furrow through moist ground, preparatory to sowing rice. It is not necessary to dry up the land by turning a furrow. The mould-board of the English plough has been used in some tropical countries and abandoned. Dry land for other crops is broken up with coarse hoes, of which full-sized specimens will be found under the table on which the agricultural models are displayed. These models are shorter in the handle, and [illegible] than those still in use in the West Indian islands, where the plough has not been introduced. It is also the implement of the modern Egyptian peasantry.

The ploughs in the southern bay consist of a taper piece of wood, shod with a sort of spear-head of iron, which forms the share, the sole being of wood, without either mould-board or coulter. Into the wood a handle is fixed, one or two bullaloes are harnessed, and the ploughman, naked but [illegible] with [illegible], holding the handle in one hand, and the reins in the other, will get over more ground than could be accomplished with an English plough, quite sufficiently enough for his purpose. Into the furrows the rice is dropped, and covered by one of the harrows, of which several models and one full-sized implement are shown, made with iron, and wooden teeth. These harrows are much more finished works than those often used in the bush of Australia, where wheat is harrowed in with a bough of a tree, or by running a flock of sheep over the ground.

The Hindoos generally get two crops of rice off the same ground—the first for food, the second for straw; and there is reason to believe that successive crops of this grain, which is the staple of the native population, except in the north-western provinces, where the rice on wheat order, has been grown on the same fields for a thousand years. Rice-fields must either lie on the banks of rivers, flowing at a level where the soil can be fully saturated and at a proper time flooded, or artificial irrigation must be resorted to.

There are a number of hydraulic machines exhibited of the kind used for irrigation, on which so much tropical cultivation depends. It is one of the arts we have yet to learn and apply to our semi-tropical colonies. In one instance, in the north bay, six bullocks are seen to be employed in hauling a leather bucket out of a well in the same manner that we sometimes see a brewer's horse haul an empty barrel out of a cellar. It is impossible to imagine a more wasteful employment of power. In the south bay are several endless-chain buckets worked by bullocks moving a gin or horizontal wheel round. In another instance the bucket is raised on the lever principle.

We would suggest that this set of models might afford the means of a very useful and interesting lecture on the application of simple machinery to irrigation. To intending colonists, such lessons would have great value. Our agricultural schools and colleges, which are preparing many colonists, should take up the question. The resources of the very promising colony of Natal cannot be developed without machinery for irrigation, as the principal rivers run between deep steep banks.

Five or six models of bees drawn by bullocks are shown: these are used in the cane-fields exhibited. It is plain that hundreds of years before Jethro Tull wrote on the sovereign merits of horse-hoeing, part of his system was in practice in Central India.

In all these implements iron is used where it can be got; and no doubt, if we succeed in bestowing railroads on the Indian peninsula, a rapid improvement in all the mechanical implements will follow the cheap conveyance to new markets which railroads will create.

The implements variously known as "scarifiers" and "extirpators," and "cultivators," which first began to attract notice in this country about forty years ago, have long been known to the Indian farmer, and are constructed very efficiently for working in light land. They consist

[illegible] by the bills, whereon [illegible] was not passed

of a set of teeth shod with iron, arranged in a heavy bar, and drawn by a bullock.

The sickles with which the grain is reaped are shown, with a model of the floor on which it is trodden out; and on the wall of the South Bay hangs a rope muzzle for "muzzling the ox that treads out the corn." This plan of treading out grain is not confined to the East; it is practised in Spain, in South America, and occasionally, when labour is very scarce, in Australia. The corn is winnowed by throwing it up against the wind. The next operation (that is to say, grinding) has been illustrated. Two women are squatted down opposite each other, having a pair of millstones between them, of which the upper one fits into a hollow in the lower one: a handle is fixed eccentrically in the upper stone by such a manner that one of the two women is always pulling towards her. This implement is as old as the time of Job.

The last operation of Indian agricultural economy to which we will refer is the manufacture of sugar, which may be seen near the level on the north bay. Two grooved rollers of wood, placed face to face, are turned by two men with handspikes, while two or three sugar-canes are thrust between them: the small percentage of juice extracted by this imperfect force falls into a pan below, and is thence conveyed to open earthenware pans, which are shown boiling close at hand. And yet India sends us a good deal of sugar.

After this cursory examination of this picture of the rural life of the Indian population, presented in this very curious set of models and figures, it is impossible to doubt, that, with the increased means of communication which roads and railroads would open, the interior of central India is capable of affording a largely-increased exportation of cotton, sugar, rice, linseed, hemp, and other staples peculiar to the soil and climate; and that the result of increased intercourse would be to greatly improve the social and intellectual condition of the native population, and to render them better customers for the manufactures which we can produce and so cheap.

At present we shall not say anything respecting the set of looms exhibited for weaving cloth, shawls, and carpets (the last is on a very large scale), but be content with observing that since, by the powers of our mechanical inventions, we are able to import cotton from India, manufacture it, and import at such a price as to undersell by 75 per cent. the half-naked cotton-eating producer of the finest muslins, it is as much our duty as our interest to assist in stimulating the growth of cotton and other agricultural produce of India.

At a more convenient opportunity we shall continue our notices of a department of the Exhibition to which large additions have lately been made.

ARTICLES FROM THE INDIAN ARCHIPELAGO.

THE contributions forwarded from the islands of Java, Borneo, Sumatra, Celebes, Singa, Malacca, and others in the Indian Sea, although possessing some degree of interest for the naturalist, the agriculturist, and the manufacturer, do not form quite so attractive a collection as those from the Indian continent. A portion of these articles, we perceive, have been forwarded by the Sarawak authorities, and the remainder by the local committee of Singapore.

From Borneo the collection of natural productions is large, including, as it does, a considerable variety of woods, ornamental and useful; grains, minerals, utensils, agricultural implements, and arms and accoutrements. The greater part of this portion is from the north-west coast of the island.

The agricultural and industrial implements from Singapore, Sumatra, and Malacca, are interesting from their extreme simplicity. The plough, for single or double yoke, although not quite so primitive as that in use in Ceylon, is still of ancient date. The harrow, the scarifier, and large hoe, all appear to be much as when designed by the first inventors, and bear full testimony to the abundance of labour, and the light loamy character of the soil in those sunny regions. Far more taste and ingenuity would appear to have been exercised upon articles of household use, and the betel-nut cracker, than upon their household and field implements. The little silver cracker which serves to bruise, and silver or gilt box which contains the betel-nuts used by the inhabitants of these islands for mastication, are really elegant articles, and the betel-nuts, received many modifications in their make; but the remark we find attached to one of these, to the effect, that, as yet, they have not been imitated, and shipped to the East, by any of our British manufacturers, is a mistake, as regards several parts of India. Betel-boxes and crackers have been for years past articles of manufacture at Birmingham, just as have the bangles and bracelets, all of which are freely exported to India and Ceylon. The carts employed in Java and Singapore bear a close resemblance to the gharree of continental India, and the bandie of Ceylon, especially the smaller description for two bullocks. In a European these vehicles appear unserviceable from their heaviness and clumsy build; but, looking to the wretched condition of most Indian roads, they are, in reality, the only description of cart which could be employed to advantage for bullocks. In some parts of India, especially throughout the cotton districts of Tinnevelli, there are no roads whatever, and the cart-driver directs his cumbrous but substantial carriage, as best he may, over the ridges of rock, between clumps of trees and masses of stone.

The hand-looms, the cotton-presses, the oil-mills, the sugar-grinders, are all of one simple make, as primitive in their form as they are possible to be: and all alike bear testimony to the cheapness of human labour in those countries. In the cotton-presses and sugar-mills of India we find no multiplying power, no complication of wheels; the labour is performed by means of one simple prime mover, worked by direct power.

Although the silk weaving and calicoblocking introduced gold have a rich and picturesque appearance beside the more simple cotton fabrics, they can hardly compete with the costly fabrics of the Deccan, Oude, Delhi, and Guzerat. By the side of the Java sarongs are similar goods from Arracan, Dutch, and Borneo. Nearly all these cotton manufactures are of very low quality, and the dyes heavy or sickly in hue. The style of some of the Cutch goods is curious, and they have, perhaps, a rather showy appearance, but they lack quality. The towelling, &c., from Beerbhoom, though not bad, hardly equals the texture and make of the Patna diapers and towels, which are really of excellent make and pattern.

Among the vegetable productions, raw and prepared, exported from the Eastern Archipelago, not the least important are the coffees, spices, and teas of Java. The cultivation of cinnamon was introduced into this island about twenty years ago, a number of young plants and "chalias" having been taken thither from Ceylon, where, at that time, the high price of the spice made it a very profitable occupation. About 1000 acres of land have been planted with cinnamon, and the prepared spice has for some years past formed an important item in the shipments from Java. The quality, however, is far below that of the Ceylon cinnamon, as may be seen by a comparison of the samples exhibited from each country. It is chiefly shipped to Holland, where it finds its way into some of the Continental markets. The samples of coffee from the Soorabaya and Banyuma districts of Java are of fair average quality; but do not appear to much advantage by the side of the Madras coffees, the produce of the estates lately formed on the Sherwarry Hills, at an altitude of 5000 feet above the sea. This article is one of large amount to the Dutch Government, and, as well as sugar, is mostly cultivated by forced labour, or brought in to the Government stores for sale at a fixed low rate.

The teas exhibited from Java as the produce of the Government plantations, are chiefly pekoe and congo, but do not seem to be of very particularly fine quality, though said to be manipulated by Chinese workmen: they appear to be inferior in make and aroma to the Assam teas, which are shown to some advantage by their side.

If we cannot say much in praise of the coffee, tea, and cinnamon of Java, we must at any rate admire the spices from the Moluccas, Penang, &c., as being of first-rate quality. The samples of nutmegs, mace, pepper, cloves, &c., are perfect of their kind, and the visitor will be much pleased with the beautiful appearance of the ripe nutmeg enclosed within its network of rich red mace, preserved as it grows upon the tree. A more lovely sight can scarcely be imagined than that of a nutmeg or a clove tree in full bearing, loaded with its rich clusters of yellow and red or brown fruit, which offers a fine contrast to the deep emerald green of the tropical foliage, lit up as it is by the noon-day sun, and waving to and from the cool sea breeze. We regret that specimens of fruits and seeds, similarly preserved in their original state, have not been sent here from other countries. The coffee berry, the cocoa bean, the cocoa-nut in flower and fruit, and many other [illegible], and might readily have been preserved.

Some of the cordage and rop[illegible] new varieties of fibrous substances, struck us as being [illegible] quality. We may instance the cord [illegible] m, the pine-apple, the

Hibiscus cannabinus, and some other materials peculiar to the Archipelago, such as gjoa, gogoo, dunchu, hemp, &c. A good deal of attention has of late years been given to some of these substances by the Madras and Ceylon authorities, and we have seen in India some beautiful fibres produced from the pine-apple, the wild aloe, and the *Hibiscus*. The former and latter of these grow most readily in any soil, and we shall not be surprised to learn that in time they form the basis of some extensive manufactures.

The medicinal oils and spirits forwarded from

2.—KNOCKER. BY PEETHAM, CLIFFORD-STREET.

this part of India, as well as from other Asiatic regions, scarcely admit of comment from any true professional men, and require to be tested experimentally before their reputed value can be properly estimated. The woods are numerous, and some of them of rich and close grain; but without some further particulars than are to be gathered from the Catalogue, we cannot venture an opinion on them.

The gutta percha manufactures are eclipsed by those made in this country by Mackintosh and others. The minerals, ores, &c. will, however, repay a careful inspection by any who are curious in such matters.

To obtain a view of the models of vessels and boats of the Archipelago we must cross the great nave, and, on the north side, in the East Indian section, we shall find specimens of the prahus, sampans, and padewahkuns of Sumatra, Singapore, and Mindanao. The Samm pirate prahu of the first class is an imposing-looking craft of about 120 tons, manned by 80 or 100 men, and armed with six long swivel carronades, and a heavy stern piece. These are truly formidable vessels when met in any numbers, as they usually are; and to any but steamers or men-of-war are most unwelcome visitors. Until of late years they infested the Eastern seas in vast numbers, cutting up the native trade, and frequently capturing European merchantmen. The active services of her Majesty's war-steamers, and those of the East India Company, have, however, pretty well scoured those waters; and it will not be long before their calling will be obsolete, and their very existence a tale of bygone days. It was not long since that so many as a thousand of these marauding craft were following piracy on the open seas, and by their swiftness, and their suitability to the dangerous navigation of the many eastern islands, eluding the utmost vigilance of our men-of-war. It was not until steam-vessels were brought against them, that any successful attempts were made at extirpating them.

4.—SILVER GROUP OF SIR ROGER DE COVERLEY AND THE GYPSIES.—BY JOSEPH ANGELL.

WEAPONS OF WARFARE.

INTERSPERSED among the products of Peace and Industry, lying side by side with the instruments of agriculture, commerce, and luxury—a strange companionship that might well suggest the lion lying down with the lamb, in the millennium of '51 -are to be seen specimens of the countless varieties of implements of death and destruction which man employs against his fellows.

Without going into the question of whether war is really a necessary evil in the present state of human nature and political society, we propose to introduce to notice some of the principal objects in this department of the Exhibition, as well as to give a slight glance at the weapons of war in bygone times, when death was not dealt out on such scientific principles as at present.

We read, a few days back, a paragraph, extracted from a Transatlantic journal, which spoke of a newly-invented pistol, which had been sent as a donation to the Anti-dnelling Society, and which, it was said, if generally adopted, would effectually compass the avowed objects of that association. This pistol was so constructed, that, however pointed, it would inevitably kill the person firing and his second. This wondrous machine certainly seems to promise well for the end proposed; and taking the hint from this pistol, we may (strange though it seem) congratulate the lovers of peace upon the thoroughly exterminating powers of several of the articles now to be seen within the glittering walls of the Crystal Palace.

It may not be uninteresting, in the first place, to turn to the past proficiency of the world in the manufacture of warlike weapons, which is brought forcibly beforeus by some specimens of the primitive weapons still used by savage nations. Perhaps one of the most obviously simple of these is a New Zealand war club, which is a piece of stone about a foot in length, merely cut into shape. From the western coast of Africa we have bows and arrows, spears, and other rude weapons. Most of these, however, are ornamented by carving, some of it being both elaborate and beautiful.

In the savage state these and such as these are still the weapons used in war—sharp stones, clubs, the pointed horns of different animals affixed to a pole in the form of a spear; the bow cut from the trees of the forest, strung with a thong of some wild animal's skin; arrows formed of reeds, and headed with sharp pointed stones; the sling for throwing stones; the knife, formed either of flint or of the teeth of the shark tied on to a stick (of which we have a curious specimen from New Zealand).

3.—SCUTCHEON AND HANDLE FOR DRAWER.—BY PEETHAM, CLIFFORD-STREET.

Turning to the more civilised instruments of destruction in the Crystal Palace, and, without taking any regular course, dotting down a few notes of the most striking objects in the order in which chance may bring them under our view, we find ourselves in the department allotted to Prussia and the small States. Here we have improved rifles, with a very excellent contrivance for loading at the breech, from Dusseldorf; and another rifle, from Magdeburg, with two barrels bored in a converging direction, so as to direct the balls to the same mark. Close by is a rifle from Bavaria, beautifully ornamented in the old German style, with a series of engravings along the barrel of the history of arms—commencing with Nimrod, with his bow and arrow; showing the invention of gunpowder; the flint-lock, &c.; and finishing with the percussion cap. Here, too, we have every variety of swords, fine-tempered weapons, light fencing-swords, heavy elegant cutlasses for cavalry and infantry service, superbly inlaid dress-swords, and specimens of the waved blade, formerly fashionable in the Prussian service. One sword in this compartment, a beautiful bit of workmanship, bears the following inscription in German:—"To the hero of Komorn, the General George Klapka, as a token of their respect and friendship, from A. and E. Hoeller, Solingen." There are also splendid specimens of gun-barrels of common wire, of lower damask, of Turkish damask, and various others which amply repay inspection. We must, however, hurry on, not omitting to notice as we pass a beautiful steel cannon, which seems to guard the frontier of the North Germany compartment, being stationed at the entrance to it from the centre aisle. France also sends a very large assortment of arms, swords, guns, and bayonets; and from Spain we see some elegant blades, the inscription on which, "Fabrica de Toledo," suggests the remembrances of ancient chivalry. One of these is a wonderful instance of fine temper. The scabbard, which is very chaste in design, represents, with the hilt of the sword, a serpent, completely coiled round in a circle. The blade, when inserted into the scabbard, takes this curve, but the instant it is drawn it becomes perfectly straight. A brass howitzer, of 9-inch calibre, from the Royal cannon foundry, Seville, called the "Formidable," and, from its

size, amply deserving its name, is not likely to be passed unnoticed. Belgium sends us some rather heavy metal from the Royal foundry, Liege, as well as a copious collection of small arms.

In the United States department we noticed some rifles and pistols on the "revolver" principle. They have but one barrel, which is stationary, the breech alone, which contains the load, revolves, each portion of it coming in its turn to the barrel.

The Turks contribute some of their peculiarly picturesque weapons. Guns and pistols, heavy and massive, with inlaid gold and silver, and with stocks of all strange shapes; sabres, knives, and daggers.

Canada, in addition to the articles appertaining to the native Indians, sends some very beautiful rifles, &c.

A very interesting collection of weapons is exhibited by the East India Company. Bows and arrows, beautifully made and elaborately ornamented; matchlocks, inlaid with the greatest skill, from Lahore, Jugdispore, Rajpootana, and other parts of their vast territories. A fine specimen of chain armour, and a lead cover from Rajpootana. A very curious gun, to fire from the back of a camel, from Lahore; battle-axes, clubs, &c., and cannon of different sizes, from small models up to some very murderous-looking field-pieces. In addition to these are one or two objects which call for especial mention. A sword with a fine Damascus blade is quite a curiosity, of nice exactness in fitting. It is a perfect sword to all appearance, and can be used and tested as such in all the usual ways; but by touching a spring in the handle, it splits, and forms two perfect swords with two perfect edges, so closely joining that when together the single edge seems of almost razor sharpness. A shield, manufactured in the arsenal of his Highness the Rajah of Kota, in the states of Rajpootana, is also very ingenious. It has four gold bosses, in each of which is concealed a pistol. A sword with a pistol in the handle, which can be fired while the sword is held in the usual manner, is also to be found in this compartment.

A good illustration of savage warfare may be seen in the model of a New Zealand war pah, contributed by Lieutenant Balneaves, H.M. 58th Regiment, which shows the method of fortification, by means of palisading, &c., adopted by the natives. The watch-towers at all the salient angles, made in the form of hideous figures, and painted with "the ochre of wrath," are characteristic.

Of our native contributions, as might be expected, Birmingham takes

the lead, and exhibits a very large collection of small arms and swords A very instructive collection is exhibited by Mr. H. Hart, of that town, showing the complete manufacture of gun-barrels, from the old horse-shoe stubs of the earliest periods to the latest improvements.

While upon the subject, we must not omit to notice the invention which, though not exactly relating to weapons of war (being adapted chiefly to sporting guns), still will hardly be thought out of place while treating of guns. It is "Erskine's newly-invented waterproof and safety gun." The object of this invention is to provide in one action against the percussion-cap being prevented from exploding by exposure to the rain, and also to prevent the accidental discharge of the gun by the hammer falling. This is effected in a very simple manner. A metal shield containing a ring of Indian-rubber encloses the cap and protects it as to keep out all damp, and at the same time prevent the hammer striking the cap, should it fall accidentally. The instant the gun is brought to the shoulder for the purpose of firing, a spring in the butt of the gun, by the mere pressure against the shoulder, immediately releases the shield, which flies up and leaves the cap free for the action of the hammer. There are other improvements in connexion with this, but the above is the chief invention; and from its great simplicity and great utility, it will, we have no doubt, be generally adopted.

The swords also exhibited, from Birmingham, are very beautiful specimens of cutlery, and fully sustain the reputation this town has so long enjoyed for that particular manufacture. It has often been disputed when the making of swords commenced in England, and very little is known for certain on the subject. A MS. psalter, written about the time of Stephen, and preserved in the Library of Trinity College, Cambridge, gives a representation of two men grinding a sword-blade at a large wheel. Although there is little doubt that swords were manufactured in England at a very early period, the blades made in Spain and Italy, and more especially those brought from the East, were considered very superior to the English swords. The Toledo blades, which are still celebrated for their exquisite temper, were eagerly sought after in the time of the Romans. During the eighteenth century, English blades had fallen into such disrepute, that in 1788 the sword-sellers petitioned the Lords of the Treasury for permission to import sword-blades from Germany. This naturally drew public attention to the humiliating inferiority of English workmanship in this particular branch, and led to important results, in fact, to the present excellence of the Birmingham manufacture. In December, 1787, Mr. Gill, of Birmingham, memorialised the Lords of the Treasury, stating that he could make sword-blades equal to those of Germany, and requesting a fair comparison. This public trial, however, was, by some circumstance or other, continually postponed, until, in 1786, the East India Company, requiring 10,000 horsemen's swords, they divided their favours among the English and German makers. Mr. Gill, however, not to lose the opportunity for the comparison he courted, spared no endeavour to obtain it, and he was successful. Every sword sent in was submitted to a severe test, by means of machine recommended by the celebrated Matthew Boulton of Soho, by which the blades were forced into a curve which reduced the length from 36 inches to 20½. Of these, Mr. Gill's swords 2680 were approved, and 4 rejected, whilst the German manufactures, 1400 were received and 24 rejected, giving a superiority to Mr. Gill in the ratio of about 13 to 1. As a proof, however, that the complaints against the English makers were not without foundation, we find that of the other English swords (besides Mr. Gill's), there were 2760 approved, and 1094 rejected, being about two bad ones to every five good ones! However, the state of the manufacture in Birmingham at the present day will be well shown at the Crystal Palace, and will serve to wipe off the disgrace of this former shortcoming.

We should mention, before we close this article, that the manufacture of swords is also shown in all its stages

Two noble guns, too, from the Low Moor Iron-Works, one a 72-pounder, and the other 10-inch shells, should not be omitted; they are mounted on improved carriages and slides.

CHEMICAL AND PHARMACEUTICAL PRODUCTS.

THE benefits conferred on society by Chemistry since the opening of the 18th century have been enormous, causing millions to circulate annually, where thousands sufficed previously, besides reducing the cost to the consumer of various useful articles, giving at the same time employment both directly and indirectly to large numbers of workmen. A glance at a few of the most prominent improvements, and also at the extensive scale on which some chemical manufactures are conducted, will be of service at the present time.

Foremost among them is the improvement of Howard by refining sugar in vacuo, which is also now adopted in making extracts from vegetable substances of easy decomposition at elevated temperature. The extraction of sugar from the cane is likely to be greatly increased by either the use or some modification of the recently introduced lead process. No process has produced such direct and indirect influence on so many of our staple manufactures as the introduction of that of Le Blanc for decomposing salt with sulphuric acid, and its subsequent conversion into soda by treatment on a reverberatory furnace with lime and small coal. Previous to this invention all our soda was derived from burned sea-weed (kelp), the whole produce of which, at the period of the introduction of Le Blanc's mode, would not be equal to more than 1500 tons of carbonate of soda, costing in the aggregate £100,000, or £200 per ton. The same can now be bought for £12 per ton, and 100,000 tons are annually made, besides a large amount of sulphate of soda (the salt cake of commerce), which is manufactured and consumed in glass-making. The diminished cost of soap, owing to the reduced price of carbonate of soda, enables our woollen manufacturers to scour their cloths at a much lower rate than they otherwise could. Although partial evil arose by throwing the kelp-makers out of employment, it is clear that four times the amount of wealth has been created; notwithstanding the charge of the material to the consumer is reduced to one-sixteenth of its previous cost. It is necessary, therefore, to see what a powerful influence this must have on the comforts of the various classes of the community. When the King of Sicily was so imprudent as to levy a high tax on the export of sulphur, a thousand heads were at work to convert our mineral stores of sulphur to an economical use, and with such success, that probably not less than 400 tons of pyrites (the mundics of Cornwall) are weekly used in this manufacture, the produce of the British dominions: 600,000 tons of coal and 180,000 tons of salt are also consumed.

Indirectly connected with the above is the manufacture of chloride of lime, which is formed from the decomposition of the muriatic acid of the soda process by manganese, the chlorine being absorbed by lime in chambers constructed for the purpose. Were it not for this economical mode of preparing chlorine, calicoes could not be bleached as cheaply as they are, for the entire surface of the United Kingdom would not form a bleaching-ground sufficiently extensive to bleach by the old mode the annual manufacture of calicoes in England.

Another substance of importance in calico printing, viz. alum, has been reduced by chemical ingenuity from £100 to £10 per ton. On other substances, if the price has not been reduced, the skill of chemists has prevented an advance in price, equally thus benefiting the community. Such an instance is given below in the case of garranium. The introduction of chromate of potash as a dye is most important. At the commencement of the present century, native chromate of lead, imported from Siberia, was sold at 20s. per lb.; it can now be obtained at any respectable oilman's for 2s. per lb.

Owing to some remissness on the part of the great soda manufacturers, their processes are not shown at the Exhibition. It is difficult to render instructive the simple exhibition of a bottle, whose contents are merely some white powder. In the following notice of various cases it will be seen that we have endeavoured to convey, in the most important instances, a brief account of their manufacture, together with a history of their introduction to economical use

In agriculture, chemistry has pointed out the proper course for manuring the soil. Though only partially put into operation, the manufacture of artificial manures is, however, on the increase; such, for instance, as the preparation of the phosphates by sulphuric acid from bones and coprolites. We hope, in a short time, that potash will be set free, in like manner, from our granites and feldspars.

It [illegible] from coal-tar, by converting the tar into naphtha for the [illegible] of naphtha-varnish and gum resins; the gas water into ammonia, ammoniacal alum, and salts of ammonia, or sal ammoniac, &c., to be used as a manure for fertilising the soil, or in arts and manufactures. Bisulphuret of carbon, which, up to the last ten years, was merely made in small quantities for philosophic inquiry, is now manufactured extensively for its powerful solvent qualities; to which substance also is due the merit of displaying the varied bright and shaded portions of the electro-plate, brilliant examples of which are to be found amidst the splendid collection seen at the Exhibition. Electro-metallurgy and electric telegraphs are the offspring of chemical science. After witnessing their prodigious infantile displays, what may we anticipate when the young giants have arrived at maturity? The demand for lubricants, required by our coarser description of carriages and machinery—such as the wagons and engines used in collieries and mines—has also been supplied by a substance called grease, made from an oil procured by the distillation of resin forwarded from the backwoods of America, and obtained from trees felled by the hardy settler—the pioneer of a resistlessly advancing civilisation. This oil, when formed into soap by combination with soda, produces a very useful and cheap lubricant, greatly diminishing the otherwise increasing cost and waste of the more expensive articles, tallow, olive oil, &c.

In dyeing, the science of chemistry has been of such service, that a volume would be required to detail the all but innumerable advantages which our manufacturers have derived from this source. Over and above those detailed under the articles soda and chlorine, we may summarily state, that all colours vast parts or mordants, that either wholly or in part are composed of the following articles, have been greatly reduced in price since the opening of the present century; viz. alum, acetate and nitrate of lead, chromates, sulphuric, nitric, and muriatic acid, chlorine, the prussiates, salts of tin, copper, ammonia, acetic or pyrolignecous acid, &c. To the production by the chemist of iodine and bromine we are indebted for the proper preparation of plates for the Daguerréotype, &c.; and, lastly, it is not probable that the Glass Palace would have had an existence but for the reduced cost of the material, principally owing to the assistance of chemical science, by which the manufacture is multiplying, cheapening, and facilitating the production of the gorgeous array of splendid and useful articles which the visitor to the Exhibition will meet arrayed around him on every side. The details of the manufacture, and other remarkable circumstances connected with the principal substances exhibited, will be detailed in what follows.

In Case 1, Messrs. Pontifex and Wood, Shoe-lane, [illegible]-street, and who have classes in Chemistry at Black[illegible], exhibit some specimens of the metallic products of which they are such extensive manufacturers; viz. copper, spelter (crude zinc), lead, and tin. There is also some very fine specimens of crystallised tartaric acid—the largest, we believe, ever shown. This substance, which is now so extensively used, is obtained from an impure bitartrate of potash, familiarly known [illegible] tartar: the commercial form in which it is imported is that known as red and white argols, these argols being the lees or sediment of wine deposited in the course of fermentation. The thick crusts on the butts and casks that have been filled with red wine is principally composed of argols. The mode of manufacturing tartaric acid from argols consists in first bleaching the [illegible] charcoal, to which it is mixed with powdered chalk and water, during which an insoluble tartrate of lime and soluble neutral tartrate of potash [illegible] the latter is then converted into [illegible] by means of [illegible] calcium. The insoluble tartrate of lime [illegible] washed, treated with sulphuric acid, the insoluble sulphate of lime precipitated, and the liquid tartaric acid is subsequently crystallised. Messrs. Pontifex, who are also extensive paint manufacturers, exhibit some interesting samples of colours and pigments, which will well repay observation. To be made by which they procure their sulphate of copper is worth relating. Messrs. Pontifex and Wood are, perhaps, the most extensive coppersmiths in the world. In the course of working hammered copper, a large amount of scales are formed; these are treated with sulphuric acid, which combines with the exterior coating of oxide of copper, forming sulphate of copper, commonly known as bluestone. The interior metallic copper scales remain, and are remelted.

Case 5, C. Butler, Holborn-bar, has a very fine assortment of the rarer chemical preparations.

Case 7, J. Wilson, Glasgow. This gentleman is, perhaps, the largest alum manufacturer in the world. The alum shale is procured from the coal-mines near Glasgow, which is a pyritous bituminous schist: by exposure to the atmosphere and moisture, a chemical action takes place, and heat is generated in the mass. The schist is composed of 30 parts of sulphur and 28 parts of iron. As the decomposition proceeds sulphates of alumina and iron (common copperas, or [illegible]) are formed. The alum of commerce is not, however, a simple sulphate of alumina. This article is a compound of sulphate of alumina and potash or ammonia: the latter is now manufactured on a large scale, in consequence of the cheapness and facility with which it can be procured from the ammoniacal liquor of our gas-works, but for many purposes the double salt of alumina and potash is absolutely required. In crystallising the alum large crops of crystals of sulphate of iron (copperas) are obtained. Mr. Wilson has in several cases shown the process of decomposition in various stages in a very instructive way. It is interesting to the chemist and geologist, the filamentous character developed by the decomposition being remarkably like serpentine. In the same case is a fine and rare specimen of [illegible], which is obtained by subjecting coal tar to distillation. It passes over after the naphtha and coal oil: it is not used in any manufacture. In No. 7, the next case, F. Spence, of Pendleton alum-works, near Manchester, exhibits the manufacture of alum from mild pyrites, obtained from the coal-mines: by this mode it is requisite to burn clay to afford the alumina. Mr. Spence also exhibits some fine cement or hydraulic mortar, the precise properties of which we were not able to ascertain. In the same case are also shown, by Messrs. Tennant, Clow, and Co., salts of copper, zinc, and tin, potash, soda, &c., used in calico dying and printing. This is a branch house of the great concern of Tennant and Co., of St. Rollox, Glasgow. The latter not having sent any specimens to the Exhibition, we shall here notice the same through their Manchester representatives. Although not in the Catalogue, there may be seen in the same case glass jars, containing samples of garranine or subium, probably unknown to our readers. Maddors are well known, and have long been used as the source of Turkey red dyes. Upto a recent period, the remainder of the madder, after infusion, was thrown away. It has, however, been found that a large portion of the colouring matter of madder remained in this refuse combined with lime. It ingeniously occurred to a Frenchman, we believe, that, by applying sulphuric acid this hitherto fixed colouring substance would be set free; the result proved the correctness of the supposition, and what was thrown away previously is now of equal value as a dye with the madder so originally imported. The salts of copper manufactured by Messrs Tennant, Clow, and Co. are procured in a different manner from those obtained by Messrs. Pontifex and Wood. In the case under notice, old copper sheeting, &c., is subjected to the action of fire in a reverberatory furnace, which converts the metallic copper into an oxide, on which sulphuric acid will act after [illegible] copper is crystallised in the ordinary manner. Arsenic is mixed with lead by Messrs. Tennant and Co. manufacture about [illegible] tons per week in this mode. The salts of soda shewn are the ordinary carbonates of soda, respecting which we shall have more to state at a future period. The salts of potash are principally interesting for some splendid specimens of chlorate of potash. The zinc salt is the sulphate, and the tin compound consists of chloride and stannates. We feel much surprised at the circumstance that the chloride of lime is not shewn by this house, as they are the largest manufacturers in the world. Adjoining the specimens shown by Messrs. Tennant, Clow, and Co. is a model apparatus exhibited by their intelligent manager, Mr. James Young, intended to display his patented method for obtaining the stannate of soda. Stannate of soda is not novel to the calico printers, it having been manufactured for some time by other processes. Previously, however, to the improvement of Mr. Young, the stannates were formed from metallic tin, which was oxidised by different modes for the purpose. The ingenuity of this invention consists in subjecting tin ore and soda, or potash, to a high heat, by which means the requisite combination is formed. The stannates are used in dyeing steam colours. Mr. Young has also shown a bottle of mineral oil from a coal-mine in Derbyshire, which is found to be the finest lubricant for machinery yet discovered. Adjoining this is a sample of paraffine, formed by subjecting coal to low heat, an inspection of which is well worth the attention of those engaged in the conversion of peat to economical purposes. So far as the commencement of what hitherto made on this subject, paraffine is set down as an important item; we are, however, informed by Mr. Young that it can be produced from coal in any quantity. On inquiring in other quarters, we are given to understand, also, that paraffine is not, nor likely to be, employed extensively for any economic purpose.

Case 9, Kurtz and Schmersahl, Manchester.—Several new colouring matters for printing and dyeing cotton, linen, silk, and wool, with specimens. Their new dyes are principally formed from various woods, extracts by means of alkalies; also some ultramarine, of various qualities. We feel somewhat surprised at there being so few specimens of ultramarine exhibited; nor have we seen any good specimens forwarded from Germany, which is the more surprising as Nuremburg is so famed for its production. Ultramarine, formerly made from lapis lazuli, previous to the introduction of the factitious mode of manufacture, used to be so high priced as four and five guineas per ounce; an equal is now produced for two shillings and sixpence per pound: the beautiful blue papers used by druggists, perfumers, and bookbinders are coloured with this material.

Case 10. Howard and Kent, Stratford, Essex, the celebrated preparers of fine chemicals. Bottles containing quinine and cinchonine (the active principles of Peruvian bark), accompanied by an assortment of raw materials, and various salts and compounds; specimens of the *Nectandra rodiæi*, or greenheart bark, and its alkaloid liberine, a very bitter substance. To detail the various other preparations and chemicals would be, in fact, to give a list of the articles in a druggist's shop.

Case 18. W. Moberley, Mulgrave Alum-Works, Whitby.—Here are to be seen raw alum shale, calcined shale, alum meal, and finished alum; sulphate of magnesia, rough and refined, and the ammonia phosphate of magnesia as a manure

22. F. C. Hills, Deptford.—Nitrate of potash, made by a patent process, consisting of the double decomposition of muriate of potash and nitrate of soda, which is thus converted into nitrate of potash, saltpetre, and muriate of soda (common salt)

31. Cheshire, J., Victoria Northwich Specimens of best table and other salt: this appears to be the representative of the immense annual wealth derived from our salt mines

[illegible] Hodgson, Bankfield, Surrey Lime, use of manure of sugar of [illegible]

36. W. Lindsey and Co., George-street, Glasgow.—Specimens of Prussian blue and yellow and red prussiate of potash. The prussiates of potash are formed by fusing horns, hoofs, &c., of animals in a tank iron pot along with potash, by which means a compound is formed, called ferro-cyanite, or prussiate of potash, which, when mixed with a free salt of iron, forms the well-known pigment, Prussian blue: it is extensively used in calico printing. In various cases are exhibited splendid crystalline specimens, of different [illegible]

48. W. Watson, [illegible] sample of sea-weed (*Fucus bulbosus*), with its chemical products; viz. kelp, sulphate of potash, chloride of potassium, carbonate of soda, iodine, and iodide of potassium. The manufacture of kelp was a most important art in the Western Highlands and Islands of Scotland, and along the coast of Connaught, in Ireland. Previous to the introduction of the manufacture of the alkaline soda, by the decomposition of common salt with sulphuric acid, as much as 20,000 tons were annually manufactured, worth from £8 to £10 per ton, containing on an average only five per cent. of carbonate of soda, for which it was purchased by the soap-boilers, the remainder of the substances being thrown away. At present, commercial carbonate of soda, containing 80 per cent., can be purchased for £10 per ton. The manufacture of kelp consequently [illegible] for many years, until the substance iodine was found so valuable. On an average, each ton of kelp contains four pounds of iodine: to make a ton of kelp, 30 tons of dried sea-weed are required. The sea-weed so collected is burned, and the ashes kept stirred [illegible] until it presents the appearance of the sample exhibited. The alkalous matter, containing the iodine is extracted. The price of iodine has ranged from six shillings to forty shillings per pound: it is at present worth about fifteen shillings. It forms a beautiful blue with starch, and crimson with mercury. The fumes are of an exquisite violet hue.

[illegible] Brarly. W. A. Douglas, Isle of Man.—Refined oil and pure cleine, for watches, clocks, chronometers, and other fine machinery. The mode of such a lubricating substance is well known to those engaged in the construction of time-keepers

[illegible] M. H. Picelvih.—Some gum-arabic bleached by a patent process, and sample of ultramarine blue

[illegible] Hall, Bow, near Bluffhal.—Bisulphuret and chloride of carbon. The former substance is now extensively employed as a solvent for [illegible] which purpose it is prepared on a [illegible] especially in the vicinity of [illegible] and Walworth. [illegible] It [illegible] film of that substance to [illegible] with metals being first dipped into the solution and then into a solution of silver or copper, by which [illegible] metal is produced on the surface; upon this other metals can be precipitated by voltaic influence.

71. S. H. Godson, Tenbury, Worcestershire. Native mineral waters, consisting of the waters of Tenbury, in their natural conditions. Bromine is found in all mineral waters. In consequence of the increased demand for bromine, owing to its extended use in the preparation of Daguerréotype and other plates, for taking portraits, &c., its economical preparation becomes of great importance.

86. W. Robertson, Banff, Scotland.—Cod-liver and skate-liver oil, extracted by steam heat, manufactured at the various fishing villages on the coast of the Moray Firth.

[illegible] A. Tilloch, [illegible] Specimens of [illegible] for [illegible] There have been [illegible] from the Waltham Abbey mills a very tastefully got-up design, composed of a box filled with [illegible] containing the [illegible] of a cartridge of fused saltpetre, which latter [illegible] inclosive of sublimed sulphur. At the back are the letters "V. R.," and a crown of sub-[illegible] this is the Prince of Wales' feathers, and in the upper compartment "V. R.," and a crown of sub-[illegible] sulphur, and [illegible] the [illegible] appearance of the whole.

94. J. H. Kent, [illegible] Bury St. Edmunds. Dried pharmaceutical Indigenous plants in [illegible] with extracts. The plants are admirably preserved.

105. C. M'Culloch, Covent-garden [illegible] Dried English and American herbs and roots. These are well worth attention

107a. T. Keating, St. Paul's Churchyard.—Jalap, saffron, kousso, or *Brayera anthelmintica*, from Abyssinia; matico, or *Piper angustifolium*, from Bolivia. These are rare drugs

128 and 141 inclusive principally contain pigments, and articles for their application, with varnishes, &c. Amongst the raw materials are the [illegible] chloride of lead, as a substitute for white lead: there are also several specimens of *cudbear* prepared from orchil, a weed which is much used to give a rose or [illegible] to silks.

143. Jerusalem and Lud[illegible] is a valuable collection for dyeing, consisting of samples of indigo, carmine, orchil, cudbears, [illegible] dye[illegible], turmeric, and specimens of 36 kinds of European and native manufactures of [illegible] dye in India.

145. W. Denteth and Co., Manchester.—Ornamental [illegible] of crystals of bichromate of potash and nitrate of lead, with mineral colours, and used by calico printers and dyers, china and earthenwares manufacturers. The chromates of potash are made by calcining chromate of iron [illegible] from India, America, and the Shetland Isles: from these salts the yellow pigments are made, known as chromes. The process is a simple one; viz. the admixture, in combining proportions, of nitrate of lead and chromate of potash. Chrome salts are most extensively used in dyeing yellow, and chromic acid is used to dispel colours. A beautiful green—the green oxide of chromium—is prepared for pottery and other uses

BOOKBINDING.

(SECOND NOTICE.)

In one of the divisions at the extreme south of the space allotted to France will be found the contributions of the French bookbinders. We are sorry to say, that, at present, only two or three of the best class have set out their cases, though several other names of repute are included in the Exhibition Catalogue. M. Gruel first claims our attention for his two large volumes bound in morocco, inlaid with coloured leathers, forming very bold and good designs; and for a missal in velvet, richly ornamented with gilt metal and jewels: but commend us more to some smaller books of "Hours," one in carved ebony, one in velvet, covered with a tracery of ivory, another in bright velvet with a beautiful design in carved box-wood, and two or three other volumes in russia and velvet slightly ornamented with metal hinges and clasps of exceedingly graceful ecclesiastical design, very different from the ill-formed and heavy Gothic patterns to be found on our English bibles In the adjoining case M. Niedrée exhibits the perfection of workmanship in delicate gold-[illegible]. There are two tiny volumes of this collection that may challenge the world for their superior. M. Niedree seems to prefer spending his chief talent on the inside of his covers; and on one of these little volumes especially there is the most exquisite design, most ably executed. For honest bookbinding, without the factitious aid of metal-work carving or inlaying, M. Niedrée clearly, in our opinion, bears the palm; and a refined taste will, perhaps, be better pleased with this little show of volumes than with all the glories of their more magnificent-looking

bra three. M. Simier sends a "Don Quichote" bound in light calf, with a good ornamental design darkened upon it, and as a centre the celebrated wind-mill; and a "Molière" decorated with a Grolier pattern: his other specimens are not to be praised. Mame and Co, the great publishers, of Tours, exhibit a variety of cloth and Morocco bindings, which we are sorry we cannot commend: in general the ornamentation is gaudy and ill-designed. Parisian taste does not seem to extend much through the French provinces.

In the Northern Gallery, over those courts appropriated to Belgium, M. Hanicq, of Mechlin, exhibits a trophy, as it were, of Liturgies in various languages and all sizes, some of them illustrated and illuminated, and nearly all bound in a showy way with stamped metal corners, clasps, and ornaments. The first impression promises something worthy of praise, but we are sorry to find that a closer inspection dispels the illusion.

We must now descend the stairs and enter the room in which MM. Leistler, of Vienna, display their beautiful bookcases: here we shall find some marvellous examples of Austrian work

Commencing at the left-hand side of the Gothic bookcase, we must first admire a folio volume, bound in blue velvet, ornamented with silver tracery of a rich Gothic design. In the centre is a figure of Christ, and at the four corners are the symbols of the Evangelists—an angel, a lion, a bull, and an eagle—all in silver. The next is an album, likewise in blue velvet, ornamented with gilt metal and tracery of ebony (beautiful in design); the centre has a bronze medallion, set round with a string of pearls. The third is a large volume in green morocco, inlaid with red and buff leather, ornamented with gilt metal-work, enclosing ten medallions, painted like bas-reliefs, in metal. Next is a large and beautiful book, entitled "Landschaften," bound in purple velvet, exquisitely ornamented with pierced ivory of most elaborate pattern. Then there is a volume of "National Musick," covered with metal-work and carved ivory. In the centre are the arms of Austria; and, surrounding them, fourteen little oil-paintings, mostly of rural costume, descriptive, we imagine, of the national songs. Next is a book in green morocco, inlaid with ivory and a light blue enamel, beautifully ornamented with gold, and, behind it, a volume bound in tortoiseshell, with gilt and silver ornaments of Gothic design, and three female allegorical figures in metal. These books must claim great attention and admiration for the elaborate and costly ornament upon them. They are—with the Gothic bookcase that holds them—a present from the Emperor of Austria to her Majesty. We have our doubts as to whether all the credit is due to Vienna; more especially as some plain morocco books in the same case do not exhibit the same amount of taste or excellence of workmanship: anyhow, here we find them, and our poor binder's court turns pale at the sight of such splendid book-ornament. Among the minor volumes we noticed a peculiarity not unpleasing: the titles of the books are lettered in raised metal letters, chased or burnished on the surface.

Now we must walk to the end of the Building, and on our right we shall find some specimens of bookbinding from the United States And, for our dear cousin's sake, the less we say of it the better. It is not what we might expect, that among all their "wonderful" specimens of this art, of most of which an ordinary country bookbinder in England would be heartily ashamed. The only books that are well-bound and bound in character are the ledgers! The rest are wretched affectations One man seems to think sunk panels the only merit, another gives us the lamentably perverse Gothic window on this side of a bible, and all agree in trumpeting their fame (?) as though they were to astonish the world.

COLOUR-PRINTING.

In the same court in which M. Gruel and the other French bookbinders display their art, will be found some interesting specimens of lithographic colour-printing, by the well-known firm of Engelmann and Graf. A view of the "Parthenon," and a "Caravan in the Desert," are excellent; and their imitations of French drawings of various mixed and other book illustrations (in ink printing) are very elaborate and good: but we must confess that, knowing their resources, we anticipated a richer show than Messrs Engelmann choose to give us M Simon, of Strasbourg, exhibits some very clever scientific pictures of the glaciers in the Alps, and a few good landscapes. This gentleman has invented a new process, which he calls *lavis aquarelle* (water-coloured wash), which our English lithographers think an important discovery, but which they cannot use on account of the patent for their lithotint, taken out a few years since by Messrs. Hullmandel, who produce effects in monochrome by the same means that M. Simon employs in his colour pictures. The great merit of of M. Simon's plan is to obviate the necessity of so many printings. M Silbermann, also of Strasbourg, sends a few good examples of colour-printing from wood blocks, and two or three sheets showing gradation of colour most admirably rendered. This, the great difficulty with wood-blocks, M. Silbermann seems to have overcome entirely. On the wall, close by, there are two imitations of bas-reliefs for paper-hanging, produced by wood-blocks by Desmarais, which are praiseworthy; but we cannot commend his large wall-picture, the "Death of the Stag." Further on is a better attempt of the same kind, an "Italian Garden," contributed by Mader *frères*, but even this is not excellent. In the north gallery, M. Jacqmain, of Ghent, sends a volume, "Lettres Initiales," well printed in chromo-lithography, but the designs are too wild and fantastic; and M. Jumar, of Brussels, contributes some coloured coats of arms and priests' vestments, printed with blocks. One of the courts devoted to Austria contains little else than the productions of the Imperial Government Printing Establishment, at Vienna, specimens of types in every language, stereotypes, books, &c. Among these we find a very interesting collection of colour printing (lithographic) executed by M. Hartinger, expressly for this Exhibition. There are six examples—two flower pieces, a fruit piece, a study of a head, a picture of still-life and a *genre* picture, representing the Emperor Joseph II prescribing 100 ducats as medicine to a poor widow dying of hunger. The original paintings are hung side by side with these remarkable productions, and we must confess, we had, at first foot distance, some difficulty in deciding which were the copies. A prospectus tells the visitor that each painting cost £25, and each copy 1s., but does not inform us how this last sum is obtained. There is much skill shown in the execution of these works: the deep tones of the flowers and fruits are well rendered; and though we find a little coarseness (almost inseparable from chalk printing) when we examine closely, we must say that M. Hartinger is deserving of very great praise for these admirable specimens of his art.

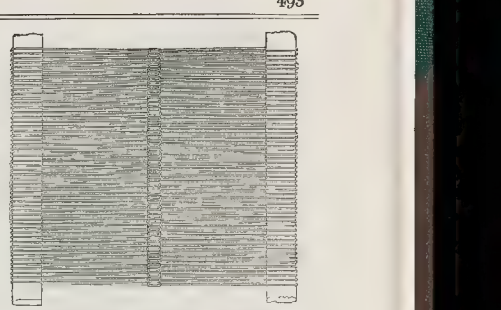
Since our last visit to the so-called Fine Art Court (it is almost a Refuge for the Destitute), we find Messrs Rowney have contributed a frame containing eight examples of colour-printing, too excellent to be passed by. The most important is "The Origin of the Guelph and Ghibelline Factions" (a lady, of course), lithographed in colours by R. P. Noble, from a water-colour drawing by F. R. Pickersgill, A.R.A. For boldness of execution and breadth of effect, this surpasses any work in colour-printing that we know: it is not finished like Mr. Brandard's copy of Frederick Tayler, and it will not bear close inspection; but, taken for what it is—a free translation of a clever water-colour sketch—it is very excellent. "Westminster Abbey" and "Clumes Church," after R. P. Noble, are not deserving of so much praise. We like Mr. Richardson's "Lake of Lucerne" better, and better still, the copies of a pair of round drawings by J.H. Mole, and the "Fisherman's Daughter," by W. Lee, and "The Gleaners," by W. A. Robinson. In the same court we likewise find a pair, called a "Village Girl," drawn and lithographed in six colours, by Mr. J. R. Pickess, from the press of Messrs. Hanhart. This is a very clever production. The flesh tints are exceedingly well given, and we cannot but admire the subject. We recommend those of our readers who wish to decorate their walls in a tasteful and inexpensive way to visit the Fine Arts Court, and select, to their own taste, some of these newly-invented pictures. For a time they can astonish their friends, who will believe they have "run mad" in the purchase of so many first-class water-colour drawings.

THE UNITED STATES GOVERNMENT AND THE EXHIBITION.—We are pleased to learn that the Secretary of the Interior has commissioned one of the agents of the United States Executive Committee at London, Charles F. Stansbury, Esq., to make a report of all those matters connected with the Industrial Exhibition which may be calculated to enlighten us on the present state of the mechanical arts in Europe. The report will be published under the direction of the Commissioner of Patents; and, from the known taste, industry, and ability of Mr. Stansbury, will be well calculated to promote the cause of science and diffuse valuable information among our own people.—*New York paper.*

DAWSON'S AUTOPHON.

Mr. Dawson's Autophon, which is simply a modification of the ordinary church organ with the addition of a pair of rollers, between which the perforated card-boards or milled boards containing the tunes to be played are introduced, is placed among the pianos and other musical instruments, in the middle north gallery. The perforated sheets of music having been introduced within the instrument, by the operator turning a handle with his right hand, pass underneath the various pipes through which the wind from the bellows is forced. The bellows and pipes are, of course, differently arranged from those of an ordinary organ. The unperforated parts of the boards serve as valves to shut off those pipes that are not required in any given tune.

A great advantage of this instrument is, that the tune may be in any key, and not limited, as in the case of the barrel-organ. The operator is also enabled to dwell any length of time on a given harmony. In many rural districts, especially where the annual stipend of a professed organist is a barrier to the introduction of an instrument of the usual kind, Dawson's Autophon will be found to be a great acquisition.



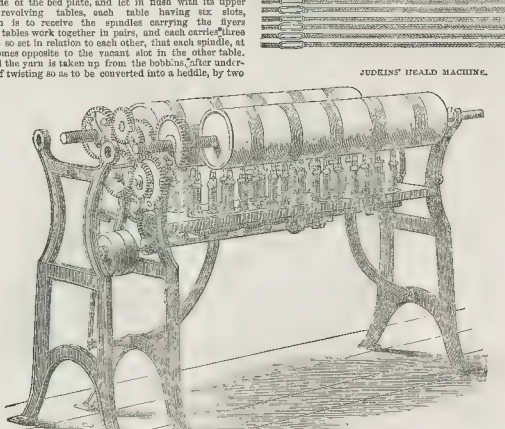
JUDKINS' HEALD MACHINE.

JUDKINS' HEALD MACHINE.

Mr. Judkins, the inventor and patentee of this useful machine, formerly lived at Sowell, Massachussetts, U. S., but has now taken up his residence at Manchester, in which important town his machine will no doubt be duly appreciated. By this machine, the yarn is doubled and twisted from single of itself, and at certain intervals is braided or plaited, so that the eye or loop of the heddle is formed without knots of any description, the whole forming one continuous line or cord.

The cut represents a set of healds, as made by this machine, with the eye or loop complete: this eye is coated by means of a metallic substance, which forms also a novelty in the invention.

The bed-plate is placed horizontally between the ends of the light iron frame; on each side of the bed plate, and let in flush with its upper surface, are ten revolving tables, each table having six slots, the use of which is to receive the spindles carrying the flyers and bobbins. The tables work together in pairs, and each carries three spandles, which are so set in relation to each other, that each spindle, at proper intervals, comes opposite to the vacant slot in the other table. After being twisted the yarn is taken up from the bobbins, after undergoing the process of twisting so as to be converted into a heddle, by two



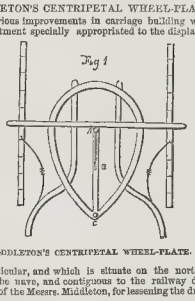
JUDKINS' HEALD MACHINE.

cylinders, one on either side of the machine. The working shaft of the machine is connected with the revolving tables by means of bevelled wheels working underneath the bed-plate.

The machine acts as a doubling and twisting machine, except at the time when the eye or loop of the heddle is formed, when at the top and bottom of each loop it becomes a braiding machine. The bobbins, during the operation, pass from one table to another throughout the whole series in a most ingenious manner. In order to show the advantage of this machine over the ordinary mode of making healds, it is only necessary to state, that from 25 to 30 sets may be produced by it in one working day, with the attendance of one girl, who, by hand, could only make a single set in the same time.

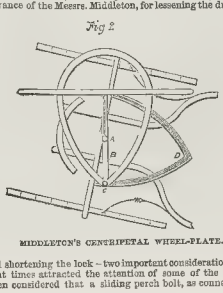
MIDDLETON'S CENTRIPETAL WHEEL-PLATE.

Among the various improvements in carriage building which may be seen in the department specially appropriated to the display of pleasure



MIDDLETON'S CENTRIPETAL WHEEL-PLATE.

carriages in particular, and which is situate on the north side of the western part of the nave, and contiguous to the railway department—is a contrivance of the Messrs. Middleton, for lessening the draught of car-



MIDDLETON'S CENTRIPETAL WHEEL-PLATE.

riages, and shortening the lock—two important considerations, which have at different times attracted the attention of some of the first builders. It has been considered that a sliding perch bolt, as connected with the wheel plate, would certainly be better than the fixed one in ordinary use. Yet it is a matter of considerable difficulty to keep the "under carriage" always under the centre of the body, which is a serious objection, as, if the carriage is curved away from the centre, it not only makes it very difficult to look round, but renders it liable to accident from being overturned, owing to a want of sufficient bearing.

By the accompanying diagrams—1 and 2—it will be seen that the inventors have overcome the difficulties alluded to. A plan of the carriage, as it would appear when running in a straight line, is shown by Fig 1. Thus, the wheels are brought much closer together, as the under carriage is full 10 inches nearer to the centre of the body than usual.

The carriage is shewn on the "full lock" by fig. 2, when the bolt A has been moved down the full length of the groove B, being guided both smoothly and equally by means of the pin C running in the groove D of the transverse plate, thereby allowing the wheels to work under the body.

The elliptical form given to the wheel-plate is both novel and ornamental, and the whole arrangement seems calculated to ensure ease and safety.

THE TUNIS COURT.

THE Tunis court or bay, of which we have given an illustration on page 494, is the first on the right hand after passing through the iron gates at the south entrance. In front it is the width of a single division; but in the rear it is more extensive. The collection of Tunisian productions which have been sent for exhibition by the Bey of Tunis, under the care of Sy Hamuda Elmkadder, pro-commissary appointed for the occasion, and Moses Santillana, interpreter to his Excellency General Sidy Mahmoud Benyad, the Bey's commissioner, are more remarkable as matters of curiosity than for their intrinsic value or importance. The most striking features in the outward show are some carpets, rugs, and blankets, and a variety of singularly fashioned garments, for male and female, of a mixed material of silk and worsted, and of all shades and mixtures of colour; caps of various denominations—calabash, orta, sake, majidia, kaleb-shed, &c.—turbans, and other head-gear; silk scarfs; in short, an endless stock of gentlemen's and ladies' "left-off clothing"—just such a stock as one might expect to see in a native old clothes' shop at Algiers or at Cairo. Two bats of gigantic proportions, in red morocco, will astonish all beholders. In the inner room are others of similar mensions, but made of straw, and ornamented with leather patches. The shoes, boots, and slippers, of red, green, and yellow morocco, well deserve the attention of the curious, as also some very substantial saddle-bags, of the same material, which, divided in two, might form very serviceable packs for a walking tour in Wales or Switzerland. Then there are samples of seeds, of saffron, of indigo, and glass jars full of sweetmeats, which last named the good-natured Turk in charge very freely dispenses, with wild gestures of welcome, to gaping juveniles as they pass. Arms and gun-locks of clumsy make are displayed in another compartment; in another various articles for domestic use, made of iron, tinleather, and pottery, and of very primitive fashion; squares of "household soap," some candles also, veritable "dips" of a dirty brown colour. In another we have musical instruments, including a lute and a timbral; and strewed about in all directions are skins of animals, dressed and undressed; pieces of matting, parasols, fans, ornaments in gold and silver; claret bottles, filled, some with scented waters, some with Begia snuff; and all sorts of odds and ends, mostly of the rudest description, but all admirably calculated to afford illustration of the *mœurs* and *consuetudes* of the North African tribes. A tent made of camel's hair cloth, which stands in the middle of the room is a perfect picture, low, dark, dismal a mere shelterfor the mountain wanderer from the blast and the rain; in which saddles, saddle-bags, leather water-bags, leather bottles, leather mats, clumsy arms, and other articles for immediate use

and adapted for prompt removal, are scattered about in admired disorder. In strange contrast to this tatterdemalion lot stand two glass cases, which contain some very splendid specimens of gold embroidered dresses and horse caparisons, and other articles of costly selected, probably, from the Bey's private collection. Nor must we omit to address attention to some very curious models of arabesque carvings in gypsum, intended for the decoration of the interior of Moorish rooms. The workmanship is of a bold character, the devices elaborate and pleasing, and the material being pierced through, must have a very light and graceful effect when applied to the purposes intended. Preparatory to the process of carving, the gypsum is enclosed in a wooden frame, with a back to it, which supports and protects it till the design is completed.

We must now quit the Tunis bay and its extremely picturesque and obliging native *custodien*, hoping we have said enough to induce many of our readers to spend an hour in exploring its diversified and truly novel contents, as we have done.

THE CANADA COURT.

A HUNDRED years ago, supposing a great international and industrial exhibition to have been possible at that time, Canada would have furnished a very different assortment from that with which she now presents us. Then we should have had a rude and miscellaneous lot of native manufactures and native finery, something after the fashion of that now collected in the Tunis bay—a wigwam, some wooden or horn spoons, rough earthen pots, a few embroidered moccasins, a few tomahawks, and a dozen or so of scalps and other military trophies; but nothing indicative of the natural resources of this vast and almost virgin tract of territory, nothing that spoke of the honest industry or intelligent enterprise of its inhabitants. Very different from this, however, is now the case. Civilisation has begun its useful work in the far west. European industry has planted the spade there, and some of the fruits are now before us—speaking much and creditably for the past, but speaking still more cheeringly of what is yet to come.

The Canada division is situated to the south side of the Western Nave, next beyond the East Indian division. Its products are not so showy, but are yet more valuable as evidences of social wealth and social advancement. They are the spoils of peace, not of war, the industrial beginnings of a junior branch of the great civilising family of the universe, not the gaudy remains of an effete barbarism, which has been demolished, but not yet replaced by anything better. The Canadians send us abundant samples of natural wealth drawn from the bowels of the earth—specimens of iron, copper, and silver ore, besides a case of native gold obtained from the gravel on the south-east side of the prolongation of the Green Mountains specimens of magnesite rock, of stones of fine quality for the purpose of lithography, of agates, soapstones, gypsum, slates, and serpentines. Of timber there is a large assortment (the upper part forming a large pile in the midst of the main avenue)—oak, curled ash, bird's-eye wood black walnut, pine, curled maple bird's-eye maple, hemlock, elm, spruce, &c. all fine specimens, and of which the black walnut struck us as especially beautiful, both for its colour, its curl and veined grain, and the high degree of polish of which it is susceptible. The maples also are extremely rich, and, as well as the black walnut, are well adapted for furniture and other decorative works. Of agricultural products we have numerous samples, the Canadian exhibitors evidently attaching a due importance to this branch of their national wealth barrels filled with corn, Indian meal, barley, oats, peas, beans, flax, potatoes preserved for sea voyage; with Siberian oil-seed, hemp, hops, and sugar from the maple tree, all show the varied richness of a land which, put to good account, might effectually relieve the distress of the older communities of the world.

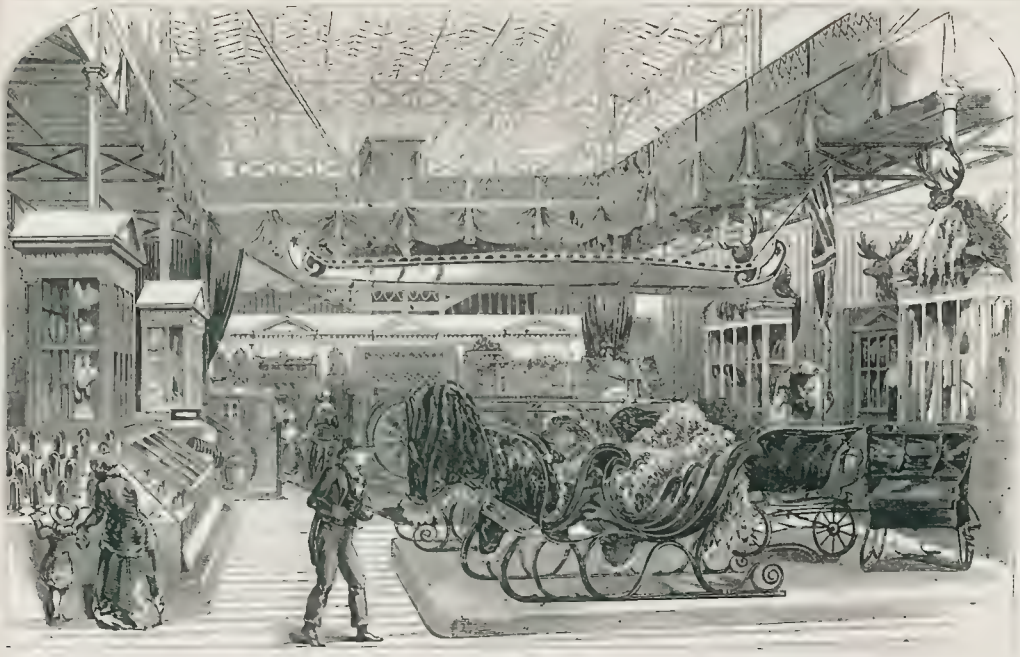
Lastly, in unmanufactured, or but partially manufactured, products, there are specimens of moose hide and leather, moose deer's head and horns, calf-skin, porpoise-skin &c.

In addition to these resources of natural wealth, the Canadian colonists are favourably represented as regards their skill of handicraft—particularly as relates to furniture and articles of domestic and general use. Of furniture there are several most creditable specimens, substantial in make, whilst showing at some trick of style in decoration, which, although of course not claiming to compete with the more finished and artistic articles of *luxe* produced in London, Vienna, and Paris, show an aptness of handling, which a little study of improved models, abundant oppotunities for which the present Exhibition affords, will doubtless, in future, direct more happily. Amongst the articles of furniture deserving of especial mention, from the loyal association connected with them, are half a dozen chairs, the seats and back worked in worsted and silk by the ladies of Montreal, "for England's Queen." There are also a handsome pianoforte and some other musical instruments, showing that Saxon industry in Canada does not intend to restrict itself for the future to mere articles of utility.

In the midst of the room are some very stylish sleighs, with harness and sleigh-robes complete; and a fire-engine of unusually large proportions, and remarkably elegant design and workmanship, capable of throwing two streams of water 166 feet high, or a single stream 210 feet high. There is attached to it a box containing necessary tools, and with a seat for the accommodation of the firemen, but this adds greatly to the length, and

THE TUNIS COURT

THE TUNIS COURT.—GENERAL VIEW.



THE CANADIAN COURT.

although a useful contrivance for the comparatively open thoroughfares of Montreal, would hardly do for the crowded London streets

Amongst other matters which the visitor will remark in this collection, are some interesting models, including one of a wooden bridge, having an arch of 360 feet span; a Canadian trading canoe, made of course of bark—a remarkably fine specimen of this class of boat building crocks and futtocks; specimens of [illegible] articles of cutlery; samples of carpeting, blankets, and [illegible] fine cloths and satinettes; patent leather trunks, bound with brass [illegible] and remarkably substantial; cooking and parlour stoves; a church bell, made from the copper of Lake Huron; some excellent printing types a new description of copying-press; snow-shoes and moccasins, and even some articles of jewellery and some specimens of artificial teeth.

MINERAL MANUFACTURES.—THE BUILDING COURT

One of the most interesting, and in a social point of view, one of the most important branches of the Exhibition, is that of the mineral manufactures of Great Britain and Ireland (Class 27), in a compartment sometimes known as the "Building Court." The progress made in the working and application of the numerous beautiful natural stones with which these islands abound, and also the ingenuity displayed in the manufacture of artificial stones bricks, and tiles, both for roofing and flooring purposes, are alike creditable and pleasing in their results.

Of the natural stones, of which specimens fashioned in a variety of forms already may be mentioned the granites of Cornwall—the serpentines of the Lizard district, together with porphyries, steatites, and some other varieties from the surrounding districts—the marbles of Derbyshire in great variety of texture and colour, from the pale encrinital marble to the fine black marble—vases of fluor spar, a very scarce variety usually known as "Blue-John"—the green Connemara marbles wrought into table-tops; tables of serpentine marbles from Ballynahinch Quarry, Galway, on pedestals of black Galway marble; slabs of red and white marble from Churchtown, county Cork; granite from Waddend Quarry, near Blessington, Ireland; slate slabs from the Island of Valentia; besides specimens of the more commonly known Bath oolite and Portland stone, and of Caen stone, and some other foreign varieties. Many of these are applied to very beautiful subjects, some of which may be enumerated: a granite obelisk and base, 20 feet high, of Cornish granite, by Hosken, of Penryn; a baptismal font, vases, and other cabinet specimens of serpentine stone from the Lizard, by Organ, of Penzance; a sepulchral monument of the decorative period, in Caen stone, by [illegible] of London; a baptismal font in Caen stone, richly sculptured with sacred and devotional figures, by Margetts, of Oxford; a statue of St. Peter, in a canopied niche of Caen stone, a very fine piece of workmanship by Lane and Lewis, of Clifton, near Bristol; various articles manufactured by the aid of steam machinery at the Derby Marble and Spar Works; ornamented specimens of Galway marbles, by A. M'Donald, a self-taught artist, &c.

Amongst the artificial products, Minton's encaustic tiles, and the ornamental bricks and tiles, for walls and decorative borders, by Bowers, of Tunstall, Staffordshire, are exceedingly beautiful, the colours and designs equally striking and in good taste, and for villa architecture would be highly appropriate. Mr. Hunt, in his Synopsis of the Exhibition

THE BUILDING COURT.

says of the beautiful specimens of tesseræ here displayed:—"These are now principally manufactured by compressing the clay in a dry state in moulds; the particles are forced within the limits of cohesive force, and are thus kept together by the operation of this power: being afterwards baked, they acquire the firmness of stone, and are excessively durable." Messrs. Francis and Sons exhibit a large specimen of interior decoration, showing the applicability of their new cements to produce imitations of marbles of various kinds, and also of scagliola compounded of their cement. The enamelled slates from the Pimlico slate-works are also very pleasing additions to our decorative resources; and the same may be said of the patent mantel-pieces, made entirely of glass and iron, by Mr. Coates, Singer's patent mosaic pavement, of highly vitrified coloured glass, and Harland and Fisher's new method of imitating marbles by painting upon glass

In terra cotta we are struck with several very beautiful productions, more especially a stove for a church, designed by Pugin, and executed by Messrs. Minton and Co. Of inventions of a more utilitarian character we are happy to notice several improvements in bricks and tiles for cottage architecture, eminently calculated to improve in healthfulness and comfort the houses of the humbler classes. A prominent illustration of the application of these new principles is afforded in a design for cottage architecture, exhibited by the Society for the Improvement of the Dwellings of the Poor, in which a new description of hollow brick is used, which, besides the advantages of increased durability as to texture, affords easy means of ventilation, all that is necessary for that purpose being the insertion of a grating in an orifice made in any part of the wall. The applicability of these new bricks to roofing, without the aid of timbers, on the principle of the arch, braced with a single tie of iron, is also illustrated in the model before us

We shall devote a separate paper to this interesting and important subject on an early occasion.

ANATOMICAL MODELS.

Grouped among the Surgical Instruments, in Section 10, are some contributions of anatomical models, a department of art which, from the extensive collections in Italy, France, and Germany, has been supposed to be exclusively confined to the Continent, but which some of the specimens exhibited on the British side will show to have advanced to a high degree of perfection in this country. The materials of which the models are principally composed are plaster of Paris painted, *papier maché*, and gutta percha, and wax; and the subjects which they illustrate are dissections of the human body some few morbid specimens—and the anatomy and development of several of the lower animals. With the exception of an interesting series of the anatomy of the male and female torpedo in wax, presented by the Grand Duke of Tuscany to Professor Owen, and deposited by him in the College of Surgeons, we have not recognised any striking display of talent on the Continental side. The original models of gutta percha, &c. which take to pieces and show the successive layers of the deeper parts in the organisms they demonstrate, however ingenious and amusing they may be, have no pretensions to a high, and far less the highest, order of anatomical modelling. The French exhibit a variety of these; and a full-length anatomical figure in *papier maché* and gutta percha, with a section of the human head, is shown by Mr. Simpson. Our attention, however, has been arrested by some very striking wax models by Mr. Towne, whose experience and skill are well known from the works at Guy's Hospital. He appears to have selected some of the most intricate and delicate dissections, and to have displayed the several structures with a rigid regard to truth, which challenged the severest scrutiny of the practised anatomist. This is obviously the case in a model of the head and neck, with a deep section of the brain, in which there is not only a most valuable piece of anatomy in the relative position of the muscles, blood-vessels, and nerves of the neck, and the distribution of the great nerve of sensation known as the fifth nerve; but there is also a minute dissection of the internal ear and the orbit, which exceeds any that we have yet seen, in delicacy, perfect colour and accurate modelling. An arm at full length, with the corresponding side of the chest, exhibits the minute distribution of the nerves, with the arrangement of the muscles, blood-vessels &c. A very beautiful and complete series of the changes which take place during incubation in the chick is also shown, and the same subject is illustrated by an exhibitor from Newcastle. The latter artist has tried to unite natural structure with his models, but with no more than the usual success of such incongruities. A case filled with some small models of the heads of the great divisions of the human family affords an interesting subject for examination, and a felicitous reference to the extent of race, which is included in the purposes of the Exhibition.

THE ENGRAVINGS.

1 SIDEBOARD. BY LE STER.

This very stately piece of furniture stands in the Austrian Court. It is entirely richly carved: the lower parts are oddities branches, covered with grapes and other fruits, crossing and twining in the boldest manner. The wood, however (from South America), bound of a dark hue, and strongly veined, somewhat interferes with the distinctness of the design. Above, on either side, are two magnificent candelabra, in ormolu.

2.—DOOR-KNOCKER. BY PEETHAM.

Quaint in design, and boldly carried out. The introduction of living animals, the dog open-mouthed, and the snail, especially the latter, may be questioned.

3.—SCUTCHEON AND HANDLE FOR DRAWERS. BY PEETHAM.

In the Elizabethan style, elaborately chased, and very effective.

4.—SILVER GROUP OF SIR ROGER DE COVERLEY AND THE GYPSIES. BY JOS ANGELI.

An agreeable composition, well grouped, which sufficiently tells its own tale. The design was modelled by J. Henning, jun., and does him great credit.

5.—CANTERBURY. BY JENNENS AND BETTRIDGE.

An elegant production in *papier maché*, richly inlaid and carved with mother-of-pearl: a highly creditable specimen of our resources in *articles de luxe*.

6.—SILVER INKSTAND. BY MARTIN AND CO.

The design for this inkstand represented as a thistle does not strike us as a very happy idea, whilst the introduction of birds' nests for pens upon the stalk is decidedly an addition not found in nature. the execution, however, is highly satisfactory.

7 AND 8.—CANDELABRA. BY SOSSE, FRERES.

Two very pretty productions in bronze; the figures being well designed, and gracefully draped.

9. THE DREAMER'S CHAIR. BY JENNENS AND BETTRIDGE.

This is another of the rich and fanciful articles of furniture in *papier maché*, exhibited by Messrs. Jennens and Bettridge. The devices, as may be observed, are emblematic of repose profound, and the chair has a most comfortable and inviting appearance. The colours, however, of a pale cold hue, are hardly to our liking, as connected with snug parlour uses. The design is by Fitzcook.

10.—TIARA. BY BOUILLETTE AND CO.

This is a very showy sample of imitation diamonds applied to head decoration. a branch of light and inexpensive jewellery in which the French unquestionably excel.

11. CLOCK BY R. AND J. MOORE.

A large and showy clock, elaborate in internal workmanship and outward decoration. It goes one month, chimes the quarters on eight bells, strikes the hours on a deep-toned bell, and plays twelve tunes, shifting, by the action of the clock, to a fresh tune every hour. The frames of the dial and the steel plate upon which the clock stands, are cast, melted upon a new principle. The base is carved in walnut wood The design of ornamentation is of rather a mixed character, and perhaps a little redundant; but, altogether, for general purposes, it may be pronounced rich and effective.

12. THE KOH-I-NOOR. EXHIBITED BY HER MAJESTY THE QUEEN.

This Engraving represents the Koh-i-Noor, or Mountain of Light, once the property of Runjeet Singh, now exhibited by her Majesty, and which, for the purpose of better inspection, is mounted upon pillars, within a gilt iron cage, prepared for the occasion by Messrs. Chubb. The machinery connected with it is so arranged, that, at the close of each day's exhibition, this valuable gem is lowered into an iron case for security during the night. Below the jewels themselves are exhibited the settings in which they originally stood.

13 SILVER CLARET JUG. BY LIAS AND SONS.

A handsome jug, ever fashion, and somewhat classic in form, covered with vine-leaves, grapes, &c. Designed by J. Fitzcook.

14.—THE KOH-I-NOOR, IN ITS ORIGINAL SETTING.

As matter of historical interest, we give another Engraving from a painting by a native artist of the Koh-i-Noor, as it appeared in its original setting, when it came into the possession of the British Government. The settings are of green enamel, and, as above stated, are preserved in connexion with them in the Crystal Palace. A full description of the Koh-i Noor, and of the Durre-i-Noor, will be found in our Supplement for May 17th, under the head "Gems."

15. JASPER DISH. EXHIBITED BY THE EAST INDIA COMPANY.

This very unique and beautiful production, which appears amongst many other articles of value in the East India Company's stand, is formed of a single plane of jasper, of a heart shape, of about the size of a dessert-plate or dish. It is elaborately inlaid with gold, and set with rubies and other precious stones.

16.—THE DURRA-I-NOOR; OR, SEA OF LIGHT. EXHIBITED BY THE EAST INDIA COMPANY.

This splendid gem is exhibited by the East India Company. It is a table diamond, of a beautiful quality and of immense value, surrounded by other smaller ones, and once the companion of the Koh-i-Noor. Our Engraving is taken (as in the case of the Koh-i-Noor) from a painting by a native artist, and shows its appearance when it came into the British possession.

17 SILVER TEA AND COFFEE SERVICE. BY SMILEY.

These are very beautiful and elaborate works, the designs, which are all punched and richly chased, representing the various stages in the culture and preparation of the tea-plant. We hardly approve of the taste shown in the introduction of the figures of her Majesty and Prince Albert as ornaments or handles to the lids.

18. PISTOLETS D'HONNEUR. BY DEVISME.

A pair of very handsome pistols, inlaid with silver, presented by the permanent commission of the provincial press of France to General Changarnier. They are highly decorated in the arabesque style, and are made by Devisme.

19. MIRROR SCONCE. BY THE COALBROOKDALE COMPANY.

A very pretty and effective production for room ornament—the design somewhat antiquated in cast iron, bronzed; and, like everything coming from this quarter, beautifully turned out.

20.—INLAID TABLE-TOP. BY VALLANCE.

A very brilliant sample of workmanship. The table slab is of Derbyshire black marble, and is inlaid with groups of flowers in various coloured marbles, serpentine, lapis lazuli, &c. The character of the different flowers is admirably distinguished; and the intricacy of the workmanship may be judged of from the fact, that in some of them as many as a thousand pieces of stone have been used

21.—TOLEDO SWORD.

There are two specimens of the famed Toledo blades in the present Exhibition, that which we have engraved being the property of Don Manuel de Yanes, to whom it was presented by General Espartero The hilt and scabbard are of silver, richly ornamented; and the remarkable elasticity of the blade is put to the test by the circular arrangement of the shank, which actually rolls it up as a ribbon is rolled.

22.—EBONY AND BOXWOOD FRAME BY W. G. ROGERS.

A very light and elegant production; the boxwood scroll-work boldly pierced, and richly carved and finished, standing over a background of ebony.

23.—ELIZABETHAN BRACKET BY W. J ROGERS.

A remarkably fine specimen of wood-carving The material is box; the devices are bold and in high relief, the masks and strap-work being magnificently cut.

24.—SPECIMEN OF PAPER-HANGINGS BY SCOTT, CUTHBERTSON, & CO.

A very handsome specimen, with graceful plan of lines and harmonious colouring.

25 AND 26.—SILVER WINE FLAGONS BY LAMBERT AND RAWLINGS.

Two noble flagons, in form after the fashion of the old camp-bottle, decorated in the *renaissance* style, in silver parcel gilt. Just the sort of thing to grace the table of an old baronial hall, on a birthday or other family anniversary.

27 STAMPED LEATHER ORNAMENTS. BY LEAKE.

This group contains several examples of the use of stamped leather in the decoration of rooms, and the manufacture of picture-frames, medallion brackets, and other descriptions of ornamental work to which commonly applied The designs are abundant in variety, and many of them of very pleasing effect.

28.—ORNAMENTAL VASE OF SEVRES CHINA

A very noble production in this unrivalled branch of manufacture. The groundwork is of the beautiful pink colour for which Sevres china is so celebrated, and the figures are incrusted upon the material beneath the enamelled surface. Produced under the direction of M. Regnier.

29. POROUS POTTERY FROM MADRAS.

Our Engraving represents two beautiful specimens of porous pottery from Madras, exhibited by the East India Company. Their forms are extremely graceful, and the hue a delicate yellow.

30. CEILING ORNAMENT IN PAPIER MACHE. BY BIELEFELD.

One of many very pleasing samples of the application of *papier maché* to ceiling and mural decorations.

31 AND 32. EBONY TABLE, INLAID WITH SILVER, WITH VASE. BY HANCOCK.

This is one of the most elegant and classical works of decorative furniture in the Crystal Palace; an ebony table, inlaid with silver, in the pure Etruscan style, surmounted by a silver vase of exquisite beauty.

33.—SILVER BELL THE FAIRY SUMMONER.

A very pleasing device, and appropriate to the use to which it is applied a lady's hand-bell. Here is represented the fairy Puck, summoning the spirits from afar to do her bidding.

THE WORLD'S HIGHWAY TO THE WORLD'S EXHIBITION.

THERE is no other country under the sun from which the invitation to the nations of the world to exhibit productions of their industry could have proceeded with so much grace and propriety as England. With the exception of the United States of America, no other country has sought to imitate, far less to rival, the efforts of England to establish regular and rapid communication between all parts of the globe. Had any of our Continental neighbours issued such an invitation, it must have been borne to the ends of the earth in English steamers, and visitors would have voyaged to it in ships sailing under the English flag. The mighty task of bringing all the nations of the world nearer and closer to each other has been, as if by tacit consent, left to be accomplished by English skill, ingenuity, and enterprise; and as by us the pathless tracks of ocean have been converted into grand highways for "joining the countries they divide," so the terminus of all these great highways has been, without dispute, selected as the most fitting place for the exhibition of the world's industry.

This is a fact, that, in after times, when the historian comments on the events of 1851, will be considered as of great significance. If the Crystal Palace be, in its extent, symmetry, materials, and the rapidity of its erection, one of the greatest wonders of the age, a greater wonder is that vast and comprehensive system of communication with all countries, without whose agency it would have been utterly impossible to have made the arrangements for the Exhibition even in double the time that has actually been required. The day has not long gone by when the voyage to China and back occupied nearly as great a length of time as the interval between the announcement and the opening of the Exhibition; but now, letters are forwarded to China in about as many weeks as it formerly took months. In our fathers' days, a voyage from America to England in four weeks was considered good and rapid sailing; but now, passengers complain if they are more than ten days on the same voyage. When we first possessed India, we knew nothing of the deeds of our Governors' General until four and often six months after they had been done, whereas now scarcely six weeks elapse between the date of an event in India and its notification in the London papers. A change of ministry in London is known all over the West India Islands in about three weeks; and honourable members rise in their places in Parliament to question colonial secretaries about disturbances that only a month before happened at the Cape of Good Hope. From Buenos Ayres, Valparaiso, the Isthmus of Panama, the West Indies, New York, the Mediterranean, the Cape of Good Hope, India, Ceylon, Singapore, and Hong Kong, the lines of communication all meet in England as the focus and centre of the world. From these highways, steamers bearing "the meteor flag of England," are never absent, nor now freighted with death-giving weapons and death-seeking men, but with merchants and merchandize of nations long hostile to each other, but now met together with the same object—the interchange of good deeds and the fruits of each others industry. This gigantic undertaking.—this holy mission, in which England has no rivals, save her own children on the other side of the Atlantic—is represented only to the mind's eye in the Crystal Palace. To the spiritual eye only can it be represented, for the vessels engaged in it, if placed in one continuous line, would extend to about three miles; and the aggregate number of miles steamed by them every year in the service of the world, is more than six times the distance between the earth and the moon.

England built the Industrial Palace for the world in about a year, and she took thirteen years only to complete the system of ocean highways to her shores from the ends of the earth. Her first attempts were laughed to scorn even by her own philosophers. Nay, so little faith had men in the power of the steam-engine over the sea, that only about thirty years ago it was considered impossible to take a steamer from Greenwich to Belfast. So thought and said the wise men of that day, but a Glasgow engineer thought otherwise. He, however, said nothing, but engaged a berth on board a little schooner plying between Greenock and Belfast, that he might have a look at the kind of sea with which the steamer would have to contend. The weather was bad—the little schooner heaved and groaned amid the troubled waters; but the engineer kept his footing on the deck, watched the waves, asked all sorts of strange questions of the seamen, made calculations, scratched his head, looked thoughtful, and finally, with the quiet remark that "It can be done," went below to his berth. The sailors were not long left conjecture what it was that could be done, for soon afterwards the smoke of a steamer was for the first time seen near the Straits of Port Patrick, and a steamer for the first time cast anchor in Belfast Bay, and the "wisdom of the wise" was confounded. Still more triumphant were the voyages of the *Great Western* and *Sirius* to New York in 1838; and from that time dates the opening up of these great highways.

They may now be arranged in three great groups:—1. The Eastern; 2. The Southern; 3. The Western.

The first includes the lines to Spain and the Mediterranean, to the East Indies and China. With the exception of the service between Aden and Bombay, which is performed by the East India Company, the whole of the communication on these Eastern routes is conducted by the Peninsular and Oriental Steam Navigation Company. They possess a fleet of twenty-five steamers, fourteen of which are employed in the European, and the remainder in the Asiatic seas. The history of this company affords a remarkable example of the rapidity with which British energy and enterprise, aided by British capital and skill, can conceive and execute the most gigantic schemes. It is only fifteen years ago since the operations of the company were limited to the conveyance of the mails between England and the Peninsula—a service performed with six times the rapidity, many times the regularity, and at a less cost to the nation, than under the old system of sailing-packets. Instead of voyages having often, as under the old *régime*, to

lay
Till the day
In the Bay of Biscay,

they were carried across that rough and stormy part of the Atlantic with a speed that greatly diminished both the inconvenience and danger. Lisbon, Malta, and Gibraltar, which within less than a week's sail from Falmouth; and British merchants could visit the vineyards and wine-presses of Spain and Portugal in less time than it once took to journey from London to Edinburgh. But the entrance to the Mediterranean was not long the terminus of this highway. As the capabilities of steam-ships were developed the demands on their services increased, and it was soon determined to extend them to our possessions in the East. The same company undertook to carry the watery highway up the Mediterranean to Alexandria; and the East India Company sent their steamers to the Red Sea and the Indian Ocean, to complete the track to Bombay. The old passage by the Cape of Good Hope, whose discovery by Vasco de Gama was one of the great events of the memorable fifteenth century, was abandoned to sailing-vessels, and at once the time employed in the journey between England and India was reduced from four months to six weeks. The mouth of the Nile was visited by mighty steam-ships with a far nobler mission than the fleet of Nelson; if the "forty centuries" that, according to Napoleon, "look down from the tops of the Pyramid," could think, they must have thought that the passage past them of "the overland mail" with its letters, and newspapers, and passengers, was one of the greatest and best changes they had seen during their long contemplation of the land of Egypt; and the waters of the Red Sea were never so agitated since Pharaoh's host was drowned, as by the paddles of the steamers turning up its waters in their way to Bombay. But soon the same company had their vessels in the Indian Ocean also, and now they maintain a regular and uninterrupted communication with the East as far as Canton. The aggregate tonnage of the vessels of the company is nearly 30,000; the power which propels them is equal to that of 9000 horses; and the total number of miles steamed every year under the mail contract, for which £240,000 per annum is received, is not much under four millions. In the same company send vessels at regular periods to Italy, Turkey, and up the Black Sea, as far as Trebizond. And all this has been achieved within the last fifteen years, by a joint-stock company of British merchants.

Thus, while England invites to the people of the world to the Exhibition of Industry in her metropolis, she, alone of all the nations, can say that she has provided a safe and speedy highway to her shores; that the Chinese can embark in English ships at Hong Kong; the Malay at Singapore; the Hindoo at Calcutta, Madras, and Bombay, the Cingalese at Point de Galle, the Arab at Aden and Suez; the Egyptian at Alexandria, the Circassian and Armenian at Trebizond, the Turk at Constantinople, the Italian at Naples, the Spaniard at Cadiz, and the Portuguese at Lisbon and Oporto.

In the second or Southern group of these great highways, England is also without a rival. The West India Company with a fleet of thirteen vessels of the largest class, to which five will soon be added, maintains a communication twice each month with all the islands in the West Indies, and with the chief ports of the Gulf of Mexico, as far north as Vera Cruz and Tampico, and once each month with the east coast of South America, from Bahia to Buenos Ayres. On the west coast another British company carries on a monthly communication between Panama and all the principal ports, as far south as Valparaiso; while a third company, also British, dispatches its steamers each month to the Cape of Good Hope, calling at the islands of Madeira and St. Helena and at Sierra Leone. The arrangements for these services are so complete and so regular, that there is no civilized inhabitant of South America, the West Indies, and the west and south coast of Africa, to whom these great highways are now open without distinction of country or of race. The establishment of this southern group has been the work of ten years only.

In the North Atlantic highway that Britain meets, not so much a rival as a coadjutor in her peaceful and gigantic labour. On this highway there are now running in the postal service of this country and the United States fourteen of the very largest steam-ships that have ever sailed on the ocean. Their speed is such, that the distance between Liverpool and New York is often steamed in about ten days. The line of British steamers has been established under the admirable superintendence of Mr Cunard for about thirteen years, and the American line of Mr. Collins for about one year. The vessels of the former bear the names of the continents, of the latter the names of the oceans of the world. The "crack ship" of the Cunard line at present is the

Asia; of the Collins line, the *Pacific*. Both have made remarkably swift passages, and each succeeding voyage seems to eclipse all its predecessors. The rivalry of these noble vessels is a fitting accompaniment to the industrial rivalry of nations at the Great Exhibition. The prize contended for is the superiority not of mere brute force or stratagem, but of ingenuity and skill; not of the power of tyrannising over man, but of aiding and helping him; not of the power of exacting service from, but of rendering service to, mankind.

To how many unworthy doubts of the perfectibility of man is not the history of these ocean highways taken in connexion with the Great Exhibition a sufficient answer! The fact that England has within fifteen years perfected a system of ocean highways of more than 20,000 miles in length, and that these are now traversed by "men of all nations, and kindreds, and tongues," anxious to see and improve by the productions of the industry of each other, gives good grounds for the hope of men the most sanguine, that the time is fast coming when the great object of the thoughts, desires, and labours of the nations will be to live in harmony, and to extend to every member of the human family the greatest possible share of the riches of the earth and the good fruits of their industry, wealth, and activity of man.

LETTERS FROM LONDON
ON
THE GREAT EXHIBITION AND OTHER MATTERS.
ADDRESSED TO HIS UNCLE ENOCH, HIS AUNT HULDAH, DEACON HIGBLOW, AND OTHERS.

BY PELEG E. WHEELER,

Of Penobscot, State of Maine, U.S., member of the Penobscot Historical Society and Major of its Independent Corps of Boundary Volunteers,

WITH AN INTRODUCTION BY BAYLE BERNARD.

INTRODUCTION AND LETTER I.
SOME ACCOUNT OF MAJOR WHEELER, AND THE ARRIVAL IN AMERICA OF THE NEWS OF THE EXHIBITION.

It is now some dozen years ago, that, through the medium of a friend, I was so happy as to make the acquaintance of Major Wheeler, of Penobscot; and my satisfaction increased, when the great project of the Exhibition numbered him among the those who resolved to visit England. The special object of his visit will be dwelt upon elsewhere, but one of its results was the desire that I should read his various letters dispatched to friends at home, in order to verify their candour; and as I must confess I was led to think the writer of a nature to be more able to a wider circle than his own, I asked his leave to make them the public, a wish that I am bound to say was met in a spirit not less creditable to his modesty than to his frankness. Thus they are offered to the world; but—in order to ensure them that respect, and even sympathy, I think they merit—I feel it proper to introduce them with a few personal details, which may be referred to in solution of their occasional eccentricities.

Major Peleg Wheeler, of Penobscot, State of Maine, was born on the frontiers of Vermont, about forty years ago; and, as the son of a thriving farmer of the old New England stock, enjoyed many of the conditions that develope active minds. With a pursuit that inspired industry and early self-reliance, he lived under a Government whose encouragement to freedom happily harmonised with nature's. But he was blessed with more distinctions: he could also boast of genius—a genius that showed itself speedily, and in an unexpected form. Peleg Wheeler was a poet—not in a mechanic sense, an aptitude for rhyme or rhythm—his muse was the Imperial Winchester; it invariably ran over, and his capacity for it never got beyond his "smiling," "When the forest streams were bilin'," or his "Arter feeling sadder" "At the swiftly spreading shadder" all stood on higher ground; he possessed imagination, the motive power of poetry, whatever is its essence; and the evidence he gave of it formed a phase of some importance in the transatlantic mind.

We had come to the belief in Europe that mind was all matter. Deceived by the necessities of its juvenile development, we could perceive in it only a monstrous mal-proportion of the practical, which was speedily converting it into a mere mechanical machine. It is true there were Western spirits—the "Columbiad" of Joel Barlow, and the "Conquest" of Dr. Dwight: but we found in one a geometrician, with a true sense of length and quantity; and in the other a good psalmodist, who could put history into long metre. A poet was demanded to defend the Western brain—to show imagination neighbouring logic, as a sure and impenetrable bulwark. And at length a poet came. Need I remind the European readers of those strange and vivid fictions which so suddenly burst upon us about a dozen years ago, and which promised to repeat the wonders of the old Arabian Nights?—inventions so peculiar, and at the same time so fallacious, that we all felt them to be as new, as they were to some extent, inexplicable. When we read, for the first time, of that strange western El Dorado, whose fertility was so wondrous, that a crow-bar planted over night sprouted nails before the morning!—whose woods were so impervious, that the full moon could never rise through them; and whose odours were so strong, they could hang up a coat and trousers! And surrounding this Elysium, that as memorable desert, where the seal put in the ground was always bigger than the harvest!—where the cattle were so poor, it took ten pigs to make a shadow; and the water was so weak, it hadn't strength to run down hill! When we were also introduced to such new aspects of humanity; when they told us of a man so large, it took two pair of eyes to see him; and of another, who was so swift, that in running round a tree he caught a sight of his own back! I give these as merely specimens; but need I enlarge on their impression, the wonder they created, and the unanimous admission that America had at last displayed a true imagination!

Now, my reader may remember, that these fancies were supposed to be the common product of the country; that it was thought that its invention, being suspended by other faculties, had gone on silently augmenting, like subterranean water, until now it had burst forth into a fresh and graceful fountain; or, that it was a case of latent heat, which, evoked perhaps electrically, had exhibited the phenomenon of spontaneous combustion. I am happy in being able to put an end to these delusions, and to render to modest merit what it has never cared to claim. So far from these being a general, they were an individual product—were the offspring of Peleg Wheeler—who, being then in his youth, or about the six-and-twentieth year, adopted such a course as his first step to publicity.

The Major began life as a poet. But this may be the common case. Youth must always be ideal, from its excess of faith and wonder; but need I say, the mind is twofold—has a real side as well, and true development is to pass to it, being a principle of wholeness. Was our hero's an exception? No; the Major felt his age—its growing spirit of progress, and that the mission of all patriots was to unite in its sustainment. He saw that the public engine required increase of fuel, and 'twas his duty to give it speed, if not his glory to direct it. And, faithful to the poetic instinct, which must ever be affectionate, it was now his wish to serve, what he had already so delighted. Understand, then, his transition from the abstract to the concrete, from the ideal to the practical. See why he resolved to harness imagination to the car of science; to bid farewell to fiction, and pour his whole soul into action. Accordingly, quitting farm in the forests to the southward of New England, as affording in its commercial spirit a proper field for his exertions, he settled in the State of Maine, where he became a general storekeeper, and, in proof of his harmonic tendency, sold everything that was vendible, from a history to a hand-saw, and a blanket to a breadstuff. It was here that he developed what the Germans call a manysidedness; not only in his store, which he appropriately named the "Focus," but in his mind, which began to radiate into a dozen different studies, from law all round to literature, and pharmacy to politics. It was here that he gave birth to his mechanical inventions, which, if found to be impracticable, was only owing to the fact that they were so original in theory. And it was here, also, he confessed to an extended responsibility—that he married and connected himself with two important institutions. He became a member of the "Penobscot Historical Society," and an officer in its corps of independent volunteers; thus acknowledging a twofold obligation to the public—to serve it mentally and physically—to guard, as well as to guide it. Services how opposite, and yet how interfusing—how calculated to balance and complete the healthful mind!

It was in the midst of these numerous and valuable activities that the author received my friend of our Great Exhibition. Now, of all the Western intellects, his was, perhaps, among the first to appreciate its scheme, as it was certainly among the foremost to stamp it with approval. From one's country to humanity, the step is easy and immediate. It is but a widening of the circle which commences in self-denial; and thus, as eagerly as he had sought to advance the interests of America, he now admitted the philosophy of serving all mankind. The result may be surmised. He resolved at once on a great testimony—to contribute to the World's Warehouse one of his principal inventions, and, as I have stated, that, some years previously, and I had become engaged, one of the first steps he adopted was to procure me with certain letters, which I shall now lay before my reader, as I should so confer what is may be essential to my purpose. His first letter was as follows:—

"The Focus, Penobscot, State of Maine

"OLD ACQUAINTANCE!—

"Well, now, if I don't do it! Just spoil it; jess be good enough to say I'm a sample of first cousin to the mint's got the cruet, and I'm a native—and as the Declaration of Independence—as firm as Bunker's—is this? to let me back! Jess you, a man from whom I've dined—that I can scarcely believe it yet! can't help thinking—I am a fool—that the toddy was too stiff, and we've got upon the subject dusted. It's too good a thing for truth! too large—Looks like Natur in a picter; not what it is, but as it ought to be. I swall! what a head! And been a pilgrim, and Leander (and that's the best imported), and there I stood with my head whirlin', and my eye-balls in a blaze, like a couple of small farmaments that's shot with summur lightnin'. The Hall Word's Exhibition! Humanity's grand assize! the common creation—Left and Show-room of the universal human race! I wouldn't have believed it, if it had been sworn by all the Saints in the papers, of course I know it's true. But—and—and—but—but after what's its total. Why, you jess tell me it—universal peace and concord! A. that Dr. Bun it talks about, whose scheme I never heer'd a bean of! it's only all fig. No! I'm not for all our speaky going to London to shake hands, and kiss instead of fighting, they mean to work and talk, and trade and make. That's its size if anything—not to war and fight; that's as earth as the heavens. And the pint is for the world, and not to try to empty it—for all—and ploughs, and swords and lagpets into rails, and say that iron shall connect men, and not sarve to part and sphinter 'em. So many on the sogers! Now they'll have to go to their livin', and I—I—and they'll have to go to their trades to stoking; and that seems natral sarvainly, as their trainin's to stand fire? Marsy on 'em still for as sure as Sabbath mornin', we shall say goos bye to gunpowder—the old world's motive power—the fine old force of history—to scatter brains and savages with. Peckin ourn's a better one. I send goods about, not bullets, and strengthen brains, not scatter 'em!

"It's—it's—it's—it's fact, and that air's a bull tote nuther. It's a—a—a—

turers are making rapid progress: these manufactures have figured at the Berlin exhibitions in considerable quantities. These exhibitions, comprehending specimens of Bohemian glass manufactures, Berlin iron-work, the porcelains of Saxony, and the iron ores of Silesia, have undoubtedly stimulated manufacturers to make those enlightened exertions

which characterised those of France in the last and during the early part of the present century. All the great foundries and manufactories are government speculations; class is protected against class, and an impassable barrier of restrictive duties warns the foreign merchant from the Austrian soil. Yet even this country boasts its exhibitions of industry. Even here the principle of gathering together the products of

the country for the instruction of the community has been recognised and acted upon. The great natural riches of Austria are remarkable She has abundance of combustible fossils; the simple evaporation of the waters of the Hungarian lakes furnishes her with vast quantities of soda; her alums may compare with those of Rome; no country is richer in salts, and these immense natural resources are neglected through the ignorance of Austrian chemists. The beet-root sugar manufactories of Moravia and Silesia, and glass factories of Venice and Bohemia, claim notice in the most cursory review of Austrian indus-

tries. The products of the Bohemian workmen have made splendid shows at the Vienna exhibitions, and have been contributed by the busy population of Wisental, and the great establishments of Gablonz and Liebenau. Venice, however, has fallen, under Austrian domination, from her ancient splendour, and has sent little or nothing beyond a few mosaics to the capital of her conquerors, on these occasions. At the last Vienna exhibition, Austria showed signs of progress, in the specimens of machinery exhibited by the Great Southern Railway Company. That these exhibitions, including examples from the shawl, porcelain, and great silk factories of Vienna, the velvets of Milan, and the light silk goods of Como, should have attracted particular attention, and proved eminently successful, is not to be wondered at, since they

30.—PAPIER MACHE CEILING ORNAMENT. BY BIELEFIELD.

displayed at a glance the industrial power of a great country, crippled by narrow national views, it is true, yet in its bondage giving proof of its giant capacities. Already educational associations have been founded, Already the manufacturers of Vienna have established a society for the examination and encouragement of useful inventions. Already a Tyrolese society for the formation of an agricultural and industrial museum has been established. Already Trieste possesses gratuitous school of arts and a savings'-bank.

In a brief record of the industrial exhibitions o Germany, the efforts of the King of Bavaria of tha King who has so greatly adorned his capital—to establish permanent exhibitions of Bavarian skill, cannot be passed over. It was in 1845 that the first permanent building erected in any country for such a purpose was thrown open at Munich. The building is adorned with sculpture by Schwanthaler, and provides nearly two thousand square yards of exhibition space

The continental states, of whose industrial exhibitions we have given a brief history, can by no means claim, exclusively, the honour of having recognised the utility of these institutions; since industrial exhibitions have been held at various times, and with varying success, also in Italy, Sweden, and even Russia. Detailed accounts of these would, however, prove of little interest to the general reader, since they included, for the

most part, only specimens which, however excellent, when considered as native products, could not, of course, enter into competition with the more advanced manufactures of Germany, France, Belgium, and England.

CHAPTER VIII.

THE EXHIBITIONS OF IRELAND.

BRITISH manufacturers were almost the last in Europe to recognise the utility of industrial exhibitions. Even Spain had organised a national exhibition of industry, before even the societies established in Ireland and London for the encouragement of arts and manufactures could gather together a decent collection of the products of native looms, potteries, and foundries. To the Royal Dublin Society, established so far back as 1729, is indisputably due the honour of having first gathered together specimens worthily representing, under one roof, the excellence of Irish industry. Before the London Society of Arts could make decent show from the vast hives of Lancashire, Cornwall, and Yorkshire, a collection of manufactures was brought together in Dublin of the most interesting and useful character. From that time up to the present, similar exhibitions have been held triennially, and always with increased success. In the face of these achievements which would have paralysed a less hopeful people, the Irish have steadily supported their triennial exhibitions. The vigour with which the Royal Dublin Society has pursued the enlightened object for which it was founded is unequalled, save by that of our London Society of Arts. These two societies have now, for nearly a century, been in competition with the Scotch Board of Trustees for the Encouragement of Manufactures, and have actively engaged stimulating manufacturers to higher achievements, and endeavouring to gather from abroad, for the benefit of their own native consumers, those models of excellence which are accumulators for the future benefit of particular countries, where industry is systematised With these societies the Irish Exhibitions have nearly zeqorted. The beautiful exhibitions of Ireland, however, deserve particular attention at the present time, as they date nearly back than any held either in England or Scotland. Up to 1850, the contributors to the [illegible] exhibitions of the Royal Dublin Society were exclusively Irish, although the [illegible] Exhibition was the first [illegible] for years to which [illegible] competition to the Irish manufacturers, and [illegible] countries. The Exhibition of 1850 [illegible] the whole of their manufactures.

"[illegible] Government suits well with the present aspect of [illegible] affairs. The contributions tendered their acknowledgment to the [illegible] facturers, who, "regardless of [illegible] and unfelt to be [illegible] by which the importance [illegible] such [illegible] They also congratulated [illegible] was in having thus not only shown the great [illegible] steam-engine [illegible] prime mover of such machinery, [illegible] called to the working classes the importance [illegible] most important agent" to substitute for other [illegible] and they trusted that the [illegible] of propelling a number of [illegible] chain [illegible] and pulleys, by one small steam-engine [illegible] individuals the practical importance of having [illegible] different of Dublin, in each room of which [illegible] power [illegible] and could be hired to [illegible] enable them to [illegible] much time and labour.

The [illegible] exhibition [illegible] a complete [illegible] English manufacturers [illegible] masks, muslins, linens, carpets, woollen [illegible] oil-cloth, cabinet-work, carving and turning [illegible] pottery, clock and watchwork, [illegible] paper [illegible] The absence of the raw materials was the marked defect in the collection. Of the damasks we give a specimen, the Portland Vase [illegible] which was exhibited by Mr. Binning, of Belfast, together with some fine specimens of printed cambrics for ladies' dresses, as a reward for which the society awarded a gold medal to the manufacturers. Irish poplins and Irish linens were [illegible] both for [illegible] and ornament with design. In short, the woven and textile fabrics exhibited [illegible] rally good, that the jury found it a difficult [illegible] between competitors. Under the head of [illegible] nets, velvets, &c., remarkable specimens were exhibited by the principal firms, and three gold medals were distributed [illegible] The manufacturers of Ulster exhibited damasks and cambrics which enable them successfully to compete with the manufactures of France, Germany, and the Netherlands, "even in the home markets of these latter."

The articles offered for competition were divided into four sections. The first comprehended all raw materials and produce. Under this head nothing beyond a few samples of prepared peat, peat charcoal, iodine, flax yarn, and leather was contributed; this department was, as has already been observed, the weakest of the exhibition.

The second section comprised manufactured articles. This section was undoubtedly the most important and interesting of the four; and the jury referred with pride to the number of articles of Irish production, excellent in design and manufacture, which it included. Under this section we find the names of many eminent English firms, among others, Messrs. Elkington and Mason, of Newhall-street, Birmingham, gained a gold medal, "for the design and execution of electro-plated articles," while in the department of "[illegible] and [illegible] the numerous certificates were nearly without an exception Manchester and London firms. Furniture, matting, saddles, perukes, combs, soaps, candles, bricks, blacking, umbrellas, lozenges, confectionery, and [illegible] chemistry were represented chiefly by Dublin firms, under the head of "Miscellaneous."

Section 3 was devoted to "machinery, mechanical contrivances, and models." Department A of this section comprehended separate parts of machines. Although little was exhibited in this section which could be strictly considered new, still it included several improvements in machinery which deserve notice. In the list of these improvements, a new railway friction buffer, invented by Mr. Wilfred Houghton, of the Dublin and Belfast Railway, merited particular attention. This [illegible] is intended to be used at railway [illegible] ings, as a safeguard in the event of a train being brought in at too high a velocity. It is simply a sledge, in the form of two inclined planes, resting upon the rails, and of the same gauge. These inclined planes, being made together by iron rods, form one machine, upon which the locomotive [illegible] in the event of the train overrunning its distance, will ascend, and the front wheel or other convenient part of the [illegible] coming in contact with a stop placed at the end of the ledge, this latter [illegible] carried forward along with the engine, the whole weight of which is thus [illegible] effective in producing friction between the sledge and the rail, and [illegible] destroying the motion of the train. The other [illegible] friction buffer possesses [illegible] [illegible] [illegible]

Meantime Parliament shares in the general depression and neglect experienced by all the other ordinary places of amusement. Never have we had more languid and less real debates. Never had we a more quick succession of "no Houses" and "counts out." Mr. Hume, the other day, after his discomfiture in bringing forward his annual Reform motion, was seen within half-an-hour after the failure to make a House, sunning-ing in the nave of the Crystal Palace, receiving with a sort of puzzled good humour the half condolences half congratulations of his acquaintances; while the hon. member made only a very feeble and skin-deep resistance to the proposition for a holiday for the Derby. The fact is, that people are gradually making up their minds to wait for real business until next year. We are then, at all events, to know by whom the country is to be governed. The final, and, perhaps, fiercest, struggle between Protection and Free Trade is to be then fought. The Whigs are to inscribe a new Reform Bill, of greater or less, most probably of less, dimensions, on their banners. The Stanleyites are to make the onset to the cry of "Protection, and no Income-tax!" The battle is for to-morrow, but there is rest or preparation in either camp to-night.

A. B. R.

THE FIRST SHILLING DAY AT THE EXHIBITION.

(From the Morning Chronicle.)

In common, perhaps, with thousands more, we started yesterday (Monday) for Hyde-Park, lost in anticipation of the scene which we were about to witness. As we called our cab in the Strand, we watched wistfully the aspect of the omnibuses. They did not appear, however, to present anything like an unusual aspect. Those going east were not all empty, and those going west were not at all crowded. Furthermore, there was no particular procession of vehicles bearing down, in a long, steady, unwonted current, towards Charing-cross. The Strand, indeed, looked as the Strand always looks. The tide of population flowed hither and thither. There was no unusual setting or swelling no exceptional Gulf stream. Certainly, the Strand gave no intimation that we looked upon the first of the shilling days.

"But perhaps they are all there?" Of course they are. It is late. Noon is striking from St. Mary's, and St. Clement's, and St. Martin's, as we have missed the sight. Before we were awake, possibly, the great crowd was dashing ruthlessly westward—pouring from every quarter of London—from distant Clapham and from distant Kingsland from Upper-street Kentish Town and Ancastle Camberwell New-road, the wilds of Bermondsey and the shores of Wapping. The Crystal Palace is crammed. Of course it is—Nave, aisles, and gallery. Not room even for the thin man who crawled down the gas-pipe in the Tottenham-court-road. All London is not going there, simply because all London is there already. The aspect of things demonstrates it. Empty omnibuses ply westward—Hansom cabmen hold up anxious and dirty fingers. It is very odd. The street clearly does not look like the High-street of Tooting about eleven o'clock on the Derby Day. No exceptional, extraordinary pilgrimage flows westward all the world is there already. Nevertheless, on we go. We entertain faint and dim lopes that the Palace may not yet be too full to squeeze in just one more individual. We endeavour to persuade ourselves that we shall not find legions of policemen combating indignant multitudes—that we shall not find Suppers and Misers ruthlessly charging the eager laity of England that the doors, in fact, after having opened for some 60,000 or perhaps 100,000 spectators, have not relentlessly closed by order of the Commissioners against all fresh and late comers. But these hopes, we acknowledge to ourselves, are faint, and partake rather of the wish than the expectation. Not less than £1000 was taken at the portals in five shilling sums on Saturday; surely the one-shillingers will outnumber the crown-piece aristocracy at least tenfold. We got frightened at our own misgivings, and declined to work out the sum.

Past Charing-cross—no particular stir. Up Regent-street—things much as they looked during the last fortnight. Along Piccadilly—still no great surplus or extraordinary bustle—as many people, or nearly so, going east as west—the heads of all the horses by no means turned down Hyde Park-corner. The thing got clearer and clearer—all London must be there already. All London had arrived, and was sweltering within the Crystal Palace, or besieging its outward walls. Five minutes more, and we pass Apsley House. No unbroken stream of private carriages pouring into the Park. Of course not. They have given place to lumbering omnibuses and tatterdemalion cabs, of that species of cavalry which old Sextament has heard called "mashers single." Legs are by the ascendant legs with boots on them good work-a-day legs, ending in Bluchers and Albert which don't look like Wellingtons, however the wearers may flatter themselves to the contrary in that particular. Bonnets and feminine if, indeed, there be such things as the latter—legs which have been waiting for the shilling—legs which will splash sturdily Exhibition-wards, as soon as the crown-piece oligarchy is over and the twelve-pence democracy has been proclaimed. Carriages—fleshy, self-contenting legs, which have evidently walked their owners right into the all-attracting portals, and monopolized all the available promenading space hours and hours ago.

So thought we as we passed Mr. Cubitt's Towers of Babel, and found Knightsbridge singularly clear. The carriages were gone. The plodding line of cabs had vanished like *Banquo's* posterity. The procession of omnibuses showed a few dismal blanks—many in fact, indeed, had a clear roof. The road, in fine, which we had fully expected to see blocked up and crammed like Greenwich Fair, you might have galloped in as freely as in Rotten-row. At length the goal. The dirty barracks are passed, and the glistering glass and the fluttering flags rise joyously above the trees. Still no mob, no multitude, no charges of police, no escorts of engineers. The doors have not, then, been closed. So far so good. There is still room. The popular wave has not been driven back the sponge of the Palace has not yet absorbed its full complement, nor do the money-changers—or rather the money-takers, for they give no change at the doors of the temple—imitate the functionaries in the "Rejected Addresses," who—

Crying "pit full," give the check they take.

Thank the stars we are not too late. We shall squeeze in, though we be the last man who accomplishes the feat.

Out of the cab at the great southern gate. There are rather fewer people than on saturday. There is certainly, inside the railing, not one carriage for every forty which waited and crawled there last week. Where are all the glistening panels? Where are all the liveries worn? Where are all the sleek, prancing horses—silver on their harness and ribbons at their ears? Where is John, glorious in his flaxen wig? Where is James, gorgeous as his plush, symmetrical as his calves? Gone; vanished with last winter's snow—with the sweets and last summer's butterflies. The place to-day is clearly the House of Commons, in the strictest acceptation of the word. The people's turn has come. The masses have their day. Kid gloves and the aristocracy have had their time. The box audience for the last four weeks has filled the house. Now they yield the benches to the audience of the pit and gallery. Belgravia is at Epsom, and May-fair and the squares, and the comfortable suburbs, have had their season. Come in now, you swarming alleys and courts, and poor mean districts and outlying wilderness—and be established brick!

No doubt the people—no one waiting at the doors no struggling groups fighting for turnstile precedence. We walk up as coolly as though we were going to a first-tier box at the Opera; and then almost with an ingenuous blush depositing our modest shilling—although the functionary in receipt don't seem a bit above taking it—the iron revolves, and we are beyond the threshold.

Wonders will never cease! There spread out the Transept and the Nave, clearer—far clearer—than they were on Friday or Saturday. The small-like procession of loungers had vanished. The gay, dancing, fluttering tide of bonnets and ribbons, and silks, and satins, and velvets, had vanished, and the blank was filled up by no adequate substitute of meaner, or coarser, or more commonplace material. There were evidently less people present than we had met in the last days of the five shillings. We hurried into the Nave. Every moment repeated the story of its predecessor. The Exhibition was certainly not so crowded as last week. You might have run as hard as you could drive across the Transept. The Nave showed masses of absolutely clear ground. There was not an approach, even at the most attractive points, to crowding or crushing The Koh-i-noor had fewer male admirers than usual, and the Queen of Spain's jewellery fewer female idolaters. Hardly believing our eyes we hurriedly rushed backwards and forwards in the Nave and Transept. No there was no mistake. The crowd was less—there was more room—more space—freer locomotion, and more deliberate enjoyment for [illegible] them for the crowners But perhaps the people were in the [illegible] into India [illegible] an Nights' tent had [illegible] more than [illegible] ual circle of admirers [illegible] dashed into France. The Cobelin- [illegible]

rushed into the agricultural districts, but found them scantily peopled. We adventured a trip into the hardware, but saw no increase of visitors. We surveyed for a moment through the cotton and cloth regions of the Zollverein, but emerged still looking for the overflow which was not. Then we began to note the eager conversations and surprised gestures of those who had been to and certainly not to every day of the last fortnight. "Bless my soul! astonishing, isn't it? I declare I was almost afraid to come; and look—not so many by thousands as on Saturday! Where are the people? Where have they got to? What is the meaning of all this?" "Strange, isn't it? Why, I hardly expected to have had room to breathe." "Room to breathe—here's room to gallop." "Well, perhaps the fact is, that just because everybody thought that everybody else would be sure to come, nobody, comparatively speaking, has come at all."

Pondering upon the probable accuracy, in part at least, of the last conjecture, we settled ourselves to serious observation of the people who had come, and by whom we were surrounded. The first glance revealed the change from the last day of last week. The glitter, the elegance, the refinement, the *luxe* was gone. The bright and eternally changing and shifting dresses of ladies the [illegible] glancing bracelet-and glistening pink bonnets, and flaring flounces of silk and gauze, were gone. The crowd, at first sight, looked dingy and sombre. Then you saw there were more men than women. The black hats were dismal compared with the "flocks of bonnets." The indescribable rustle and low continuous hum of your well-dressed mob had disappeared. Instead of it, there was a quick active trampling, and a sharp bustle, and sharp voices, and occasionally laughter—louder than that conventional degree of simpering which enjoined by the mincing canons of the exclusive world. Looking abroad, you saw the old stereotyped class of frequenters had vanished from the Nave, that the loungers had given place to the walkers, that the great central avenue was rather a thoroughfare than a promenade. It was now the wills to study the people attentively. They were far less well-dressed far less elegant than the previous crowds; but it was only here and there that a [illegible] woman [illegible], belonged to the working classes. Sunday clothes and holiday garments predominated. If the toilets were not elegant they were mostly respectable—if not respectable, they were always at least decent. While, as to conduct, we passed the latter part of the day in doing little else than studying the conduct of by whom we were surrounded, and certainly a more perfectly orderly, a more respectably decorous assemblage, could not have been gathered together. If there were any exceptions, they were probably to be found in the case of the children, who had been brought in on incredible numbers—not so much the children of artizans as of tradesmen, and who, particularly the boys, were more prone to touch, feel, and finger the goods than they ought to have been. Here and there, also, were groups of rather slatternly-looking girls, who called aloud to each other as any one of the party caused incohesion or impropriety, but only, we repeat, here and there groups of the class looking people we have mentioned, evidently not too much absorbed in the wonders of art and science by which they were surrounded. We have said that there seemed to be comparatively few artizans present. The middle classes, and those between the middle classes and the working classes tradesfolk, and the great nondescript order of people who are seen on all public occasions in England, who are difficult to place socially, but who never miss a Derby, who throng the back benches of the courts of law, who always turn up at a hoat-match or a house on fire—an unremarkably slightly shabby-genteel generation, who, as they bear no outward mark of social rank, leave a vague, and general, and hazy impression upon the mind such formed the mass of the undistinguished Crystal Palace public of yesterday. No doubt there were many working-people there also; but we repeat that the influx in the respectable class less than we expected. Of those who did come, not a few patrolled the Nave and aisles in groups. Some were with their wives, or sweethearts, or sisters. Children hardly liable to walk had also been introduced in their train. There was a general consumption of oranges and fluids of bread and meat going on, which gave a new feature to the shifting motley of the changeful crowds. Still a quiet, not elegant, but sturdy and sombre, respectability reigned through the assemblage; there was decent enjoyment, but not more observation less chatting and more curiosity. As a general rule, the object which had excited most interest throughout the last fortnight excited most interest on Monday. Thus, the English department in general was fuller than the foreign ones. There was always a native and foreign, had their full complement of visitors. The national manufactures of France, the art cabinet-making of Austria, and the statues of Lemberg, attracted considerable crowds, but crowds less orderly, less quiet, and leisurely moving as those which slowly defiled through the galleries in question any day last week. The organs, and, in general, any of the musical instruments being performed upon, attracted much attention. The quaint, stuffed specimens of Swedish life, and the Zollverein States excited their usual tribute of laughter and applause, and the statues and fountains in the Nave were surrounded by groups yet undecided as where actually to begin.

The departments most crowded in the English division were those of paper and the fine arts, the carriage and locomotive department, the hardware department, the precious metals department, and particularly the machinery department. In these the glistering wheels and twisting spindles, by far the largest and most attentive groups were collected. There, too, were the greatest number of mechanics and artisans—worthy and intelligent men, criticising as well as observing, studying as well as admiring, cross-questioning the attendants and, in short, evidently bent upon gaining instruction as well as amusement. That this spirit will spread to the other departments, we doubt not. The first shilling day, with the majority of the visitors bewildered and amazed, is no fair test of what we may expect when repeated visits begin to be paid, and men begin to settle down to the investigation of the branches of science and industry in which they take naturally the most interest. The studious, for such many were in the machine-room, were of excellent omen; and so was the degree of attentive examination we saw towards the latter part of the day being paid to the agricultural implements. Above all, however, the utter absence of anything like rude crushing, or confused and disorderly thronging round particular points of interest, betokened the instinctive feeling of propriety by which the visitors were guided, and which will no doubt prevail on the shilling days, when the number has greatly increased. It is, of course to be anticipated that the shilling receipts will gradually rise, just as did those of the five shillings. And it is a matter of congratulation to know that the augmentation will probably be gradual, orderly, perfectly manageable, and good-humouredly amenable to rule.

MANAGEMENT OF THE ROYAL WOODS AND FORESTS.—The Government bill to make better provision for the management of the woods, forests, and land revenues of the Crown, and for the granting of future sites for buildings, has been printed. It contains 36 clauses. The object of the bill is to separate the duties of the Commissioners of Public Works and Commissioners of Woods and Forests. The First Commissioner of Works, on the passing of the act, is to be the First Commissioner of Works and Buildings. Alterations are to be made in the two departments. The Royal woods and forests are to be placed under the management of a surveyor-general. The duties

THE "ILLUSTRATED LONDON NEWS" (APPLEGATH'S) PRINTING MACHINE

PATENT VERTICAL PRINTING MACHINE, IN THE GREAT EXHIBITION.—CLASS C, No. 122

ter. The printing cylinders work into the type cylinder by means o toothed wheels placed beneath them

The surface of the impressing cylinders is made partly of fine woollen cloth, and partly of paper, or from card board, reduced in those part requiring the overlaying, by cutting or scraping, according to the thick ness required. The ink is carefully spread over a circular invert opposite to the type, and connected to the vertical spindle of the type cylinder by hinged arms resting on an upright bar, which is terminated by a pulley. This pulley acts upon a circular undulating railway fixed below the type cylinder, and from which the distributing surface receives a slight up- and-down motion as it revolves. The distributing surface is fed with ink by means of vibratory rollers, which continue in action between it and the upright ink boxes placed under the copper reservoirs.

The contact of the inking-rollers with the type is regulated by long coiled springs connected with the bearings, so that they merely touch the surface of the letters, which is one of the great advantages of the vertical portion of the machine. To show the advantage of this arrangement, it is only necessary to mention, that in the case of the *Times* machine, 40,000 impressions have been taken without any difference being discovered between the first and the last. Another advantage of the vertical machine is, that the dust or small particles adhering to the p per are shaken from it when suddenly stopped, and fall to the floor, stead of being deposited upon the form or distributing table, as in t case of horizontal machines.

Mr. Applegath is still occupied in making further improvements this valuable invention, with a view to render it suitable for the printi business generally.

THE OLD AND NEW HOLY ALLIANCE.

THE state of Europe at the present time suggests curious matter for reflection. Englishmen are accused of never paying much attention to foreign politics; and, although the excitement consequent upon the convulsions which followed the memorable month of February, 1848, for awhile deprived the accusation of its former truth, there has been a lull during the past twelvemonths, in which the Britannic mind has relapsed into its ancient indifference. "One thing at a time, and that thing thoroughly and with the whole heart," is the rule with the English public, both in politics and in pleasure; and the Exhibition—its wonders and its beauties, its present and future purposes—is the only theme upon which writers have lately cared to write, or about which readers have delighted to read. But this very Exhibition, which is itself the most remarkable incident in the contemporary history of Europe, might well serve to recal the vagrant attention of the public to the remarkable events that are taking place on the Continent. In Hyde-Park we have inaugurated what might justly be called the Holy Alliance of Nations. Another and very different sort of Holy Alliance among Sovereigns has been simultaneously inaugurated elsewhere.

Two great principles always agitate the world—the principle of change for the better, and the principle of stability lest in changing we change for the worse. At one time—not far distant—Paris was the great seat and focus of the first, towards which the hopes and aspirations of those who dreamed of popular progress and of liberty were constantly directed. By some means, St. Petersburg became the seat of the antagonistic principle, of the *vis inertia*, although Russia, in her views of self-aggrandisement, was anything but a fair representative of it. But within the last year matters have greatly altered. Paris has ceased to be the metropolis of European freedom, and St. Petersburg has become more than ever the home and centre of absolute conservatism, or conservative absolutism. The reason for this was, that Paris was theoretical, and not practical. The men who vaulted at a bound into the Government of that country, proved false to their own principles; and France, with all her high aspirations and her arden struggles, became, after one year's trial of the Republic, a country in which happiness was nowhere to be found, and in which freedom was absolutely non-existent. The French ceased to have faith in their own idol, and longed even for the most stringent of tyrannies, to put an end to anarchy and incertitude, as "Order" became a passion with the French; and the very name of "liberty" lost its charm for a people who so short a time previously overturned a dynasty in the hope of securing it. While Frenchmen thus made themselves the supporters of "order" at home, they, by a strange treason to their own interests and antecedents, no less than to the cause of justice and humanity throughout the world, constituted themselves the friends of "order" abroad, and sent an army to quell the most noble effort ever made by any people to secure their independence. In despatching their legions to Rome to overawe the Roman triumvirs, and to restore the antiquated tyranny of the Papacy, the French destroyed not simply their own character, but the hopes entertained of them by the popular party in all the countries that struggled for a national existence.

But by this time it became a little more generally understood than it had previously been, that constitutional freedom was not the growth of a day—that it was practical, not theoretical; that the nations of Europe which had received the blessing, were working, and not fighting nations; and that the benefits they enjoyed were the result of long training, of patient experience, and of an industrial no less than of a moral education. It was felt that our old England was in reality the only free country in Europe, Belgium and Holland, perhaps, excepted; and that, with our widely-stretching commerce, our incessant activity, our wealth diffused in every part of the world, our steam-ships on every sea, our lines of communication to the remotest parts of the earth, our capital, our skill, and our energy, no less than our great mechanical and scientific triumphs, we were in reality doing more for the great cause of peace and liberty, and the consequent advancement of the human family, without talking or making any fuss about the matter, than ever had been done by any other people. The idea of a great international Exhibition of Arts and Industry, to be held in London—the only spot on the surface of the globe where such an Exhibition

ASCENT OF MR. HAMPTON'S "E INGO BRAGH" BALLOON AT BATTY'S ROYAL HIPPODROME, KENSINGTON.—(SEE NEXT PAGE.)

w[illegible]—was opportunely started at this time, and London b[illegible]g, to a greater recognised extent than ever, the real capital, not alone of the world's material civilisation, but of the spiritual idea of progress and improvement. London, with its Crystal Palace, is now doing this great work. Its means are alike intelligible and agreeable. To the World's Fair have come the world's citizens, to behold the spectacle of a country, where there is freedom of speech, of writing, and of public meeting; where the law secures the rights of the meanest; where myriads may congregate without danger to the public peace or to private property; where the principle of loyalty is based upon reason no less than upon affection; and where, in one vast building, one of the most beautiful ever raised upon the earth, and as novel as it is beautiful, people of all climes and tribes and races have sent the contributions of their skill in friendly rivalry, to learn the great lesson of their mutual dependence; to see, to know, and to respect each other; to wipe off the thick incrustation of old error that had gathered upon their minds in the isolation of their former estrangement, and to prepare the way for the coming of that promised time when swords shall be turned into pruning-hooks, and men shall make war no more.

But, in the meantime, and while the attention of the people of this country has been almost exclusively devoted to this great gathering within our shores, the antagonistic movement has not stood still. It has been unnoticed, but not inactive. If, turning from the Crystal Palace, and the congregation of the world in the west of Europe, we look to the east, we shall find, that, while the industrial spirit has been in the ascendant here, and has gathered to itself the sympathy of all those who have faith in humanity and indulge in the hope that the manifold evils which afflict it are capable of much diminution, if not of eradication, the military, the anti-democratic and anti-industrial principle has made an inroad into the very heart of Europe, and fixed itself in places where its existence was long dreaded as the greatest of calamities. Russia—a power which is evidently determined to play a great part, perhaps for good, but many think for evil, in the future history of the world—has taken advantage of the events that succeeded the convulsions of 1848 to fix her grip on Germany. And had it not been for her aid, the empire of Austria would have gone to pieces from its own rottenness, if not from the vigorous assault of the Hungarians. Austria only exists by the perilous friendship of a rival power. Within the last few days, Prussia has been drawn into the same vortex; and the Emperor Nicholas is virtually lord, master, and arbiter of the destinies of the whole of Germany. The King of Prussia played a false game, and lost it. He might have been the benefactor of Germany. He might have secured to Fatherland the blessings which her wisest and best sons have long and ardently struggled to obtain; but he proved a selfish blunderer, and threw away all his grandest opportunities. The result is, that he also is a suppliant for the friendship and support of Russia, and that the Emperor Nicholas, having yoked Francis Joseph I. to his triumphal chariot, has done the same by Frederick William IV. The sword is now the only emblem of Government in all Germany, and through every part of Europe where Russian influence is paramount. Within the last few days the two Sovereigns have met at Warsaw. The meeting, considering the part which has been played for the last three years by the King of Prussia, must have been excessively humiliating to the one, and highly triumphant to the other. A similar meeting between the Emperors of Russia and Austria is about to be celebrated at Olmütz; and an alliance, of which the objects cannot but be anti-popular, is about to be cemented by immense standing armies over the greater portion of Continental Europe, has by this time been inaugurated. We shall not indulge in any speculations as to how long this state of things may last, or attempt even to divine to what ulterior uses the Czar may seek to turn the triumph which he has gained. It is enough to signalise the fact, which ought to escape no observation, there is yet much to fear in the state of Europe, and that, if "order" reigns in Germany, in Italy, and in Hungary, it is "order" that has no foundation in nature or in justice. The contrast between Eastern and Western Europe is, at all events, sufficiently striking. England with her Great Exhibition, and Russia with her great armies, are, to use a common expression, "fulfilling their mission." We cannot doubt which of the two principles will ultimately prevail.

BALLOON ASCENT FROM BATTY'S HIPPODROME, AT KENSINGTON.

The announcement that a Balloon Ascent would take place from this novel and capacious place of entertainment, attracted a vast multitude of spectators on Monday evening; and at five o'clock, an eager wave flowed public to obtain admission, that it was with difficulty we gained an entrance to the Elliptical Pavilion, which is said to be capable of accommodating 14,000 spectators; and the proprietor had an opportunity of testing the accuracy of this estimate, as it was filled in every part. At the moment of our entering, the Balloon was filling rapidly; and at a quarter to six o'clock it was fully inflated, when its size and beauty were much admired, as testified by the plaudits of the thousands of spectators. The Balloon is 90 feet in height, and 120 feet in circumference, and contains 40,000 cubic feet of gas: it is decorated by two large medallions—one bearing the figure of Britannia with the national emblems, the other an emblematic representation of Hibernia and her wolf-dog; between the medallions is inscribed "Erin go bragh" in silver; the whole had a most brilliant effect.

All things being ready by six o'clock, Mr. Hampton, the aëronaut, took his seat in the car, accompanied by two gentlemen. When the signal was given, the ropes that confined the Balloon to earth were cast off, and she ascended majestically into the air amidst the acclamations of the spectators. The clearness of the evening enabled the Balloon to be seen distinctly upwards of an hour: it then entered the clouds; and after continuing in the air upwards of two hours, the aërial travellers descended in safety a short distance from the New Cross railway-station. Mr. Hawkins and other gentlemen connected with the station rendering them the most prompt and kind attention.

Mr Hampton describes his Balloon as the largest but one in the world, and the first ever made in Ireland: the cost of its construction was defrayed by public subscription of the inhabitants of Dublin, who presented the Balloon to Mr. Hampton in place of one destroyed by fire, when ascending after an ascent from the Portobello Gardens, October 14, 1844. The silk was manufactured in Dublin, expressly for the Balloon: it is very closely woven, and consists of 500 yards, 42 inches wide; cost, £700. The net was made by working in 150 brass eyes or thimbles: it is not attached, as on the old plan, by being tied to the hoop, but by means of toggles, which renders the descent easier.

Last week an excellent specimen of the male osprey was shot on the estate of S. M. Peto, Esq., M.P., at Somerleyton, near Lowestoft.

Lowestoft.—The herring and mackarel fisheries from this port have been much more prosperous this spring than last. The nucleus of a trawling fleet has just been established here, through the exertions of Mr. Peto, M.P., and Captain Andrews. Seven boats are now constantly employed on the grounds, and are developing results of a most satisfactory kind. The importations of cattle, &c., from Hamburg and Ballum increase weekly. The Cumberland brought over last week 150 head of oxen, 6 horses, 31 pigs, and other goods. Owing to the very inclement weather of April, which continued with but occasional intermissions, the cattle are landed in first-rate order. At Lowestoft for landing them are [illegible] twenty yards, and two boats are in the [illegible] Yarmouth Herald states [illegible] that Prince [illegible] during the sitting of the Ipswich [illegible] Lowestoft [illegible] visited in January, 1850, of felony, for [illegible] a forged acceptance of Mr. John Marsden's name to a bill of exchange, knowing the same to be forged, and [illegible] by Mr. Justice Erskine to transport Mr. George Grey, the Home Secretary, has advised the Queen to grant Mr. Joel her Royal pardon, the result of two verdicts in Ireland having established the fact that Mr. Clements' acquittal was not forged.

Cold cider is now selling in the neighbourhood of Taunton at 30s. the hogshead.

FOREIGN AND COLONIAL NEWS.

FRANCE.

Louis Napoleon has again thrown down the gauntlet of defiance to the Legislative Assembly, or at least that large section of it that is opposed to such a revision of the Constitution as would prolong his tenure of the Presidency of the Republic, and thus put off to a remote period, if not for ever, any chance which the Princes of the ex-Royal family, whether Bourbon or Orleanist, may fancy the present unsettled state of things offers for the restoration of the Monarchy in one or other of their persons.

The occasion of which Louis Napoleon availed himself for this demonstration was the opening of the railway at Dijon, on Sunday last. The Vice-President of the Republic, several of the Cabinet Ministers, the President and the Vice-President of the National Assembly, and other persons of note were present at the dinner which followed the ceremony of the day, and the effect produced upon them by the bold language of Louis Napoleon is described as astounding. The guests of the people as the banquet, however, applauded the Prince's sentiments. The speech was as follows, with the exception of the last paragraph, referring to the Assembly, which was of a more violent character as spoken by the President; the modified report, which the authorities allowed to be published, being that given below:

"I wish that these persons who doubt of the future had accompanied me through the populations of the Yonne and the Côte d'Or. They would soon have had their minds set at rest, by being able to judge for themselves of the real state of the public feeling. They would have seen that neither intrigues, nor attacks, nor passionate discussions of parties are in harmony with the sentiments and state of the country. France does not wish either the return of the ancient régime—(Tremendous cheering)—no matter under what form it may be disguised—nor the trial of evil and impracticable Utopias. It is because I am the most natural adversary of the one and the other that she has placed her confidence in me. (Renewed cheering.) If it was not so, how else can be explained this touching sympathy of the people towards me, and which, while it repels the most ruinous controversies, absolves me from being the cause of their sufferings? (Great cheering.) In fact, if my Government has not realised all the ameliorations it has had in view, the blame lies in the manœuvres of factions, which paralyse the good dispositions of assemblies as well as those of Governments the most devoted to the public good. It is because you have shared those convictions, that I have found in patriotic Burgundy such a reception as is at once for me both approbation and encouragement. (Loud and long cheers.) For a long time power I have felt much the pressure of the great interests of society. I made abstractions of what touches myself personally. The most unjust and most violent attacks have not been able to induce me to give up my attitude of calm. Whatever duties the country may impose on me, it will find me resolute to execute its will. And believe me, gentlemen, France will not perish in my hands. (Tremendous applause.) I profit by this banquet as if it were a public tribune to open to my fellow-citizens the bottom of my heart. A new phase of our political life is commencing. From one end of France to the other petitions are being signed in favour of the revision of the Constitution; I await with confidence the manifestation of the country and the decision of the Assembly, which can only be actuated by the sole thought of the 'public good.' The reception of the President by the people out of doors, at the inauguration, and on his arrival and departure, was the most enthusiastic imaginable.

The Journals generally, with the exception of the *Constitutionnel*, condemn the language of the President; and, in the Assembly on Tuesday, it gave occasion to General Changarnier for an outbreak of hostility against Louis Napoleon, which, as it was wholly uncalled for, has much lowered the General in public estimation. Colonel Charras, speaking on a motion relative to military rewards, made allusion to the speech at Dijon, and to certain supposed designs in which the army might be called on to take a part, observing that under such circumstances the extent to which the passive resistance of the army ought to go became a question for serious consideration. Such a doubt as was here implied met with general reprobation on the part of the majority; and the Minister of War, echoing the general feeling of the friends of order, protested against any other doctrine being admitted but that of obedience by the army to the orders of its chiefs.

General Changarnier, however, expressed himself as follows:—

> A grave question has been raised; and, in consequence of what has been said, I think it necessary to put an end to the agonising expressions of Colonel Charras. According to the assertions of certain persons, the army is ready, in its enthusiasm, to act against the laws of the country, and to change the form of Government. Is the first place, are we sure that such cannot be the case, it is sufficient for us to ask, when in there any motive for such enthusiasm? (Laughter on the Left.) I may add, that the army, profoundly penetrated with the sentiment of its duty, with the feeling of what is due to its own dignity, scorns no more than you to indict on France the misfortune and shame of the overthrow of the Empire, when Emperors were successively raised to power or hurled to the earth by drunken Praetorian Guards. (Great applause.) Insults is deeply resold in the French army. The soldiers will always hear the voice of their chiefs; but none will ever induce the soldiers to march against the Right—against the Assembly. Such an attempt could be indicted to faith or honour, for such a purpose, whoever might be the officers whom they are accustomed to obey. Consequently, representatives of France, deliberate in peace! (Agitation.)

M. Léon Faucher immediately surrounded the instructions of the ex-Commander in Chief as to the complicity of the Government in some dark conspiracy, and in turn read him a dignified rebuke for having given importance to a discussion that ought never to have been introduced. No Government could, he said, exist without the discipline of the army being preserved; and all the Government wanted to do was to maintain military discipline, while it upheld the cause of order by enforcing obedience to the laws.

Louis Napoleon has returned to Paris.

PORTUGAL.

The intelligence from the Peninsula this week is of a satisfactory character. It is dated the 30th ult., and from it we learn that tranquillity prevailed in the capital and generally throughout the country; the only exception having been at Oporto on the 29th, when two regiments of Caçadores, at the instance of the Cabral party, attempted to get up a reactionary movement, but it was at once suppressed by the troops and the populace.

At Lisbon the first meeting of the Council of State since the arrival of Saldanha was held on the 28th ult., but little of importance was transacted. A committee was being formed to examine into the financial state of the country. The *Diario* contains an official minute from the Minister of Finance, announcing that the dividends on the home and foreign debt will be paid as regularly as heretofore.

The Queen has dissolved the Chamber of Deputies, and convoked the Cortes for the 15th of September, for the purpose of the revision of the Constitution.

A telegraphic despatch, old Madrid of the 29th ult., has been sent, contradicts the account of general tranquillity given above, and affirms that another military movement had taken place in Portugal, several regiments of cavalry, infantry, and artillery having raised the standard of revolt against Saldanha and his government. This intelligence, however, wants confirmation.

UNITED STATES.

The accounts from New York are to the 24th ult. In South Carolina the spirit of "secession" seems to grow daily stronger. On the 17th, the representatives of the principal political parties in the state had a grand military encampment at Orangeburgh.

A Baltimore paper, in speaking of the soldiers, says there is great political animation and enthusiasm in the camp, and their countersigns and parolee are strongly indicative of the feelings which predominate. "Calhoun," "Secession," and "State Action" are constant watchwords.

From Boston we learn, that, on the 16th ult., the Senate agreed to the following resolution on the question of slavery, by a vote of 33 yeas to 8 nays—(the negatives being 2 Whigs and 3 Dems.):—

> Resolved—That Massachusetts protests against the fugitive slave law as hostile to the sentiments of Christianity and abhorrent to the feelings of the people of this commonwealth; that such a law will materially fail to secure that object which is declared to be its purpose, the restoration of fugitives, without which any law must cease or later become a dead letter.

The Maryland Reform Convention has adjourned after pronouncing in favour of the abolition of State lotteries, abolition of imprisonment for debt, and also for a more uniform State representation.

It would appear, from letters now received, that the expedition to Cuba had not been abandoned, one of the United States revenue cutters having lately captured 30 of the adventurers off the coast of Georgia; Florida, however, seems to be the locality where the invasion is about to be attempted, and 1000 of them are said to be enlisted. The proclamation, or manifesto, of the American President had contributed greatly to lessen the apprehension of a descent at Havannah.

The fatal accidents announced this week are very numerous. From Cincinnati we learn that on the 12th ult., on the railway between Frankfort and Louisville, a luggage train to which were attached two passenger cars, containing the engineer, superintendent, and others connected with the road, when passing over a new bridge near Frankfort, was, in consequence of the bridge giving way, precipitated, engine, cars, &c., a distance of twenty feet into the water. Six mutilated bodies were recovered.

On the same night the city of Cincinnati was visited by a thunder-storm of unusual severity: several houses were struck by the lightning, and much other damage was done. On the next day, Washington city was greatly damaged by a similar storm.

On the night of the 20th ult., at dusk, the steamer [illegible] from New Castle, with about 100 passengers on board, was [illegible] near Pleasant Point, below Philadelphia, by the steamer [illegible]. The [illegible] was sunk, and [illegible] in twenty minutes. The consternation was so great [illegible] all the lights being extinguished by the [illegible] that it was impossible to tell the extent of the accident. Two or three are known to be drowned, and it is apprehended that many others found a watery grave. Nearly all the baggage floated off, and was lost. The *Commodore Stockton* was seriously damaged, but did not sink.

The steam-propeller *Franklin*, trading between Newfoundland and Halifax, has been lost, the crew, passengers, and mails only being saved.

Two boiler explosions had occurred at New York and Brooklyn, occasioning the death of three persons.

Twenty firemen arrested in Florida as Cuba conspirators had arrived at Baltimore, and during the previous month 1909 suspicious men had [illegible] or had disguised

CALIFORNIA.

According to advices from California to the 15th of April, the steam-ship *Panama* and *Isthmus* left San Francisco on that day with nearly 2,000,000 dollars in gold-dust from the diggings, in circulation principally coin-dots. On examination and settling by the United States assayers, [illegible] had been found deficient in value from 1 to 10 per cent; in consequence of which all private issue of coin, with the exception of Moffat and Co.'s, who redeem theirs at par, having ceased further issue, was refused to be received by bankers, &c., unless at fitting discounts.

CANADA.

From Toronto we have intelligence to the 30th ult. Parliament [illegible] that day. The Governor stated in his speech that the receipts [illegible] in customs and canals were increasing and that the change in the imperial navigation laws had increased foreign shipping at Canadian ports.

On the 23rd, ult. the Government suffered a defeat in the Legislative Assembly, in reasoning a motion to introduce a bill for preventing the expenditure of public money not previously authorised by the Parliament, and for restraining the granting of pensions. It was the first division of the session and the votes stood 26 to 25.

INDIA.

The advices received in anticipation of the Overland Mail are dated Calcutta, April 23, and Bombay, May 3. No political event of importance had occurred since the date of the last mail, but the trial of Lalla Josee Pirsaud, on a charge of fraud. He supplied our troops from the Nepaul frontier to the termination of the last Burmese war, for which he charged the Government 26,000. The latter accused him, on the other hand, with enormous frauds in the provision of cattle, and in various other ways; and upon these grounds had him brought before the judge and jury at Agra, when, after twelve days' inquiry, he was honourably and triumphantly acquitted, the verdict being unanimous, which was fully approved of by the judge.

Another case of military pensing delinquency has been brought to light. Colonel Pomonby, while officiating as the North-Western Bank, had taken 66 shares without giving an actual value in return; but, instead of leaving the scrip for those shares with the North-Western Bank till they were *bond fide* paid for, he pledged them to the Delhi Bank for 35,000 rupees to Major Angelo, not as secretary, but in his private capacity, having obtained the par value of his stock from the Delhi bank. Colonel Pomonby cancelled these shares in the books of his own bank, without informing the nominees of the fact, who did not discover it until lately, as the dividends on the shares continued to be paid to them. Major Angelo, without informing the directors the unpaid and disbanded troops are paying themselves by plundering the peoples and inhabitants, scoring (in one instance) the women and children of a whole village till their demands are paid.

Intelligence was received in Bombay from Calcutta on the eve of the departure of the last Overland Mail, that a very fine ship, the *Nurvanmey*, bound to the Mauritius, full of Coolie emigrants, had been burnt to the water's edge, near Kedgeree. The crew and Coolies on board amounted to 468 souls, of whom 366 were lost.

The trial at Calcutta of Messrs. Holey and Thornton, for the illegal arrest and abduction of Mr. Arathorn at Chanderanagor, had resulted in their conviction. The latter "to six months' imprisonment, the former four months," and a fine of 1000 rupees.

CHINA.

The accounts from China are to the 30th of March. The rebels to the imperial authority in the provinces next to Canton were making head somewhat against the Emperor's troops. The *Friend of China* of the 30th of March says: "We have heard that the rebels have left Kwangsi, for the province of Kwangsi, has been taken possession of by the rebels. This town is only a short distance from the province of Hunan (bounding Kwangtung on the north). The whole tract of country appears to be in possession of the insurgents is about the size of England and Wales united."

CAPE OF GOOD HOPE.

We have intelligence from the Cape to the 7th of April, at which date the Kaffir war presented all the appearance of being a protracted struggle. No military operations of any importance had taken place since the accounts previously given. Some Lascarine auxiliaries had been sent out against the Kaffirs, but nothing had resulted from them worthy of notice. Sir H. Smith was at King William's Town by the latest advices; but, with the numerically small force at his disposal, it was impossible for him to act upon the offensive in any great engagement with reasonable chance of success, opposed as he was by such overwhelming hordes of the enemy. His Excellency accordingly, to avoid a very anxious step to bring the Kaffirs to a decisive battle, was obliged to wait for reinforcements.

THE LATE RIOT AT TAMWORTH.—SIR R. PEEL AND MR. GEORGE FREDERICK YOUNG.

The riot at Tamworth, arising out of the Protectionist meeting there, which we noticed last week, has given occasion to the publication of the following specimens of the frank epistolary style of communication—the editor of the *Times* being the *veritum quid* through whose invoked agency the correspondents are their shafts of courtesy at each other

(To the Editor of the "Times.")

"Sir,—May I be permitted, through the medium of the *Times*, to thank the constituency, which, together with Captain Pechell, I have the honour of representing in Parliament, and as a son of the late Sir Robert Peel, for the spontaneous burst of indignation which greeted those unruly pilgrims of Protection who, on Wednesday evening last, sought in the town-hall of Tamworth a but deceitful refuge for the [illegible] of festivity and lamentation and abuse? It is indeed a source of congratulation to me that no 'mawkish sensibility' should have silenced the inhabitants of the borough and neighbourhood into apathy and indifference, or restrained them from giving vent to their feelings in resenting, as I am happy to say they have done, every insult, reputation, while it ennobles their political antecedents, is so uncontestably rendered to their recollection. It is not surprising, although perhaps satisfactory, that popular indignation knew how to control itself, even in the moments of bitterest exasperation, and that so much leniency should have been shown to the strangers who, for the gratification of their animosity, and with the view of giving greater point to their vituperation, did not hesitate to make use of the name of my father, the hall where yet echoes the scarce inaudible voice of the departed dead, and the walls of which are the very spot which it is to be consecrated to his memory, in the vain hope of seducing a deputation of the working men to keep the peace of such miserable impostors as Mr. G. F. Young, we may not have to deplore other results than those which sooner or later must inevitably be the consequences of their reckless folly, particularly should they again attempt to foist themselves upon the notice of the borough of Tamworth.—I remain, your obedient servant, ROBERT PEEL.—House of Commons, Friday, May 30."

(To the Editor of the "Times.")

"Sir, The columns of your journal are usually so free from offensive personalities, that I was somewhat surprised at observing that I am designated by name as a 'miserable impostor,' in a letter bearing a signature which even I should have imagined would have constituted a security against coarse vituperity. It appears I was mistaken. The present Sir Robert Peel's taste in composition is on a par with his eloquence.

"Without wishing to be unnecessarily scurrilous, I may be permitted, in the first place, to ask the learned gentleman whether he considers it in character with the dignity of an orator [illegible] his speeches, and break down in delivering them; if, after breathing for years the atmosphere of the free land of freedom, he should return to his native soil, prefer since to be the champion of liberal principles, and be found [illegible] on his consistency on [illegible] principles of [illegible] would such [illegible] be observed, [illegible] might not be branded as an impostor; and if he should have restored to fling the foul epithet at men more upright and con-

silent than himself, deservedly might he be set down as a calumniator also. Let Sir Robert Peel beware. "They who live in glass houses should never throw stones."—I am, Sir, your faithful and obedient servant,

" Winchester, May 31." GEORGE FREDERICK YOUNG.

The two letters above given appeared on Saturday and Monday respectively.

On Tuesday, Sir R. Peel again addressed a letter to the *Times*, enclosing a communication which he had addressed on the 10th ult. to his agent, Mr. Mathews, on the subject of the then anticipated meeting at Tamworth. In that communication the hon. Baronet tells his agent:

"I consider myself as tenant farmers' friend as any one else, I certainly have as good a reason as any one else.

"Their prosperity is mine, our interests are common, but I look upon a return to Protection (so called) as fatal to my friends, and as likely to be productive of consequences far more injurious than the pressure which Free-trade has occasioned. I believe only temporarily.

"Make no hesitation in letting my opinions be known distinctly.

" I wish to leave the most complete independence to those who have a perfect right to judge for themselves. I would only direct their judgment, not interfere with it.

" If any of my tenants were to ask you whether I would disapprove of their assisting at a Protectionist dinner, you can say 'Yes,' and for this reason—because I believe they would be endeavouring to promote that which would prove almost entirely composed of Tamworth tenantry, and that nothing whatever fell from him in any way insulting to the memory of the late Baronet. A letter from Mr. Nevill repeats the above statement whilst an elector of Tamworth (not a Protectionist) writes to decline the honour of Sir R. Peel's thanks to his constituency for committing a breach of the peace.

COURT AND HAUT TON.

THE COURT AT WINDSOR CASTLE.

Her Majesty and his Royal Highness Prince Albert have been dispensing a royal hospitality during the past week at Windsor Castle

The Court left Buckingham Palace on Monday afternoon for the Castle. Her Majesty, Prince Albert, and the Royal Family, with their illustrious visitors, occupied seven carriages, and proceeded to the Paddington Station of the Great Western Railway. A special train was in waiting to convey the various parties to Windsor, where they arrived at half-past four o'clock. The Duke of Cambridge, his Royal Highness Prince Henry of the Netherlands, the Duke and Duchess of Norfolk, and Lady Adelaea Fitzalan Howard, the Duke of Buccleuch, the Duchess of Sutherland, and Lady Constance Leveson Gower, the Duke of Devonshire, the Duke of Newcastle, the Marquis and Marchioness of Westminster and Lady Octavia Grosvenor, the Marquis of Breadalbane, the Marquis of Abercorn, the Right Hon. Sir George and Lady Grey, and the Earl and Countess of Bessborough arrived at the Castle on Monday evening, on a visit to the Queen and the Prince.

On Tuesday her Majesty and Prince Albert, with the Court, left the Castle at twenty-five minutes before one o'clock, for Ascot Races. The cortège consisted of nine open carriages, in the first of which rode her Majesty the Queen, her Royal Highness the Prince Royal, her Royal Highness the Duchess of Saxe-Coburg-Gotha, and his Royal Highness Prince Henry of the Netherlands. The second carriage conveyed their Royal Highnesses Prince Albert, the Prince of Wales, the Duke of Saxe-Coburg-Gotha, the Duke of Cambridge, and Duke Ernest of Wurtemburg. In the third carriage rode the Duchess of Norfolk, the Duchess of Sutherland, his Serene Highness the Prince of Leiningen, and the Duke of Norfolk. Her Majesty and Prince Albert, and their illustrious visitors, returned to the Castle at five minutes before five o'clock. In the evening the Queen gave a grand banquet in St. George's Hall, at which her Royal Highness the Duchess of Kent, his Royal Highness Prince Henry of the Netherlands, their Royal Highnesses the Duke and Duchess of Saxe-Coburg-Gotha, his Royal Highness the Duke of Cambridge, his Royal Highness Duke Ernest of Wurtemburg, his Serene Highness the Prince of Leiningen, and a distinguished circle of guests were present. Her Majesty had after-dinner an evening party.

On Wednesday, the Queen, with the Duchess of Saxe-Coburg-Gotha, paid a visit to the Duchess of Kent, at Frogmore. The Duke of Wellington and a distinguished circle of the nobility arrived at the Castle to-day on a visit to the Queen.

On Thursday the Court again attended Ascot Races.

The Countess of Charlemont arrived at the Castle on Wednesday afternoon. Her Ladyship has relieved the Viscountess Jocelyn in her duties as Lady in Waiting to her Majesty. The Honourable Colonel Grey, the Hon. Charles Grey in his duties as Equerry in Waiting to the Queen. Colonel Bouverie has relieved Lieut.-Colonel F. H. Seymour in his duties as Equerry in Waiting to his Royal Highness Prince Albert

THE QUEEN'S DRAWINGROOM.

The Queen's birthday was celebrated on Saturday last by a Drawingroom, held at St. James's Palace, which was very numerously attended

Her Majesty and his Royal Highness Prince Albert arrived from Buckingham Palace at two o'clock, accompanied by a detachment of the Life Guards, were received by the Great Officers of State. Soon after the Queen's arrival the Archbishops and Bishops of the Established Church were admitted to an audience, when the Archbishop of Canterbury delivered a congratulatory address to Her Majesty on the Queen, on the auspicious return of her natal day. The Queen was attended by the Mistress of the Robes, the Viscountess Jocelyn (in Waiting), the Duchess of Norfolk, the Countess of Gainsborough, the Countess of Charlemont, the Countess of Desart, the Marchioness of Douro, and the Countess of Mount Edgcumbe, Ladies of the Bedchamber, and a brilliant Court

His Royal Highness Prince Henry of the Netherlands, his Royal Highness the Duke of Cambridge, his Royal Highness the Duke Ernest of Wurtemburg, his Serene Highness the Prince of Leiningen, and his Serene Highness Prince Edward of Saxe-Weimar were among the early arrivals.

The principal Knights of the British Orders of Knighthood were their Collars, the day being observed as a Collar Day.

The Queen wore a train of white silk, richly embroidered with silver, and trimmed with silver blonde and blue corn flowers, and also ornamented with diamonds. The petticoat was of white satin, with tulle and white satin ribbons, diamonds and feathers, and a wreath of blue corn flowers, formed the headdress.

Her Royal Highness the Duchess of Saxe-Coburg-Gotha wore a train of blue silver moire, trimmed with silver lace. The petticoat was of white satin, having the front trimmed with two rows of blue and silver ribbon. The stomacher was covered with silver lace, with diamond ornaments Her Royal Highness wore, as a headdress, a diadem of diamonds, with feathers and blonde lappets.

Her Majesty and Prince Albert, with the Royal party and the Ladies and Gentlemen in Waiting, having entered the Throne-room, the diplomatic circle was introduced. An unusually large number of presentations took place, and the saloons were densely crowded until after four o'clock.

His Excellency the Prussian Minister and Madame Bunsen had a reception on Tuesday evening, at the residence of the Legation, on Carlton House-terrace. Upwards of 400 guests, including a large number of *Neraids* and men of science, attended.

Viscountess Palmerston had a very numerously attended assembly on Saturday evening, at the noble Viscount's House in Carlton Gardens.

Lord John Russell had an assembly on Wednesday evening, at the official residence of the Premier in Downing-street. The company began to set down at ten o'clock; and from that hour until after midnight an uninterrupted succession of arrivals took place.

NAVAL AND MILITARY INTELLIGENCE.

WAR MEDAL.—According to the *United Service Gazette*, the Commander-in-Chief has extended the period for the reception and investigation of claims to the war medal to the end of this month; such claims are to be forwarded immediately to the board of general officers, Whitehall, as no further extension will take place.

ROYAL NAVAL SCHOOL, NEW-CROSS.—Captain Gladstone, R.N., has presented the munificent sum of £100 in aid of its fund for the erection of a chapel attached to this institution.

The quarantine recently imposed by the Neapolitan Board of Health on arrivals from almost all countries, owing to a few cases of death having occurred at Leghorn on board a ship from the Levant, has been taken off, owing to the determined opposition to the measure by the English and French Ambassadors at Naples.

ST. PAUL'S SCHOOL.—The annual distribution of prizes amongst the most worthy *alumni* of St. Paul's School took place on Wednesday, amongst a very numerous assemb age of the friends of the students. The head master, Dr. Kynaston, with the other teachers, took their places at 2 o'clock, and were warmly greeted. The commemoration address was delivered by Mr. Lobb, the captain of the school, and those parts which referred to the munificent donation of £1000 by the present Lord Chancellor, to be applied in awarding a gold medal, of the value of 10 guineas, and a purse of the value of 30 guineas, or books to that amount, each yearly specification, to the author of the best English essay; and also the donation of Sir C. M. Clarke, for the purpose of founding an annual prize, to be called "the Milton prize," were warmly applauded. The prizes on the present occasion were awarded to Mr. Lobb, the captain, for his Greek verse translation of Shakspeare's "Henry VI.," Part II., Act iv., Scene 2; to Mr. Lord, for his Latin hexameters; to Mr. Lawrence, for his English verse, Mr. Capes second place on the same subject The principal students then delivered passages from Dr. Johnson's "Vanity of Human Wishes," from the "Colossus," Shakspeare's "Henry V.," Pla.tus, and Aristophanes, and were highly applauded, after which the assemblage broke up.

THE ILLUSTRATED LONDON NEWS.

IMPERIAL PARLIAMENT.

HOUSE OF LORDS.—MONDAY.

INDIA.

Lord WHARNCLIFFE moved for papers relative to public works and improvements in India, and complained of the little encouragement given to such works by the Governor-General of India.

Lord BROUGHTON defended the Governor-General and East India Company, and pointed out various works of public utility which had been carried out in the province of the Nerbudda, but at the same time admitted that there was great room for improvement.

After some observations from the Earls of ELLENBOROUGH and HARROWBY, the papers were ordered.

The Marquis of WESTMINSTER asked why Cleopatra's Needle, which had been given by the Pasha of Egypt, had not been brought to England, and whether a site had been thought of for its erection when it should arrive?

The Earl of CARLISLE said that the subject was still under consideration.—Adjourned.

HOUSE OF COMMONS.—MONDAY.

COMMITTEE ON INCOME-TAX

Mr. HUME nominated the committee on the income-tax, and in a few observations intimated that his object was not to get rid of the tax, but to make it just and fair, so that the burden of taxation might be cast upon the shoulders best calculated to bear it.

Mr. HERRIES said he had voted for the income-tax being limited to one year, with a view to its final extinction. It was an unjust impost, and liable to be evaded to a very great extent. Viewing the evils of the tax as incurable, he could not see the necessity for the committee; and he also objected to its constitution as proposed by Mr. Hume, for ten out of the fifteen members had already expressed themselves in favour of a modification of the tax.

Mr. V. SMITH thought that as to late a period of the session the labours of the committee would be fruitless, and therefore it would be unnecessary to appoint it.

The CHANCELLOR of the EXCHEQUER admitted the difficulty of nominating such a committee, and felt no surprise that Mr Hume had not succeeded in nominating one more acceptable to the House. He suggested that one name (that of Mr. Hume) should be agreed to, and that the appointment of the remainder should be postponed, to give an opportunity of ascertaining if the committee could not be constructed so as fairly to represent the various interests at stake.

Mr. FREWFIELD then moved as an amendment, that the order for the appointment of the committee should be discharged.

Mr. DISRAELI thought it unnecessary to appoint the committee, but if Mr. Hume thought proper to proceed with it, he would support him, thinking the House pledged to inquiry by its former vote.

Mr. AGLIONBY protested against the attempt to get rid of the committee as a fraud on the House and on the country. The restriction of the tax to one year was on the special ground that in the interim an inquiry should take place, with a view to its modification

Mr. HUME exp ained that he had applied to the leaders of the principal parties in that House for names to be placed on the committee, and he had adopted the names thus given him.

After some observations from Mr. DENDES and Sir H. WILLOUGHBY,

Lord J. RUSSELL said, he gave every credit to Mr. Hume for a wish to act fairly in the selection of the committee, and his having failed to do so showed the difficulty of the case. He would recommend to him to choose a committee from his own friends, who might undertake the inquiry, and seek to suggest some plan by which the income tax could be fairly and equally assessed. He would certainly oppose the amendment.

Mr. HENRY did not like the committee of Mr. Hume, and liked still less the suggestion of the noble Lord, which, if adopted, would lead to great inconvenience and no possible advantage. He would therefore support the amendment.

Mr. HORSMAN, Mr T. BAINES, and Mr. BOOKER severally supported the appointment of the committee

Mr. CURDEN had originally voted against Mr. Hume's motion for limiting the tax to one year, but he thought the House was now pledged to the inquiry, and should, therefore, vote against the amendment

Mr. HERRIES said he would vote for the amendment.

The House then divided, and the numbers were—

For supporting the committee	.. .. ..	153
Against it	.. .. ..	94
Majority	.. .. ..	59

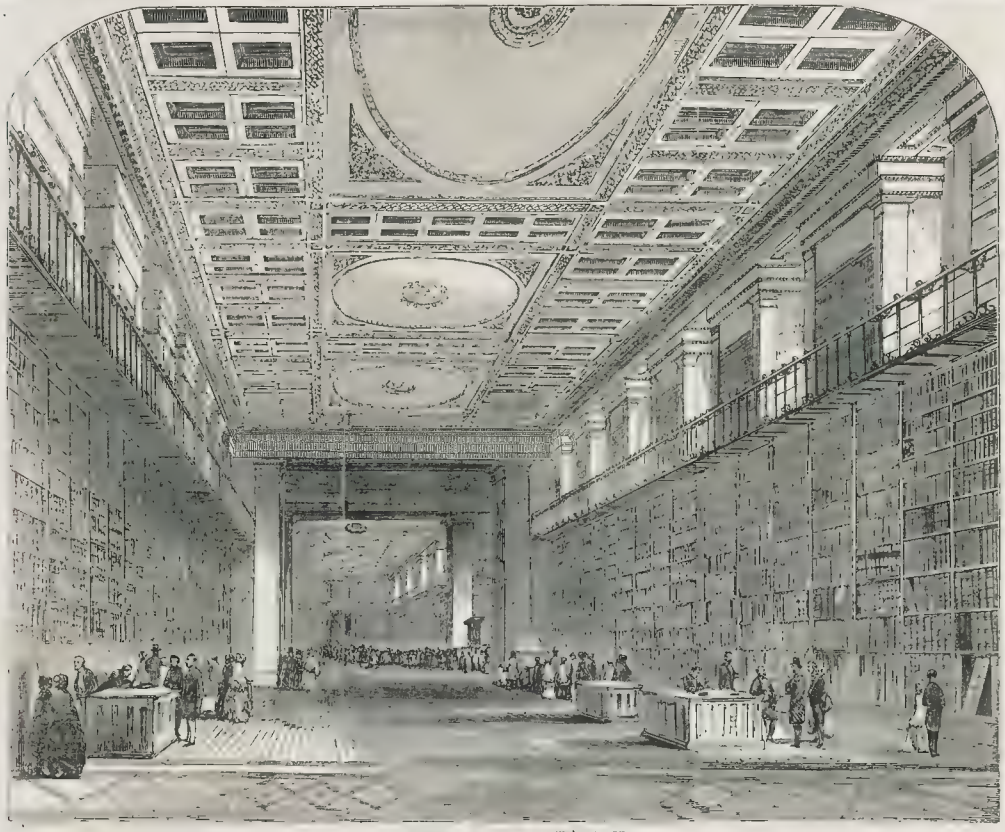
Mr. HUME said he was willing to leave the appointment of the committee in the hands of the Government.

Lord J. RUSSELL said, that, under these circumstances, he would be prepared to nominate a committee as the first business on Friday.

ECCLESIASTICAL TITLES BILL.

The House then went into committee on the Ecclesiastical Titles Assumption Bill.

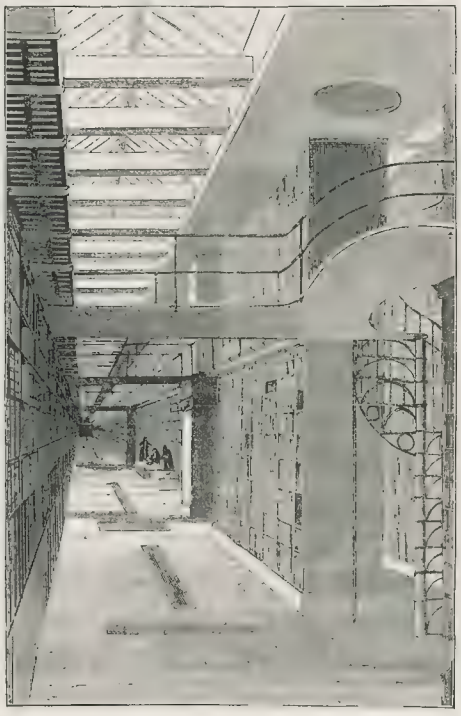
Mr. WALPOLE, in accordance with his promise of Friday night, stated the course he intended to pursue with respect to the numerous amendments which he had placed on the paper. In order that the bill might not be unnecessarily delayed, he would forego all of them which were not absolutely necessary to make the bill as perfect as was possible under the circumstances; but there were three things which he looked upon as indispensable. One was, that the principle of the bill should be clearly defined in the preamble; and if this were done, there would not be a pretence for saying that there was any ambiguity about the declaratory clause of the bill. The second thing to attend to was to prevent the necessity for future legislation. The third was to take care that the law should be enforced. For the first object would be effected by enabling the subject as well as the Crown to institute a prosecution for a breach of the law, and without such a provision he would rather have no law at all. He proposed, therefore, to adopt that of Mr. Sharman Crawford, which would be effected by omitting



BRITISH MUSEUM.—THE ROYAL OR KING'S LIBRARY.

Latin MS. of the Bible, for some time supposed to have been the property of Charlemagne; while immediately opposite are two rolls of the Hebrew Scripture, in a similar case. In two table cases, right and left of the door, leading out of the room, which we now approach, are several MSS. of almost priceless value. The most remarkable, though far from the most beautiful of these, is the celebrated Codex Alexandrinus, the most ancient copy of the Greek Bible known to exist. It is in four volumes, and written on parchment in what is called the uncial character. Beside it is the no less famous Durham book, being a copy of the Scriptures in Latin, with a commentary in Anglo-Saxon, illuminated in a most wonderfully elaborate and beautiful style, and supposed to have been written between the years 690 and 720. But the finest of all these treasures is in the right-hand table case. It is a splendid MS. of Valerius Maximus, illuminated in a style of surpassing beauty and richness, and exciting astonishment, no less by the vivid colouring of the scenes than by the extreme accuracy and finish of the drawing. We need scarcely add, that its value is inestimable. In the next compartment are two or three of the exquisitely illuminated Missals, "by monkyshe labourre wroughte." It should be mentioned, that the public are here confined to the middle of the room by temporary barriers of rough deal; the presses in which the volumes stand not being guarded with glass doors, as in the Grenville Room.

Passing between two lofty oak doors, beautifully inlaid with bronze, we next enter the Royal or King's Library. This magnificent gallery is, as will be seen from our Engraving, of considerable, perhaps disproportionate length, measuring from door to door no less than 300 feet, and occupying the remaining portion of the east wing. It is 41 feet in width, except in the middle compartment, where it increases to 58 feet, and is 30 feet in height—the uniform elevation of the whole suite of rooms. The floor is of polished oak, handsomely inlaid; and the ceiling, especially in the centre, richly decorated. All the presses on the ground-floor are protected by trellis doors of brass wire, which, with the bright brass railing of the galleries, add very much to the appearance of this splendid library. In each recess caused by the additional width of the centre are two Corinthian columns of polished granite, valued at £1000 each; the shafts being single blocks nearly 20 feet high and 2 feet 8 inches in diameter. Here, the books being in safety, there are no barriers This room contains, as we have before stated, the Library of King George III., said to have been presented* by George IV. to the British nation. This noble collection is, as far as it goes and for its size, the most perfect ever formed. It consists of about 80,000 volumes, comprising some of the rarest specimens of early printing, and is especially rich in valuable classics and the productions of Caxton's press. The number of historical, geographical, and topographical English works is also very great. In table cases on both sides of the centre are shown various objects of typographical and bibliographical interest. On one side is a compartment devoted to early Hebrew books; on the other, a similar compartment filled with Aldine classics on vellum, and numerous other treasures, such as Dominie Sampson would have shouted "Prodigious!" for half an hour to behold. Along the whole length of the King's Library, on its eastern side, but rising no higher than the window-sills, is a supplementary gallery, lately erected; called very appropriately the Long Room, of which we give an Engraving, though the public are not admitted to it. It is devoted to the recent and daily augmenting accessions to the General Library.



THE LONG ROOM.

From the King's Library we pass into a vestibule whence a staircase leads up to the Natural History department, and a door, which faces us, into the Eastern or first Reading-room. Thither the public are prevented from intruding by a barrier. So we turn sharp to the left, and passing some book-shelves fixed against the elsewhere blank wall of the vestibule, with a corkscrew staircase of dizzy height leading up to them a melancholy evidence of the pressure for space—we enter the first room of the General Library. This is in part occupied by the collection bequeathed by Sir Joseph Banks (after whom it is named), consisting chiefly of natural history and travels. It is a room of moderate size, but giving, like the succeeding rooms, with one exception, an impression of unnecessary darkness as well as of loss of space above the gallery book-cases. Parallel with this, on its north or right-hand, side runs the second Reading-room. Our friends the barriers here join us again, and accompany us through the rest of the Library; but we have not represented them in the Engravings, because, although undoubtedly necessary for the preservation of the books, they are no ornament to the rooms. Here and there they have locked gates through which the *employés* have access to the books, and pass to and fro.

The next room in which we find ourselves, and which we enter from the Banksian Room, at the south-east corner, is called the Great or Large Room—a sufficiently obvious appellation. It is a saloon of colossal dimensions, though much broken up by the recesses on each side, the projections forming which are terminated by square pillars supporting the roof. It measures 80 feet long and 30 feet wide, and occupies the whole depth of the north front, so that it is lighted with windows on both sides. From hence, looking in the direction we have come, we catch a glimpse of the Reading-rooms and their studious occupants, through the glass window that separates them from the Library, and through which the books are passed. On both sides of this window are arranged the volumes of the *supplementary* catalogue—the main body of it is in the recess on the left. Duplicates of both are in the Reading-rooms; the belief that there is no catalogue of the Library, or only one reaching to letter A, being a popular error. Tickets for the Reading-rooms, empowering the holder to read for six months, and then to renew the permission if he pleases, are granted to any one on an application by letter to Sir H. Ellis, the Principal, enclosing a satisfactory recommendation. This may be procured from any person of eminence in rank or profession, or from any clergyman, especially if an incumbent and dating from his parish. The recommendation of a firm is not sufficient, though that of an individual member of it—if a respectable one—will generally be accepted; that responsibility of firms, as firms, which is pretty generally recognised in the case of a bond or cheque being supposed in this case to have no existence. The rooms are open from nine to four in winter, and from nine to seven in the summer months, except on Saturday when they close at five. The average number of daily readers is about [illegible] the average number of fresh reading tickets issued per annum is more than 2000. There are now on the reading-room books between 40,000 and 50,000 readers.

But to return to the Large Room. All along the barriers are placed glass cases, containing bibliographical rarities of greater or less value. Here are to be seen Coverdale's Bible, the first complete edition of the

* See the *Quarterly Review* for December last, No. CLXXV., page 143.

THE LARGE ROOM.

Scriptures in English; "The Game and Playe of the Chesse," the first book printed in England, having issued from Caxton's press in 1474; the first edition of Chaucer's "Book of the Tales of Canterburye," of which only two perfect copies are known; and many other objects of the greatest interest.

At the south-west corner of the Large Room, and on our left as we pass out, is a door leading to the Cracherode Room, which is opposite to, and of the same dimensions as, the Banksian Room above noticed. It contains principally the library bequeathed by the Rev. Dr. Cracherode, very rich in classics; and the collection called the King's Pamphlets, a mass of tracts and curious works, printed for the most part about the middle of the 17th century, and chiefly relating to the affairs of the nation at that period, presented by George II.

We next pass through two rooms, called respectively the First and Second Supplementary Rooms, in which there are chiefly to be noticed four cases, containing books with the autographs of illustrious men, viz. Shakespeare, Ben Jonson, Bacon, Luther, Voltaire, &c., and three others filled with specimens of ancient binding, some of them very elaborate. A door from the south side of the Second Supplementary Room leads into the Egyptian Antiquity Gallery, or west wing of the building.

Last of all we come to the Arched Room, the termination of the suite of rooms forming the library and the north front of the Museum. The double galleries of this handsome apartment produce an impression of additional height, while their pierced iron floors and the arching of the piers of the recesses give the room an appearance of lightness and elegance which show it in favourable contrast with the others. The design, we understand, was a suggestion of Mr. Panizzi, the keeper of the Printed Books. Here we are prevented by a gate from penetrating farther into the room than is necessary to distinguish its architectural characteristics; the remainder of it being kept private for the accommodation of the gentlemen engaged in the business of the department. Our view is taken from this end of the room, facing the gate.

It only remains to add, that the Library has the right, conferred upon it by George II., of claiming a copy of every book entered at Stationers' Hall, and increases at the rate of about 30,000 volumes a year. We do not wonder at the incessant demands for space. In a few years' time, the whole of the ground-floor will scarcely contain the growing giant.

JULES JANIN.

HIS pleasant and gay-hearted literary Majesty, *le Roi du Feuilleton*, has left us after a brief but busy and improving visit, to resume his crown and sceptre and gown; not with a rod of iron, but with a wand of keen-sighted cleverness and good-humoured drollery—his printed realms in the *rez-de-chaussée* of the *Débats*. Janin, we believe, left England delighted with the country, and naturally gratified at the cordiality of his reception. During the short month he passed among us he was lionised in the most persevering fashion, and never did lion shake his mane with more grace and *bonhomie*, or roar with more polite and courteous vigour. He assisted, of course, at the opening of the Exhibition, and was indefatigable in getting up the sights of London. In one of his *feuilletons* in the *Débats* he sketches Windsor and Hampton Court; in another, he paints the "Glories of Epsom." "J. J." did not find us *so triste* or so far gone in that mystic disease, the meaning of which is only known to our French critics, *le spleen*, as he had perhaps been led to believe. Altogether he saw more in London than that huge suicidal collection of smoke-crusted bricks, and business-hardened faces, which more than one of his predecessors have sketched, with greater credit to their powers of imagination than their faculties for candour; and it is understood that the fault will not be his if he do not take an early opportunity of revising the anything but treacherous stores of "*Perfide Albion*."

Jules Janin—the portrait of the man stands at the head of this article—occupies a very prominent position in the French press as a theatrical critic, and the living concocter of innumerable dashing off hand literary sketches, grave and gay, fantastic and severe, often containing very little matter or substance, but the tissue uniformly wrought with the most delicate cunning of hand, and a marvellous command of the very plausible resources of the French language. As a writer of this species of composition—each specimen only intended to live and sparkle through its little immortality of a week Jules Janin is probably the most popular author in France. His books have never been up to the mark of his *feuilletons*. He seems, indeed, incapable of the sustained flight and steady concentration of power demanded by a continuous narrative, or an elaborated and detailed exposition of doctrine; but so long as he can gambol and riot in the plastic columns of the *feuilleton*, as he can give a clear field to his fancy, letting it leap hither and thither, and play the oddest, the most grotesque, and yet the most graceful, as they are the most fantastic of tricks, "J. J." is quite inimitable. In his own *specialité* he certainly has no brother near the throne.

M. JULES JANIN.

Jules Janin was born at St. Etienne, a smoky manufacturing town situated in the heart of the coal district. Upon the right side of the Rhone, some thirty miles from Lyons, the future *feuilletonist* came into the world, which he has since so much amused, in 1804, so that he is now forty-seven years of age. His father was a provincial barrister, holding a good position at the bar of the local tribunal, and generally esteemed as a man of talent and information. In 1815 the young Janin was sent to school at Lyons; but already fate seemed to be beckoning him to his future metropolitan life, and he soon left the Rhone, and was entered as a student in the college of Louis le Grand at Paris. Here he acquired a sound classical education, and imbibed a love for classical quotation and illustration which has never left him, and which he never scruples lavishly to indulge. His college studies over, the scholar—still a very young man—determined that, come what might, he would not leave that Paris, with its busy and its gaiety, its pleasures and its distractions, which were so well adapted to the lively turn of his mind and the buoyant elasticity of his animal spirits. Truth to tell, however, Janin's means were not such as to allow him to take much share, other than as a philosophic spectator, in the agreeabilities of the capital: he had no profession, and no fortune; so, after a little casting about, he was fain to mount an unknown number of flights of steps, and take up his quarters in the highest and smallest of garrets, from which he could overlook the learned and dusky towers of the Sorbonne. Here Janin assisted young gentlemen in "cramming" for their degrees—in other words, he became a "grinder," and manufactured me and of learned Bachelors and Masters. To this humble period of his life the *feuilletonist* loves to allude; and the garret in the Quartier-Latin, with its poor but gay-hearted and busy occupant, has been frequently and charmingly sketched. Janin himself recounts the neatest which all at once flung him out of the learned harness of a sober scholastic professor, into the more glittering trappings of a thoroughbred journalist:—He was loitering one evening before a theatre of the Boulevards, watching the company as they formed a gay and laughing *queue* up to the pay place, and possibly prevented from himself becoming one of the joints of the tail by the reflection that it was to the pay place which it led, when he was accosted by an old fellow-student, upon whose arm hung a gay and graceful young lady. They were going to the play. Would Janin join them?—A seat in their box was at his disposal. He would be only too happy; and so, in five minutes, he found himself by the side of one of the prettiest and merriest actresses of the day. "Ah!" sighed the poor grinder, "you are a lucky fellow to be rich—to have private boxes, and to be able to offer them to charming actresses." "Rich!" was the reply, "I'm not rich, but I'm a journalist!" The word opened a new world to Janin. A journalist! He, too, he believed, could write—he, too, had felt the promptings which drive some men to ink as instinct drives ducklings to water. A journalist! "And I, too," said Janin, "will be a journalist!"

Ere a week was over, Janin had procured some slight employment as critic upon a little theatrical paper. Even in his first essays there was a natural nerve and an easy sparkle which showed that he had discovered his craft; and no long time had elapsed ere he became one of the most active and able editors of the *Figaro*, a satiric journal of nerve and power, which flourished greatly in Paris during the last years of the Restoration. Shortly afterwards, Janin published his first romance—a strange, grotesque production—full of cleverness, and not by any means devoid of nonsense—the odd name of the odd production being no other than "L'âne mort

et la Femme guillotinée." The book, in spite of its manifold and manifest faults, achieved a fair success, was much read, severely criticised, and universally talked of. Next came the *roman* of "Bernane," by turns fanciful and impertinent, flippant and tender, but never dull. "Le Chemin de Traverse" was the appropriate name of Janin's third novel—appropriate never sets out on his literary journey clo g the bostes does not thwart it for the most crooked cross-road he encounters, and manages so after following the *chemin de traverse* for a short distance, it is h regular practice to give it up also, wandering and to field and bower to lower, and ending by finding himself, with no panting readers clustered round him, in some other and quite full court path, leading in the same direction, but not destination to that originally chalked out with all due gravity and decorum.

Janin's latest novel was a two volume book, entitl d "Un Cœur pour deux Amours." But these more pretentious works appeared in the midst of the swarm of fugitive papers—tales, essays, and sketches, which he is continually dashing off, and which have from time to time been collected and ... ded as "Contes Fantastiques" and "Nouveaux Contes." It is, indeed, of these happy trifles, as a finished producer of that charming ... ay whipped cream—all sweet froth and effervescing bubbles—that ... tion of Janin will last. It is easy to depreciate this school of ... flimsy writing—to say there is nothing in it—it is all mere *soufflé*, which a heading is filled and a breath can puff away. Do not let the admirers of the ponderous, however, go too fast. Trifle is none the worse trifle for not being beef; a screen of daintily worked and fancifully guipured lace is none the worse fabric for not being a ... of clay or a fence of iron There are men whom we have heard talk contemptuously of Janin as a mere wordspinner, a mere juggler with phrases, and no doubt he does ... relativity, though rather thin, web of words, and does juggle ... thrilling them and twirling them into the most fantastic ... iliant and unreal of clever empty paradoxes; but there is a ... and very peculiar art about all this which is very far from being a low one, or one which can be easily imitated or acquired. ... success has drawn forth many copyists, who hit only his extravagance, utterly missing the airy grace and elastic eloquence of his style, ... ending, in fact, not much better than the German gentleman who shook a bogie down by jumping over the tables, in order, as ... said, "*apprendre à voltiger*."

With all his gaiety of style and fondness for pretty triviality of phrase, it must not be supposed that Janin is not, on occasion, a very powerful writer. His long been condemned, on the first day of each succeeding week, and graphically contrasts the grateful interval of toil proclaimed by the ... hebdomadal "church-going bell" with his own Sundays of hard and ... ing literary labour.

Janin is a married man, a universal favourite in society, and one who has always aimed at the reputation of being a thorough good fellow, an honest, tender friend, a wholesome-minded, sound-hearted, good-humoured man, a John Anything, in short, just as much as he has aspired to the character of a trenchant critic and a brilliant periodical writer.

Paisley, Dundee, Leith, and Edinburgh, the old system is utterly inadequate. In these great centres of activity, the rising generations of the Scotch are without the proper means of instruction. Hitherto, all attempts to cope with the evil have either been nugatory or exceedingly trifling in results, although the three great religious bodies of Scotland are not separated from each other by any difference of doctrine which could lead to any such religious difficulties as are experienced in England. In the southern portion of the kingdom the rival sects have such well-defined differences as to render religious instruction under a general system quite impossible, and to make secular instruction without religious teaching equally as distasteful to them all. But the Independent or Anti-burgher, the Free, and the Established Churches of Scotland have the same catechism and confession of faith, and only dispute upon matters of Church government, discipline, and patronage. But these disputes are, unfortunately, very bitter, especially among the adherents of the Established and Free Churches, who partake in a manner which is perhaps very natural, but very intelligible, but which is, nevertheless, very deplorable. The question of the education of the people has thus become as tender a one in Scotland as it is in England, and the result is, as stated by the Lord Advocate in the House of Commons on Wednesday night, that, out of 600,000 children who ought to be receiving education in that portion of the kingdom, no means of education are provided for at least 300,000. In ten years these 300,000 children will have grown up to manhood and womanhood unable to read or write. We agree with the Lord Advocate and with Lord Melgund, that the prospect is appalling. Lord Melgund, to whom the friends of popular enlightenment are under great obligations for the ability as well as the zeal which he has displayed, introduced a measure at the commencement of the present session, drawn up after long and patient investigation, of which the object was to diminish this crying evil. It passed its first reading by a small majority, and came before the House a second time on Wednesday. His Lordship presented an array of facts which was quite irresistible in support of his measure, in which he showed, not only that there was a deficiency of schools, but that many of the existing schools were of the worst description—not fit to be called schools at all, and not fit to be compared, for the quality of instruction or the capacity of the teachers, with the schools established in the workhouses and the prisons. His Lordship's plan was a purely permissive act, giving the people of the town the power to rate themselves for the establishment of schools for the religious, or, if they preferred the latter alternative, for the merely secular education of the people. These schools were to be locally governed and managed, and to admit no test of religious exclusion against competent teachers. The facts stated by his Lordship were generally admitted and deplored, even by the opponents of the bill. It was shown beyond the possibility of doubt, however much men may differ as to the new machinery which is to be employed, that the old has failed in its purpose, and that a scandal exists among a Christian people, which must by some means or other be removed. The Government, in the persons of the Prime Minister and of the Lord Advocate, supported the principles of Lord Melgund's measure without pledging themselves to all its specific details. The speech of Lord John Russell upon this occasion was worthy of his former name and career. In replying to the allegation of Sir Robert Inglis, that the ancient parochial schools had effected much good, his Lordship was just as well as brilliant. "I quite agree," he said, "in the panegyric which the hon. member for the University of Oxford has pronounced upon the schools of Scotland, for I think they have been extremely useful and beneficial. I should have also agreed with the honourable member if he had pronounced a panegyric on the turnpike-roads of England, or the ancient oil lamps which formerly illuminated our streets. They were both great improvements over the former state of barbarism and darkness in which we lived; but I do not see why we may not improve in our day, as our ancestors improved in theirs."

The House of Commons, however, seemed to think otherwise. A majority of 137 against 124 decided in favour of the old oil lamps and semi-darkness, and against the full daylight which Lord Melgund and the Government were willing to provide. But, notwithstanding the result, there is good reason to hope that the subject will, in consequence of this discussion, become sufficiently urgent to force attention at a future time. The very statement of the case is a public benefit; and when the facts are admitted with sorrow and shame, even by those who oppose the remedy sought, there is reasonable ground to believe, that, sooner or later, a system of popular education will be devised which shall be more religious and useful, and less sectarian and worthless, than the half systems and no systems that are now prevalent, not only in Scotland, but in a more populous and important portion of the empire.

HER MAJESTY'S VISIT TO THE CITY.

HER MAJESTY having graciously consented to be present at a grand entertainment to be given at the Guildhall on Wednesday, July 2, in honour of the Great Exhibition, the Court of Common Council, on Wednesday last, agreed to expend £5350 in fitting up the Guildhall for the occasion, and in providing a suitable banquet

The invitations are to include her Majesty's suite, the foreign ambassadors and ministers, the great officers of state, official personages, members of the Houses of the Lords and Commons; other distinguished personages specially invited, the Royal and foreign commissioners, jurors, British and foreign, superintendents of exhibiting departments, architects, heads of literary and scientific bodies, officers of the corporation, and other visitors, in all about 2100 personages, exclusive of the members of the corporation and their ladies.

CONVERSAZIONE AT THE MANSION-HOUSE.

On Wednesday evening, the whole of the state apartments at the Mansion-House were thrown open to a brilliant circle of rank, science, beauty, and fashion, such as is seldom seen collected under one roof, even in the great metropolis. The arrivals were incessant from nine to half-past ten o'clock, by which time every available corner of the civic palace was crowded to suffocation. The Egyptian Hall was brilliantly illuminated, and arranged as a concert-room, in which was performed a concert of English music, and we need hardly add that it formed the great point of attraction. In the ball-room were laid out various objects of interest contributed by friends of the Lord Mayor, among which were beautiful models of ships from the Admiralty, electro-plate from Messrs. Elkington's, the beautiful and novel glass globes which now figure so frequently at public entertainments, some fine specimens of enamelled glass, and last, though not least in interest, a rare and curious manuscript chronicle of French history, sent from the City archives by the Guy Remembrancer. In other parts specimens of the armour, and suits of armour from various quarters; in short, nothing was wanting to give colat to the welcome which our worthy chief magistrate dispensed to his distinguished foreign and English guests. Between half-past 10 and 11 o'clock the scene was gay and attractive to an extraordinary degree, the number of foreign and specially Eastern costumes giving quite a pictorial character to the groups, or rather crowds, which one met in every quarter. There were about 1800 present.

Among the arrivals were the Earl and Countess of Rosse, Earl and Countess of Ennisdillen, Earl of Harrowby, Lord Ashburton, Lord and Miss Campbell, Earl and Countess of Lovelace, Count Pulsky, Baron Brunnow, Baroness Rothschild, Alderman Wire, Sheriff Nutia Bey, General Pennisel, Sir I Deane, Mr. Justice and Lady Talfourd, Sir P. and Lady Egerton, the French Chargé d'Affaires, M. Marascalchi, the Bavarian Minister, Baron de Cetto, a host of foreign Commissioners, all the jurors at the Exposition, M. Thalberg, Ismail Hamed, Egyptian navy, Sir J. Clark, Sir R. Murchison, Dr. Locock, Viscount and Viscountess Hereourt de Thury, Sir Baldwin and Lady Walker, Mr. Croften Croker, the Chevalier Lenehan, Professor Ansted, Mr. and Mrs. Wentworth Dilke, Hon. M. D. Isaacs, Lord and Lady Colborne, the American Minister, &c. The company began to depart shortly after the concert, but great numbers protracted the reception mnil nearly 12 o'clock.

THE ILLUSTRATED LONDON NEWS.

POSTSCRIPT.

HOUSE OF LORDS.—FRIDAY.

MARRIAGES IN AUSTRALIA.

The Duke of ARGYLL presented a petition from Australia complaining of the present state of the law of marriage in that colony. It appeared that by an ancient law of England all marriages that were not celebrated by a "massed priest" were invalid; and it had been some time ago decided by the judges that no Protestant clergyman, except those connected with the Established Church, could come within designation. He left it to the right reverend prelates that House to decide how far that decision accorded with their view of the subject. The consequence of that decision was, that marriages celebrated by Presbyterian clergymen throughout the British empire were invalid. An act had been passed by which those marriages had been declared legal in Ireland, but that act had not been extended to the colonies, and the petitioners prayed for a removal of that grievance.

Earl CARE admitted that it was desirable to amend and further define the law upon the subject; but the colonial legislature could introduce that amendment. It must be remembered that any marriages which would make a legal according to the laws of the country in which they were celebrated would be legal in this country.

Lord CAMPBELL thought that the prayer of the petition was a reasonable one, and expressed a hope that the Imperial Legislature would interfere for the settlement of that matter.

Lord MONTEAGLE presented a petition from Australia, complaining of the continuance of transportation.

Some bills on the table were forwarded a stage, and their Lordships adjourned.

HOUSE OF COMMONS.—FRIDAY.

BUSINESS OF THE HOUSE.

Lord J. RUSSELL, in moving that the House at its rising should adjourn until Thursday next, stated the course which he proposed public business should take after the Whitsuntide holidays. On Thursday next he would move the Committee of Supply on the Navy Estimates, and to consider the plan respecting the retirement of Admirals. After which he would move the votes connected with the expenses of the Kaffir war. On Thursday and Friday also he would proceed with the consideration of the miscellaneous estimates, and on the following Monday he proposed to go on with the second reading of the Customs Bill and the Repeal of the Window Duties Bill. On the following Friday he would proceed with the Ecclesiastical Titles Assumption Bill.

The motion of adjournment until Thursday was agreed to.

INCOME AND PROPERTY TAX COMMITTEE.

On the order of the day for resuming the adjourned debate on this motion, Mr. HUME complained of the difficulties he had met with in endeavouring to appoint this committee, owing to the opposition of some hon. members, and the backing out of others from the duty of serving. The public would find it difficult to understand these difficulties in nominating a committee, more particularly as Lord John Russell had withdrawn the name of the Chancellor of the Exchequer after having in the first instance given him permission to serve. He thought hon members ought to be obliged to serve when nominated on public as well as on private committees, and he should, therefore, move that the Chancellor of the Exchequer be added upon the said committee.

The CHANCELLOR of the EXCHEQUER did not think it quite fair that he should be the only person acquainted with finances who should be placed upon the committee, more particularly as he had opposed the appointment of the committee, from the labours of which he expected no beneficial results. He also thought an unfair preponderance was given in the committee to those who were in favour of a modification of the income tax. He had no wish to serve on the committee, and would not object to serve if it should be properly constituted, and he would therefore recommend Mr. Hume to postpone his name until the rest of the committee were chosen.

After a short conversation, the question of the nomination of the committee was postponed to Friday next, Mr. HUME saying that he would leave the motion in the hands of the Government.

ECCLESIASTICAL TITLES ASSUMPTION BILL.

The House went into committee on this bill, and the remainder of the evening was passed in discussing the amendments on the second clause. Adjourned.

ASCOT RACES.—FRIDAY.

SWEEPSTAKES of 20 sovs each.—Convulsion, 1. C by Cotherstone, out of Layla, 2.

FIRST Class of the WOKINGHAM STAKES.—Cane, 1. Sir Rowland Trencher, 2.

SWEEPSTAKES of 50 sovs each.—Telegustion, 1. Entre Nous, 2.

Second Class of the WOKINGHAM STAKES.—Strength, 1. The Old Fox, 2.

The BOROUGH MEMBERS' PLATE.—Emily, 1. Repleion, 2.

LATEST FOREIGN NEWS.

FRANCE.

The accounts of yesterday (Friday) from Paris are of little interest. The Minister of the Interior presented a bill in the Assembly yesterday, for a renewal of the law prohibiting political clubs from meeting for one year, the previous law being about to expire. The Minister demanded urgency for the bill.

The Paris police have discovered the presumed author of the outrageous Socialist bulletins which excited so much attention a short time back. He is a person who filled the post of secretary to Mr. Sobrier, and is suffering punishment for his attempt on the 15th of May, 1848, with a gang of ruffians, to seize the Minister of the Interior.

The police arrested on Wednesday, at a place near Paris, ten persons connected with Socialist conspiracies. Some papers were also seized. It is said that seizures of arms have been recently made.

Acts of incendiarism have taken place in the department of the Côte d'Or.

BELGIUM.

For some time past there has been a Ministerial crisis in Brussels, which has been terminated this week by the King refusing to accept the resignation of Ministers, and they have accordingly resumed their official duties.

THE GREAT EXHIBITION.

THE continued fine weather has brought its thousands of visitors to the Crystal Palace, though Friday, the 30th ult., the first day at half-a-crown, was by no means so crowded as might have been expected at the intermediate rate. Saturday being the Queen's birthday, the drawingroom presented its attractions to the aristocracy; the field-day at Woolwich to the strangers in town; and so, for the first Saturday since its opening, the Exhibition was by no means crowded, the numbers being about 16,000, and the receipts amounting to £1772.

On Monday the vicinity of Knightsbridge was all alive at an early hour, and for a short period previous to the opening of the doors to the public, the crowding of omnibuses and cabs from Hyde Park-corner to Sloane-street was a sight worth seeing from the top of an omnibus. So admirably, however, are all matters arranged, and so management is there in the visitors, however numerous, that no inconvenience appears to arise, whatever may be the crowd, and the doors are no sooner opened than the assembled hundreds are quickly absorbed and distributed through the vast area.

Speculations as to the numbers to be present next week are as rife as usual. That a great deal will take place from the country, and more particularly from the manufacturing districts of the north, cannot be doubted; but, with the experience of the past, the authorities are quite confident that all will go well. The truth is, that great numbers of those who attend early quit the Building by two or three o'clock, and it has been ascertained that there is a full third of the space of 2000 per hour. It is, therefore, a question of continuous circulation, rather than the capacity of the Building to contain a given number.

On Saturday last her Majesty met a portion of the exhibitors who were specially invited to attend. We think that a smaller number at one time would be better, as it is too much to expect that the Queen can visit and listen to remarks of some three hundred exhibitors in one morning, all of whom are nervously anxious to make the most of their opportunity, and many must, therefore, be disappointed. The distribution of rewards that Saturday embraced the South and North-western Galleries, in which the raw produce in the vegetable kingdom, the chemical products, models of civil engineering and architecture, philosophical and musical instruments, and miscellaneous articles are arranged. The excitement amongst the exhibitors was very great; one of them actually fainted therefrom; and the kindness and affability with which her Majesty conversed with those whose productions interested her was a source of great gratification.

To-day the machinery department is to be explored; the various inventors and exhibitors being invited to explain their varied and highly interesting contributions to the Queen and Royal party.

The business of the jurors progresses, but the amount of labour is so enormous that it must be some time before it can be brought to anything like a conclusion. We hear that the foreign jurors and commissioners, despite a little soreness at the contest, in consequence of the determined punctuality of the Royal Commission and Executive Committee in the matter of the Exhibition, are now delighted with the reception their claims have met with at the hands of those whom they looked upon, in many instances, as grasping and selfish rivals. The manner in which the whole of the business has been conducted, the kindness, consideration, and hospitality they have received, has impressed them with a high sense of the English character, which in itself will prove no mean element of future good-will.

Messrs. Truman, Hanbury, Buxton, and Co. have arranged for the whole of their workmen and 2000 in number to visit the Crystal Palace, giving them two days holiday for that purpose, and a half-crown on each day towards their expenses. The Directors of the Iron and Citizen Steam-boat Companies have also arranged to give their men (above 500 in number) a holiday, to visit the Great Exhibition, and have provided them with their expenses for the same.

The Surgical Instrument Makers' Committee of Exhibitors dined at the Artichoke Tavern, Blackwall, on Wednesday evening. Mr. Philip, of St. James's-street, presided, and was supported by Messrs. Williams, Biggs, Ferguson, Gressmith, and Simpson (members of the committee), and others connected with the trade.

EPITOME OF NEWS, FOREIGN AND DOMESTIC.

His Royal Highness Prince Albert has contributed £25, and his Grace the Duke of Sutcleuch £20, to the Nelson Memorial Fund.

His Royal Highness Prince Albert, when inspecting Mr. Martin's new picture, "The Day of Judgment," on Tuesday last, was graciously pleased to signify his desire, through the Hon. Colonel Grey, to purchase Mr. Martin's picture of "Moses viewing the Promised Land."

By a decision of Vice-Chancellor Sir J. Knight Bruce, on Tuesday, Richard Henry Christian Hutchins, son of a Sussex gentleman who married in Calcutta, but who has for some time been a cripple, and an inmate of the Brighton Workhouse, has been declared entitled to a sum of £2184 os. 6d., and interest, under the will of a maternal great uncle, a person of "Chec-chee" extraction.

On Saturday last the Protectionists of Hampshire, to the number of 500, entertained Mr. G. F. Young, in St. John's Room, Winchester: F. W. Fleming, Esq., in the chair.

Arrangements have been entered into by the trustees of the docks of Birkenhead and the Dock Warehouse Company to co-operate for carrying on the outer works of the docks on the plans of Mr. Abernethy, C.E. We congratulate the promoters of Birkenhead on the important prospect these arrangements foreshadow, that a deep-water entrance, and of to the exigencies of the times, will speedily be obtained.

At the last Chester assizes, Thomas Smith, J. Feehan, James Haggarty, and Matthew Griffin, with another prisoner, since discharged, were convicted of a riot at Birkenhead, and sentenced to twelve months' imprisonment. A petition praying for a mitigation of the sentence received 17,000 signatures in one day. It was presented to Sir George Grey by J. A. Roebuck, Esq., Sir George Stephen, and the Earl of Arundel and Surrey. Upon considerat on of the whole facts of the case, her Majesty the Queen ordered the immed ate discharge of the prisoners.

The Duke of Wellington has abated the rents of his Strathfieldsaye estates. He Grace inquired of the steward if he had made any abatement of the rents, and the steward replied that he had not, for he considered the rents well paid cheerfully, without asking for any reduction. The Duke replied, that was the very reason why the abatement should be made, and he directed that it should be made on the last, as well as on the rentals of the current year.

By a "concordat" just terminated between the Crown of Portugal and the Holy See, the Goa prieats are to have no jurisdict ... whatever within the British territories the Archbishop of Goa is to remain in the only one that is at present in charge of the temporalities, and may be exempted from the bonds over to Dr. Carew, Roman Catholic Bishop of Cashel.

A return procured by Sir R. Hall shows that the Bishop of Exeter holds, with the bishoprick, in commendam, the treasurership of the cathedral, with a canonry, and the rectory of Shobrooke. The value of the former is £1199, and of the latter, £580. Besides which he has a stall in Durham Cathedral, which averages about £3600 a year. There are 43 preferments in the diocese, ranging from £20 to £1000 a year.

A meeting of influential gentlemen and tradesmen of the diocese of Exeter, members of the Church of England, was held on Saturday, at the Athenæum, to protest against the Synod proposed to be held by the Bishop of Exeter on the 25th inst.: Sir John Kennaway, Bart., presided. A form of protest was unanimously adopted, and a committee was appointed to procure signatures, and take the necessary steps for its publication.

The Parliamentary Committee on steam communication with India, China, and Australia, have decided by a majority of 11 to 8 in favour of the route to Australia by the Cape, as being the most desirable for the transport of the mails.

A Parliamentary paper, printed at the instance of Mr. Alderman Copeland, contains a return of the names of all persons, being collectors of the assessed taxes, and assessed taxes, who have been in default from the 1st of January, 1848, to the 31st December, 1850. It appears that the total number of defaulters is 77; namely, 43 on account of income-tax and 34 on account of assessed taxes. In the majority of cases no security was given by the collectors, and in several instances the arrears, or a portion of them, have been recovered from the collectors themselves. The total amount of default during the three years did not exceed £20,000.

The *Edinburgh Witness*, a strong Free Kirk and dissenting newspaper, in reviewing a book entitled "Church Polity," by Mr. A. C. ... takes the following candid admission. The result, probably, of the difficulty the Free Kirkites experience in "raising the wind:"—"Dry-as-dust disquisitions on the voluntary principle are now behind time. Sensible people are now beginning to see that Mr. Voluntary Principle—the enemy of all other principles—is but an unprincipled impostor."

A monster pike was captured on Thursday week, by Mr. Wilson Tyson, of Hawkshead, whilst trolling opposite the Rag Point, Westmoreland. This is the third which has been taken within the present month, and weighs 20 lb., being the largest yet taken in a quarter of a pound.

The *Calcutta Englishman* quotes a paragraph from a Sydney paper of February last, to the effect that two vessels had been lowered, and an accidental explosion of the powder on board April, about 100 miles off Penang. The ship *Adelaide*, a British vessel, Captain Lovett, was completely destroyed, and the vessel in company saw the rapid progress of the flames, but were compelled to leave, as their private property lay behind them.

Great efforts are making in the United States, to induce Jenny Lind to visit California, and letters received from Mr. Barnum induce the belief that the object may be effected.

Accounts to the 16th of March, from the Sandwich Islands, report aggressive movements of the French, to repel which the King (Kamahamaha) and Government were about to appeal to the American people. The French authorities had threatened to destroy the fortress and blockade the port, unless the whole treaty demands were not repealed; they also demanded a seat in the Cabinet, and that in future all the official correspondence of the island should be carried on in the French language. The Cabinet will not assent to any one of the demands.

Galveston (Texas) letters contradict the reported death of Wild Cat, the Seminole Chief.

Lieutenant-Governor Hamilton is appointed to administer the government of Barbadoes and the Windward Islands, in the place of Sir William Colebrooke, the Governor-in-Chief, during his leave of absence. Joseph Pope, Esq., is appointed treasurer of Prince Edward's Island.

George Poles, Charles Young, W. Swabey, J. Warburton, J. Pope, W. Warren Lord, J. Jardine, E. Whelan, and Stephen Rae, Esqrs., are appointed members of the Executive Council of Prince Edward's Island.

Mr. Richard Barnett, the extensive draper, in the Piazza, Covent-garden, has, with a praiseworthy liberality, presented the charity-scholars of St. Paul's, Covent-garden, with 1s. 6d. for each child, and 2s. 6d. for each teacher, to enable them to visit the Crystal Palace.

On Sunday evening, Mr. Drew (a brother of Mr. Drew, dentist, St. James-street), residing at Chatham, in crossing the rails from the platform at Wouldham station, slipped down, and a train of empty carriages passing over him, killed him on the spot.

In the gardens of the Royal Hospital, Chelsea, will be held, on the 4th and 5th June for the benefit of the Hospital for Consumption, Brompton, hitherto unknown in this country, and consisting of the bands of the 3d and 42d Highlanders, and of the Royal Artillery, which, for the first time, will be formed into one corps, and perform together.

The *Giornale di Roma* of the 17th ult. publishes a sentence of the Supreme Tribunal of the Sacred Consulta, condemning Pietro Ercoli, aged 34, to the galleys for 20 years, for having, on the night of the 10th of May, attempted to prevent one Luigi Cianniui from lighting a cigar he wanted to smoke; that the Tribunal, after having heard the witnesses, and delivered the said accused to the Propaganda of Mazzini, has assumed.

On Saturday, a Highland ox, weighing 140 stone, bred and fed by Sir Thomas Acland Knight, of Beechwood Park, Herts, and selected by the celebrated cattle judge, Mr. Torr, of Aylesbury, was roasted whole in the Prof ssor of Agriculture's Symposium, in commemoration of her Majesty's birthday, amidst an immense concourse of the nobility and gentry. The evening terminated with a series of pyrotechnic illuminated *tableaux*.

The Mayor of Limoges is about to place bronze plates, with appropriate inscriptions, on the houses in that town in which the Chancellor d'Aguesseau, Marshal Jourdan, and Marshal Bugeaud were born.

A letter from Hobart Town states that Mr. Meagher the Irish political exile, was about to be married to Miss Bennett, daughter of a farmer near New Norfolk.

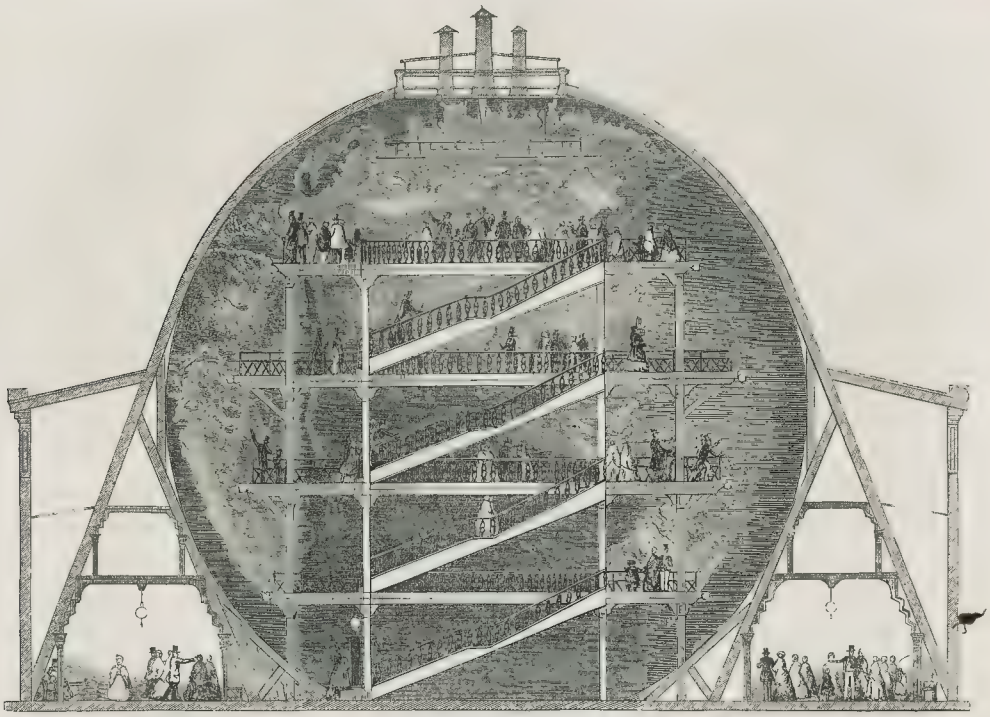
On Saturday afternoon, during the crowded promenade, M. Schweitzer, a Swiss gentleman, was thrown with great violence from his horse, and stunned, in addition to other injuries, a very severe and complicated case found fracture of the arm. Two medical gentlemen, Mr. Garrett and Mr. M'Cann, were fortunately present, and promptly rendered every assistance, and it is hoped that the limb may be saved. Mr. Schweitzer is a son of one of the wine merchants of Vevay, and has been a pupil of Mr. Crocker, at Drimpton, was discovered to be on fire. The inmates had with such terrific fury, that before it could be subdued four cottages were consumed. The fire was caused by an incendiary.

The Duke of Leinster has recently let several large farms in Kildare (Ireland) to Scotch farmers, and upwards of a dozen of the new settlers are located between Athy and Castledermot. Near Roscommon there are three Cheshire farmers located; their farms adjoin, and are about 100 Irish acres each.

The following paragraph, under the head of "mesmerism," appears in a Dublin paper:—"It may be in the recollection of our readers, that Sir Philip Crampton, some time since, in order to test the powers alleged to be possessed by persons in what is called the clairvoyant state, professed by the mysterious influence of mesmerism, offered to enclose a bank note for £100, in a sealed envelope, which should become the property of any individual who could, while blindfolded and in the mesmeric sleep, tell its date and number. This challenge has been accepted by Mr. Hill H. Hardy."

ASCOT RACES, 1851.—SKETCH ON THE ROAD—STAINES BRIDGE.

ILLUSTRATED LONDON NEWS NEWSPAPER PENNY



MR. WYLD'S MODEL OF THE EARTH.—SECTIONAL VIEW.—(SEE NEXT PAGE.)

ASCOT RACE PLATE.

THE three Cups, or groups, contended for in the past week, at Ascot, are fine specimens of modelling and construction, and will support the reputation of their respective artists.

The principal prize, the EMPEROR OF RUSSIA'S VASE, is modelled by Mr. Cotterill, and manufactured by Messrs. Garrard, goldsmiths to the Crown, Haymarket. It is a shell-shaped cistern, or wine-cooler, supported on scrolls, which rest on a base of ebony, the surmounting group being a sledge attacked by wolves. The composition is remarkably fine, and the execution alike meritorious.

The QUEEN'S GOLD CUP is by the same artist and manufacturers. It is a group of travellers in the desert, at their place of repose for the evening, a camel and its driver, and a Turkish horseman, whose Arab steed is displaying his characteristic antipathy to the camel.

The ROYAL HUNT CUP, the third prize, is from a design of Mr. A Brown, manufactured at the establishment of Messrs. Hunt and Roskell (successors to Storr and Mortimer), New Bond-street, goldsmiths and silversmiths to her Majesty. It is a cup of the Italian school, and is surmounted with a Highland deer-stalker and his dog: the vase is decorated with oak, and bears a group of stags; and at the foot are a blood hound, staghound, and greyhound. The whole is cleverly modelled, and ably executed in silver.

THE ROYAL HUNT CUP

ASCOT HEATH RACES.

TUESDAY.

From the outline of the engagements for the week published on Monday, it was evident that the prospects of the meeting in respect of sport were barely up to the Ascot standard; and, in particular, that the attractions of the third and last days were materially lessened by the withdrawal of the Flying Dutchman and Voltigeur from the Emperor's Plate, and the discontinuance of the Great Western Railway Handicap. With the provision for the first day (always the best of the four) no fault could be found; as, allowing for the probability of small fields for three or four races, it included many events of interest. The meeting commenced most favourably as regarded weather, and with an *éclat* which the presence of her Majesty alone could have given.

The Court movements have always been so remarkable for punctuality, that some little surprise was manifested at the non-appearance of the Royal cortège at the entrance of the new mile until a few minutes of the time fixed for the first race - half-past one. It consisted of nine carr iages-and-four, preceded as usual by the Master of the Buckhounds and the Royal huntsman, and was attended by the usual retinue of mounted servants. In the carriage with the Queen were the Princess Royal, the Duchess of Saxe-Coburg-Gotha, and Prince Alexy of the Netherlands. Prince Albert followed in the next, with the Prince of Wales, the Duke of Saxe-Coburg-Gotha, and the Duke of Cambridge. In the other carriages were the Prince of Leiningen, the Dukes of Devonshire, Norfolk, and Newcastle, the Marquises of Westminster and Abercorn, the Countess of Desborough, Sir George and Lady Grey, Lady Olivia Grosvenor, Lady Adelaide Seward, Lady Constance Gower, Lord William Powlett, and the Lords and Ladies in Waiting. It is scarcely necessary to add that her Majesty's reception was loyal and affectionate. It was graciously acknowledged

The Grand Stand, which has undergone several improvements since last year, one of the most important being the raising of the lawn so as to admit of a much better view of the racing than heretofore, was very fully and fashionably attended. We noticed in it and in the smaller stands appropriated to the stewards of the races and the Jockey Club the following influential members of the aristocratic and sporting circles :- His Excellency the Swedish Min ster; Dukes of Rutland, Richmond, and Buccleuch; Marquises of Exeter, Waterford, Ely, Stafford, Drogheda, Kildare, Worcester, and Clanricarde; Marchioness of Salisbury, Drogheda, Stafford, and Kildare; Earls Zetland, Granville, March, Eglinton, Uxbridge, Strafmore, Strathmore, Chesterfield, Wilton, Easton, Mansfield, Grosvenor, Cardigan, Glengall, Durham, and Airlie; Countesses Granville, March, Eglinton, Strafmore, Chesterfield, and Wilton; Viscount Canterbury, Combermere, Clifden, Torrington, Enfield, Villiers, Lascel es, Cranley, Newport, Newark, Anson, Dungarvon, Exmouth, and Emlyn; Viscountesses Cranley, Torrington, Enfield, Newport, Emlyn; Lords Stanley, Robert Pelham, Clinton, Robdeadin, Burleigh, H. Gordon Lennox, G rge Paget, Villiers; Ladies Bateman, Elizabeth Lascelles, Burleigh, Elizabeth Grey Egerton, &c. . Hon. Messrs. S. Herbert, R. Boyle, H. Pitt. Captain Ross, Frederick Villiers, Francis Villiers, James Macdonald, Lascelles, A. Hood, G. Anson, G. Barrington, W. Bagot, Cecil Forester, — Petre, F. Lave-on. C. B. Philips, S. Lawley, &c. ; Hon. Mesdames White, Melville, G. Anson, A. Villiers, S. Herbert, Phipps, &c ; Sirs J. Hawley, W. Fraser, W. W. Wynn, W. Codrington, G. H. Beswal, Colonel Peel, Colonel Newton, Colonel Wyndham, &c.

It will be seen from the above list that the display of "rank, beauty, and fashion" was worthy of Ascot. We cannot speak so well of the general attendance, which, it must be admitted, was below the average. The receipts at the Stand were the greatest ever known on the first day.

THE QUEEN'S GOLD VASE.

Immediately after the arrival of her Majesty racing commenced, and proceeded up to the Ascot Stakes, which was not run until near four o'clock. Immediately after its decision, the illustrious party in the Royal Stand departed for Windsor Castle. Five races succeeded the Handicap, and about half past six a long and most excellent day's sport was brought to a close. The following are the results :—

The Trial Stakes of 5 sovs. each, and 50 added.—Mr. Death's The Moor (W. Abdale), 1. Capt Archdall's Sphynx (Richards), 2.

The Gold Vase given by her Majesty, added to a sweepstakes of 20 sovs. each. —Mr. Greville's Cariboo (Flatman), 1. Lord Exeter's Little Jack (Johnson), 2.

The Produce Sweepstakes of 50 sovs each —Sir J. Hawley's Morry Peal (J. Marson), 1. Lord Caledon's Aston Smith (Marlow), 2.

The Ascot Stakes of 30 sovs. each.—Sir J. Hawley's Vatican (Flatman), 1. Lord Wilton's Herbert (Crouch), 2.

The Ascot Triennial Stakes of 10 sovs each, and 100 added.—Duke of Richmond's Red Hind (Kitchener), 1. Mr. A. Scott's Sorceress (Templeman), 2.

The Ascot Derby Stakes of 50 sovs each. Lord Exeter's Pitsgethon (Marlow), 1. Sir J. Hawley's the Ban (J. Marson), 2.

The Second Ascot Triennial Stakes of 10 sovs each, with 100 added.— Lord J. Scott's Miscrims (Whitehouse), 1. Lord Eglinton's Cnsus (Marlow), 2.

The Welcome Stakes of 20 sovs each.—Mr. Powney's Lamartine (A. Day), 1. Mr Neville's Artisan (F. Butler), 2.

Sweepstakes of 50 sovs each.—Lord Dorchester's The Chase (A. Day), 1. Mr. Payne's Hurwata (Flatman), 2.

WEDNESDAY.

To-day there was a very fair show of fashionable company in the Grand Stand, including his Royal Highness the Duke of Cambridge. The subjoined description of the racing will show a very satisfactory "total," a large field for the Hunt Cup, and a sequence of five "cups" in favour of the fielders :—

The Fernhill Stakes of 15 sovs. each.—Mr. Magenis's Sorcerer (Bartholozow), 1. Mr. Greville's Adine (Crouch), 2.

Sweepstakes of 18 sovs. each.—Mr. Thomas's Cornelius (Flatman), 1. Mr. Howard's Prestige (A. Day), 2.

The Royal Hunt Cup of 300 sovs —Mr. H. Robinson's Sir Charles (H. Grater), 1. Lord Clifden's Longbow (Flatman), 2.

The Coronation Stakes of 100 sovs. each.—Mr. Greenville's Barcelona (Flatman), 1. Sir J. Hawley's Merry Peal (J. Marson), 2.

Plate of £70 (Handicap) — Mr. Meagan's Louis Philippe (Mahon), 1. Mr. Hughes's b f by Cowl out of Celandine (Cowley), 2.

His Majesty's Plate of 100 guineas.—Mr. Arnold's Pitsford (A. Day), 1. Captain Lowther's King Charming (G Sharp), 2.

The Windsor Town Plate of £50.—Lord Exeter's Prosiaw (Norman), 1. Mr. Armstrong's f by Ambassador out of Matilda (Osborne), 2.

THURSDAY.

If the list of racing for to-day fell somewhat short of that of Tuesday, it was still satisfactory in quantity, though we cannot say much for the quality.

The Queen and Royal party arrived on the course shortly before half-past-one o'clock, the procession consisting of six carriages and four, and four pony phaetons. Her Majesty and his Royal Highness Prince Albert were loudly cheered, both on their arrival on the course and on their appearance at the window of the Royal Stand with the Royal children. At two o'clock the first race of the day -that for the Visitors' Plate—came off, and was almost immediately followed by that for the Emperor's Plate. There was but little betting, owing to the uncertainty existing with regard to Russborough, which it was known that Lord Eglinton had been in treaty for, but it was not known until within a few minutes of the race that the offer had been declined, and the horse would not run. Of the race itself, all that need be said is, that Woolwich waited on the favourite until within the distance, and won cleverly by a length. For the New Stakes, twelve came to the post, Brother to Ethiron winning easily by a length. To this followed the £70 plate immediately after the running for which Her Majesty took her departure, amidst hearty plaudits. The "Queen's weather," as it has been styled, did not hold good to-day, for immediately after the cup was run for, the rain began to come down, and never ceased till the close of the races, at half-past five—the course looking like a forest of umbrellas, and the formation of a regular betting ring rendered impossible. The fashionables present were very numerous, and the races of the day were got through as satisfactorily as possible. The following is the return of the races :—

The Visitors' Plate.—Nious, 1. Artisan, 2.
The Emperor's Plate.—Woolwich, 1. Little Jack, 2.
Sir James Emerald Stakes.—The Ban, 1. Midge, 2.
The New Stakes.—Brother to Ethiron, 1. Grey Tommy, 2.
Plate of £70.—Flare-up, 1. Despair, 2.
Sweepstakes of 50 sovs each.—Pilegrim, 1. Pilegra, 2.
The Stand Plate.—Prosiaw, 1. Joe Muggins, 2.

NATIONAL SPORTS.

To the cosmopolite gathering at Epsom, and the Royal and aristocratic *réunion* at Ascot, will succeed a meeting of a very different character on Monlsey Hurst, on Wednesday and Thursday next. It is essentially for the "million," and affords a treat for man and beast, without those restraints which prevail at most other places. We see every reason to anticipate better racing, and more of it than usual. The other meetings are, Epping, on Monday; Manchester, with a good list, on the same days as Hampton;—Sandown arrangement; Congleton, on Wednesday; Southwell, on Thursday; and Kulghton, on Friday

Cricket Fixtures.—Monday, an All England match at Lord's; and matches at Streatham and Derby. Tuesday, a match at Wolverhampton; Wednesday, matches at Westminster (Household Troops) and Sevenoaks; and Thursday, at Bromley and Kennington Oval.

Aquatics.—On Tuesday, the Royal London Yacht Club match from Erith to Chapman Head and back; and on Saturday, the Isleworth regatta.

TATTERSALL'S

Monday.—Business was too dull this afternoon to require more than a return of the market prices :—

ASCOT STAKES

6 to 5 agst Vatican (t)	8 to 1 agst Alderaman	10 to 1 agst Chearful

	40 to 1 —— Hamdreweed (t)		
	13 to 1 agst Exeter (t)	15 to 1 agst Mountain Deer	

ETON REGATTA.

This brilliant and animating affair, so interesting to Etonians, came off on Wednesday, with more than ordinary *éclat*.

Early in the morning, the Ait, boats, barges, and wharfs were decorated with royal standards, union-jacks, and elegant banners, of every hue and device, and the river above bridge was alive with craft of all sizes and sizes. The sociability and gaiety from all parts of the kingdom were continually arriving throughout the day.

At half-past six o'clock, a little before the time of the starting of the boats for Old Surley, the Brocas was crowded with fashionables.

Shortly before seven o'clock the Eton Montem Prince Albert unexpectedly rode into the Brocas, affording the highest gratification to all present.

At seven o'clock the boats left for Surley Hall in the following manner :—

UPPER BOATS.

Monarch, 10-oar.—Blundell, ma., captain of the boats; Mr. Trefusis, Graham Warre, Watson, Luttrell, Welby, Nevill, Byng, Legge. Freemantle, steerer.

Victory.—Meade King, second captain; Clive, Bridges, Antrobus, Barton, Gelen, Robertson, Johnson, steerer.

Prince of Wales.—Ewart, captain; Rolt, Arkwright, Earl of Lincoln, Lonsdale, Fitzgerald, Scott, ma., Prodgers, Gwynne. Holford, steerer.

LOWER BOATS.

Britannia.—Pemberton, captain of the lower boats; Mr. Fiennes, Clayton, Lord Norvey, Fletcher, Rendel, Chapman, Mynors. Lord E. Clinton, steerer.

Dreadnought.—Arbuinot, captain; Wigram, ma., Pinckney, Field, Tyssen, West, Radclyffe, ——, steerer.

Thetis.—Peach, captain; Blundell, mi., ——, Lloyd, Hencage, Whitley, Moore, Campion. Clough, ma., steerer.

St. George — Harding, captain; ——, ——, Parish, Sir B. Hamilker, Seale, Hayne, ——, ——, Barners. Mr. Bertie, steerer.

On arriving at Surly Hall, the gentlemen partook of an elegant repast, which was set out for them in a manner on the opposite shore; after which the boats were again manned in the same order they arrived, and the crews returned to Windsor Bridge, which they reached about nine o'clock, where a brilliant display of fireworks took place, and the company dispersed.

MR. WYLD'S MODEL OF THE EARTH.

The gigantic Globe of Mr. James Wyld, M.P., now opened in Leicester-square, is modelled on a scale of ten geographical miles to an inch horizontal, or six inches to a degree, and it is one mile to an inch vertical, the diameter being sixty feet. By means of a gradual ascent at different stages, this colossal figure of the earth, with its mountain and valley, sea and river, may be viewed from a moderate distance. The objects just mentioned are represented by numberless raised blocks, and castings in plaster, figured on the interior concave of the sphere, the fittings up of which must have been both difficult and expensive. The President of the Royal Geographical Society, in his late address, stated that Mr. Wyld was good enough to show and explain to him the whole of his undertaking, with which he was both surprised and pleased. "Recollecting that only a limited part of the sphere can meet the eye at once, it occurred to Mr. Wyld, that by figuring the earth's surface on the interior instead of the exterior of his g obe, the observer would be enabled to embrace the distribution of land and water, with the physical features of the Globe, in one view. And in this," added the president, "he has succeeded; from the great size, the examiner of details is hardly aware that he is gazing on a cavity. The attempt is well worthy of the projector and of the spirit of the age."

Little need be added to such high praise; but the last phrase reminds us that Mr. Wyld has himself recorded, that, "but for the Industrial Exhibit.on, his work would never have been undertaken. The congregation in London of the different nations and races of our empire and of the world of foreigners, has suggested for the first completion of a great model of the Earth's surface, and the realisation of a thought which had for many years occupied his mind." We are also informed, that, had time and the occasion permitted, and had obstructions not been offered by some of the inhabitants of Leicester-square, Mr. Wyld would have endeavoured, by the formation of attached galleries, classrooms, and museums, to render the institution still more available for the allied sciences of geography and ethnology; nor does he yet abandon the hope of being able to do so. What is already realised, however, is an important boon, and calculated to supersede to a great extent the inefficient use of maps.

On the first inspection, the observer cannot fail of being deeply impressed with the disproportion of land and water. "Once water was the world." Here are great oceans, covering 150,000,000 square miles, continents and isles occupying only 60,000,000. The immense expanse of water, in which the northern hemisphere is brought out in strong contrast with the wide-spread lands of the northern ; and the great chains of mountains, which are remarkable features of the Earth's surface, are shown to be ranged in a circle round the ocean and the Indian Sea. The water-shed, or river-course, of every country is laid down, and the great areas drained are exhibited—phenomena connected, of course, with the elevations and depressions of the land."

Mistakes are inevitable to be avoided, but the advantages of being now able to embrace at one view the whole of the globe. Much has still to be learned by this means. Mr. Wyld has well observed, that geographical science is still incomplete, and that, "after the labours of a life, the great Humboldt even has had to extend his studies, and in the "Cosmos" presents to us a further developement of his early essays. In the passage of the work alluded to through the process of translation, Colonel Sabine indeed found new matter still to be added, and further emendation to be still necessary; and Mr. Wyld is right in inferring that it may be asserted without presumption, that the "Cosmos" is even now in arrear of our advanced knowledge. The Globe in Leicester-square, therefore, will require to be constantly visited, and will repay the student for renewed investigation. We should counsel Mr. Wyld to procure lectures on the different topics suggested by its contemplation to be delivered at set periods, and in due course This gratuitous would at once raise the exhibition to the status of an institution.

THE THEATRES.

HER MAJESTY'S.

Mdlle Cruvelli appeared on Saturday night as *Norma*. After the versions of the character presented by Mdlle Jenny Lind, Mdlle. Parodi, and Madame Foremini, since the secession of Grisi, and the results of those successive attempts on public opinion, it was perilous policy to pursue for Mdlle. Cruvelli to risk the admiration; her reputation will, however, not suffer by the attempt, although it is a performance which will more assuredly net take the town by storm The talents of Mdlle. Cruvelli are great; but her style is in a state of transition; she has yet to moderate the very exaggerated tendency she exhibited on her first appearance three years since. She has all the elements to occupy the highest position, and she can well afford to be told that her defects can easily be corrected, if she will but study in the right model. Nature has gifted her with a rich, sonorous, and powerful voice of extraordinary compass; but she essays effects with this noble organ that she cannot achieve; the forces the higher notes of the register in harsh *roulades*, in order to make a cap-trap contrast with her contralto notes. Her vocalisation was most legitimate and pleasing in the *mezza voce* passages of tenderness; in the delivery of the lofter emotions she was less successful: to arrive at the happy medium between impetuosity and exaggeration is the *crux scl'entiæ* is the great secret of histrionic and vocal genius. Madame Cruvelli made one of the most splendid and sublime impersonations of the Pythoness, but marred the impression subsequently by over-ambitious coldness. The recitative lacked declamatory dignity; in the expression of maternal affection she was more tormented; and in the rich finale the denunciation of *Pollio*, "Oh! di qual sei la vittima," was given with more dragging irony than rapid bitterness, and therefore failed to excite the auditory. We object, also, to Mdlle. Cruvelli's attitude at the close of the finale, as a complete misconception; she points with one arm of defiance at the faithless Roman, and places the other hand on the head of *Adalgisa*, as if in the way of motherly protection and blessing. In the latter sentiment lies the part of the fiery Priestess of the Druids, who has just discovered that *Adalgisa*, whom *Norma* has released from her vows, is her successful rival! The head too much upraised and the arms too angularly whirled are defective gesticulation, usually modified and, generally, it may be suggested to Mdlle. Cruvelli that a more subdued reading will increase the force of her histrionic power.

Madame Guillani's *Adalgisa* was excellently sung; and in both duos, with *Norma*, she fully participated in the plaudits of the audience. She is an admirable musician; and, with a little more study of the characters, would be as effective in the *High Pyritone* as many *artistes* of infinitely higher pretensions. Fardini is deficient in power; otherwise there was much merit in his *Pollio*, for the music of which his compass and quality of voice are well. Lablache's *Oroveso* was full of dignity, his ponderous tones telling in the concerted pieces; his one exclamation, "Madre!" in the last scene, was sublime, and more powerfully truthful in sentiment and force than anything in effect than all the grandest and elaborate contortions of all the other *artistes* in the cast put together—such is the true force of histrionic genius.

The ballet of "Le Diable à Quatre," in which Carlotta Grisi dances so exquisitely, and mimes so eloquently and piquantly, concluded the entertainments, the house being quite crowded, and Cruvel l's impersonation having been honoured with every possible rapture. As there is a lull in the way by M. St. Georges and Taglioni, for Mdlle. Monti, would it not be a source of increased attraction if Carlotta Grisi could be included in the cast? Two such mimes as Monti and Carlotta Grisi are indeed rarely seen.

On Tuesday night there was a fashionable assemblage to witness Sontag and Lablache in Alary's "Tre Nozze." The pa.ks duo between these two great artists and the polka variations of the *prima donna* created the usual sensation. Her palacea was encored, as also the duo ("Barcarola") with Gardoni, and the trio with Guilini and Ida Bertrand. The ballet was the picturesque "L'Ile des Amours."

On Wednesday night, Beethoven's "Fidelio" was given, for the fourth time, with Mdlle. Cruvelli, Madame Guilani. Mr. Sims Reeves, Signori Coletti, Balanchi, Mercuriali, and Casanova; followed by the second, third, and fifth acts of Auber's "Gustave," sustained by Mdlle. Fiorentini, Mdlle Feller, and Mdlle. Caroline Dupree. Signor Casanova, Lorenze, F. Lablache, and M. Poultier. Amalia Ferraris danced in the Pas des Fées, in the ball-room scene.

On Thursday night, Donizetti's "Don Pasquale" was revived, Madame Sontag resuming her beautiful performance of *Norina*, and the brothers of basse appearing as *Don Pasquale* The piquant acting and brilliant vocalisation of Sontag, and the unctuous humour of Lablache, render this work one of the most popular operas in the repertory. To appreciate the high artistic intelligence of Lablache, it is only necessary to contrast his *Don Pasquale* and *Baron d'Acetos* ("Tre Nozze") ; similar as the two characters are, he presents them under two totally different aspects. The last act of "Lucia," with Mdlle. Caroline Dupree and Mr. Sims Reeves, a selection from "Esmeralda," with "Les Cosmopolites," concludes the attractive programme.

Last night (Friday), for the fourth *soirée extraordinaire*, Bellini's "Norma" was announced, with the 2nd and 3rd acts of "Masaniello" and "Les Mélomanophones."

ROYAL ITALIAN OPERA.

Beethoven's "Fidelio," was given for the second time, last Saturday night, to a well-filled house; the two overtures were again rapturously encored, and the accompaniments throughout, to finely executed under Costa's direction, were the main sources of attraction Madame Castellan, Mdlle. Bertrandi, Signori Tamberlik, Tagliafico, Stigelli, Polonini, and Herr Formes, constituted a magnificent *ensemble* in the ca-t.

On Tuesday night, "Lucrezia Borgia," with the second act of "Der Freyschutz," sustained by Mmes. Castellan, Mdlle. Bertrandi, Tamberlik, Polonini, and Formes, were announced; but, owing to Marlo's hoarseness, "Norma" was substituted for the former opera. The house was crowded from the pit to the ceiling. With the exception of Mdlle. Bertrandi's *Adalgisa*, which was much too cold and tame, although not deficient in grace and correctness, the execution of "Norma" was remarkably fine and imposing. Grisi was grand, terrible, and sublime. To her esthetical attainments are superadded chivalric attributes, never possessed by any other representative of the *Druidical Priestess*. With her rich, luscious tones, she combines in the vocalisation genera rofinement and delicacy of execution; her *fioriture* is as varied as it is striking. She is never exaggerated, but always appears to act and sing with ease and naturalness, looking the absolute ruler of the votaries of the temple of Iru inani in their presence, but when with *Pollio* and *Adalgisa* the high wrought tragic emotions of the wronged woman predominate. It is in the union of face, figure, personal beauty, expression, voice, gesture, facility and power of vocal exertion, and intensely dramatic declaration, that Grisi's *Norma* has distanced all her competitors, and that physically and artistically it stands forth as the perfect Greco-poem of histrionic genius. There is but one *Norma*, and Grisi is the prophet. To follow her is the phrase of homage that would be to the every sense of this unappreciable display of histrionic supremacy. Let us record that she roused the auditory to the highest pitch of enthusiasm, the pit rising *en masse* as usual at her noblest points, and that there was no end to the ovations at the close of each act.

The music *Oroveso* of Formes, the startling singing of Tamberlik as *Pollio* (no tenor having so forcibly relieved this part from its repulsiveness), and the admirable exertions of the orchestra (including the military band) and chorus, completed the fine *ensemble*.

On Thursday, for the extra night, Mozart's immortal "Don Giovanni" was revived with the following cast:—*Donna Anna*, Mdme. Grisi; *Donna Elvira*, Mdle. Bertrandi; *Zerlina*, Mdme. Castellan; *Il Commendatore*, Signor Tagliafico; *Masetto*, Herr Polonini; *Don Ottavio*, Signor Tamberlik; *Leporello*, Herr Formes; and *Don Giovanni*, Signor Tamburini.

The return of the popular tenor was most cordially greeted He is in excellent voice, and sang and acted with infinite taste and vivacity. He was encored, both in the drinking song and the serenade, and in the "La ci darem," with Castellan. Mdlle. Bertrandi sang the part of *Elvira* with much merit; she was nervous, but sang the difficult "Ah tradi" cleverly. Mario's cold not having departed, Tamberlik was the *Ottavio*, and, for the first time, it may be stated that Mario was not missed; Tamberlik's fine voice and expressive style in "Il mio tesoro," which was demanded twice. Nothing could be finer than his vocalisation. he made a great hit in the finale to the first act. The "Batti, batti," and "Vedrai carino" of Castellan, were encored; as also the trio "Protegga il giusto cielo," sung by Grisi, Bertrandi, and Tamberlik. It was a magnificent *ensemble*, and the house was filled in every part.

ST. JAMES'.

The return of Mdlle. Rachel to this theatre was on Monday welcomed by a fashionable audience. Her *rôle* on the occasion was the *Phèdre*, in which she was passionate and artistic as ever. With one exception on the English stage, we have no actress capable of illustrating the heroic and poetic. French tragedy requires its exemplification; and Mdlle. Rachel is unequalled by natures and art for a practical instructress. Her style has already become popular with English playgoers, and we hope from it the most beneficial histrionic issues.

PRINCESS'.

An adaptation of M. Dumas' "Mademoiselle de Belle Isle," by the author of "The Templar," under the title of "The Duke's Wager," was produced on Wednesday. Mr. Slous, in giving to the English public a version of the effective play, has prudently sacrificed the comic to the serious interest His lovers are the right amount of sincere passion, and the latter quite commendable. Mr. Charles Kean, as *Leon St Mars*, is just such an enthusiast as would stake his life on the turn of the dice, and commit suicide in the name of honour. No performer in the modern stage can approach Mr Kean in his assumption of the gentleman. He moves with the ease of the drawingroom; yet, when occasion requires, can give such depth and tone to the character, as to elevate it into the ideal sphere. His scenes with *Mdle Lestelle de Belle Isle* (Mrs. Charles Kean) were energetic, pointed, and solemn, full of fine feeling, and effective without exaggeration. He was admirably supported by his wife's performance of the heroine, who has some situations to realise of intense interest and passionate force. We use the word "realise" advisedly, for this is what Mrs. Kean did in her interviews with the profligate *Richelieu* (Mr. Alfred Wigan), partic.larly in the famous one in which she gives him the "lie," only to be herself confounded with the evidence of her own ring. Perhaps the res lution was carried too far, for the impression became painful. It is a rule of the highest art, that its exhibitions should stop short of this point, and even in the depths of despair be redeemed within the limits of poetic pleasure. This, at least, is Shakspearian art; that of M. Dumas, is, we know, of a more prosaic sort. We concede, then, much to the

domestic interest of the subject. Mr. Wigan, as the Beentiens Duke, played with his accustomed verve and intelligence; nor may we pass over Mrs. Winstan.y as the *Marchioness de Pri.* She looked the character grandly and acted it forcibly. The house was crowded, of course, the piece perfectly successful. The scenery, it need scarcely be added, was beautifully painted.

MUSIC.

ERNST'S CONCERT.

The above grand entertainment, given on Monday night, at the Hanover Rooms, which were filled to overflow, has been the musical event of the week. There was a full orchestra, of which Mr. Lavenu and Mr. Eckert were alternately conductors, and Mr. Wily first violin. Weber's "Der Freyschütz," and a spirited overture in E of the Amber school, "Anne of Gierstein," by Lavenu, with the march from Mendelssohn's "Midsummer Night's Dream," were finely executed. M. Sllas performed admirably an andante and finale from his concerto in C minor, composed when he was quite a boy, but containing evidence of his early genius. The slow movement is scored in beautiful and picturesque style; the rondo required a more distinctive theme than it possessed to invest it with interest. Piatti and Bottesini, in a concertino duo, for violoncello and contra-basso, on themes from Halévy's "Partisan," display the astonishing improvements on their respective instruments to the highest advantage—each developing impassioned feeling in the flowing cantabile, and astonishing the auditory by prodigious execution in the contra-bassa flourishes, of course, the most marvellous of these. Ernst played three times: first, Beethoven's only violin concerto; secondly, his own fanciful composition, the "Rondo Papagena;" and, finally, the "Il Pirata" caprice. It was the general remark that Ernst was never heard to greater perfection; the reading of the concerto, so unpretending and so essentially, was poetic and intellectual, and the digital skill and wonderful bowing in the two cadenzas which he had invented for the close of the first and last movements quite electrified the assemblage, amongst which were the most finished performers and connoisseurs, whose enthusiasm was shared by the band and general company in the highest degree. The speciality of the genius of Ernst on the violin is, in his instance, the triumph of mind over matter. His touch is the more passionate instance, with a more quick perception and a greater amount of sensibility than any other violinist; his excessive nervous susceptibility may at times make him less sure and finished than his competitors, but from Ernst the hearer may be certain to have the most refined reading and the most subtle and vivid development of the composer's intentions. In pathos in an andante he has no equal; and the individuality with which he invests the ideas of the latter masters is his exclusive achievement. The vocal se.ections were allotted to Miss Catherine Hayes, Mdlle. Zerr, Madame Marra, Mdlle. Grammann, Miss Browne, Herr Reichert, Herr Stockhausen, and Mr. Augustus Braham. Miss Catherine Hayes powerfully affected her auditory by her pathetic rendering of *Fidèle's* air, "Ah! mon Fils," from Meyerbeer's "Prophète;" and in the rondo finale, from the "Sonnambula," Madame Marra in an equal *furore*. Madame Rita is another German *debutante*, who, like Mdlle. Zerr, aims at imitations of the manner of Jenny Lind, which, however natural, we own a decided preference, sincerely wishing that the astonishing achievements of the two Teutone songstresses had been impossible.

MUSICAL UNION.

The scheme of Tuesday's extra *matinée* included Onslow's quintet (adagio and rondo), in which Battesini played the violoncello part on the contra-basso; Mozart's quartet in D; the posthumous andante in E; and scherzo in F minor, by Mendelssohn, played by Sainton, Deloffre, Hill, and Piatti; and Mendelssohn's pianoforte trio in C minor, Op. 66, executed by C. Halle, Sainton, and Piatti: a new solo on the contra-bass, by Bottesini, evinced much rich tread, and executed to perfection; and a song, by Schubert, sung by Reichart, which was encored. There was a very full attendance, including the Duke and Duchess of Roxburghe, the Earl of Falmouth, Dean Milman, several foreign commissioners of the Exhibition, Hausmann, Ernst, Berlioz the composer, &c. Ernst leads at the fifth *matinée*; and a new violoncellist, Herr Seligmann, from Paris, will make his *début* at the next extra meeting

MUSICAL EVENTS.

M Billet, on Monday, at the Hanover Rooms, commenced a series of three *matinées* for classical pianoforte and vocal music: he played Beethoven's Sonata in A, Op. 101; Weber's Polacca in E, "L'Hilarité" Mendelssohn's Rondo Capriccioso in E minor, Op. 14; and studies by Scheibler, Chopin, Thalberg, Kalkbrenner. The instrumental pieces were cellalifully relieved by the charming vocalisation of Madame Anna Thillon in French romances and an air by Mozart, and by the classic Adelle of Herr Siegfried Saloman.

Signor Brizzi gave his annual *matinée musicale*, last Monday, at the Queen Anne-street Rooms, assisted by Signor Gardoni, a pianist from Bologna, Madame Grisi, Madame Castellan, Madame Steffanoni, Signor Tamberlick, Coletti, Ciabatta, Mei, Polonini, Tamburini, jun., R. Costa, with Alary and Biletta as accompanists. A prophkra, by Costa, for male voices, was performed under the direction of his brother, Mr. R. Costa, and was unanimously encored, being well vo-ced and richly harmonised.

Mr. John Parry's "Noise" attracted a large auditory in the Music Hall, last Monday night.

Miss Lizzy Stuart and Mr. G. Tedder gave an evening concert at the Sussex Hall, last Tuesday night, assisted by the marvellous pianoforte-player Bottesini, Mesdames J. Wolf and E. Ward (pino), Master J. Ward (concertina), Mr. F. Chatterton (harp), Mrs. A. Newton, Misses Poole, A. and S. Cole, Herr Menge, Messrs. Drayton and Whitworth.

Herr Molique's third and last morning concert of chamber music took place at the Queen Anne-street Rooms, on Wednesday, aided by Mdlle. Molique (piano), Herr Wilt, Herr Schmidt (violin), Mr. Mellon (viola), Signor Reinardi (flute), and Signor Piatti (violoncello), with Mdlle Bertha Johannsen and Herr Stockhausen as vocalists. The concertentainments have been remarkable for their excellence, both in selection and execution. Molique is one of the most distinguished violinists and composers of the age, and his daughter is a charming pianist.

Messrs. H. and R. Blagrove presented their first quartet and solo concert on Thursday morning, at the Mortimer street Rooms, with the co-operation of Miss Rainforth, Mdlle. Verdavaine, Messrs. R. Blagrove, Lucas, Banks, Watson, Clementi, Rice, Hausmann, Guest, and J. L. Hatton. Mr. Henry Blagrove, of the Royal Italian Opera and Philharmonic Society, ranks as one of our first violinists, and was the original founder of the Chamber Concerts, which has achieved so much for art in this country.

The Cecilian Society, on Thursday, at the Albion Hall, under Mr. Gadsby's direction, performed Haydn's second mass, and a selection of music.

Miss Messent and Mr. Herbert, the tenor, had a concert at the Hanover Rooms on Friday. The other vocalists were Mdlle. Grammann, Mdlle. Johannsen, Mdlle. Lavinia, Miss Browne, Herr Pischek, Signor Marchesi, and Mr. F. Bodda. Mdlle Coulon, Mdme. Goffrie (piano), Piatti, Herr Goffrie (violin), and Guilo Regondi (concertina), were the solo players; and M. Frelon, Mr. A. Green, and Signor Bottesini, the accompanists

M. Verdavaine gave his third and last *soirée* at the Queen Anne-street Rooms on Friday night.

The Sacred Harmonic Society repeated the performance of Mendelssohn's "Elijah" last night, at Exeter-Hall, under Costa's direction; the principal vocalists were Miss Catherine Hayes, Miss Eliza Birch, Miss Dolby, Miss Williams, Mr. Sims Reeves, and Herr Formes

In addition to the extra vocal and orchestral forces of the Royal Italian Opera, under Costa's direction, Mrs. Anderson has engaged them for her annual morning concert on the 20th inst., Herr Pischek, Herr Reichart, Herr Blagrove, Chatterton, and Bottesini, and her niece, Miss Anderson Kirkham.

The musical arrangements for the ensuing week will be, the seventh Philharmonic Concert, Mr. F. Chatterton's morning concert, and Mr John Parry's entertainment, on Monday night: on Tuesday, the fifth meeting of the Musical Union, and the concerts of Miss Dolby and the Family Quartett de Romero, on Wednesday, the performance of the Beethoven Quartet Society, Mdlle. Corbett's concert, and the annual concert of the Royal Society of Female Musicians—a most excellent institution, in all of which a host of native and foreign celebrities give their gratuitious services; on Thursday, Miss E. Busby's morning concert, on Friday, Mrs. Sunman's Scottish entertainment; and on Saturday, the morning concert of Regondi and Kalkbrenner.

The Choral Fund will perform the "Messiah," for their annual concert, on the 16th inst.

The first morning concert at Her Majesty's Theatre for the season is fixed for the 16th instant, with all the resources of the establishment.

The only musical festival this year will be the annual gathering of the three choirs of Hereford, Gloucester, and Worcester, to be held at Worcester

BEULAH SPA GARDENS.—These beautiful grounds at Norwood, once one of the most frequented breathing places in the environs of London, but which of late years had been deserted property, promise to regain their former popularity. The widow of the original proprietor has recently recovered possession of them, and they were on Tuesday thrown open for the season. The day was a magnificent one, and the gardens appeared to the best advantage. The juvenile band of the Caledonian school, and Mr. Angus Mackay, the Queen's piper, with his little band of youthful pipers, were in attendance, and performed as they marched about the grounds. The red cloak of the gipsy, without which Beulah Spa cannot be considered perfect, was of course not wanting. Notwithstanding that this was the first day, there was a good sprinkling of company, and pic-nics were not unfrequent. Improvements are promised in the gardens, and we trust that, with the inducement of reaching the place by a short railway trip, the Beulah Spa Gardens will again become a favoured resort. The grounds are open to the public daily, except on Sundays.

CREMORNE GARDENS.—The improvements made in these delightful grounds for the present season are of a most extensive character, and bring by the crowds which nightly resort to them. Boston's orchestral band attracts at present to the new dancing platform, the Ballet, in the theatre, is very successful; and the Bosjesmans have a host of visitors to witness their interesting feats. Franconi's troupe will very shortly occupy the new hippodrome in the gardens; and this entire establishment, under its present tasteful and efficient management, is increasingly popular.

"THE DEVIL'S DYKE."—A very clever lithograph of the celebrated prospect from "the Dyke," has just been published by Mr. Grant, news-agent, Brighton. It is from a drawing by F. Ford, and is nicely executed in tint by H Vennells. The view is four feet long, and about six inches in depth, and shows the view in distinct detail.

CHESS.

TO CORRESPONDENTS.

M T Shropshor (Bombay)—Your highly interesting account of the manner of Chess playing among the natives of India is too long for our very limited space: we have thought it best therefore to transfer it to the editor of the *Chess-Player's Chronicle*.

D L T Now and a most fascinating game.

E T M; A Dorchester You shou'd send your subscription for the Chess Tournament, without further loss of time. In Mr. Long's hand.

MITRE The real "Staunton Chess-men" may be got of Leuchars, in Piccadilly; of Mechi, in Leadenhall-street; and at the Fulgrian Exhibition 3, We never to say at present, owing to some unexplained detention, the famous Staunton players, Jaenisch and Shumoff, have not arrived

THE CHESS TOURNAMENT.—We are requested to mention that the subscription lists in furtherance of this forthcoming object will continue open till the end of the month. Those parties who have already subscribed their names, but have not yet paid in the amount of their donation, are requested to forward it without delay to Robert Longbottom, Esq, 8, Carendish-square

THE CHESS TOURNAMENT.

The interest excited by this memorable contest increases daily. During the present week, the first section of matches has been determined; and the victors —Messrs Anderson, Horwitz, Kennedy, Mucklow, Staunton, Saul, Williams, and Wyvill—have subsequently drawn lots for their respective antagonists, with the following result; viz.

Anderson	has to play against	Saul
Staunton	,,	Horwitz
Capt. Kennedy	,,	Wyvill
Williams	,,	Mucklow

The series of games in these matches is to consist of seven, each of the winners of the first four being eligible to contend for the highest prize.

Independent of the general tourney, which is open to competitors of all nations, a number of matches are being played by picked members of the British Provincial Chess Clubs; among the most interesting of which we may particularise those between

Messrs. S. Angas and Boden.		Messrs. Hedges and Wellman.
,, Brian	,, Trelawny, M.P.	,, Ranken ,, Roberston.
,, Deacon	,, Gilby.	

In our next Number we shall be enabled to give the result of all the contests now pending, and also two or three of the most striking games which the keen encounter of the conquerors may elect.

METROPOLITAN NEWS.

QUEEN ADELAIDE MEMORIAL FUND.—The first annual meeting of this society, established for the relief of the Female orphan children of officers in the navy and marines, as a memorial to the memory of the late lamented Queen Adelaide, was held at Willis's Rooms on Monday; Admiral Sir Charles Malcom presiding. The report stated that the society originated from the wish of an individual to render one of the memorials suggested by national respect and affection for the character of the late Queen Adelaide a means of assisting, in some degree, the duties in which her name had involved those persons connected with the naval and marine services, who had hitherto been accustomed to look to the Royal bounty as a sure resource in time of need. The parties whom this charity was established to assist did not ask for the means of living in idleness, but to receive such assistance as would give them an education to enable them, by their industry, to live in comfort and respectability. The balance sheet showed that the fund received had been £631 1s. 8d., and the expenditure £148 6s. 10d. They had an investment also of £436 12s. 6d.

ROYAL COLLEGE OF CHEMISTRY.—On Monday, the annual meeting of this institution took place at the college, Oxford-street; Mr. James Adam Gordon in the chair. The report stated, that, although the subscriptions had increased, the number of pupils had diminished, which had caused a slight decrease in the funds. During the past year, the question of the supply of water to London had occupied the attention of the Government; and Dr. Hofmann, with the sanction of the council, had undertaken the most extensive analysis of the different waters around the metropolis in order to ascertain from whence the purest and best supply could be obtained. The financial statement showed the receipts to have amounted to £1089 17s. 8d., and the expenditure to £1020 14s. 4d., leaving a balance of £169 3s. 4d. The report was unanimously adopted, and a vote of thanks passed to his Royal Highness Prince Albert for his continued patronage of the college.

ROYAL BOTANIC SOCIETY, REGENT'S-PARK.—On Saturday the second show of flowers for the season took place at the gardens of the society. In consequence, however, of the backward state of the flowers, tickets were exchanged at the doors for Saturday, June 14th, when another show will be held. The rhododendron exhibited by Messrs. Standish and Noble were very fine, and contained some specimens of the brilliant crimson flower which had been heretofore the great desideratum. The azaleas were in favourable bloom, but did not contain anything very new. We must not omit to notice a fine specimen of the *Cupressus funebris*, brought from the Vale of Tempe, on the Peikin River. This is the first time the English public has had an opportunity of seeing this graceful tree. It would be unfair to pass any especial criticism upon the present show, as it may be considered only preparatory. In consequence of the influx of foreign visitors, the society has given notice that each fellow shall have the privilege of admitting four instead of two friends on Mondays, Tuesdays, and Fridays in each week. The drawing-room held at St. James's last week, numbered amongst the visitors, but the society may hope for a more brilliant assemblage upon another occasion. The bands of the Royal Horse Guards Blue and Coldstream Guards were in attendance throughout the day.

NOMINATION OF SHERIFFS BY THE LORD MAYOR.—At the Court of Aldermen, on Tuesday, the Lord Mayor, according to ancient custom, nominated the following Gentlemen of London to be publicly put in nomination for the office of Sheriff on Midsummer day; John Thomas Norris, Esq., spectacle-maker; Thomas Cotterell, Esq., cordwainer; Thomas Shepperson, Esq., spectacle-maker, and Joseph Parsley, Esq., merchant tailor.

PURCHASES BY A CITY COMPANY.—We understand that, at a meeting of the Goldsmiths' Company held a few days ago, a resolution was unanimously passed that £5000 should be expended on the purchase of one of the magnificent plate exhibited at the Crystal Palace for the use of the splendid Hall.

EXTENSIVE ROBBERIES.—On Saturday information was given that Count Reventlow, of No. 2, Wilton terrace, Pimlico, his groom-square, had been robbed of a number of valuable articles, amongst which was a Danish Order, of silver, in the form of a star, with a heart in the centre, and had enamelled cross on the top; a silver-gilt medal, having on one side a man in Roman costume; and on the reverse an inscription, commemorative of "Conrad, Comes de Reventlow," born in 1664, and who died in 1708. Also, three gold seals, with chain. Information was also given that a man absconded on Friday week with £43, stolen from his employers, Messrs. Knight and Co., soap-boilers, in old Gravel-lane. He is described, of fair complexion, about 40 years old stout, and bow-legged and wore a white smock-frock.

BREWER'S-COURT RAGGED SCHOOLS.—The annual meeting of the friends and patrons of these schools was held on Thursday, at the Music Hall, Store-street; the Right Hon. Lord Kinnaird in the chair. The report stated the schools had progressed most favourably. An infant day-school had also been opened in September, and, on its opening, forty ragged urchins entered, which number had now increased to 200, and the daily attendance had reached 130. The receipts for the year amounted to £124, and the expenditure to £107 3s., leaving a balance of £16 :7s. 6d.

WATERLOO-BRIDGE COMPANY.—The half-yearly meeting of this company was held, on Thursday, at the Freemasons' Tavern; Mr. F. Jenkins in the chair. The report stated that the receipts for tolls during the past half-year had amounted to £8039 16s., whilst those of the corresponding period of the preceding half-year were £7267, showing an increase of £672. The bridge and roads continued in a most satisfactory state. The total receipts for the half-year were £8564, and the debt incements £8425, leaving a balance of £139 The report was adopted; and, in course of discussion, it was intimated that there was every reason to believe that ere long this bridge would be taken over by the Government, and opened to the public.

SMITHFIELD.—ITS REMOVAL.—On Wednesday, the parliamentary committee decided that they would not admit evidence on the details of the plan proposed by the corporation for the improvement of Smithfield-market. Mr. Arbor, C. Grote, on behalf of the opposition, said, that, as the committee had thought fit to deprive the corporation of the privilege, he had, on behalf, to announce that they would not proceed further with the case The hon Chairman regretted the learned counsel, whatever he might be inclined to withdraw opposition a together. Mr. Talbot replied in the negative, and said they intended to carry their opposition before another tribunal (the House of Lords), where he trusted justice would be permitted to be done. After the usual formalities the corporation and others representing it then retired from the committee-room. After some discussion, the room was cleared, and, on the re-admission of the public, a ter an absence of half an hour, which was spent in a state of speculation and amusement as to the result, the hon Chairman intimated that the committee had resolved that the preamble of the bill (for providing a commodious market in the suburbs in lieu of Smithfield) was proved.

FATAL RIVER ACCIDENTS.—On Tuesday, Captain Artus, of the brig *Melbourne*, lying in Bagsby's Hole, in attempting to ascend the side, missed his hold, fell into the water, and was drowned. Almost at the same time (twelve o'clock), Captain Downie, of the ship *Mentor*, lying off Stone-stairs, Wapping, fell overboard, and perished About 8 o'clock P M., a boat, containing two men and a woman, was swamped near Aldermant-stairs; the crew were saved, but the female, Mrs. Coghlan, residing in Old Gravel-lane, was drowned.

BIRTHS AND DEATHS.—The births of 764 boys and 769 girls, in all 1533 children, were registered last week. The average number of six corresponding weeks in 1845-50 was 1336. The mortality of the metropolis has been greater than usual during the four weeks of May. In the first three returns of the month the deaths numbered respectively 1041, 1003, 1020; in the week ending last Saturday a decrease occurred, but not of considerable amount, the number having fallen to 980. Taking the weeks corresponding to last week in the ten years 1841-50, it will be seen that the mortality, which in one instance fell so low as 736 (namely, in the fourth week of May, last year), did not in any case exceed 960, and that the average was 855. If this average be raised in proportion to the supposed rate of increase in the population, it will amount to 938; compared with which the 980 deaths of last week exhibit an increase of 42. The relative force with which the present mortality, so far as it differs from the average amount, falls on the young, the middle-aged, and the old, is shown by the following statement: —

Week ending last Saturday.	Persons.	Average of The Corresponding Weeks, 1841-50.
From birth to 15 years, there died ..	473 ..	.. 412
From 15 to 60	316 ..	.. 327
At 60 years upwards	185 ..	.. 115

From the above it appears that last week was not more fatal than usual to persons of advanced age, while rather less than the usual number died in the middle stage of life, and that the augmentation of mortality was entirely confined to the youthful part of the population. Diarrhœa, or epidemic cholera, produced last week 220 fatal cases, and of these 165 occurred amongst children under five years. Small-pox had been circumscribed to 23 persons, 6 of whom were twenty years of age and upwards, measles carried off 39 children, scarlatina 10, hooping-cough, 64, and croup 7. Of these complaints, almost exclusively confined to young persons not under one year, the most excessive annual contingent and scarlatina falls still more below it To diarrhœa 16 deaths are ascribed, to cholera 6, to typhus 6, to erysipelas 1, to puerperal fever 1, and to the usual amount of fatality from the present time, 32 are referred. The above class of diseases exhibits an increase on the preceding week; but those which affect the organs of respiration show a decrease. Convulsions numbers 3 cases, bronchitis 51, pleurisy 5, pneumonia 64, and asthma 7; from all other undefined diseases of the lungs, number in the aggregate 136 deaths, which is rather more than the corrected average of preceding weeks. Under diseases are comprised in the tubercular class: scrofula, from which five deaths are enumerated last week: tabes mesantarica, which counts 10; hydrocephalus, 35; and phthisis, or consumption, 140 In the last corresponding week of 1841-50, the lowest number ascribed to consumption is 103, and the highest 166.

METEOROLOGICAL OBSERVATIONS.—At the Royal Observatory, Greenwich, the mean daily reading of the barometer for the week ending on Wednesday, and on the following days it rose continuously, and was 30.361 in. on Saturday. The mean of the week was 30.092 in. The mean daily reading of the thermometer, at 9 A.M., was 57.3 deg., which is the same day on 10 years, but on all the following days, except Friday, was below it. The mean temperature of the week was 55 5, which is about 2 deg. below the average. The wind generally blew from the south to the beginning of the week, and towards the end was in the south-east and north-east.

HER MAJESTY'S BIRTHDAY—REVIEWS, ILLUMINATIONS, &c.

THE celebration of her Majesty's birthday, on Saturday last, was signalised by the usual military displays, illuminations, &c., both in and around the metropolis.

On the parade, in St. James's Park, the Household Troops were reviewed at 10 o'clock, in the presence of his Royal Highness Prince Albert, the Duke of Saxe-Coburg, the Duke of Wellington, the Marquis of Anglesey, and a brilliant staff. The Prince Consort and the other illustrious personages were loudly cheered. His Royal Highness and the Duke of Wellington were habited as Field-Marshals. The number of spectators was upwards of 30,000.

The corps of the Honourable Artillery Company mustered very numerously in front of the Armoury, in the City-road, and went through a variety of evolutions, under the command of Lieut.-Col. Henry Ellerey.

At the Tower a Royal salute was fired during the afternoon, and the *employés* of the Ordnance Department generally were granted a holiday and a day's pay in honour of the occasion. In the evening Tower-hill presented the animated appearance usual upon the anniversary, there being several thousand persons present on the western side of the fortress, facing the Old Queen's Head Tavern, where there were two bands of music and hundreds of gaily dressed individuals.

At Woolwich the whole of the troops in the garrison assembled in review order at eleven o'clock, and marched to the common, where they took up their position: the Royal Horse Artillery, under Lieutenant-Colonel Bell, on the upper part of the ground facing the north; the 17th Lancers under Lieutenant-Colonel Bowles in the centre; the Royal Engineers, the gentlemen cadets under arms, under Captain Eardly Wilmot; the right of the Royal Horse Artillery under Lieutenant-Colonel Williams; the centre battalion under Lieutenant-Colonel Thorneloe; the left battalion under Lieutenant-Colonel Harrison's and Captain Fressel's companies, gunners dismounted; the left battalion under Lieutenant-Colonel Le-bridge; the three battalions under Colonel Cruttenden; the Royal Artillery and Miners under Captain Freeth, Royal Engineers; the battalion of local pensioners under Staff Officer Major Forbes; and the Royal Marines under Lieutenant-Colonel Gillespie; and the light field-batteries under Lieutenant-Colonel Anderson. The whole under the command of Lieutenant-General Sir Thomas Downman, C.B., K.C.H., Lieut.-Colonel Commandant.

The Marquis of Anglesey, Master-General of the Ordnance, arrived about a quarter before one o'clock, accompanied by Major-General Sir Hew D. Ross, Deputy-Adjutant-General of Artillery; Major-General Lord Frederick Fitzclarence, Major-General Fox, Major-General Lacy, Director-General of Artillery; Colonel Campbell, Royal Artillery; Colonel Lewis, Lieutenant-Governor of the Royal Military Academy; Lieutenant-General Sir Alexander Dickson, K.H., Royal Horse Artillery; Lieutenant-Colonel the Earl of Cardigan, of the 11th Hussars; Brigade-Major Bingham, Royal Artillery; Brigade-Major Walpole, R E., and Royal Sappers and Miners; Captain Tylden, Deputy-Assistant Quartermaster-General of Artillery; and Captain Wingfield, of the Riding house troop of Household staff officers

Precisely at one o'clock the 9-pounder field batteries in the centre of the line commenced firing a Royal salute of twenty one guns, followed by a round from each gun of the Royal Horse Artillery in quick succession from right to left, with a running fire from the line, commencing on the left, and the right and centre battalions at a trot; the Horse Artillery and Lancers changing their front at the bottom of the common, and then passing the Master-General, the former at full gallop and the latter at a canter The ground near the staff was kept by the Riding-house troop under Lieutenant Phillips and Lieutenant Macpherson, the spare men of the Royal Artillery and Royal Marines keeping the outer circle and round the centre common. After the review, the Master-General and a great number of his friends proceeded to the Royal Artillery mess-room, and partook of an elegant *déjeûner*. The Duchess of Orleans, the Count de Paris, two young sons, and a daughter of the Prince d'Aumale, and a large number of distinguished personages, with from 30,000 to 40,000 spectators, were present at the review.

The illuminations in the West End, of the houses of the Royal tradesmen, the Clubs, and other public buildings, were unusually brilliant, and the leading thoroughfares were thronged with admiring crowds until near midnight.

(SEE NEXT PAGE.)

THE BOMBAY "BURNES MEDALS."

THE first of this series of medals, by Mr. Benjamin Wyon, has now been completed, and is greatly admired, not only for the execution, but also for the excellent likeness it bears to the gentleman whom it is designed to honour—Dr. James Burnes, K.H., F.R.S., late Physician-General of the army at Bombay. These medals were founded for educational purposes by the Masonic brethren of Bombay, on the departure of Dr. Burnes from India, in November, 1849, as explained by the following resolution, passed by them on that occasion:

BOMBAY "BURNES MEDAL."

"That, as a token to all men and brethren, both here and in our native land of the affection, gratitude, and regard we entertain towards our R. W. Br., and of the appreciation in which we hold his brilliant achievements in the cause of charity and love to all men, four medals be founded by us for the encouragement of good conduct and learning in youth, to be awarded yearly to the most accomplished pupils in the following schools:

"1st. At the Grant Medical College, Bombay, to the best student apprentice, recommended by the Board of Education.

"2d. At the schools of the Bombay Education Society at Byculla, to the best pupil in the boys' and girls' school (one medal each), as nominated by the Committee of Management.

"3d. At the Academy at Montrose in Scotland, where the R. W. Br. Burnes himself was educated, to the best boy nominated by the R. W. himself, his heirs and successors."

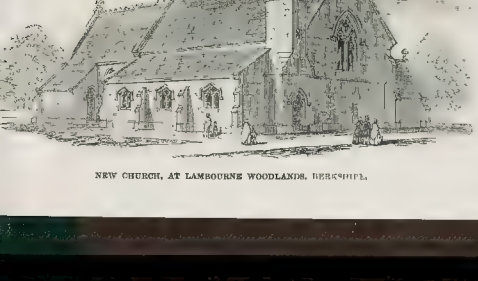
GIANT ASPARAGUS.

THIS gigantic head of Asparagus was grown in the garden of Mr. Farndon, of Woodstock, Oxon; it is a self-sown plant, and this is the seventh year of its growth. It is flat, 3 inches in width, resembling twelve heads in one; and it is about 14 inches in length. There have always been in the same bed other flat heads of similar luxuriance, and some of the usual form, invariably very fine.

There are those who think gigantic asparagus to be a peculiar variety; but it is ascertained, that, on being removed into less favourable soils, it gradually loses its vigour, and degenerates into the common kind.

NEW CHURCH AT LAMBOURNE WOODLANDS, BERKSHIRE

In consequence of the dilapidated and very insecure state of the church of Lambourne Woodlands, which would not admit of any effectual remedy or restoration, it was found absolutely necessary to erect a new

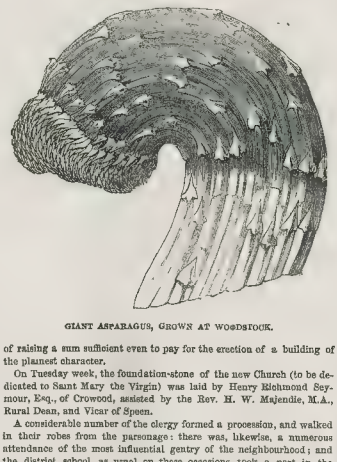


NEW CHURCH, AT LAMBOURNE WOODLANDS, BERKSHIRE.

KIDDAPPLE, THE REBEL BUDDHIST PRIEST, SHOT AT KANDY.

Church, and, after the present building had been shored up, to use it until the completion of the new building.

The funds for the accomplishment of this object were not wanting; for, on the circumstances being made known, two ladies, residing in the neighbourhood, spontaneously contributed the munificent gift of £1000, which would have defrayed the cost of the Church as at first designed. The value of the gift is the more enhanced from the anticipated difficulty



GIANT ASPARAGUS, GROWN AT WOODSTOCK.

of raising a sum sufficient even to pay for the erection of a building of the plainest character.

On Tuesday week, the foundation-stone of the new Church (to be dedicated to Saint Mary the Virgin) was laid by Henry Richmond Seymour, Esq., of Crowood, assisted by the Rev. H. W. Majendie, M.A., Rural Dean, and Vicar of Speen.

A considerable number of the clergy formed a procession, and walked in their robes from the parsonage: there was, likewise, a numerous attendance of the most influential gentry of the neighbourhood; and the district school, as usual on these occasions, took a part in the ceremonial. After the service appointed for the occasion was completed, the greater part of the company returned to the parsonage, where they were most hospitably entertained by the much esteemed incumbent, the Rev. John Bacon, who, while he "feasted with the great, did not forget the small," and provided for the wants and comforts of the school children.

This Church, which in plan has only one aisle, with porch on the south side, will accommodate 134 adults and 66 children, and will cost about £1500, and may be considered to be founded by the Misses Seymour of Speen, Berks, and Lady Duckett, of the Regent's-park. Grants likewise have been made by the Diocesan and London Church Building Societies.

The church is to be of the style of the Middle or Second Pointed period. The dimensions are—Length of the nave, 45 feet; width, 18 feet: aisle length, 45 feet; width, 8 feet: chancel, 28 feet long by 16 feet wide. The height to the ridge of the roof is 34 feet, and to the top of the bell turret, 54 feet. The porch is on the south side, and the materials of which it is to be built are Bath stone dressings and flint walls. The architect is Mr. Talbot Bury of Welbeck-street, Cavendish-square.

GUNGALEGODA BANDA, THE KANDIAN PRETENDER.
(SEE NEXT PAGE.)

PARIS FASHIONS FOR JUNE.

THE Chantilly Races were the rendezvous of the *élite* of Parisian society last week, the uncertainty of the weather not preventing the magnificent lawn being spread with the new and brilliant toilets. The neighbouring country-seats furnished the more aristocratic part of the meeting; the *chateaux* of Chantilly alone remained closed, and wore a cheerless aspect.

We saw at this *fête* many very pretty *capotes* of net and blond lace, net and ribbon; rice straw *capotes*, with transparent crown, covered with blond lace; (Italian straw) Leghorn bonnets trimmed with marabout feathers, bunches of heads of feathers, and branches of flowers. Mantelets of all shades of taffeta, from the elegant white lilac or pink mantelet, as well as black, were to be seen in the most novel shapes; such as the Parisian mantelet with sleeves, scarf mantelets, trimmed with a deep fringe, or two rows of lace. Here were also cashmere shawls, and scarfs embroidered with silk; Indian embroidery; *cripes de Chine*, embroidered shade upon shade, or white ground, with lively and brilliant colours, and some beautiful black ground cashmeres, embroidered with gold and silk.

The tops of dresses are generally skirted, and the petticoat trimmed with flounces either sloped or with lace; we remarked a magnificent shot taffeta, with bouquets sprinkled over the ground, and only trimmed at the bottom of the skirt with a few knots of ribbon to match.

To most of the toilets which we noticed, the low body was alone wanting to fit them for evening dress. Even the stuffs were richer.

The chief concern is now as to the light summer toilets, before leaving for the country or going to the watering-places. It is difficult to point out anything precise; for in this, more than any other fashion, taste guides our elegant ladies in their choice.

For the country there are many woollen coloured drills, with stripes down the front. The paletot is made to match, of the same stuff; the

PARISIAN FASHIONS FOR JUNE.

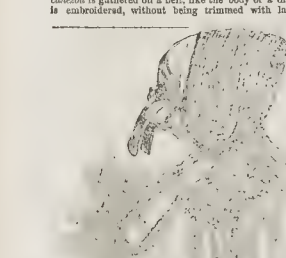
front also striped. The shape is that of the Turkish jacket, slit on each side only. The jacket is bound, as well as the slits, with arabesque embroidery, made with a small silk braiding, No. 7. The embroidery on the side slits should rise higher than the slits, and form a quantity of arabesques, in the style of Turkish patterns. The same style of toilet is made of cambric muslin, many-striped, the stripes wider in front; and the jacket, instead of being trimmed with one braid, is trimmed along the edge with a small gathered flounce of the same stuff as the dress and jacket. There are also *peignoirs* of cambric muslin, *en négligé dresses*, with wreaths, disposed so as to ascend the front and jacket, of the same stuff, surrounded with a small flounce. The sleeves of all these dresses are very large, and trimmed to match the dress, whether it be with braid or gathered flounce. These sleeves all require under-sleeves of very light embroidered muslin, with flounce, and following the shape of the sleeve of the dress exactly; they should also match those of the jacket.

ILLUSTRATIONS.

Mantelet of taffeta, embroidered throughout, and trimmed with two rows of lace, and ending in a point like a *schale* behind.

Dress of taffeta, with pattern before, with coloured flowers.

Cap of Malines lace, trimmed on the side with a bouquet of white or pink poppies. *Canezous* of embroidered muslin, with large plaits. This *canezou* is gathered on a belt, like the body of a dress; the small collar is embroidered, without being trimmed with lace; the sleeves are



embroidered, and trimmed with two flounces of embroidered muslin. Dress of silk barège, or with pattern. Night-cap, of muslin, trimmed with six rows of trimming, put on flat, the strings and curtains trimmed the same.

Fichu, or neckerchief, disposed so as to be worn with a dress open in front: white muslin embroidered *à colonne*. Lace collar, as well as the frill, reaching to the waist. Small jacket of white (*pique*), trimmed with a white braid, a little gathered, with pockets, and trimmed with English embroidery, with large cuttings, for morning dress, country toilet.

LORD TORRINGTON.

GEORGE BYNG, 7th Viscount Torrington, eldest son of the 6th Viscount by his second wife, daughter of Sir Robert Barlow, born at Yates Court, Kent, September 9th, 1812; was educated at Eton; and gazetted in 1827 to a Lieutenancy in the 60th Rifles, in which regiment he served in Ireland and at Gibraltar. He was subsequently promoted to the Royal Fusiliers, and was quartered with that corps at Bristol during the exciting period of the Reform riots. In 1831 he succeeded to the title, and, in 1838, on his marriage to the only daughter of Sir John Dugdale Astley, Bart., retired from the army, and in the same year took his seat for the first time in the House of Lords. He was appointed Lord of the Bed-chamber to William IV. under the Melbourne Administration, an office which, on the break up of the Administration, in 1837, and the appointment of the late Sir Robert Peel, he was asked by the King to retain, but resigned, preferring consistent adherence to his party to the retention of any office, however advantageous and honourable.

On the death of William IV. Lord Torrington was appointed Lord-in-Waiting to the Queen, and had the honour, whilst he held that office, of attending upon the son of the Emperor of Russia during his stay in this country, and was also selected to proceed to Gotha in 1840, and escort to this country his Royal Highness Prince Albert, on the occasion of his marriage with her Majesty. From the return of Sir R. Peel to power, in 1841, he devoted the greater part of his time and attention to the improvement of his estate and the general encouragement and promotion of agriculture in the county of Kent, and received a very handsome testimonial from the county.

In September, 1846, Lord Torrington was appointed Governor and Commander-in-Chief at Ceylon. On his arrival in the island in May, 1847, his first acts had regard to its embarrassed financial and commercial position. His at once adopted measures of retrenchment, and relieved trade in accordance with the policy to which he had lent his support at home, by abolishing differential duties on imports, &c. Lord Torrington had proved himself the most useful, and bid fair to be one of the most popular governors the island had ever had, when in 1848 post after post brought news of revolutions throughout Europe; the Kandians, led by priests and head-men, gathered and proclaimed a king. Measures of repression were promptly taken by Lord Torrington, under the advice of experienced military officers, some of whom considered that as immense amount of life had been sacrificed in 1848 from a sufficiently stern example not having been made at first.

The rebellion was speedily repressed, but Lord Torrington's measures gave rise to a committee of the House, which for the two sessions of 1849-50 carried on the most searching inquiry into the matter, and which finally resulted in a report drawn up by Lord Hotham, without concert with any other members of the committee, and which recommended the recall of Lord Torrington.

On his return, his Lordship took the earliest opportunity of moving that a copy of the Commons' report should be sent up to the Lords, and on that occasion entered upon a complete defence of his policy, in which he was supported by Earl Grey. On the 23rd of May Mr. Baillie brought on his motion of censure; Lord John Russell spoke in complete vindication of Lord Torrington, and Sir J. Hogg, in the course of an able defence, stated that "his Lordship found the colony embarrassed and with a deficit, and left it flourishing and with a surplus;" the debate occupied two nights, and closed with a majority of 80 for the Government, the numbers being 282 against, and 202 for the motion.

In the House of Peers his Lordship has from the first been the consistent supporter of every liberal and free-trade measure, and has never been absent from his place on important divisions; but he had taken no part in any debate, and in reality could scarcely be said to have spoken in the House until the 1st of April, in defence of his acts and policy at Ceylon.

Our Portrait is from a Daguerreotype by Kilburn.

THE INSURRECTION IN CEYLON.

OUR Portraits of two of the prime movers of the late insurrection in Ceylon (so prominent in the Parliamentary business of last week) are from sketches by an artist until recently resident at Colombo. First is

KADDAPPOLLE UNANSE,

the Buddhist Priest, who was shot in his full robes, at Kandy, for his participation in the rebellion; though it was attempted to be proved that he was not a Priest at all, or, if a Priest, then only a "Jungle Priest."

A correspondent of a Colombo journal states:—"Thus stands the matter: the victim, a Priest, about to be shot to death, implores the Governor to be allowed to divest himself of the dress which marks his sacred vocation, being executed in which as a felon would indelibly disgrace his order. My Lord says, 'No, you shall be shot in your robes, as a terrible warning to your priestly fellow-traitors.' And it is done. What results? Public indignation is aroused, and with execration thundering in his ears from every side, he naturally seeks grounds of vindication, and resorts to the highest evidence he can obtain in such matters—that of the two Chief Priests of the great Kandy Wihares. And what do they tell him? That the dress in which a Priest may meet a felon's death is of no importance, and conveys no signification, and that the actual execution of Kaddapolle Unanse in his clerical robes reflects no disgrace on either the individual or his order, and is viewed with utter indifference by the whole Buddhist population!" Had, therefore, Lord Torrington referred to these men as to the probable effect of his subsequent decree, he might have saved himself from the charge of cruelty that he incurred.

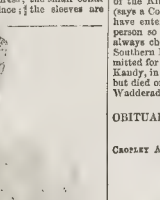
THE KANDIAN PRETENDER.

The wretched puppet-king, who was set up by the Kandian chiefs and priests as the ostensible leader of the rebellion, was named Godgaleegoda Banda, and was of the Juggery caste, a very low one in the Cingalese social scale, the members of which are employed to draw the sweet juice of the Kittul palm, and boil it into sugar. It may be safely asserted (says a Colombo journal) that the Kandian chiefs and people never could have entertained the idea of permanently submitting to the rule of a person so low in the scale of caste. Their former rulers were almost always chosen from a Tamil family, "the solar race" of Madura, in Southern India. "The king," not having been taken in arms, was committed for trial before the Supreme Court; found guilty, was flogged in Kandy, in January, 1849; was sentenced to transportation to Malacca, but died on his passage there. The accompanying sketch was taken in Wadderady gaol, in February, 1849.

OBITUARY OF EMINENT PERSONS RECENTLY DECEASED.

THE EARL OF SHAFTESBURY.

CROPLEY ASHLEY COOPER, Earl of Shaftesbury, Baron Ashley, of Wimborne St. Giles, in the county of Dorset, Baron Cooper, of Paulett, in the county of Somerset, and a baronet, was born on the 27th December, 1768, and succeeded as sixth Earl at the death, without issue, of his brother, Anthony Ashley, the fifth Earl. He and this brother were the only sons of Anthony Ashley, the fourth Earl of Shaftesbury (after which succession to the honours of his house, the sixth Earl, the subject of this notice, was, in 1814, having previous y held the office *ad interim* for Lord Walsingham, elected chairman of committees



of the House of Lords, and he continued to be so elected annually for thirty-six years. His fulfilment of the duties of this important and onerous office earned the most general satisfaction. His alertness and impartiality, and his weight and extensive knowledge as an authority on questions of order and Parliamentary usage, rendered his services invaluable. Latterly, in consequence of the increase of business from private bills, this office became onerous, yet his energy and assiduity continued to overcome them. This year, both Houses of Parliament marked their sense of the obligation they and the country lay under to his Lordship, by sending addresses to her Majesty expressive of their approbation and gratitude, and recommending the grant of a retiring allowance to the Earl. In private life his Lordship was equally respected and beloved. He died on the 2nd instant, at his seat, St. Giles' House, Cranbourne, Dorsetshire. By his wife Anne, daughter of George Duke of Marlborough, whom he married the 10th December, 1796, the Earl leaves, with other issue, an eldest son and successor, Anthony Lord Ashley, M.P. for Bath, now seventh Earl of Shaftesbury.

The first of this distinguished family who was ennobled was the celebrated Sir Anthony Ashley Cooper, created Earl of Shaftesbury, the turbulent and mysterious politician of the times of the Commonwealth and the Restoration. It was this Earl who was a member of the Cabal Administration which achieved the passing of the great Habeas Corpus Act, and who concluded his career by promoting to his utmost the panic of the imaginary Popish plot, and so much offending all sides that he had to fly his country, and die abroad.

A portrait of the late Earl of Shaftesbury—an excellent likeness—appeared in the ILLUSTRATED LONDON NEWS for February 8, 1851.

THE RIGHT HON. RICHARD LALOR SHEIL.

RICHARD LALOR SHEIL, whose name will go down to posterity, if not as a patriot, at least as one of the great men of Ireland, was born in 1794, of respectable parentage. After receiving his education at Stonyhurst and Trinity College, Dublin, he was called to the Irish bar in 1814, and was making some way there when the formation of the Catholic Association opened a new and more attractive arena for his energies and his eloquence. Second to O'Connell alone, Sheil often, in that famous assembly, surpassed even the Agitator himself in his powers of captivation, from the beauty of his language and the grace of his imagination. As an author, Sheil was also eminently distinguished. He wrote some successful tragedies; one of them, "Evadne," still retains possession of the stage: his articles in the *New Monthly Magazine*, in the palmy days of Campbell's editorship, were generally admired, especially his able sketches of the Irish bar. When the Emancipation Act passed, Sheil took his seat in the British parliament, and began his first and only career as a statesman at once in the foremost rank. He was for many years one of the most leading and attractive speakers in the House; and when O'Connell's energies declined, many in Ireland looked upon Sheil as about to grasp the sceptre of Erin's popular agitator. The orator had, however, too closely allied himself to the Whig party to do so, and he may be said to have literally given up to place what was meant for mankind. For some years back the right honourable gentleman was heard in the House but on rare occasions, and he invariably held some appointment of profit under the Crown. Besides being a Queen's Counsel and a Privy Councillor, Mr. Sheil was successively a Commissioner of Greenwich Hospital, Vice-President of the Board of Trade, Judge Advocate General, and Master of the Mint. His last place was that of her Majesty's Minister Plenipotentiary at Florence, whither he went just prior to the bringing in of the Ecclesiastical Titles Bill. Mr. Sheil married first Miss O'Callaran, niece of Sir William M'Mahon, Bart., Master of the Rolls in Ireland; and, secondly, in 1830, Mrs. Power, a widow of fortune, the daughter of John Lee, Esq., of Orsan, near Clonmel, and by her had a second Power, Esq., of Gurteen, in the county of Tipperary. The news of the recent death, by suicide, of the lady's son, John Power, Esq., is said to have had a fatal effect upon his step-father. Mr. Sheil was stricken grief in the stomach, and died somewhat suddenly, at Florence, on the 25th ult.

St. Amant, the great chess-player, is appointed French Consul at California.

Half the bread now manufactured in Limerick is the produce of Egyptian flour, being a cheaper article than any other flour.

On Saturday afternoon, two boys bathing in the Thames at Bankside were washed from their footing by the swell of a passing steamer, and were carried away by the tide and drowned. The bodies have not been recovered.

TOWN TALK AND TABLE TALK.

THE Tamworth row, and the letters which it has provoked, have formed one of the most notable topics of the last fortnight. The physical shower of brick-bats which crashed through the windows of the Tamworth Town-hall has been followed by a still more efficacious moral pelting, administered at the hands of a generally indignant public. The utter lack of taste, tact, good feeling, and common sense which led the rump of the Protectionists to pitch upon Tamworth as the scene of their illogical saturnalia, are universally deprecated by the community. Had no disturbance taken place upon the occasion, of course the Protectionists shout would have been —" Reaction—Reaction in Tamworth—Reaction in the family borough of the great commercial reformer—Reaction in the very atmosphere of the departed chief" Reaction over the grave of Sir Robert Peel" As, however, the justly indignant community of Tamworth rose with universal and unpremeditated impulse to resent the shabby insult, a different tone has been taken by the promoters of the scandal. They had never connected Tamworth with Sir Robert Peel—in fact, they had utterly forgotten that once familiar *formula*, "The Right Honourable Baronet the Member for Tamworth." The remembrance of the echoes which the voice of the mighty dead had so often called up in the room whereof they sat, had faded. They ignored the fact that they had deserted the broad counties, studded with populous towns, to come and howl out their lamentations over the cheap food of the people by the grave of the great statesman who overthrew the greatest faction which England ever saw, and won for the working men and women of England the greatest victory they ever achieved. Can any man with blood and brains deny that the outburst at Tamworth was the natural result of the spiteful folly which selected the very property and home of the departed statesman as the place for abusing his policy and insulting his memory? Sir Robert was the very *genius loci*—he was the soul, and the sentiment, and the intelligence of Tamworth. He raised the little obscure country place to historical and political immortality. He consecrated and hallowed the soil; he made those rough-paved streets haunted holy ground. The very Town-hall, a bare, cold, ugly room, became a fane which many a future traveller will visit as the spot in which the greatest economic reformer of the world set forth his opinions, and from it addressed a listening nation. I well remember many of Sir Robert's most famous speeches pronounced either within or without the walls of that ugly little pillared structure. I heard him there deliver the excellent practical address containing the famous allusion to the bull, which afterwards became the nucleus for so many jokes, good, bad, and indifferent. I remember well the roar of laughter which greeted poor Sir Robert's business-like announcement, and the curious, puzzled expression of his face as he stopped, and by his looks mutely asked the company what there was so very funny in what had just been said. I remember, too, his last speech on the Tamworth hustings, at the general election which brought in the Whigs. Just before he began, I asked him, on behalf of the London reporters present, what would be the probable length of his address, with a view to some railway arrangements for the more speedy transmission of the speech to town. He replied, that he thought he should not be above half an hour or so; that he had already really said all he could say on the subject—that of general commercial legislation. Sir Robert, however, counted without his host. His speech was nearly an hour and a half in length; so obviously did one subject suggest another, and so hard and good-humouredly did he labour, by the most homely arguments and familiar illustration, to drive his meaning into the crowd before him. I never heard Sir Robert so didactic. He lectured rather than oratorised, taught rather than argued, putting all sorts of cases, tracing practically out, in the instance of the farmer, or the tradesman, or the merchant, the operations of Free Trade, and showing how all, in the end, must benefit by the operation of a law founded on common justice and common sense. Messrs. Young, Newdegate, and Spooner will not easily eradicate the effects of such lessons. They got their answer the other day, in the shape of the arguments they can best understand; and as to the disagreeable consequences of the threatened contact between their heads and brick-bats, I am strongly inclined to think that the brick-bats would have had the worst of it.

Various *on dits* and anecdotes are afloat as to the secret preparations made by the police to put a stop to the plotting and mischief-making apprehended as likely to result from the numbers of discontented foreigners, refugees or otherwise, now speedily to be in London. I suspect, however, that Scotland-yard will in this matter have a very easy task. The Exhibition bugbears have vanished one after the other in the most ghostlike manner possible; and the only real evil which seems to have resulted—from the Crystal Palace employing all the theatres—was exactly the one least dreamed of by the prophets. Meantime, I suspect that the respectable gentlemen with young France beards, wide trousers, and no particular display of linen, who are generally deemed to form the materials of those mysterious conclaves called secret and central committees—who publish from time to time mystic proclamations and terrific appeals to arms—I suspect, I repeat, that these gentlemen do not find the soil of England particularly favourable to the prosperous concoction of deeds of future revolutionary darkness. Conspiracies to influence France must be formed in France. Plots to turn the Austrians out of Lombardy, must be cooked south of the Alps. The dish gets cold in the carrying from London. The passage is too long between the parlour and the kitchen.

In one of the galleries there is laid out a collection of paste models of all the great diamonds of the world; and, judging by the Hope gem and the Koh-i-noor, the counterfeits look quite as well as the genuine articles. The former stone, called the "Hope Rose," a sapphire blue diamond, is now exhibited by its proprietor, Mr. P. Hope, for the first time. Its great value is in its colour, rather than size, the large oblong cut stone increasing the nominal price some eight or ten fold. The history of Mr. Hope's becoming possessed of the diamond is curious:—In 1831, at the epoch of the coronation of George IV., the stone was in the possession of a Mr. Ellinson, a great diamond merchant, and by him reckoned as of the value of £60,000, though he offered to sell it for 30,000. The King was very anxious to make the purchase, but the state of the privy purse was not favorable. Then he tried to borrow the diamond for one day—to be worn among the coronation gems—offering the enormous hire for the gaud of 1000 guineas. The negotiation was going on when Mr. Hope called on Mr. Ellinson, giving the merchant first to understand that any dealings between them were contingent on the notion of letting on the jewel to the King being given up; Ellinson readily agreed to this, provided he got his price—£30,000. Mr. Hope took from his pocket a cheque for 13,000 guineas, laid it on the table, put his watch with it, and said, "I give you three minutes: then take either the cheque or the diamond." He sat down and looked coolly at Ellinson. "Three minutes!" exclaimed the diamond merchant. "Three minutes," said Mr. Hope. "I can't—I won't—it's impossible to make my calculations—to confer—to" "Three minutes," said Mr. Hope. Ellinson stood aghast. The watch ticked loud between them—the minute-hand moved on. Ellinson gazed at his customer's face. It was cool, and calm, and determined. The three minutes were all but out. The seller made a rapid motion with his hand towards the diamond, stopped, and slowly took up the cheque. Mr. Hope took up the stone. "You've got it cheap—dog—dirt cheap," said Ellinson. The gem was used by its purchaser, not as an ornament of distinction, or simply it, as a striking rarity in the show of the coronation, but simply as illustrative of mineralogical science. He took it home, and deposited it amongst other specimens in his collection, under the head "Minerals Combustible."

THE REPRESENTATION OF BATH.—The elevation of Lord Ashley to the Upper House, consequent on the death of the Earl of Shaftesbury, has caused a vacancy in the representation of this city. His Lordship has issued the following farewell address to "The Electors of Bath, June 2, 1851,—Gentlemen,—By a domestic affliction which has just occurred, I am removed from the representation of the city of Bath. I take the earliest opportunity of expressing to you my deep sense of the high honour you conferred on me when I obtained the seat by your suffrages in 1847, and, I must add, the lasting gratitude I shall feel for the kindness I have ever experienced at your hands, and which I cease to entertain the liveliest interest for your individual and collective welfare. I am, gentlemen, with much gratitude, your very faithful friend and servant,—Ashley." Captain Scobell, R.N., has offered himself as candidate on the liberal interest. A meeting of the liberal portion of the constituents was held on Wednesday night, and it was resolved to adopt the necessary steps to secure the return of the gallant officer. It is stated that Mr. William Sutcliffe, of this city, will be solicited by the Conservatives to contest the representation.

NEW PROTESTANT FREE SCHOOL IN ST. GEORGE'S-IN-THE-FIELDS.—On Tuesday evening, an interesting examination took place of the children taught in the free school recently established in the parish of St George the Martyr, Southwark, by the Rev. T. Darnell Baker, curate and evening lecturer. It is intended to erect, as soon as funds can be raised for the purpose, a new district church and schools, in the south-western portion of the above-mentioned extensive parish, at its junction with the parishes of Lambeth and Newington. The proposed district will comprise a population of 7000 souls; and at present the only place of worship in it is the Romanist cathedral.

THE NATIONAL SOCIETY.

A discussion of the "sacred question" of State interference with National Education has assumed a more serious character than was anticipated at the commencement of the proceedings of this society, at its annual meeting on Monday, which was held at the Society's Central School-room, Broad Sanctuary, Westminster. The crowd was immense, a large portion being clergymen. Soon after the chair was taken by his grace the Archbishop of Canterbury, who was supported on the right hand by the Archbishop of York, the Bishops of London, Lincoln, Bangor, Exeter, Llandaff, Chester, and Rochester; and on the left hand by the Archbishop of Dublin, and the Bishops of Worcester, Salisbury, and Gloucester. The Bishops of Ripon, Oxford, and Winchester, Salisbury, and Gloucester, and Archdeacon Hoare, were also present. The Archbishop of Canterbury, and the Bishops of St. Asaph, Bangor, Chester, and Rochester, and the Rev. G. A. Denison. There were also present

THE GREAT EXHIBITION.

NAVAL ARCHITECTURE.

THERE can, we apprehend, be little doubt in the opinion of all connected with, or interested in, naval art and the manual science of ship-building, that Great Britain, in her maritime capacity, is not so fully or so adequately represented in the Exhibition as she ought to be. If there was any one department of industry—any one national pursuit to which, more than another, the place of honour, in all the meanings of the phrase, ought to have been assigned, it was surely that connected with our much boasted empire of the seas; we ought to have had a complete epitome of the naval architecture of the realm, and, if possible, also, a complete epitome (both by means of models, of course) of the history of ship-building in England from the earliest times; we ought to have been able to trace our progress from the days of the currach and the primitive galley, founded, perhaps, in a great measure, upon Roman models, to the last screw-propeller man-of-war launched from Woolwich or Plymouth, or the last crack yacht set afloat at Cowes. A few ancient models are certainly to be found in the Naval Gallery: we have a model of a Roman war-galley, with four banks of oars, very curious; and another of the famed ship of Henry VIII., which carried him to the conference of the Field of the Cloth of Gold; another of a first-rate, built in Charles I.'s time; and several of the not ancient, but old-fashioned, tubs in which Rodney and his sea-dogs won their battles. The collection is, however, but fragmentary: we have only scattered links of the chain which, if completed, would have formed one of the most interesting and purely national portions of the Exhibition. Surely Government had it in its power to do more than it has done. There is a fine, although by no means perfect, collection of models in Somerset House, to which the general public have no means of access; and there are, doubtless, many more such assemblages of miniature vessels of all ages, and all styles of architecture and rig, connected with our national ship-building establishments at the different arsenals. Surely, from all these a perfect array of specimens of our progressive skill might have been educed. We will answer for it that such a fleet would have attracted much and enlightened curiosity, and that it would have been esteemed a graceful tribute on the part of England to that constructive skill and marine intrepidity which, more than any other causes, have contributed to place her at the head of the list of nations. Or even if the formation of such a collection had been deemed inadvisable or impossible, surely we ought, at least, to have had a series of models of the different species of ships, and coasting and fishing craft, used in the present day round our own coasts. The interest of such a collection would have been the greater when we recollect that it frequently happens that the style of vessel used upon a certain range of coast reflects not only the geographical, and in some degree the atmospherical, conditions of the district, but also often indicates the peculiar descent, race, and blood of the people who inherit it. Thus, take the west coast of Britain, from the Highlands to Cornwall. The shore is in many parts mountainous—at least to a greater extent than the east coast. Squalls and sudden gusts of wind are the necessary consequence—a consequence which we see reflected in the construction of the western coasting craft, which are more generally schooner-rigged, and therefore provided with smaller and more manageable sails than the old-fashioned smack arrangement of spars and canvass, which long held good upon the east coast, and which disposed of two-thirds of the sail a vessel carried in one huge and unwieldy web of cloth. Again, take the range of the eastern coast about Yorkshire and Lincolnshire, from the Humber to the Wash; the shore is remarkably flat, muddy, and sandy. The tide ebbs and flows over long expanses of slimy marsh and mud, in fact, reminds you of the Dutch and Belgian coast, in [illegible] ing levels. It is evident that coasting craft [illegible] em it be constructed so as to take the ground [illegible] of the tide without straining or injury. And one of the principal peculiarities of the quaint Dutch and Flemish schuyts we often see in the river, and knocking about down Channel and in the North Sea; while, so steadily do the same causes produce the same effects, that an inexperienced eye might be pardoned for mistaking a Yorkshire billy-boy, laden with stones for the New Houses of Parliament, for a Dutch sloop bringing over a cargo of eels from the dams and sluices of that swampy land. One other illustration of contemporary naval architecture as showing national derivation. Upon the north-east coast of Scotland we have frequently watched the fleets of herring-boats assembled at the principal fishing stations in Sutherland and Caithness. Minor differences excepted, there were always to be seen two species of boat, differing in essentials the one from the other. The first of these classes consisted of short, very strongly built craft, of great breadth of beam, and still greater depth and hold of the water, the bow and stern almost perpendicular, each boat carrying a couple of lug sails, the larger spread upon the foremast, which is placed chock forward in the very bows. The mizen is a smaller and less important sail, but helps to counterbalance the broad canvass spread forward. The second class of boats, again, are much longer than the first. They have about equal breadth of beam, but are exceedingly shallow, with the bow and stern sloping at a blunt angle from the keel, and overhanging the water. They carry more sail than the first class of boats,

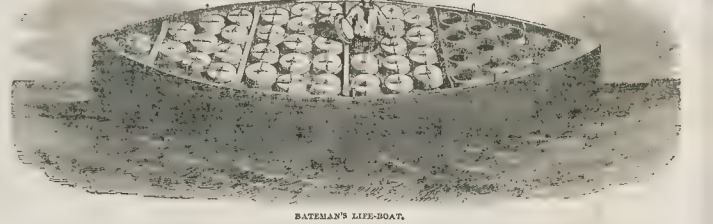
MODELS OF SHIPS AND BOATS.—INDIA.

the main sheet of canvass being always upon the after mast, and the foremast displaying no larger a sail than the mizen of the first described class. Now, these distinctions of hull and rig are merely national. The short deep boats are manned by crews descended from the Scandinavian colonies, established all along the eastern coast of Scotland; the fishers who ply their trade in the long shallow boats are Celts to a man. In the first class of craft, the language used is a strange *patois* of corrupted Norwegian and broad Scotch; on board the other set of boats it is invariably Gaelic. Let us add, that the descendants of the sea-kings entertain a profound contempt for their *Erse*-speaking brethren; and that a northern populace, amongst them is to the effect, that a Highlandman will never go to sea so long as there is wind enough stirring to shake a dock-leaf.

We have, perhaps, said enough to give some idea of the peculiar investigations which might have been pursued, and the peculiar light which might have been thrown upon our national characteristics, had we been furnished at the Exhibition with a complete collection of specimens of our naval construction, illustrative of every coast and every river, and every theory of marine construction which is born of the coast and the race around us. No opportunity, however, being afforded for instituting a complete inquiry into this interesting subject, we proceed to describe the main feature of the collection which has actually been brought together.

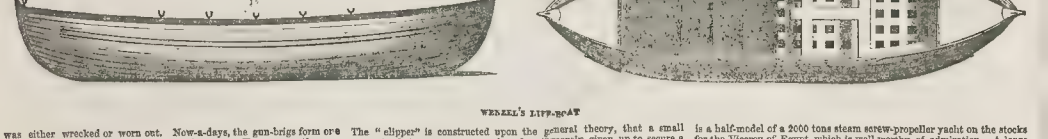
It consists, then, principally of models of ships of war, showing their lines; and, in a few cases, of section models, showing the dispositions between decks. Many of the former class of models are in what may be called *bas-relief* that is, only one side of the vessel is represented, the object simply being to show her mould and run. These are arranged upon the western wall of the Exhibition, and are principally representations of vessels constructed in our naval dockyards within the last twenty years, many of them having been built during the long contest which agitated the naval world between the Surveyor of the Navy and his numerous antagonists and detractors. There are also a fair number of models of steam-boats—some screw and some paddle—some in relief and others entire. A large passenger-ship or two is exhibited, shewing some of the most recent improvements in interior arrangements; and, after glancing at a number of minor rigged models of schooners and cutters, introduced rather as specimens of the skilled neatt-handedness of their builders, than as exemplifying any principles in naval architecture, we come upon a vast variety of plans and inventions for life-boats. The number of these indeed is curious. There must be between one and two hundred models of craft intended for saving life in cases of shipwreck. Every possible combination of cork and air-tight chambers, having been resorted to, to work out the notions of their inventors. We have given Illustrations of two of these boats—Bateman's and Wenzel's. On the other side of the stall on which the life-boats make so conspicuous a figure, is arranged a great variety of models of ship machinery, particularly that connected with anchorage, such as capstans, windlasses, chains, and anchors themselves. We have then a number of compasses and graceful designs for binnacles; and, lastly, after inspecting an ominous *patheron* of naval odds and ends, such as gun-harpoons for striking whales, and almost equally formidable weapons for shooting ducks from punts, models of oddly-shaped ships with sliding keels, and catamarans constructed out of spars of wood, and air-tight bags acting as buoys, we have an infinity of diving apparatus, illustrative of the entire progress of adventuring, remaining, and working below water.

We will first briefly direct attention to the bas-relief models of the men-of-war. Had this been complete, or had specimens of different ages been copiously introduced, the observation of the gradually shifting forms adopted in our dockyards would have been specially interesting. As it is, however, we can gather from the collection hints not without their meaning and significance. The first thing which strikes one in modern ship-building is the cutting down of the bulk which our ancestors were fond of rearing above the water. The castles, and quarter-decks, and poops with which they delighted to encumber their vessels, began first to give way at the bows; and the forecastle has long been a mere name, the thing having vanished more than a century ago. It was not, however, until a much more recent period that the mountains of timber piled astern began to be reduced; and the naval battles in the latter third of the last century were fought by ships of the line with taffrails rising 40 and 50 feet above the water. The tendency of improved ship-building is now to keep the whole expanse of deck as nearly as possible upon the same level. A few smaller vessels, we believe, have been actually built flush from stem to stern; but, at all events, the modest height of the quarter-decks now constructed contrasts strangely with the old notion of the symmetry and propriety of a towering poop, ornamented with all the art of the carver, and furnished with range over range of quarter galleries. Beneath the water-mark the tendency of advancing ship-building has been so to adapt the curve of the swelling side and the concave portions of the ship, which, in nautical phrase, "take most hold of the water," so as to prevent, as much as possible, the heavy and injurious



BATEMAN'S LIFE-BOAT.

tendency to roll; and that the dimensions of the part of the ship diminish immediately before the rudder, called the run, and in which the convex form changes into a pure and finely modelled concave, so as to allow the body of water displaced to close quickly and easily, flinging its full force upon the helm—the spectator will observe that in modern ships this "run" is of larger dimensions than in the olden craft. An exception to this rule is, however, in some degree to be found in the vessels of the survey or of the navy. Take the *Queen* for example, a first-class man-of-war of 116 guns: a full model of her hull is exhibited, which, for bluffness, and, to modern eyes, clumsy ugliness of mould, could not be beaten by any of the ships which carried the flags of Byng or Rodney. The merits of the *Queen* have accordingly been long a fruitful theme of controversy in the naval world. Her best qualification is, we believe, that she carries her guns well out of the water; but she is slow, and rolls tremendously in a sea-way. In the lines shown of new frigates and gun brigs, it is curious to observe the approach to the style of building which has been long ago adopted in the construction of yachts—the bow sharper and finer than ever; the runs of great size, and delicacy of mould; and the height of the ship attaining its extreme point when measured from the taffrail to the lower extremity of the stern-post. The effect of this latter arrangement, taking into consideration that the ships in question are made to sit with the stern low in the water, is to cause them to throw many more feet of water aft than forward, to give them great steering power, and a strong firm hold of the water. The attention of



WENZELL'S LIFE-BOAT

was either wrecked or worn out. Now-a-days, the gun-brigs form one of the most creditable departments of the navy. Here we see the models—and beautiful they are—of the fleet built both by private and official enterprise, the peaceful records of whose cruises filled so many newspaper columns half a dozen years ago. The precise question of their merits was never very fairly settled; but the general opinion was, that the *Medina*, the *Daring*, and the *Espiegle* were the flowers of the fleet. The *Medina* afterwards greatly distinguished herself on the coast of Africa. The *Flying-Fish*, one of the quickest of the squadron, was so wet, as seriously to interfere with the comfort of all on board, but still, altogether, the vessels in question formed, perhaps, the most beautiful and best adapted squadron which ever went to sea.

A few, but only a few, models of merchant sailing-vessels are exhibited. To one of these the attention of the visitor is requested, as a perfect specimen of the latest improvements in first class passenger ships; we allude to the model of the hull of the *Owen Glendower*, one of Mr Green's splendid fleet of frigate-like merchantmen, built at Blackwall. The capacity for stowage in this fine ship is beautifully combined with a faultless outward mould. Her bows are sharp, and have that slightly concave tendency which denotes speed and dryness, and the run is beautifully fine, and what sailors call "clean." In one respect the *Owen Glendower* differs from the new fashion of flush building, now so prevalent. *Cæteris Paribus*, in our opinion, a flush built ship is, for abstract sailing and weatherly purposes, superior to a higher piled vessel. She has less upper weight to carry, consequently she will roll less. She exposes a smaller superficies of hull to the wind, consequently she will sail faster; and she is altogether lighter and more compact, consequently she will last longer.

Ships intended for passenger traffic, particularly for long voyages in hot latitudes, must, however, be designed with a view to other than the considerations which would make the quickest and the most handily managed vessel. They must be comfortable, and commodious and healthy, as well as fast and good sea boats; and care must also be taken that the stowage space of the ship is not unduly interfered with by the demands of passengers. These were the considerations, in all probability, which presided at the designing of the *Owen Glendower*. She carries a quarter-deck not too high, but of more than ordinary length, and sufficiently lofty to allow an airy and comfortable cabin, with berths and state rooms to extend below it. Thus the passengers are accommodated upon the level of the main deck. They have plenty of air and ventilation. The height at which they stand above the sea allows of larger windows being formed than would be possible had they to descend a "companion" to attain their cabin, and thus a handsome airy apartment is secured, removed as much as possible from the unpleasant smells, which are always strongest the further down you go in a ship; while a considerable space is gained beneath for extra stowage, which would, of course, have been lost had a dull, dingy, close-smelling cabin been "howked" in the recesses of the ship. A similar arrangement now very generally holds in the American packets; and different modifications of the same plan, such as round-houses, cuddies, and so forth, have been long familiar to the passengers of East India ships. Forward of the deck cabin, in the *Owen Glendower*, is an excellent arrangement of pens for live stock, and a compact cooking apparatus; while the crew are accommodated beneath a raised forecastle upon exactly the same principle as the passengers abaft.

Above Mr. Green's fine ship is a rigged model of a class of vessel which is making great and rapid innovations upon our old-fashioned mercantile marine—an Aberdeen clipper schooner. The port in question has taken the lead in the production of this very beautiful, very safe, and very fast class of vessel. Indeed, the Scotch ports on the eastern coast, particularly Leith and Dundee, stand conspicuously out by their excellence in constructing a new class of exceedingly elegant and exceedingly rapid ships, which will, no doubt, gradually come into universal use, and fling totally out of employment our old-fashioned clumsily-built coasting craft—the Newcastle and Sunderland tribe of brigs, for example, which are a disgrace to our age and our country

The "clipper" is constructed upon the general theory, that a small amount of stowage-room may be advantageously given up to secure a great amount of speed, and with that speed a perfection for cargo and a greater degree of safety from the accidental risks of the sea; since no one can dispute that a vessel able so go ten or twelve miles an hour, stability not being sacrificed, must, in the nature of things, be a more secure ship in every respect than one which is able to go only five or six. The clippers were, we believe, first built to carry up perishable cargoes of salmon from Norway and the north of Scotland to the Thames. They are now commonly used in traffic for the conveyance of easily-spoiled goods, and for that of cattle, which are deteriorated in condition by being long at sea. The general fruit trade from the Mediterranean, the orange trade from the Azores, as well as the Scotch coasting traffic are now almost entirely carried on by clippers—craft of as beautiful an appearance on the water as any of Cooper's slaving, or pirate, or privateer schooners, and able to go from the Nore to the Humber in the time which a clumsy Newcastle brig would take to work down the Swin to Harwich. The fast increasing class of screw-propeller boats—principally devoted to traffic in cattle, between the Thames and Ireland, and Holland—are also built and rigged on clipper principles; and Aberdeen has recently been asserting her right still to continue in the van of the race in naval architecture, by building clipper ships of large tonnage, one of which, in a voyage from China lately, beat an American ship, loudly trumpeted as the fastest vessel which ever bore the stars and stripes, and consequently, of course, in the opinion of Yankee-land, the fastest vessel in the world. The model in the Exhibition shows that the Aberdeen clipper schooners, while they are formed about much upon the ordinary moulding of a yacht—this is—as we have explained, with a long and fine run, and very high from the bottom of the stern-post to the taffrail, are modelled forward upon the principle of the bows of a Clyde-steamer, involving great sharpness, rising into a concave shoulder of exaggerated hollowness compared with that mere tendency to concavity which we have described as characterising many new vessels both men-of-war and merchantmen. The effect of this construction is not to prevent the vessel pitching, but to cause her to pitch without being wet, the overlapping portion of the bows flinging the water downwards and backwards from the obstacle, while the sharpness beneath enables the ship to slide quickly and steadily through the water. As yet, with few exceptions, the clipper-build is confined to coasting craft; but the initiative has been taken in the construction of large full-rigged ships upon the same principle; the success of more that one of which hailing from Liverpool and Aberdeen has lately formed the subject of newspaper paragraphs. Of the coasting craft, a few, but only a few clipper brigs have been built, the majority of the smaller vessels being schooners. In the rigging, considerable improvements, both as respects lightness and elegance, have taken place. The clipper is frequently less traversing aloft than the old-fashioned hermaphrodite schooner; but her yards are squarer, her boom and gaff longer, and she is thus enabled to carry as great a spread of canvass and to manage the cloth with more facility than the loftier rigged vessels. The old hermaphrodite schooner carried foremast, fore-topmast, and fore-top gallant-to. She can go at double the speed of the lumbering collier-brig or coast-schooner, and shews beside them, too, like a hunter compared with a couple of dray-horses.

The steam-boat models are numerous, and not uninteresting. A number of bas-reliefs are shown of vessels in the process of construction by Mr. Mare, for the General Steam Navigation Company—craft of beautiful design, and which will, no doubt, turn out very fast; and there

rolling motion, which is increased by the quantity of weight a man-of-war must carry above the water—to cause the ship to sit as stiffly as may be—and to arrange the lines of floatation so that the lowest tier of guns shall always be carried at least three or four feet above the water line. To these divers qualities the naval architect has, of course to add the consideration of that of speed, and the delicacy of the ship in answering the slightest touch of her helm. The peculiarities of modern improvement in all these respects are easily observable, upon comparison of an old-fashioned with a newly-built hull. The spectator will observe that the bows of modern men-of-war are sharper and far finer than the old style; that there is more of the concave shape about them—a form which flings the seas sideways and backwards instead of aboard, as the old bluff bows used to do; that the belly of the ship is by no means so round as it used to be, the sides or walls being far flatter, an improvement which diminishes the

the spectator may be profitably directed to the models of the *Pique* and the *Inconstant*, two of our heavy first-class frigates. Of these, the former seems the more graceful; but the latter has proved herself the most efficient vessel. Both the *Pique* and *Inconstant*, however, belong to the old school. Our first-class frigates are now rated to carry fifty guns, and beautiful specimens of these may be seen in the models of the lines of the *Raleigh* and the *Arrogant*—two of the noblest ships on the water, and bigger than Lord Nelson's old seventy-fours. The *Phaeton* and *Arethusa* are now at sea in the experimental squadron, being tried against each other. Both vessels are models of symmetry and grace.

After inspecting the new-fashioned men-of-war, furnished with auxiliary screw propellers, such as the *Hogue* and the *Agamemnon*—vessels carrying the most formidable batteries of cannon, ever borne across the ocean, and no doubt destined to take a conspicuous part in our next naval war—if ever such a misfortune should arise—the visitor may advantageously study the moulds of the little squadron, if experimental gun-brigs, the evolutions of which excited so much interest some five or six years ago. There is no department of our naval architecture in which we have made more progress than in the construction of the small men-of-war, called gun-brigs. The old vessels of this class were a disgrace and a reproach to our dock-yards. Over-masted, deep-waisted, ill modelled, they went down or went ashore with ease, and rarely, if ever, that they acquired the sig-down or went ashore with ease, and rarely, if ever, that they acquired the nickname of "coffins;" but were still—not much to the credit of successive governments—employed as packets, until the last of the fleet

is a half-model of a 2000 tons steam screw-propeller yacht on the stocks for the Viceroy of Egypt, which is well worthy of admiration. A large model of a new paddle-wheel steamer, fully rigged and complete down to the minutest details of finish, is placed in a prominent position, facing the eastward-running inner gallery, and deserves minute inspection as a peculiarly perfect model of a first-class craft of her species. She is flush decked and carries swivel regent guns upon her paddle platform. The floats of the wheels are disposed, not, after the too common fashion, in a plane with the spokes, but perpendicularly, so as to strike the water edgewise and to expend the whole force of the paddle upon a productive lateral, and not an unproductive downward movement. A number of contrivances, more or less ingenious, of feathering paddle floats are displayed, but we understand that it is found in practice that machinery of this sort, however theoretically plausible and however supported by abstruct scientific laws, has such an unfortunate tendency to get out of order as to counterbalance the nominal advantages. With improved mechanical contrivances, however, it is quite possible that the feathering system may yet be made practically available, unless, indeed, the screw achieve the final overthrow of the paddle-wheel.

The models of the *Albert* and *Victoria* and the *Fairy*—the well-known Royal yachts—excite much attention. We do not know, however, whether we are to place perfect credence in the miniature presentment of the larger vessel. Soon after the launch, it was popularly reported that she was a contemptible botch, and that all sorts of tricks and sly patching had been resorted to in order to make her sail respectably. Whether these stories were true or not, we cannot vouch, but it was often asserted, and never denied, that, as in consequence of some mistake in lines, the *Victoria and Albert* went fastest when down by the head, she was built so as to be always in this position, and then built up upon, so far, of course, merely as the bulwarks went, and new painted to conceal her awkward set upon the water. Be that as it may, however, the *Victoria and Albert* now goes very quickly through the water, a consummation for which she has, in some degree at least, to thank the immense steam power wherewith she has been provided. The *Fairy* is a sweetly formed and almost faultless little craft. Her speed in smooth water is wonderful, and the good weather she manages to make in rough, considering her shallowness, is equally marvellous. In crossing the Irish Channel in a gale of wind the day her Majesty returned from Belfast, we are told that, except mere spray, she did not ship a single hundred-ful of water, while we can bear personal testimony to the fact, that the sea washed in tons over the fore part of the deck of the *Caradoc*, one of the new crack Holyhead and Kingston packets, while crossing at the self-same hour. Not far from the models of the Royal packets is one of the screw steam yachts built by Mr. White, of Cowes, for the Emperor of Russia. The *Peterhoff* seems much such a vessel as the *Fairy*—very fast, extremely elegant and graceful upon the water, and made a good sea boat by the very force of her lightness and buoyancy, combined with a sharp wedge-like outline, which enables her to slip through head seas, offering them but a very trifling resistance.

In the same case is a large and handsome model of a Gravesend boat, the *Jupiter*, said to be the fastest on the river Thames. She is immensely long and narrow, with vast paddles, and will probably go at high velocity, but is only intended for smooth water. Close to her is deposited a curious contrast, in the shape of a model of a Roman galley, showing the way in which the oars were worked on board these eminently clumsy vessels. Beneath the water line the model is round and lumpy, with very little indication of a run, but we much doubt whether any authority exists for the exact mathematical proportions actually observed by the early Italian shipwrights. What may be called the main deck is very low down indeed—a mere flooring, a fact above the keel; but upon it are erected double platforms of four different heights, each platform seating five or six rowers, who grasp the vast sweeps by which the vessel is propelled. The arrangement of these sweeps is curious. The circular holes through which they pass run diagonally from the upper gunwale sternwise towards the keel, the benches within of course observing a similar

disposition. Upon small patches of deck, running round the bulwarks, and crossing from side to side—somewhat in the fashion of a steamer's paddle bridges—the warriors stand; and at the stern and stem there are species of covered receptacles, surrounded by circular wooden roofs, which afford shelter from the weather and the sea. It is difficult, however, to get anything like a clue to the actual accommodation for such a continued residence of a number of men in these ships. The—

and awful slavery it must have been to tug these long heavy sweeps—probably took up their sleeping quarters upon the pricking-for-the-softest plank principle.

The two *moyen-âge* ships—the *Harry Grâce de Dieu* and the *Royal Sovereign*, built by Charles II.—are well worthy inspection. The former model is rigged, the latter only a hull; her form and general mould, however, differing in no remarkable respect from, and shewing little advance in construction over, the former—although the latter was built not less than 113 years before her. Both ships are piled up with huge unwieldy masses of forecastle and poop. In the *Harry Grâce de Dieu* a number of circular sentry-boxes, or watch-towers, use all round the hull work, as though it had been the outer wall of a fortification, and the portholes are surmounted by ranges of loop-holes for musketry. The *Royal Sovereign* appears to have been built rather for purposes of pageantry than war. She is elaborately carved, principally with Britannias, or perhaps, more properly speaking, with Latin emblems and devices; but we miss the warlike appendages of turrets and pepper-box towers which gave the true *moyen-âge* ships the air of sailing castles—the idea of the architects having, indeed, manifestly been to manufacture a species of portal floating fortress. The rigging of the *Harry Grâce de Dieu* shows us the earlier stages of the combination of the still-existing square rig, with the latteen disposition of yards common to feluccas and their northern offspring—lugsail. Below three masts rigged square, with huge round tops, the two after-masts showing the latteen rig, which afterwards changed into the common schooner fore-and-aft mode of slinging the yards, still in existence, and which is based upon the same principle as the latteen arrangement of the Mediterranean. Altogether, the two models are so interesting as to make us again regret that they only show two incidental eras in the history of our naval architecture—two accidental links in the chain which began with the log or bark canoe, and ends for the present with the 120-gun ship, carrying 84-pounders on her lower decks, and flinging thousands of pounds of iron at every broadside.

Passing to the department principally devoted to the exhibition of life-boats and the partial machinery of ships, we observe two models of square-rigged masts, intended to illustrate the shape, manufacture, and working of a new species of blocks, dispensing with the clumsy outer strapping formerly in use, bound with iron, so as to make them very much stronger than the old-fashioned implements, while they are not by any means so heavy. The advantage in the purchase communicated by the new blocks is shown by an arrangement of weights, and they are certainly more compact and more elegant-looking, so far as a block can be called elegant, than the old implement.

The anchoring gear department shows a great number of windlasses and capstans constructed upon the new principle of hearing up the anchor by a pumping motion, which imparts a continuous movement to the cylinder on which the chain is wound, while it communicates a power of leverage unattainable by the rude old handspike system. The ancient windlass—and its use was all but universal in seafaring craft until within the last few years—was a peculiarly rude and clumsy instrument; and heaving up the anchor by means of it was a laborious and a particularly tedious job. We are glad to observe how rapidly the new pumping windlass is coming into observance, and to note the number of modifications of the principle submitted by inventors and improvers, showing that the subject is one attracting general interest. The form of the anchor itself has also undergone great changes within the last few years—the leading invention having been that of Porter's patent anchor. The principle of this improvement, several versions and modifications of which are exhibited, is very simple. In the old anchor, the weight of the chain lay upon the single arm which caught in the ground; the other was, for the most part, useless. In Porter's anchor, the arms form one solid piece of iron, moveable and working through the head of the shank. When one fluke bites, therefore, the arm to which it is attached spreads out at a blunt angle from the shank—a circumstance which tends to increase the holding power, while the opposite fluke closes down upon the shank and rests there, thus dividing the strain over the whole of the members of the implement. An objection made by sailors to Porter's anchors is, that if the cable, as it sometimes will, says the report, be difficult to fish up again, as there is no arm sticking up for the drags and so forth to catch hold of. On the other hand, this fact renders the cable less liable to foul; and it is undoubted that Porter's anchors are far more potent in their grasp of the ground than the old anchor.

Amid a number of glittering binnacles, compass-cases, and so forth, very prettily ornamented, we come to a dingy old relic, no less than the quadrant which Captain Cook used in some of his voyages round the world; and then, passing round the extremity of the stall, we note the gun for discharging harpoons at whales, and a similar implement for conveying a line from the shore over a wreck, so as to establish communication. A notice attached to the whale-gun informs us, that, since 1844 (we think), 183 whales have been taken by its instrumentality. Ingenious, and no doubt often effectual, however, as the contrivance is, we suspect that most whalers would prefer a good harpooner with a strong arm of the latter, and that Long Tom Coffin's quickness of eye, and steadiness and force of hand, would do the work even better than the spear-darting machine before us.

Nothing—for we find that we have no space to extend our remarks—the curious model of a sloop or boat with a deep sliding keel, the lower part of which slips into the upper when she touches ground, we close our account by calling particular attention to the vast number of models of life-boats displayed, suited to any coast, and to the peculiar principle of buoyancy; many of them mounted upon wheels, so as to be quickly drawn to the most favourable point for launching, and the carriage framework of others so contrived as to form ways along which the boats can be made to glide readily into the surf.

MECHANICAL FORCE.

WHEN the Crystal Palace was first opened to the public, the visitors were satisfied to promenade up and down the Nave, and survey the Building from various spots, to see the beautiful effect of the vistas and to contemplate the novel scene to which this structure had given origin. By degrees, little excursions were made to the interior of the Austrian sculpture-room, or to take a peep at the little fountain of eau de Cologne. After a time, the desire to be made acquainted with the objects exhibited has induced the public to stroll into the more distant parts of the Building; and now those who have been constant visitors since the opening have begun to extend their observations to the Mechanical Contrivances. As upon a mere brute force is concerned, man is surpassed by various animals in many particulars; still, in the delicacy and multiplicity of the movements of the fingers of the hand, he greatly surpasses other creatures. Still, by the hand alone but a small portion of the manufactures for which this country is so famous can be made; and we have now to consider some of those mechanical contrivances which are adapted to the machinery which is exhibited.

The power by which all the machines are kept in motion is derived from a series of steam boilers, in a building completely detached from the Crystal Palace. The water is evaporated by means of the heat of the fires, and the steam generated is competent to exercise a certain pressure, which determines the force of the machinery at work.

In this building we have a novel means of communicating this power, because the steam from the boiler is carried by a large pipe to all the numerous steam-engines which work the various machines. The bulk of the engines which is seldom adopted, as usually manufacturers employ but one or two steam-engines, which give motion to what are termed main shafts, which act over the building. The ordinary mode which manufacturers adopt is well seen at the extreme western end of the Building, as one or two shafts are there employed. In manufactories these shafts run from end to end of the building, and communicate by straps from floor to floor, so that the engine can keep in motion every machine in the whole building. These machines are connected with the shafts by leathern straps, and lately straps of gutta percha have been much employed. This material slightly contracts in time, and hence it is found to have the advantage of hugging the wheels over which it is placed.

In examining the various contrivances, we find that the several parts are so devised, that either a small force is applied over a great space, or greater force over a small space. In other instances force is regulated, or accumulated to produce great effects at intervals; or various effects are produced simultaneously, or in a various order of succession.

In the first place, having any definite amount of force, man is enabled to obtain a great result, but only over a small space. The lever is an instrument much used for such purposes. By it a man is enabled by his own natural powers to exercise an enormous power over a short distance. Many of the objects have been moved about the Building by this contrivance, and results have been obtained which could not readily have been accomplished without its aid. The screw, also, is another mechanical contrivance greatly used in the construction of the Building, and also in the various mechanical adaptations. By it the human force can be so applied, that the continuation or repetition of a power insufficient to obtain the result at once, is competent to exercise enormous force by degrees. A similar effect can be obtained by means of pulleys: for one or two men, by winding a considerable quantity of rope, can apply a repeated effect of force, and lift a weight, which, by their unassisted powers, could not have been accomplished. The visitor may see pulleys amongst surgical instruments to reduce dislocated arms, and many samples of cranes are shown. Another example of obtaining vast power by a repetition of the exercise of human force, is well seen in that vast hydraulic press which raised the Britannia Bridge. Here we have a large surface of piston in the press, against every part of which an equal pressure is exercised—the power of a single pump, applied in small pump, against which the pressure would be comparatively nothing. In point of fact, a certain amount of force, say one pound, is added per minute, and thus in an hour sixty pounds of force would be exercised. This vast hydraulic press may be examined in the gallery to the left of the Western Nave. Again, great force can be applied by wheels revolving at a certain speed, being connected with other wheels with a much larger number of cogs, so that the second wheels can go at a much slower speed than the first wheels. Various beautiful specimens of rolled metal are shown in different parts of the Building which have been made by wheels slowly revolving.

In mechanical contrivances we not only require to get a great power over a short distance, but sometimes we desire extensive motion. Now we obtain an extensive range of motion from any definite force, we have recourse to the reverse contrivances for the exercise of a great power over a small space. We then apply the force to the short end of the lever, we then make a larger wheel turn a smaller wheel, and, in fact, we reverse every process which is adopted for the former case.

Many ingenious modes are adopted to give motion from one part of a machine to another. Such motions, parallel to each other, are easily given by straps and belts, as may be seen in many parts of the room for machines in motion. Sometimes we require a second motion at right angles to the first, and then a bevelled cog-wheel is often employed. Frequently a to and fro motion is required to be converted into a circular one: this is required in every steam-engine, as the piston moving backwards and forwards causes the crank to turn round. This motion may be observed in several steam-engines, and the visitor should be careful to examine the various different plans which the piston communicates with the crank. In cases where the extent of this circular motion is limited, the effect may be obtained by the pinion and rack, a pretty example of which on the large scale may be noticed in the working model of Armstrong's hydraulic crane.

In some cases we have various contrivances for the accumulation of the force. The fly-wheel is an important adaptation of this character. It consists of a large mass of metal, which revolves at a certain speed, and by its means any sudden force may be applied without materially checking its speed. This contrivance may be observed in many of the steam-engines. In some cases a great mass of matter is raised, as in the machines for pile-driving, which comes down suddenly and produces great effect. A very pretty plan has been lately devised for making guns for discharging harpoons. It has a number of vulcanized India-rubber springs, and these collectively could not be moved by the force of many people, yet one by one each spring may be put upon the stretch by the manual labour of a single person, and when the force of all has been obtained, a power exists for throwing harpoons for killing whales superior to any heretofore used. This very interesting mechanical contrivance was designed by Mr. Hodges, who observed that the black men raised enormous logs of mahogany by bending down a great number of small trees singly, when the sum of the forces raised the log, and its smaller bulk more it in any direction. Thus we find that one of the more remarkable inventions in the Exhibition has been made by observing a class of men whom civilised nations consider as so far inferior as still to be kept in abject slavery, and even those whose inhabitants consider themselves to be the acutest people in the world. We fancy in this invention we see the germ of a new application of a great principle, and therefore we particularly direct the attention of our readers to it.

Mechanicians regard the steam-hammer of Nasmyth as one of the more remarkable contrivances of modern days. It is placed on the right-hand side of the Western Nave. This great mechanician so contrives that a great mass of metal, which in some cases is 1 ton, is raised to a considerable height, and accumulates force through a space of perhaps a feet, when it is capable of giving the most enormous blows. It is, nevertheless, so perfectly under control, that the workmen are in the habit of putting a nut under it for cracking it without injuring the kernel. As this contrivance is famous amongst the manufacturers of all nations, we advise the visitors to look at this machine.

By means of the spring force is accumulated in the form of a watch. A certain quantity of force is husbanded, as it were, to produce its effects when required. Sometimes water is pumped to a height to accumulate force; and at others a vacuum is formed, into which, at any moment, air may rush, and produce the same result as if force had been raised to a height. Another instance of the accumulation of force to act as a reserve is seen in the use of weights to fall when required.

When a force is obtained, it is necessary to regulate its action and character. The pendulum is the most certain regulator, as by it the rate of the movement is determined, and according to that of movement so is the force expended. Where steam-engines are used, governors are employed. They generally act by centrifugal force, whereby the steam are thrown out, and close or open the cock which supplies the steam. Amongst the machines in motion may be noticed a governor, which, when in action, has the appearance of the planet Saturn with its belt. This, according to the rapidity of the movement, is made to assume a horizontal posture, and regulates the supply of steam. These contrivances are a kind of spontaneous or automaton regulators; but the visitor will observe in locomotives, and, in fact, in all other engines, contrivances for enabling the engineer of his own will to regulate the amount of steam supplied to the engine.

When machinery is in motion, sometimes the movement must be continuous, as in the case of the cylinder of the printing-press of the ILLUSTRATED LONDON NEWS, which continually goes round. At other times the movements are only occasionally required, as with those artificial arms which throw the shuttle in the different looms. The visitor should carefully examine these, as the marvellous to see one arm throw the shuttle and the opposite return it. This interrupted motion is produced by a wheel, with projection at one point, which lifts a lever at one part of its revolution, and by this throws the shuttle.

In some machinery a definite rate of speed is required at every part of its action. The perfection of De la Rue's envelope folding machine, which attracts such crowds of observers in the Western Nave, is due to actions of this kind, which are given by varying cams upon a circular disc, and which is called a cam movement. The perfection of Dunin's expanding model of a man is due to movements somewhat analogous to the cam, the curves of which were the subject of elaborate calculation.

One of the more remarkable results which are obtained by a combination of mechanical contrivances is the machine for making cards for carding cotton. A piece of wire passes into the machine, is cut off at suitable lengths, receives its proper bend, and is thrust into the cloth. This machine will, doubtless, amuse visitors as much as any in the Building, as it really appears to perform the duties of the human hand.

The properties which bodies possess of being thrown from the centre on revolution is now employed to many purposes. This centrifugal force, as it is called, is used for drying cloth. If wet cloths are placed in a frame and revolved with great rapidity, the moisture is thrown off. This property has been used for purifying sugar, and a beautiful sample is shown of sugar deprived of all its brown matter by this process. Mr. Appold has applied this principle to the pumping of water, and vast cataracts are discharged, to the great delight of the visitors. Besides this pump some centrifugal pumps are shown.

There is a class of machines which belong to the higher order of mechanics, as, according to circumstances, they act either in one way or another. A specimen of such a contrivance is seen in the weighing-machine, for separating light coin from that which is heavier. One natural philosopher speaks of such machines as exhibiting judgment, and affording a faint image of the operations which are naturally performed by the brain. Another speaks of them as the most perfect of mechanics. The first idea of such a machine was formed by Mr. Cotton, formerly Governor of the Bank of England; and he not only has the merit of having conceived this application of mechanics, but also, unaided, of having perfected the invention so that it has become the most trustworthy instrument which can be employed. The French have sent an instrument which divides coin into three parts—light, heavy, and standard, though most engineers seem to consider, that, although invented after, it is even not so applicable as the beautiful machine which so astonishes those who are fortunate enough to get an order to visit the Bank of England.

In the department of machinery in motion there are other cases where the machine sets according to circumstances. Amongst all the power-looms a thread is very apt to break; and if it did break the whole cloth would be spoiled, if the machine were not stopped. A contrivance is appended whereby the moment a thread breaks the action is stopped. This action according to circumstances is very interesting, and we recommend our readers to wait to see the thread break and the machine stop, till the mischief is rectified.

Besides machines which act according to circumstances, there are others which have a line of action impressed upon them; we always look at these contrivances with pleasure, for they appear to be to mechanism what instinct is to the organization of birds. We are writing with a number of nests of the same bird before us; and all are alike—the impress of the design appears to be fixed upon the organization of the creature; and the stork which built its nest on Trajan's Column, built a similar nest to the storks which now build up the Rhine. In the Jacquard loom a definite line of action is arranged for the machine by the manufacturer, which it implicitly obeys; and two pieces of work are as exactly similar as two bird's-nests. Many of our readers will now have an opportunity of observing how the patterns in the dresses are made, and they will notice how the design is formed, by punching small holes in cards, which regulates the action of the threads by means which we have not space at the present time to describe. Piece after piece may be woven by the same loom impressed with the same design, and the pattern of each will be exactly the same.

The mechanical powers by which the results have been accomplished are various. Animal power has been used in many manufactures; most of the works of art have been made by the animal power of man, assisted by tools alone, though Cheverton has contrived a machine whereby busts, &c. may be multiplied. Power derived from the weight of solid bodies is also sometimes used, and many clocks are kept in motion by the falling of a weight. At other times the weight of fluids is brought to bear, and we recommend the visitor to examine the models of the great overshot water wheels which pump out the water from the Devonshire mines. These gigantic wheels work by means of a very small stream of water, which has a good fall, and by their aid the mines are kept clear. These wheels are always at work in the department of Machines in Motion. Another very curious example of a power from falling matter is seen in the hydraulic ram. In this case the water gets a velocity from running through a long pipe, which, being suddenly checked, is enabled to rise to a considerable elevation. There are two specimens of this interesting contrivance, one in the North Transept, the second amongst the machines. Mechanical power derived from electricity we have already noticed in former articles as being applied economically to clocks, but not to other purposes

The great source of power, however, is steam, which has its origin in combustion. The mechanical force derived from steam enables us to travel with the velocity which in former times was only seen in the flight of the bird. It enables us to traverse the seas, and practically join continents thousands of miles apart. We see the perfection of the adaptation of mechanical force derived from these various sources. We may view the huge engines of the Great Western and North-Western Railways, and marvel at their excellence; we may be astonished at the machines which are actually shown, still the philosopher delights to look for new applications of force, and in the Exhibition he is doomed to disappointment, for there we do not find any new mode of generating mechanical power. The question naturally suggests itself as to whether combustion and the generation of steam is the plan best suited for man, or whether there may not be other means yet to be discovered, wherein combustion may be superseded by some other change of matter, or the generation of steam may be supplanted by other physical properties. The great display of human ingenuity has well indicated the value of steam; but it must remain for future ages to determine whether other means may not be adopted more conveniently and economically.

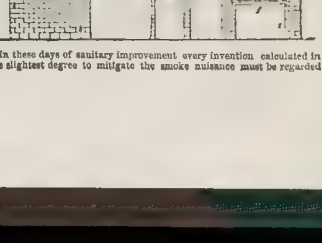
Various modes are used to resist the action of force. In Cox's soda-water machine, we have contrivances of great strength to resist a pressure of 120 lb. to the square inch, and the soda water is made to bear such force that not one in a gross will burst. This result is obtained by making them of a round or oval form, without any angle. In all the high-pressure boilers the circular form is also adopted. In the construction of the Building, the perfect adaptation of the knowledge of the laws of resistance is exemplified, for the whole structure has only been erected by putting the right quantity of metal in the right place; and when the visitor views the perpetual rows of lines in the girders which support the roof, he should think of the force that every one has its function—that not one can be removed without detriment to the strength of the Building. The resistance to the force of gravitation is nowhere better seen than in the Britannia Bridge, where a small amount of materials has enabled the engineer to effect an heretofore unheard of span. The mode in which the Americans build cheap bridges is well deserving attention; and there are many other contrivances for resisting the action of force which may be noticed.

We have now only to consider those mechanical contrivances which we have taken a brief review, we find that six points deserve attention. First, the source of power—whether it be animal power, whether it be derived from heat, electricity, &c. Secondly, the point whence the force is accumulated, as in the steam-boiler, fly-wheel, vacuum apparatus, spring, &c. Then we regard the mode by which the force is regulated by the governor, &c. Fourthly, we study the apparatus employed for adjusting the direction and the extent of motion. Continuing our investigations, we study the point at which the work of the machine is being performed—be that the folding of envelopes, that the twisting of threads, be that the forging of steel, and, lastly, we may study the result of the manufacture. In this mode of studying machinery, we begin with the cleavage of matter which gives rise to the force, and we finish with the change of matter which constitutes the manufacture.

This article will conclude our sketches of the four great forces—electricity, light, heat, and mechanical force—the capacity to generate which distinguishes man from all the lower animals. The electric eel and torpedo may give terrible shocks, but they cannot make the battery; the glow-worm and fire-fly may send forth their brilliant lights, but they cannot make the candle; the elephant may uproot huge trees, but he cannot make a lever; and the bird, although it is rendered lighter by the high temperature which is generated within its frame, cannot make a fire. These sketches have been written rather to assist the observation of the visitor than to give a perfect description of the objects themselves. Many exhibitors of beautiful and interesting objects have expressed themselves hurt that their valuable contrivances have not been mentioned in these general articles, but these will form the subject of further examination; and the ILLUSTRATED LONDON NEWS will endeavour to lay before its readers a detailed description of all such objects as will be interesting to them.

The minds of the reviewers, no less than those of the public, have hardly as yet been enabled to grasp the magnitude of this Exhibition. Manufacture after manufacture, and machine after machine, crowds before the mind, and no one can do more at present than give a passing glance to discover the treasures which the Building contains. Sometimes the object contained in a single case are of a character that they would take hours to examine, weeks to understand, and would require pages of print for their complete elucidation. Here the greatness of man is well shown; here his dominion over the forces of matter, and his control over the power of animal force, is nobly exemplified. Within the Crystal Palace he well appears as the lord and master of creation, but no sooner does he cross the threshold of this Building than his own insignificance becomes apparent. When he compares the beautiful scene within the Building with the lovely landscape which exists in Kensington Gardens—when he compares the roof with its multitudinous lines with the vaulted roof displaying the starry firmament of heaven—then he is in a condition to appreciate the infinite perfection of nature, and in some degree comprehend the immeasurable distance which exists between the works of man and the creations of God.

CLAY'S SMOKE-BURNING APPARATUS.



In these days of sanitary improvement every invention calculated in the slightest degree to mitigate the smoke nuisance must be regarded

PRESENTING A BOUQUET TO THE PRINCE OF WALES.

with satisfaction. Mr. John Clay's apparatus for this purpose seems entitled to consideration, and we have therefore thought it worthy of being illustrated in our pages. The two Illustrations consist of a transverse vertical section and a portion of a longitudinal section of the boiler, furnace, &c. *b b* represent the back partitions, *c* the bridge, *d d* the boiler, *e e* the furnace, and *f* the furnace bars. The novelty of this apparatus consists in dividing the volume of smoke at the bridge, and causing it to pass between and along the passages formed between the brick partitions *b b*, thereby rendering the latter red-hot, thus keeping up the temperature to a high degree, and causing it to be fired as it passes through the heated channels with the air introduced at the four ventilators. A steady combustion is kept up by observing regularity, on the part of the stoker, in supplying fuel to the doors of the furnaces alternately.

PRESENTATION OF A BOUQUET TO THE PRINCE OF WALES.

Our Artist here represents an incident not unworthy of being recorded in connexion with the grand solemnity of the inauguration of the Crystal Palace on the 1st of May. The son and daughter of Mr. Younghusband, who supplies some of the refreshments, having previously obtained the permission of her Majesty and Prince Albert, respectively presented the Princess Royal and the Prince of Wales with a handsome Bouquet, soon after their arrival, and whilst on their way with their august parents to the Royal pavilion in the centre of the Transept, and which humble offerings their Royal Highnesses accepted in a very gracious manner.

CARVED PICTURE-FRAME. TUSCANY.

The specimens of wood carving from Tuscany are of a very superior order of merit, the devices being generally in good taste, and executed with extreme delicacy of finish. Amongst other matters in this line with which we have been struck, are some small picture-frames, in walnut-tree wood, by Lombardi and Barbetti, both of Sienna, one of which we have engraved.

SCENES IN AND ABOUT THE GREAT EXHIBITION

CONSTANTIN'S ARTIFICIAL FLOWERS.

THE PIANOFORTE GALLERY.

Now that the frequenters of the Great Exhibition are becoming familiar with the general arrangements of its varied contents, it is curious to observe the manner in which they congregate in groups about the particular objects interesting to their several tastes: practical men and utilitarian ladies devoting their attention to the machinery department, where new wonders of mechanical and manufacturing skill astonish them at every turn; connoisseurs in articles of vertu lounging about the Gobelins room of the French department, or the sculpture and furniture rooms of Austria; the general masses on these shilling days crowding round the great diamond, and the Indian tent, and the great printing press, and the Queen of Spain's jewels, and a thousand other wonders which give them

CARVED PICTURE FRAME.—TUSCANY.

much to talk about whilst they are there, and will give them more to talk about when they go home. Even outside the Building, amongst the eager crowds approaching it, there are scenes worthy to engage the attention of the observer of mankind, and to employ the painter's talent—scenes of peaceful bustle which will become memorable in after days, on account of the singularity of their aspect in a social point of view, and of the all-interesting event of which they are illustrative.

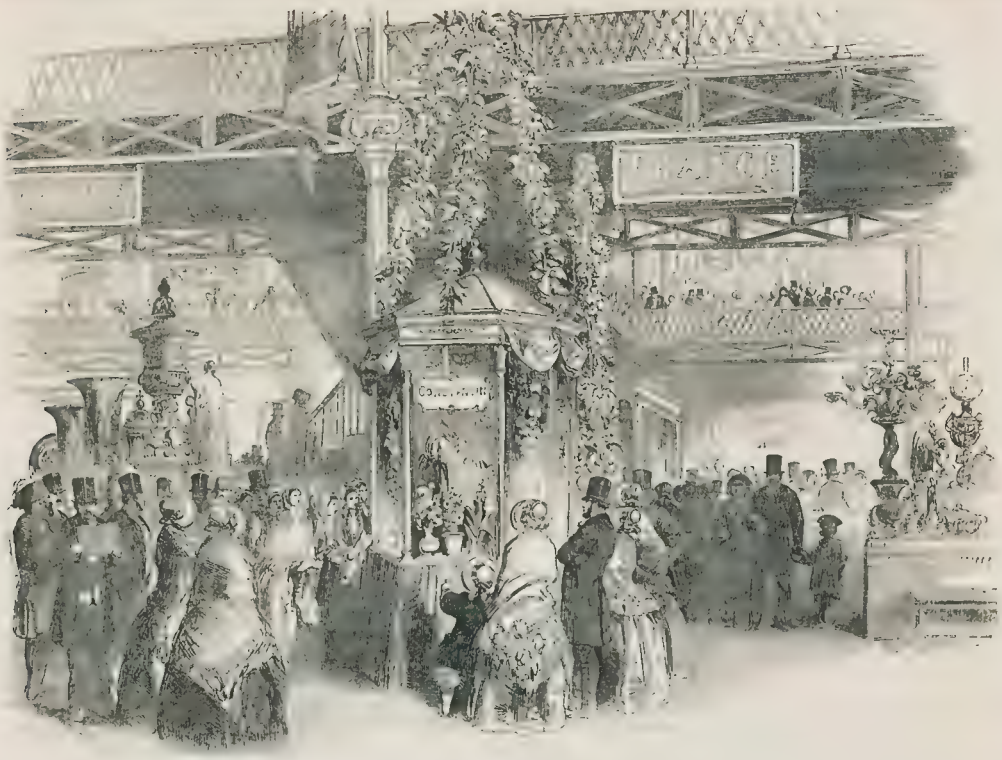
Our Artist will, from time to time, try his hand at some of these subjects. On the present occasion he has selected Constantin's "Conservatory" of artificial flowers, and the Pianoforte Gallery, both favourite resorts of the ladies.

We wish we could, in this hurried notice, do justice to the exquisite truth and delicacy exhibited by M. Constantin in an art which he may fairly be said, if not to have created, at least to have brought to a point of excellence which it had never reached before. As, however, we shall return on some future occasion to the subject of artificial flowers, we will only here add, that those of M. Constantin's productions are hardly to be called so, being, in beauty and in almost everything but smell, identical with those of nature. Roses, lilies, hot-house plants, ivies, and endless other varieties, are here before us, as it were, in *propriâ personâ*, and not always in full bloom, but occasionally represented, with most truthful effect, in their day of declining and withering, with the canker-worm at the core, and blight upon the face. All these wonderful realisations are produced in one material—cambric; and very high praise is due to the artist who has achieved what he has done with it.

2.—INNOCENCE DEFENDED BY FIDELITY.—BENZONI

3.—GRATITUDE.—BENZONI.

The above are two pleasing little *pièces de genre* in marble, executed by Gio. Maria Benzoni, of Rome. One represents a little girl fallen asleep in the midst of her frolics in the fields, whilst her favourite dog tramples upon an adder which would otherwise have bitten her, looking up in her face well pleased at his achievement. In the other, the little girl shows her gratitude to her canine friend by extracting a thorn from his foot.



LOUNGES IN THE EXHIBITION.—CONSTANTIN'S ARTIFICIAL FLOWERS.

The pianoforte and harp compartment, in the North-western Gallery, is crowded throughout the day, chiefly by ladies, who thus rest from the labours of exploration, whilst they derive exhilirating impulses from the polkas, galops, and waltzes, which, intermixed occasionally with more classic *morceaux*, are for ever given forth from pianos by Erard, Collard, Broadwood, and others.

So absorbing is the power of the traffic-din of the Great Crystal Palace, that, although there are sometimes half a dozen musicians working their hardest in this department, they scarcely interfere with one another—each having his own particular audience. Wonderful Crystal Palace! Wonderful crowds that fill it, and throng through it, and seem to have adopted it as a new resting-place and a new home!

LOUNGES IN THE EXHIBITION.—PIANOS OF ERARD

SCULPTURE.

(FOURTH NOTICE.)

IT is impossible to survey the works of art—particularly those of sculpture—in the various foreign departments, without being struck with the contrast they present to the display in our Sculpture Gallery, and the miscellaneous contributions in other parts of the British side of the Building. It becomes, indeed, but too obvious, that whilst foreign artists have received our national invitation in good faith, and acted upon it with alacrity, British artists have held aloof, and disdained the friendly competition to which they had tacitly given their assent. Where is the blame that British artists have been thus remiss in their exertions to aid the general cause, we have not now to decide: certain it is, that, as far as the purposes of this Exposition go, British art may be said to be wholly unrepresented, the actual display being limited to some score or two of rough plaster models, many of which have been drawn from a long seclusion in the darker recesses of the studio, to be thrust forth to take their chance of "a commission" in the general *mêlée*; whilst the Art Union candidates, congregated in the midst, throw ridicule over the whole affair, and might lead the stranger to entertain very erroneous notions, as to the standard of excellence, and the honours and rewards that attend successful merit in this country.

But to return to our foreign friends. Although old Rome would of prescriptive courtesy claim our attention first amongst the foreign contributors, the more numerous and varied display presented in the Austrian department must be our excuse for giving the latter precedence on the present occasion. The little chamber, with its ante-room, which has been allotted to the various nations owing allegiance to the Imperial House of Austria, for the exposition of their productions in sculpture, is crammed full of works of the highest finish, not in plaster, but in marble, affording very interesting means of studying the actual state and the prevailing tendencies of the various schools followed by nations distinct in themselves, and some of which have had little intellectual intercourse with the older art-fields of Europe. Not to go too deeply into generalities upon this head, we may first observe, as the result of our present notes upon the various collections, that as Milanese art occupies a sort of middle place between the colder classicism of the modern Roman school, and the wilder fancy of Germania—the more virgin minds of the central and eastern states, whilst they are not without their share of the impulses evinced by others of their day, give a hint in some of their examples of working after the models of the more ancient schools of Greece, the predecessors of those of Italy herself. In many cases there is much to condemn: experimental conceits, manipulative achievements unworthy of art, and incongruities in composition which sober judgment cannot reconcile either to the requirements of poetry or of common sense; in short, many instances of art misdirected, and marble misapplied, some of which it will be our duty to refer to more particularly as we go along. But, with all these drawbacks, there can be no question, that, viewed as a whole, the Austrian Exposition in sculpture is one of the most creditable and interesting we have ever seen brought together by contemporaneous artists.

We must remark, by the way, that the Austrian Gallery, limited in dimensions, is always inconveniently crowded. Forcing our way through the ante-room, we are by no means favourably impressed by a group of "Atalé and Chactas," by Innocenzo Frescaroli, of Verona, which is a commonplace affair enough. This artist, we should mention, has another work of a much higher class in the main avenue, "Achilles Wounded," the attitude of which is striking and effective, whilst the expression of pain and horror in the face, as the hero views his wounded heel, is well depicted. An attempt at exhibiting the more essential feeling of which this incident is susceptible the full appreciation of the evil cannot attaching to the mishap, would have heightened the effect, and given that touch of historic poetry to the character, of which it is now deficient.

To return to the ante-room of the Austrian Gallery: on either side of the table are two infant subjects, by Antonio Galli, of Milan, and Benedetto Cacciatori, of Carrara. True, the gilt ring or halo round the head of the one implies that it is intended for the Infant Christ, whilst the other, lying on a rocky surface, is supposed to be John the Baptist. But there is little attempt at expressing the divine character upon the countenances; indeed, how should it be in such mere babes as they are, and asleep too? And, divested of this, what of high or poetic interest can attach to a marble representation of a human subject before it is formed, even in the stage of boyhood, and as yet ungifted with the intelligence and impulses of our nature? In painting we have abundant instances of the introduction of the Infant Saviour, as part of what is called "the Holy Family" but, except in some few cases where the child is depicted as already inspired with the prescience of his divine mission, and as in the act of blessing the spectator, the sanctity of the subject is generally realised by the devotional and reverential regards of the mother and bystanders, all which in the single marble subject is necessarily out of the question.

"The Vintage," by Gaetano Motelli, of Milan, is a very elaborate piece of carving, representing a whole family of cupids disporting amongst the branches of a clump of vine, making free with bunches of grapes as big as themselves, scrambling in and out, between and around them, some pressing the gathered grapes in a vat below, whilst one little fellow at the top squeezes the purple juice into his tiny mouth. The figures are thrown in the round; and the whole is treated as a block or centre-piece: but we submit, with all its unquestionable beauties, that the composition is one better adapted to wood carving, or, better still, to silver, as a dinner table decoration.

A group, by Democrito Gandolfi, entitled "Grief and Faith," stands in a prominent position at the entrance of the inner room, and provokes criticism as much by the incongruities involved in its composition, as by its sins against harmony of outline and proportion in the arrangement. In the foreground—fancy a foreground in a piece of sculpture!—in the foreground is a tomb or sarcophagus of large dimensions, over which leans, covering her face in her hands, a female figure; this is Grief: according to the commonplace types exhibited on the walls of every parish church in England, only that there the artist has generally contented himself with representing it in bas-relief, whilst here it obtrudes upon the floor in the fullest dimensions of reality. For the rest, Faith is represented upon a circular pedestal in the rear, in the person of a young female kneeling. This figure, we should observe, is the only tolerable bit in the whole performance, and would be pleasing enough if separated from the rest, with which, essentially, it has no connexion. The gross error against common sense of representing a real object (the weeping female), and an ideal existence (the spirit of Faith), in the same material, and that, hard unyielding marble, must be too obvious to call for much remark. Even Reynolds was criticised for introducing in his "Death-bed of Cardinal Beaufort" the ideal presentment of the evil spirit waiting for his soul in the background; though by many he has been held to be justified, as only realising the picture presented by Shakspeare's lucid description of the scene. But if this was a license hardly excusable in painting, where, by means of the well-known appliances of the art, the separation of the actual from the imaginative part of a subject may be clearly defined, it is one totally unjustifiable in sculpture, where the material is capable of no such modification, either by the application of colour or the interposition of aerial media.

One of the principal show-pieces in the room, and which excites the wonder of gaping thousands every day, is "The Veiled Vestal," by Raffaelle Monti. The ambition of the artist in this production is to represent the effect of a face seen through a veil; and so ingeniously has he managed it, that at a distance of the breadth of the room, the face—the marble face—actually looks as if it were covered with a real piece of lace. This is a triumph of mechanical dexterity certainly, but upon the score of merit of which we may have some misgivings, seeing that it seduces the spectator into a multitude of the worthless rag of a veil being to the eye reality—than of the poor face, which remains still, pale, cold stone. The ancients would never have been guilty of such profanation of their subject. Its true they took a pride in representing the soft outlines of the limbs as rounding out and supporting the crisp light folds of the drapery—as the folds of their figures (which, by the way, they seldom liked to exhibit entirely nude, except when the case rendered it necessary), but they would certainly have torn the vestal's veil from her face before they took her portrait, or would have abandoned her altogether as a subject. So much for the ancients, who can well take care of themselves. Proceeding to a nearer examination of Signor Monti's performance, we find, as we suspected, indeed knew must be the case, that his veil effect is a mere trick of art, and a trick practised to the utter destruction of the beauty of his vestal's face, whether seen from afar or near. Artfully disposing the folds of the veil, and making them generally very broad on the outer parts, and very narrow, nay, almost vanishing, on the inner parts, being those next the face, he further roughs the surface of the intermediate spaces, as if the face, he further roughs the surface of the intermediate spaces, as if the flesh were actually covered with a veil; and these surfaces seen at a distance, take the lights in such manner that, blending with those on the outer surfaces of the veil, they produce the general effect intended, the form of the face being dimly and indistinctly seen as through a veil. In reality, portions of it only are seen at one and the same time, and in one direction, and these effect so produced is not a genuine effect *quoad*, but a delusion; not a matter brought to the mind's eye by means of the sense of sight, but a trick played off upon the too credulous fancy at the expense of the organ of vision. Common sense and legitimate art are further outraged in this work by the introduction of a basket of *real artificial* white roses in the hands of the figure, instead of a sculptured offering in marble. The drapery generally is artificial, and the whole character of the piece is unearthly and disagreeable.

There are two other examples of the same sort of trickery in the room. One entitled "A Bashful Beggar," by Democrito Gandolfi, whose "Grief and Faith" we have already noticed, represents a woman seated by the roadside, her face covered by, but partially revealed beneath, the folds of a linen drapery, in which is also wrapped the infant in her arms. More prominent, and at her feet, are two children begging. A mile-stone, with "Dover" on it, informs us that the party are on their travels, and an inscription on a scroll upon the ground states her sad case:—"Je suis émigrante, mère, veuve, et j'ai une aneurisme au cœur." All these points show a striving after effect by illegitimate means, which pure art would disdain. The third veiled figure is smaller than either of the others, and which it may be sufficient to point out by name: it pretends to represent "A Slave in the Market," by Raffaele Monti, the artificer of the "Veiled Vestal," who seems to have adopted this notion as a *speculation*. Indeed, it appears he has not been without encouragement, the "Veiled Vestal" being announced as the property of the Duke of Devonshire.

We turn with pleasure from these *caprices* to other works of more sterling quality, which the room contains. Adjoining the "Veiled Vestal" is another work of importance by the same artist, "Eve after her Fall. The attitude and character of the figure are full of merit, the limbs graceful, well-rounded, and realising as near as may be the softness of flesh. The artist has represented the hair in massive and dishevelled tresses hanging over the face on each side; and the executive skill displayed in accomplishing this difficult point is worthy of honourable mention, though it must by added, that the soft and flexible character of the human hair—its great beauty—is somewhat sacrificed to attain the end in view. The introduction of a little Cupid peering up from amidst a cluster of roses behind, is, to say the least, a conceit rather apocryphal in itself, and, upon the whole, had better have been dispensed with.

Antonio Galli has a "Jephtha's Daughter," very pleasing in character, simple yet graceful, and the head endued with considerable expression. Marchesi's "Eurydice," which stands next it, is also a meritorious performance; but, perhaps the sweetest and most touching effort in the room, is the little cabinet group of "Hagar and Ishmael," by Emanuel Max, of Prague. The treatment of the female figure is full of dignity and truth; the hand, thrown open as in the act of supplication, rests upon the bosom of the dying boy, whilst the steadfast and imploring look she directs to heaven reveals the whole story. All the points are finished with great delicacy and purity of handling. The same artist has a very clever bas-relief of an Amazon. The face and figure would seem the true ideal of Amazonian *physique*, and there is prodigious energy in the action both of horse and rider. The details and accessories, which are generally ample, are finished with great care, but in a style judiciously subdued; in short, in most respects, this work indicates a ripe appreciation of the purer models of antiquity, which we should be glad to find more frequently exhibited by other artists of our day.

"Ishmael," unattended by Hagar, is a subject simply painful—a poor youth in all the agonies of death from thirst; and this Signor Strazza, of Milan, has represented with terrible earnestness and reality, in a prostrate figure, life-size, which occupies a prominent position in the centre of the room. No one can deny the wonderful talent displayed in the working out of this subject: the features of the face are drawn and livid under the hand of death, and the whole figure exhibits a dreadful prostration in its last stage. But can we look upon it with any feeling but that of shuddering? and must we not regret the absence of the only redeeming and poetic feature of which the story is susceptible, and which M. Max has so beautifully and with such touching effect introduced?

Joseph Koekseman, of Vienna, has a very pretty "Hebe," the head charmingly graceful and expressive, and the whole treatment of high excellence. We do not quite like the "Flora," tall and sentimental "Shepherd," unnecessarily denuded; nor his "Flora," who is too artificial in her attitude, and overburthened with a heavy garland of flowers extending from head to foot. Nevertheless, the face of the latter is pleasing enough.

WOOLLEN AND WORSTED FABRICS.

THESE important branches of our national industry now claim our attention, and present an extensive and varied field for observation. The growth of those vast hives of industry, the towns of the West Riding of Yorkshire, has been as much dependant upon the woollen and worsted trades, as practised in the present day, as the development of the vast population of Lancashire has been upon the cotton manufacture: the only difference being, that, while in the one case the raw material is an exotic, in the other it is grown at our own doors, and is intimately connected with the employment and prosperity of a large portion of our agricultural population.

Certainly, the complaint we had occasion to make as to the imperfect manner in which some departments of the cotton manufacture is illustrated cannot apply to that of woollens or mixed fabrics, for, in every respect, the display is as full and complete one; and although in many points, it is by no means so attractive to the mere lounger or sightseer, yet to the thoughtful visitor it presents features of a highly interesting character; and the student of art, as applied to textile manufactures, will find here, if he studies it properly, a suggestive course of instruction such as he would seek for in vain elsewhere. With an opportunity for comparing the products of various districts, the modes of production and ornamentation, the manner in which the endless varieties of mixed fabrics are wrought out, the character of colour and the style of finish, we trust that when our intelligent artizans from the north pay the Exhibition a visit, they will carry away with them hints for the future which will re-act in no small degree on our future success on these departments of national industry, and amply repay the manufacturers for any labour and trouble which they might have been at in getting up so excellent a display of their skill and judgment.

As the West Riding of Yorkshire represents the great mass of the combined manufactures set down in the official classification under the heads of Class 12 and 15, it was thought desirable that the illustration of the industry of so important a district should be as complete as possible, and an exception was therefore made in favour of the towns comprised in this important district, and each was allowed to arrange the whole of its products in textile manufactures together. This, of course, gave a hint for the management of the other towns engaged in kindred pursuits; and, with the exception of shawls, the woollens and mixed fabrics from other places are all arranged topographically rather than technically, in the court set apart for these classes of manufactures; and certainly, as a whole, it is a display which Englishmen, Scotchmen, and Irishmen, may be proud of, since it embraces the famous poplins of the latter to an extent which must be cheering to the advocates of the national industry of that part of the empire; and, appropriately enough, the display, as arranged, has London at one end of the frontage to the central avenue, and Dublin at the other, the manufacturing towns and districts filling up, in no sparing manner, the large space between the two. Commencing with the

LONDON WOOLLEN CLOTHS,

we find a rich and varied display of high class goods exhibited by the leading cloth merchants of the metropolis; and, as might be expected, the advantages of buying from varied sources is seen in the results. Producing nothing in this department of industry, the traditionary power of its merchant tailors and wool staplers is to be seen in the command which the capital and enterprise of the representatives of these once powerfull trades give them of the markets; and thus, without being manufacturers, or taking any part in the production of the goods they exhibit, they make a display of which they may very justly be proud.

Messrs. Barber, House, and Mead, of St. Paul's Churchyard (13), make a most satisfactory exposition of fine West of England broadcloths, manufactured by Pocock and Rawlings, of Chippenham, of admirable texture, colour, and finish. The Yorkshire cloths, too, are very excellent. The novelty, however, of this contribution is a series of shawls, manufactured by Mr. William Bliss, of Chipping Norton, of the natural coloured wool of the Alpa Vicunna, a species of South-American llama. These are certainly very admirable for softness, lightness, and warmth. Messrs. Brett Brothers (20); East, London, and Holland (2); and Scott and Wright (1), each make a display of the peculiar fabrics in coatings and trouserings which they usually supply to their customers, all of an excellent character and make. The price-cloths of Messrs. Bull and Wilson form the leading features of the contribution of that house. These consist of black cloth of extraordinary fineness and texture, and black doe-skin of equally excellent character. As an engraving of the gold medal awarded to J. and D. Lingerley, of Stroud, for the former, and Mr. W. Helme, of the same place, for the latter of these fabrics, has already been given in the ILLUSTRATED LONDON NEWS, more need not be said on the question of the prize, further than that the spirit and energy of the donors entitle them to every credit.

Examples of patent cloth, with two distinct surfaces of different colours, are exhibited by the inventor, Mr. S. Powell (6); and in examining the varied productions of the West Riding, we discover that its application is very general. It offers great advantages in the top coat cloths, since a rough or smooth-surfaced coat may be obtained in one garment. There are some excellent examples of its application to children's clothing in Class 30.

In Mixed Fabrics, the fancy vestings exhibited by Brown and Foster (3), W. and C. Murley (10), and J. Goodwin (11), are all of a very neticeable character, tasteful alike in design and in arrangement of colour.

THE WEST RIDING OF YORKSHIRE.

The arrangements for the display of the industrial productions of this important district have been commensurate with their extent and variety; and had this Exhibition done nothing more than bring together the many excellent specimens of manufacture here displayed, and thus shown to manufacturers of this great community the reliance they may safely place in their own energies, it would have done a great national service. To the thoughtful observer a walk through that portion of the court for woollens and mixed fabrics devoted to the West Riding will afford much food for reflection. He will see how completely communities, apparently employed in exactly the same pursuits, are really divided by a line of demarcation as distinct, though not as distant, as the boundaries of the towns of which they may be composed, and that the peculiar characteristics of each is not a matter of indifference. Thus, Leeds is distinctly marked by its woollen products; Bradford by its worsted, alpaca, and other fabrics; Huddersfield further illustrating the woollen trade, but bringing in a new element in the form of mixed fabrics, and even cotton manufactures of a peculiar class. Halifax, again, is distinct from the others by the artistic elements it brings to bear in the damasks, worsted, and mixed, which characterise the leading features of its display. The smaller towns of the West Riding are all subordinate to these four great centres; and under these heads they are arranged, by means of fittings, glass cases, and other appliances as substantial as the Building itself. In short, there is a permanent look about the West Riding arrangements which conveys the idea that the manufacturers of that locality have settled down and established a regular mart for their trade, all to which to display to all future time the products they undertake to supply for the use of their fellow men, both at home and abroad. These arrangements, too, have been in constant process of alteration and improvement, and it is now intended to mark each town by a distinguishing flag, and induce all the corporate towns of England, Scotland, and Ireland to contribute their heraldic buntings to enhance the display.

LEEDS.

As already stated, Leeds is the exponent of the woollen cloth manufacture of the West Riding; and, in the extensive contributions here displayed, the peculiar character of the materials for clothing which this district supplies to the markets of the world is well and successfully shown; for, whilst the West of England may be said to be almost exclusively employed in the production of cloths for the higher classes, the looms of Yorkshire may be said to be entirely employed in producing woollens for the million. The prevailing feature of the Leeds trade, then, is utility combined with moderation in price. As an exhibition, the appearance to the eye is more sombre than gay—the dark colours producing little contrast one with the arrangement. The most striking display, as a whole, is that of Messrs. Benjamin Gott and Sons. The large glass case projecting into the central avenue is devoted to the contributions of this house, and contains specimens of goods manufactured for the Russian, Chinese, American, and home markets. The cloths are of great brilliancy of colour and beauty of texture; and, manufactured as they are exclusively for large markets, may vie with any specimens of the same class produced in this country, or any other. Messrs. John Sykes and Son also send a beautiful assortment of woollen cloths, which may be considered as illustrating the ordinary manufacture of the Leeds district. Messrs. Pawson, Son, and Martin; York and Sheepshanks; Thomas Wheater; Walter Stead and Co., and various other exhibitors, send some of the best specimens of the finest goods; whilst the display of W. Smith and Son, in pilots and beavers, shows to what an extent this class of goods are manufactured in Yorkshire. Messrs. Cook and Wormald, and Messrs. William Yewdall and Son, show some excellent specimens of Spanish stripes.

Billiard cloths, which are extensively manufactured in this locality, are illustrated by Mr. Wm. Fenton; and John Wilkinson and Co exhibit a large variety of felted cloths suitable for all purposes for which such material is generally used.

In camel's hair and in mohair-cloths, Messrs. James Walker and Co.; Edwin Firth and Sons; and Hall and Bishop, exhibit specimens of good quality; and, as these materials are now in general use for outer garments, the display is a valuable one, as the character of the manufacture is thus fairly illustrated, and an opportunity given for close examination of very beautiful materials both as regards use and appearance.

Messrs. Pease, Heaton, and Co.; T. W. George and Co.; and R. F. Green and Son, shew a great variety of examples of stuff goods, in lastings, damasks, &c., and the materials are extensively used for upholstering purposes in the larger patterns and coarser qualities, and for ladies' dresses in the finer and more highly finished kinds. In those intended for the latter purposes the combination of colour is a goodly exposition of the highest to the very highest class of goods. These are contributed by Messrs. Hugue, Cook, and Wormald, Thornton, Fr.th, and Co., and others. Nor must we omit to mention some very excellent silk warp cashmeruttes by the last-named firm, manufactured chiefly for the American market.

Altogether the Leeds contribution leaves a good impression upon the mind of the careful observer; and though, perhaps, by no means so attractive to the general visitor as the more showy displays, yet to the manufacturer and manufacturer it conveys a large amount of information, and to our foreign visitors there can be no doubt it gives valuable hints as to future commercial transactions.

HUDDERSFIELD.

The contributions from this thriving town are of a more miscellaneous character than those of any other of the West Riding, and the illustration of its industry fully commences with a carefully elaborated series of specimens of the raw material, the course of manufacture, and displaying in a most satisfactory manner the various processes from the raw material to the woollen cloth in a finished state.

This interesting contribution is arranged in a very admirably constructed glass case, placed by some mischance in a very out-of-the-way position at the back of the court. It is exhibited, together with a variety of excellent cloths, by Messrs. John Brooks and Sons, of Henley (46). The series commences with a specimen of assorted Silesian wool, and then follow examples scoured, woaded (a first preparation for dying), dyed black, willowed, and scribbled; then specimens of carding, slubbing, spinning into coppins for warp, and bobbins for weft, warped yarn, and then an example of raw thread or piece from the loom ready to take out the oil added for the purposes of spinning and weaving after the finished dye. Then follows the balk or twilled cloth, the cloth raised, cropped, and ready for boiling. The same kind of cloth boiled and tentered; and, lastly, a specimen of finished cloth as

the connecting link between these processes and the cloths already quoted as exhibited by the same house, which are hung around.

This admirable arranged exposition is not in a mere flat glass case in which the specimens are so small as to be scarcely visible, but is displayed to great advantage by the mode of arrangement, and we cannot but regret that it has not been placed in a more prominent position.

Messrs. Hinchcliffe and Son (93) exhibit trouserings, and Walker and Sons mohair cloths of excellent quality, dye, and finish, as also alpaca rough cloth, with a short-haired surface, in contradistinction to the other. Mr. Peter Ishaw's (90) contribution consists of specimens of fine black cloth of excellent quality and finish. Armitage Brothers exhibit a general assortment of top-coat cloths, such as elephant beavers, weighing 45 to 48 ounces to the yard, made entirely of Australian wool; as also specimens of the cloth made according to the mentioned arrangement, whereby the two sides are of different colours, and even of texture of surface. These are excellent examples of this peculiarity, as are also those manufactured of vicuna wool on one side and fine sheep's wool on the other, and exhibited by Messrs. J. and A. Bennett (95). The effective character of colour and surface in these specimens at once conveys the idea of a coat in which the lining and outer surface are sufficiently contrasted to produce an agreeable effect by contrast of colour and texture.

The fine cloths and black doe-skins exhibited by Hastings Brothers 100), and the livery cloths by Wrigley and Son, are noticeable for many excellent points. In the ordinary practice of the woollen trade to-day, Messrs. Vickerman and Beaumont exhibit a general assortment of piece-dyed goods, together with corded trouserings, manufactured entirely of wool. Messrs. Lockwood and Keighley (104), too, display a superior quality of corded trouserings. The summer coatings exhibited by Mr. Schwann, manufactured by Milner and Hale, are noticeable for their admirable cloth finish; and Messrs. Bardsley and Hurst's examples of trouserings, of a quality in which it is usual to mix German wool, prove the value of our colonial productions of this material, by showing that the latter may be successfully substituted for the former. The plain and fancy trouserings contributed by Charles Beardsell, are worthy of especial attention, not only for the excellence of their make, but for the tasteful character of the colourings.

Messrs. Isaac Beardsell and Co. (108) exhibit cloth coatings and fancy trouserings of good quality, together with top coatings, with the fancy linings already alluded to as being now manufactured so generally. A peculiar make of cloth for top coats is also exhibited by David Shaw, Son, and Co., the mixture being effected in the carding, by placing different coloured cardings or rovings together, and then carding again. This gives a certain irregularity of tint to the cloth, which, when woven and raised in a velvet-like pile, produces a very agreeable effect. Coatings of a beautiful quality for livery purposes are exhibited by Messrs. J. and G. Hinchliffe (119), as also by W. Willott and Co. (124), the latter also displaying specimens of very fine doe-skin cassimere, of a very superior quality

Messrs. J. and T. C. Wrigley and Co. (117) exhibit an excellent series of top-coat fabrics suitable for Russian and Canadian wear. These have mohair backs, and are of great strength, thickness, and weight. In the latter respect some are 3½ lb. to the yard. These cloths present many attractive features to those who best understand them, but in the present warm weather they conjure up sensations of heat by no means seasonable as regards the general visitor. Messrs. Huth and Fischer (123) also exhibit similar goods, this house being the originators of these articles, and the proprietors; Messrs. Wrigley being the manufacturers. Those who have experienced the severity of a Russian or Canadian winter can best appreciate the value of a garment made of such dreadnought materials as these articles certainly are.

In fancy goods, vestings, &c., Messrs. John Taylor and Son (111) display a varied assortment of the latter, the designs and colourings of which are generally very excellent, the cotton quiltings being also of a very superior character. The same may also be said of the quiltings exhibited by James Nelson and Song. (115). The dress goods exhibited by this house are also very good; and in addition to these there is a display of beautiful grey trouserings of a character well worthy of attention. The plain woven cashmere-warping and clear white goods of the same kind exhibited by Mr. Jonathan Schofield, together with shepherds' plaid trouserings, are beautifully made, and remarkably even in texture.

Messrs. Joseph Norton and Co. display a selection of table-covers and shawls. The former are of good quality and make, the latter shawls being made of wool and cotton, with the occasional introduction of silk. The style is bold and effective, and the designs much better than is usually found in these articles. Those of the shawls are novel and effective. The imitation of ermine is the especial novelty shown in the mode of production, and the effect is elegant and pleasing. The trouserings of a chequed pattern, in cut plush, and shawls of the same character, are worthy of notice, as presenting a tasteful novelty to be extended to other classes of goods. The glove-cloths exhibited by this house are very excellent, and are composed of wool and a mixture of rabbit's down. The fabric is knitted by Claussen's circular loom, which is now attracting so much attention in the machinery department.

The most illustrative general display of the manufactures of the Huddersfield district is certainly that of Mr. F. Schwann (115), who has been at much pains to give a full and comprehensive collection of the goods usually produced for the ordinary markets of the world, rather than to exclusively illustrate the higher class of productions. In the exposition thus made we find excellent productions in every class, from the woollen and cotton figured vestings, as also those in silk and cotton, are all of a very noticeable character; some indeed are excellent alike in design as in manufacture. The cotton quiltings, too, are very superior, being tasteful and appropriate, especially in colour. The Ponsees mohair mantilla cloth, in a variety of shades, presents great excellences of manufacture and finish; and the Angola wool and cotton-chequed pantaloons possess many points which will render them interesting to buyers for their admirable qualities, alike in the more ordinary as in the higher examples

As an illustration of the direction which certain branches of manufacture take in the West Riding of Yorkshire, we may quote the examples of tweeds manufactured without wool; that is, made of woollen waste—a material which the ingenuity of the manufacturer alone can render at all valuable. For this purpose the refuse of other departments is collected together, and we have here, exhibited by Messrs Oldfield, Allan, and Co., examples of tweeds made entirely of waste. It is by this economic use of the apparently useless material that our manufactures flourish in many of the more extensive departments, and when used legitimately, with the intention to contribute to the true nature of the manufacture, and not, as is too often done, as means of adulteration—if we may use that term—he must be a very fastidious being who would object to its employment in the production of articles to which it is really suited.

BRADFORD.

The manufactures of Bradford display another phase in the character of the general productions of the district, as the leading feature of Leeds is the woollen trade, so that of Bradford is the worsted or stuff trade, together with all those recent novel introductions such as alpacas and mohairs. The distinctive difference between the woollen and worsted trades is but little observed, yet they are essentially as one as—indeed, more so than—those of flax and cotton. Woollen manufactures are produced from the same general material as the worsted, but the trade of material are essentially different—the shorter quality of wool being used for the production of woollen cloth, and that of longer staple for the production of worsted or stuff goods. The machinery employed in the spinning, too, is as different as that employed for the long fibre of flax and the short fibre of cotton; and the whole trade of Bradford has to undergo a variety of operations after it has quitted the loom, worsted fabrics are in a comparatively finished state, being merely in need of a final dressing, as a finish to the texture, or rather of the surface. The different length of staple in wool is, of course, adapted to the various kinds of worsted by the skill of the spinner, and the material for stuff goods or for hosiery is selected accordingly; so that the worsted trade is again sub-divided into two distinct classes of manufacture.

This brief explanation may be sufficient to show that, in now treating of worsted goods hosiery is not to be considered, but simply those articles which belong to the garment or furniture trade. Of the former we may have worsted in its integrity; the same with cotton, silk, or other material as mixtures, together with mohairs and alpacas, plain and figured—of the latter, damasks, moreens, lastings, and other fabrics, either decorated or not. The various names by which many of the mixtures are called, are merely fanciful, and really have no reference to the nature of the material. Thus, while the terms merino, *mousseline de laine*, *mousseline de soie*, alpaca, or mohair, are names descriptive of the materials of which the fabrics are made, those of Orleans, Cobourgs, and Princettas are merely commercial terms to distinguish one mixture from another.

By far the most extensive exhibitor in the Bradford department is Mr. Titus Salt, and he has certainly been at some trouble to give as complete an idea as possible of the peculiar trade of the district of which Bradford is the centre. Mr. Salt's display consists of chenés, alpacas with satin stripes and silk figures, in which there is much taste and skill displayed. The shot alpacas, being a mixture with silk, are very beautiful and effective specimens of manufacture. In furnitures, Mr. Salt's moreens command attention from the beautiful character of the varied dyes and their watered effects.

In the front of the portion of the court devoted to Bradford, a very handsome glass case with polished mahogany frame-work is placed, corresponding in its arrangements with that already noticed in the contribution of the Messrs. Gott. This case is very judiciously devoted to the exposition of a selection of the best goods from Bradford, as contributed by four manufacturers. Mr. Salt shows an epitome of his more extensive contribution, whilst Messrs. J. G. Horsfall and Co. (174) display Cobourgs, and plain coloured goods of super-Saxony wool, all of an excellent quality and make. Messrs. Rand and Sons (173) show merinoes and Cobourgs, single and double-twilled, and very fine. The varied coloured Henrietta cloths, of silk warp and worsted weft, are also of the finest twill. Messrs. W. Milligan and Son have, in addition to a large display at another point, a pleasing collection of imperial alpacas in figures and stripes. The effect of the "embroidered" moreens, of this latter manufacture, is sadly misapplied, is so excellent, and the mode of production so skilful, that we are almost tempted to give a description of the process. Bradford, then, may be proud of the display in this one glass case, the combined efforts of four of its manufacturers

Messrs. Schwann, Kell, and Co. (141) make a very valuable display of the various classes of goods which they, as merchants, bring into the markets; and the illustration given of the peculiar trade of Bradford is as complete as that already alluded to as being the exponent of the manufactures of Huddersfield; and Mr. F. Schwann being the principal of both houses, there is an uniformity in the arrangements which adds to their value. In such exposition a dialogue is printed for the use of those directly interested in the articles exhibited.

Messrs. A. Trenel and Co. (147) exhibit a great variety of alpaca and mohair mixtures, and silk figured brocades, of an effective and excellent character. The specimens of dying in the piece, with silk and cotton warps, sateens, and Brazilian cloths, contributed by Messrs. Teale Armitage and Co., (146) are also very admirable. In all probability, however, the most excellent goods of their class are those exhibited by Mr. Jacob Behrens (150), and manufactured by Messrs. Behrens, Wilkinson, and Co. They consist of an excellent display of figured goods, imperial sateens, &c., of first-rate quality in dye and finish. Messrs. Moses Bottomley and Sons (166) also exhibit silk-figured cashmirs of the excellent character, and an example of a novel robe skirt, in which the design is applied to suggest flouncing, the effect being good as a whole, but somewhat confused in the arrangement of the parts. The weaving, however, is first-rate. Messrs. W. Keroyd and Son (136), of Burnley, exhibit a variety of fabrics of good quality, the Cobourgs being very excellent.

It would occupy too much space to go over the whole of the very excellent contributions from Bradford, but the importance of the yarns now demand particular attention; and must therefore dismiss the piece goods by the general remark that Jonas Sugden and Brothers (167), T. Jowett and Co., of Bingley (144), Foster and Son (143), and George Rogers (142), and others all exhibit goods of a very superior character, many products. The first-named of these houses display a peculiar kind of goods manufactured for Italy and Spain, and used in those countries for the dresses of monks. These are "says" of all wool They also show another variety known as "union says," a mixture of wool and cotton. In the compartments devoted to these goods are some excellent summer coatings, and a glass case containing specimens of 800 varieties of Genappe yarns used in the manufacture of poplins and small wares, as also for a great variety of fancy articles.

The worsted yarns of Bradford are famous wherever the manufacture is carried on, and a very interesting display is made by various spinners of the peculiar character of the various kinds used in making the goods we have been describing. Messrs. J. Rand and Sons contribute a case containing examples of the spinning processes of worsted yarns. The specimens are very beautiful; and, whilst the ordinary numbers are from 30's to 50's, we find in the case examples of 120's, 130's, and even 160's, which, in a material like wool, is certainly a great novelty. Mr. William Cheseborough displays a very tastefully arranged assortment of specimens of wool grown in the various counties of the United Kingdom, as it comes from the fleece; and Messrs. Isaac Holden and Son give illustrations of the preparation of alpaca wool from the fleece to the cloth, with assorted natural colours; and a beautiful example of the operations by which these colours are mixed to gain one uniform tint. This display is accompanied by a series of specimens of alpaca mixtures. Other houses also exhibit specimens of mohair and alpaca yarns; Messrs Harris and Fison showing examples of rabbits' down cloth, spun and manufactured entirely from this material; and, in addition to these various specimens, there is every reason to suppose that this will become useful in an economic point of view. The Berlin wools, manufactured and dyed in England, and exhibited by Messrs. Quitzow, Schlesinger, and Co., are good examples of this class of manufacture.

As a whole, the Bradford contributions are most excellent; and representing, as they do, a trade of such an extensive and world-wide character, too much importance cannot be attached to the manner in which the manufacturers of this flourishing town have come forward to sustain their own interests and the manufacturing dignity of this country in that department to which they devote their skill, industry, and capital.

HALIFAX.

The leading feature of the Halifax display is its decorative character, the great proportion of the goods being either for furniture purposes, such as damasks of various kinds, moreens, and table-covers, or intended for the South American markets, where gaiety of colour and striking effects are in request as an element of manufacture. The contribution of Mr. J. Wilson (138), of ponchos, mantuas, and shawls, will best illustrate the peculiarities of the class of goods. These contrast in a remarkable manner with those articles intended for our own domestic purposes Messrs. Hoadley and Pridie's (128) display, for instance, shows this point very clearly. In these examples the patterns are bold and effective, and generally in good taste, the self-colours being very excellent in dye and finish.

Mr. W. Brown (129) exhibits some neat and effective patterns of the same class. The silk, however, is so sparingly introduced as to give a thinness of effect to the parts where it is seen. Messrs. Shepherd and Perfect (131) also exhibit some good patterns in worsted damasks; but the character of the table-covers and shawls might be better. The designs being more clumsy than elegant. Mr. J. W. Ward's (134) furniture damasks, striped in the warp, are very superior in design and effect, and altogether his display is a tasteful one. In Mr. H. C. M'Crea's exposition there are two or three very excellent examples of the furniture class, as also specimens for the South American market of the usual effective character.

After looking at the gay articles around, the contribution of Messrs. Clay and Sons (126) strike by the contrast they afford, being chiefly jacket cloths for cricketers, froning blankets, and blue flannels.

It is display, too, of Messrs. W. Barraclough and Son is peculiar in its character, being an assortment of druggetings, linseys, &c. The continuation of Messrs. Ackroyd and Son is, however, the most extensive display of the manufactures of Halifax, particularly in ladies' dresses, which are especially neat and tasteful, and of excellent quality. These are chiefly merinoes, princettas, and goods of a similar class. The damasks, too, are bold and effective in design and colour. Messrs Aked and Sons show another class of goods—pantaloons, mixture coatings, and fancy cheques—and these are excellent of their kind, in colour and quality.

We have thus gone over the whole of the productions of this important district at greater length than was originally intended; but the examination of its various excellences, the important interests at stake in connection with its welfare, and the general connexion, the efforts made by the manufacturers of the West Riding to give full effect to the Great Exhibition by good and truthful examples of all they could do, demanded that every attention should be paid to the result of those efforts; and we are perfectly satisfied that no unprejudiced mind can look upon this display with anything but satisfaction, since, in spite of all sorts of sneers and inuendos about base imitations of superior goods, the deception practised in the manufacture of cloth is all too rare to be the instances in the ordinary course of trade, we have here such a proof of the capabilities of the manufacturers of this great district, as to show at once of what they are capable, and which will tend to place them in an infinitely better position than they have ever held before in the estimation of those most interested in these productions.

Our notice of the woollens of the West of England, and the mixed fabrics of Scotland and Ireland, together with the foreign contributions of the same class, must be postponed; but we commend them to the serious attention of those visitors whose pursuits are of an analogous character, as likely to afford many useful and important hints as to methods of production and style of finish.

MINERAL FUEL.

THE visitor arriving at the Exhibition Building from the west, or passing out from that extremity, will not fail to be struck by a number of large objects there collected and arranged, amongst which some gigantic blocks of coal are not the least remarkable. These form part of a noble series of specimens of mineral fuel, most of them, as might be expected, the produce of English mines, and capable of giving to the general observer, as well as the practical man, a most valuable idea of the relative as well as positive importance of this source of our country's wealth. We propose to detain the reader a little in the consideration of this subject, as one worthy, from its general interest as well as its importance, of special notice on the present occasion.

Mineral fuel exists in various ways in the earth, if by this term we include, as we may fairly do, all those deposits in any sense available for fuel which form now an essential part of the earth's external layer or surface. Using the expression in this general way, we understand it to mean peat and turf, as well as coal; and not only such coal as is brought to us from Newcastle, Lancashire, Yorkshire, South Wales, or other places in the great coal districts of the north and west, which chiefly supply London, but the less perfect and much less valuable material obtained in other countries and other places, and known technically as lignite, or brown coal.

Peat, like all other supplies of fuel from the earth, is nothing more than vegetation of some kind in a more or less altered state. When, owing to my cause, the decomposition of dead plants is checked or prevented, a gradual and steady accumulation takes place; and, where circumstances are favourable, this is much assisted by a particular kind of moss, making, with the other plants, a spongy semi-fluid mass, which gradually increases till the magnitude becomes as large as a considerable portion of the surrounding ground will admit. From 12 to 20 feet is no uncommon depth for such material; and so great is the surface extent, that not less than one-seventh part of the whole of Ireland is thus occupied. Anything which could render this peat available as fuel at a price at all competing with that of coal, would, unquestionably, be a great advantage to a country like Ireland, and also to many parts of Germany; and several such methods have been adopted, which are illustrated in the general collection in Class 1. We may refer here more particularly to the preparations by Mr. Jasper Rogers, and those by Mr. Evans (Stone's patent), and Mr. Cobbold—the latter effected, we believe, by centrifugal force without pressure and while the material is in a pulpy state, and certainly yielding some very curious material resembling jet, and capable of being turned in the lathe. Mr. Evans exhibits chiefly the numerous products obtained by the destructive distillation of peat, the economic value of which does not at present seem very distinctly pointed out, but which are well worthy of experiment; while the interest excited by the products exhibited by Mr. Rogers has a wider range, as it is connected with large sanatory questions and the employment of peat charcoal for manure.

The great objection to peat as a fuel has generally arisen from the large quantity of water which it contains even when it has been exposed to the ordinary process of drying. This, under the most favourable circumstances, contains no less than one-fourth part of its weight of water, and in any use of the substance as fuel, the first thing that has to be done during combustion is to turn into steam and drive off by evaporation this extraneous moisture. In charring peat the merit of the writer is seen in another way; for as it is present chiefly in the little cells of the plants of which the mass is made up, the charcoal produced is very light and easily reduced to fine powder, just as would be the case if leaves, twigs, and moss were burnt. The very light and porous state thus obtained is unfavourable for the use of the fuel in cases where great heat is needed, and where a blast of air is employed. All these objections to peat and charred peat are, however, much diminished, and even removed, when the peat is reduced to a more compact substance, and the water got rid of. By some contrivance the weight of such prepared fuel is greater than that of a similar block of coal, and the charcoal is more dense than that from wood. When we consider that in Ireland, as we have already said, not less than one-seventh part of the whole surface of the country is covered by bog, while coal, though it exists, is dear and not very good, the vast importance of the utilisation of peat will be at once appreciated. It is calculated that a cubic yard of peat and coal, it may be sufficient to say, that 1 lb. of ordinary peat will evaporate 4½ lb. of water; 1 lb. of perfectly dry peat will evaporate 6 lb. of water; 1 lb. of Newcastle coal will evaporate 7 lb. of water, and 1 lb. of pure wood as much as 10½ lb. Compressed peat varies in this respect according to the method adopted to bring it into a convenient and valuable form.

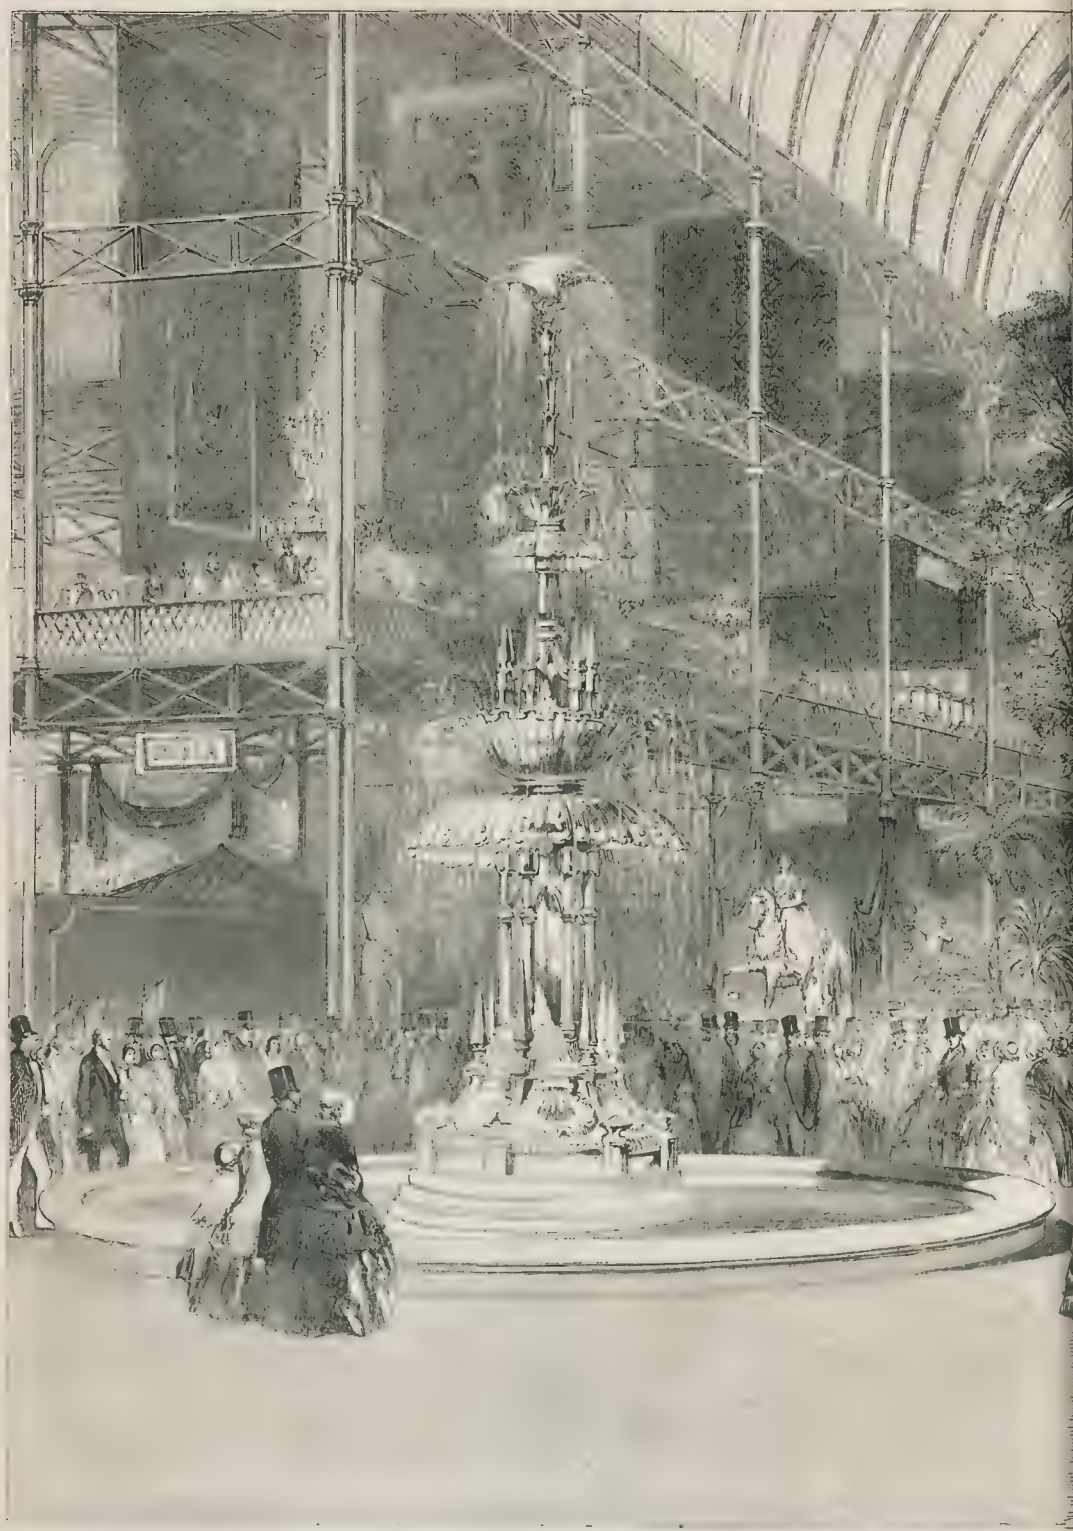
There is a form of mineral fuel of which we have but few and unimportant examples in this country, but which is incredibly abundant in several parts of the Continent where coal is comparatively rare. This variety is called *lignite*, and consists, generally, of large accumulations of trunks of trees, heaped together in particular places to a thickness of 40, 50, 100, or even 200 feet, and occupying sometimes a considerable space. Even in Ireland, on the shores of Lough Neagh, this substance exists in three beds, having a total thickness of 60 feet, and extending over 12 square miles, so that its commercial value is really very considerable. At Bovey Tracey, in Devonshire, similar beds exist, but of smaller size, and these are actually worked, the lignite being used in some potteries in the neighbourhood. The value of lignite as fuel has not yet been appreciated, as there are some important practical difficulties in the way of its use connected with the presence of water and earthy impurities. There can, however, be no doubt, that before long these vast stores will be rendered available, especially where, as is the case with Austria, they exist in the immediate vicinity of supplies of iron ore, practically inexhaustible. Those interested in examining material of this kind will find amongst the foreign goods some samples of lignite as obtained from Moravia and Styria, and used in Vienna.

Coal differs essentially from peat and lignite in having its minute cells either occupied with a gas instead of water, or so completely obliterated, that nothing remains but carbon and a very small percentage of ash. There are several different kinds of coal dependent on this condition. Thus, amongst lignite, it is not unusual to find black brittle bands like jet, and jet itself is but another name for the same thing. The vegetable matter in this state contains much gas, and burns so readily, and burns like wood steeped in resin, with a bright flame and smoke. It is clean, not soiling the fingers, and is very brittle. It is the step intermediate between lignite and coal, and when in sufficient quantity, and not too brittle, is often worked into ornamental articles of light form. Some good examples, both of the raw and manufactured material, will be found exhibited by Messrs. Slater and Wright in Class 1, and are worthy of notice. Jet, however, has been too long known as an ornamental substance in this country to require it with coal as the substance with which it has the nearest relations.

The next step is the progress of vegetation towards the mineral kingdom is seen in cannel or parrot coal, which contains about 30 per cent. of volatile matter; and, like jet, can be worked up into various ornaments, as may be seen by the beautiful specimen exhibited by H R H the Prince Albert in Class 27. There is there a garden chair, which well shows the nature and capabilities of the material, and a block of the raw material is placed near for comparison. In Class 1 is a model of the Durham monument, and a number of smaller objects constructed of the same material.

But cannel coal is not only useful for ornamental purposes. It has a far more important value in the very large quantity of common street gas that can be obtained from it, and the excellent quality and great purity of the gas. There are large deposits of this material in Scotland, where it has been used for years for the gas companies, but it has not long been employed to any great extent in London. Now, however, there is found to be a supply obtainable from the Newcastle coal district, and this is used exclusively by the Western Gaslight Company, There is also a large quantity used in London obtained from the Wigan coal field, where a thick bed is being worked to very great advantage. Specimens of these two kinds (Russell's Newcastle and the Ince Hall Wigan cannel) may be seen amongst the general series of coal in Class 1.

Next to cannel coal, the common bituminous coal of Newcastle and other districts is the most remarkable for the quantity of gas it contains, and the common household coal in most parts of England; and, as it takes fire readily, burns freely with considerable heat, has a cheerful appearance, and is of moderate price, it is likely to retain its reputation. There are two kinds of bituminous coal, the one swelling and becoming compact while burning, as the common caking coal obtained from the north; but the other, although containing as much volatile matter, and therefore equally fit for gas-making, remaining unaltered in form while undergoing combustion. The non-caking kinds come chiefly from the inland coal-fields, and are easily distinguished from the others. Generally speaking, the disadvantage of the Newcastle coal is that it requires constant stirring to keep a draught of air through the fire; but, on the other hand, the heat given is considerable; the ash is small and



INTERIOR OF THE GREAT CRYSTAL

E.—THE TRANSEPT, LOOKING NORTH.

red, or at least, dark-coloured, and the coal readily takes fire. The midland coals do not require stirring, but they burn with much fine white ash, and are not so profitable where strong heat is needed.

Within the last year or two, very large quantities of coal have been brought to London by railroad, from various inland coal-fields, and the estimation of the older and longer known kinds has undergone some change; but the general feeling still remains that the best Newcastle coal is that best adapted for use amongst English families in London and its neighbourhood.

When coal contains so small a proportion of gas and volatile ingredients, that it cannot be used with advantage in the manufacture of gas, it may still have a value for other purposes, which may render it very useful and important. This is the case with the kind called *steam-coal*, rarely seen in London, but of which there are some noble examples in the Exhibition, and remarkable as making hardly any smoke, lighting readily, and burning with intense heat. The more important of these coals come from Wales, and contain upwards of 80 per cent. of carbon. They are especially useful for the steam navy, and are now employed for that purpose to an enormous extent. They are also most valuable in the manufacture of iron, as they stand the blast, and contain few or no noxious ingredients.

Anthracite is the name given to a peculiar kind of coal containing hardly any gas, and consisting almost entirely of pure carbon. It is very difficult to burn, but, when once fired, gives off intense heat, and stands a blast perfectly, being thus well adapted for stoves and for the manufacture of iron. It is heavier than common coal, often hard, and bright, and with a shining irregular surface. It exists abundantly in South Wales and North America, but occurs also in Ireland and on the continent of Europe. Being free from smelting, it is especially adapted for malt-drying, hop-drying, lime-burning, and other purposes where smoke is injurious.

Of all these different kinds of mineral fuel, the Exhibition yields admirable examples, not only from our own country, so rich in this source of a nation's wealth, but also from distant countries, who have cared to show in what way they can enter into the field of rivalry with us. There cannot be a question that the foundation of our national importance is based upon the natural resources of this kind that we so abundantly possess, and it is both interesting and useful to see this recognised in the efforts that have been made to illustrate sufficiently the different districts most remarkable for their coal in our own island

Of all these, the great district in Northumberland and Durham, which for a very long period has had the entire monopoly of the supply of coal to the east and south coast and many of the large towns of the interior of England, must be considered the first in the extent and esteemed the character of its workings, if not in magnitude. This tract occupies half a million of acres, and has been estimated to contain not less than ten thousand millions of tons of coal, of which, probably, an eighth part has been already removed. It is illustrated in the Exhibition by a considerable and interesting series of the different qualities of coal, the coke obtained from the coal, the clay on which the coal reposes, and which is valuable for various purposes in the arts; and also by the various maps, plans, and diagrams illustrative of the district and the mode of obtaining the coal. Several models are also exhibited which will render still more clear the method of obtaining this mineral from the bowels of the earth, and the contrivances necessary to supply a sufficient quantity of fresh air to the men employed underground.

The Lancashire coal-field is remarkable for its influence on the great manufacturing towns of Manchester, Bury, Wigan, and others; and the great Yorkshire coal-fields, on which are Leeds, Sheffield, Halifax, Bradford, Huddersfield, and many other large and important towns, are also illustrated by the specimens of produce referred to this department.

From the Wigan coal-field, which is actively worked, and which supplies the cannel coal, already referred to as exhibited by the Ince Hall Company, we have also two kinds of household coal of excellent quality outside the Building, and some samples in Class 1. From Manchester there is at present no series; but on the Yorkshire side coal has been sent from Barnsley, illustrating very well the importance of the deposit and the nature of the supply. Several exhibitors have sent from this locality, and the group is both interesting and useful for the purpose of comparison. Two columns of coal in the Building, and one outside, sufficiently show the quality of this coal; while one exhibitor has erected a column of a peculiar variety, called sometimes "peacock" coal, which presents a display of colours more like the tarnish of some metals than the ordinary dark and gloomy surface of coal. While speaking of the coal of this district, we ought not to omit mention of the Stavely block of coal, from a mine near Chesterfield. This block is estimated to weigh not less than 24 tons.

The South Staffordshire coal-field, containing one seam or bed not less than 30 feet thick, is also abundantly illustrated in the collection. In the western enclosure (outside) is a column showing this vast thickness in the way in which it is presented in nature; and the magnitude of the mass is also further illustrated by two blocks, one weighing nearly 10 tons, and another 15 tons—one exhibited by Mr. Round, and the other by Mr. Haynes; the latter being interesting in reference to the vast mechanical power required constantly in a large colliery, as this single block, weighing, as we have said, 15 tons, was actually removed from the bed of coal, conveyed to the pit bottom, lifted to the surface, and deposited on a truck by the machinery in daily use at the mine, and without any special contrivance or extra force

The South Welch coal-field is that which contains the greater part of the steam coal and anthracite found in the British islands, and is well illustrated by several varieties of each exhibited on a large scale. It has been estimated that the district occupied by coal in Glamorganshire and neighbouring counties must contain nearly a hundred thousand millions of tons—a quantity so large that it is hardly possible to imagine any consumption that shall seriously affect it within any time that man can look forward to.

The steam coals described as "Russell's," "Rice," "Nixon's Merthyr," "Powell's Duffryn," "Llangennach," and some others of which there are specimens, are all well known, and greatly employed in our steam navy in different parts of the world. Many beautiful and valuable anthracites are also to be seen, some presenting a peculiar polish, and others remarkable for their want of smoothness and face; but all of good quality, and capable of wide application.

There are several specimens of coal from North Wales, which are also interesting. The most remarkable of these are the gigantic block, exhibited by Mr. Oakeley, and said to weigh 16 tons; another large block of 12 tons, from the Brymbo Company. Both are fine specimens and illustrate the Flintshire coal-field, which, however, may be regarded as a portion of the Lancashire, though obscured and covered up by a very great thickness of the new red sandstone.

Some specimens will be found illustrating both the Scotch and Irish coals; amongst them the parrot coal already alluded to. We may also refer to an interesting series illustrative of the coal-field of Mid-Lothian, exhibited by Mr. Cadell; some fine specimens of which in less variety than might have been hoped. Lastly, we may refer to the anthracite or culm obtained from Bideford, in North Devon, which is exhibited together, with some of the products obtained from it

Amongst the foreign coals the Belgian series affords the principal points of interest, not so much for the extent of the coal-field as the great relative importance of the production. The coal area does not include much more than a quarter of a million of acres, but the annual production is at least five millions of tons, exceeding, therefore, that of any other country in the world except Great Britain. The specimens of coal sent for exhibition are interesting, and of fair size for comparison with our own, but it is not of course to be supposed that the beds are of sufficient dimensions to observe the peculiarities of the different parts near the floor or roof of the mine.

Next to Belgium, Austria has sent the most interesting series of fossil fuel, but the variety is not very considerable. The States of the Zollverein and the Peninsula (Spain and Portugal) have contributed a small but not uninteresting quota, while France and the United States have also added to the stores. In these notices, however, the large itself not occupying the important position that it does with us, as the source of all wealth, has not been forwarded in large quantities, or in great variety; and the same must be said with regard to our Indian possessions, which, however, possess extensive coal deposits. From New Zealand and Van Diemen's Land specimens appear, and also from Western Australia and some of the islands of the Indian Archipelago; but it is remarkable that the Newcastle of the southern hemisphere, though rivalling our own coal metropolis, not only by assuming its name, but supplying for New South Wales a considerable quantity of fuel, has not sent any sample to represent it in the great gathering of raw material we are now studying.

Besides the natural fuel supplied by coal, we have also forwarded for examination, chiefly on the British side, a number of samples of artificial fuel, of which the best kinds are made from coal-dust, and partly charred. These are valuable, as giving fuel of great density and high power in a comparatively small space, and will be valued accordingly wherever space is an object. They are generally constructed of the fine powder of coal and the smaller lumps, which are otherwise of little value.

In concluding these remarks on the subject of Mineral Fuel, we take advantage of what has been said on the subject in the bulletin of the Central Commission of Statistics in the kingdom of Belgium:—

This is essentially the age of commerce and steam, the foundations of which are our *coal mines*. Thus coal produces steam; steam fashions the metals which serve to fabricate machines. The implements of various trades, leaving the workshops, are distributed through every branch of industry. Steam becomes the universal agent; if she is the producer, she is at the same time the vehicle of production.

The powers of man are centupled: he is no longer the serf of creation; he is rather the King. The Barons of feudality have made room by their side for the nobility produced by industry. The sword commands no more: it is capital which commands. To the state of strife, of warlike antagonism, succeeds a *régime* of industrial competition, and of exchanges. Men know themselves and each other better: national characteristics are obliterated; it seems that humanity is invested with a new form, organisation is established between states and between continents.

Mineral and metallurgic industry is, with agriculture, the most vital element of a country's prosperity. Coal is the most essential agent of all industry. the foundry, the iron, constitute merely the instruments, the elements of riches.

WALKS IN THE GALLERIES.

A FEW CURIOSITIES.

In resuming our exploration of the galleries, we no longer find nooks of solitude; the shilling admission fee has let in a crowd of eager provincials and acute town-bred mechanics, besides armies of boys and girls, who are not content to lounge down the main avenues, eye-glass in hand, to see and be seen, but conscientiously take out their money's worth in passing every zigzag of the eighteen acres of counter-room. Far from diminishing, this constantly varying multitude of eager investigators adds very much to the pleasure of the scene.

We will begin where we paused in our last notice, at the organ in the Western Gallery, at the end of the Nave. The walls are hung with models of ships-of-war, constructed from the Royal Dockyards, from the yards of the Messrs. White, of the Isle of Wight, and many who other private builders have successfully competed for Government work.

Referring our readers to an article upon the subject of Naval Architecture generally, which appears in another part of our paper, we are attracted by a singular broad-built craft, and find that it is a model of Noah's Ark, constructed to scale, from the description in the Book of Genesis; that is to say, "six breadths for the length and ten breadths for the depth," which the exhibitor asserts to be the proportion which experience has proved to be most suitable for our largest steamers.

Another curiosity close at hand is a model of a submarine boat, driven by a screw-propeller. The shape is that of a broad-backed carp, and the inventor proposes to make it sink under water, swim any distance, and rise again, at the will of a crew bold enough to trust themselves in this moving diving-bell. As his description is somewhat of the vaguest, we should not pay much attention to his plan, if it were not that Captain Johnson, the celebrated smuggler, who was no theorist, but an individual of an essentially practical character, had planned to rescue Napoleon Bonaparte from St. Helena, by aid of a submarine steam-boat, and was only prevented from making the experiment by the death of the captive. It would be absurd, after the triumphs that science has achieved in this century, to say that it is impossible to travel from Dover to Calais in a submarine boat; but we shall have more faith when an experiment has been exhibited, even on a small scale in one of the tanks in the Exhibition.

Not far from the submarine boat, keeping guard as it were over the Western Gallery, stands what looks like a man in armour, capped with a steel helmet; but the errand of this effigy is rather peaceful than warlike, rather meant to save than to destroy. It is simply composed of the complete and unique accoutrements for diving and working under water. Caoutchouc, in this as in so many other instances, has been found a valuable material for pipes to convey air to, as well as to form impervious clothes for the men who undertake to explore and raise treasures from wrecks, to lay the foundation of deep-water piers, to examine the bottoms of ships, and other difficult duties of the same character. All the appliances for the business of a diver are arranged alongside the figure. We believe similar paraphernalia form part of the regular stock of all contractors for deep-sea work.

Hanging from the roof, and taking rank with the submarine boats, are inflated models for guiding balloons. On a table under them are several contrivances for assisting swimmers—some not without merit. *Clayton's swimming gloves*, which form webs for the hands, and ingenious and unobjectionable contrivances for adding to the power of the feet, by presenting a broad surface to the stroke, and feathering, as it were, on the return would be very unsafe in practice, because the swimmer would be unable to walk in them, on reaching the shore, without a tedious process for unfastening such artificial fins. If such things are required at all, they would be better affixed to the ankles or knees.

After the swimming contrivances, we reach a vast collection of models of life-boats, the greater number of which have been produced in consequence of the Duke of Northumberland having offered a prize of £100 for a life-boat to be used on the coast of the county from which he takes his title.

Life-boats should be of two kinds, for two qualities are required of them which are incompatible in the same craft. Passenger-ships should be compelled to carry boats, or the component parts of boats of buoyancy sufficient to sustain a great number of individuals in the roughest sea. But the life-boat required on a dangerous coast must be light enough and handy enough to be moved about from place to place with ease, and launched through surf in the teeth of a gale blowing on shore. It is obvious that these qualities are incompatible with the power of carrying a great number of passengers.

Among other articles exhibited for the benefit of the yachting community, is a cork hat, which the inventor recommends on the ground that it is not only capable of supporting a man in the water, but calculated "to form, on an emergency, an *excellent washing-basin*." Amid the costly complicated contrivances for assisting swimmers, we do not see one of the simplest and best—a cork collar, with an India-rubber bag. We are strongly recommending it to those who have to learn to swim in deep water. Unlike cork floats and air-bags, it is safe, without impeding the motion of the arms.

On the same table with the life-boats is a model of Sir William Snow Harris's lightning conductor for ships, which has been adopted in the navy.

FIRE-ARMS.

Turning round the organ, we reach the British collection of fire-arms arranged in the south-western galleries, of which some notice appeared in our last Supplement. The division is specially marked by four life-size figures, with characteristic wax faces, of British infantry of the line, placed there to exhibit the contrast between the present and Mr. Bentley's proposed mode of slinging the knapsack. Mr. Bentley, from his placard, is very much in earnest on the subject, and seems to have common sense on his side, but it is hard to move constituted authorities. The veteran sportsman writer on guns, gunnery, and an enthusiast on the subject of wildfowl shooting, Colonel Peter Hawker, has not only sent a famous standing gun, which loads at the breech, and balances so nicely that a finger touch is sufficient to adjust the aim, but a very neat model of an improved punt, the result of his experience for a quarter of a century, in which, armed with the said gun, and clothed in the various garments, for a list of which his book must be consulted, on the most keenly freezing nights, he has been in the habit of paddling out on the south-west coast, and slaughtering ducks, teal, widgeons, wild-geese, and even wild swans, with terrific bombs. There is a peculiar interest in seeing the handiwork of this Nestor among sportsmen; because he handles the gun, the gunmaker's tools, and the author's pen with equal skill.

Among the guns, one case from Birmingham presents an epitome of the trade. No. 1 is a common flint musket with a stained beech stock, sold wholesale for about a dozen shillings for the African trade. It is a much better article than what used to be made in the old slave-trade days, when a gun was the price for a man; but still, although warranted, the African musket is the zero of a respectable manufacturer. By steps improvements and ornaments are introduced, until we are led from the plain double gun for the American market to the best article that Birmingham can produce; while, as a kind of *hors d'œuvre*, we have a specimen of a Californian protector, a neat double-barrelled carbine with a bayonet. It is not, however, to be compared for efficiency with Colt's revolvers, exhibited in the American section, which, from one barrel, without reloading, can discharge six successive shots by the simple process of re-cocking each time. But we must not pause longer with these details; we are now guiding the visitor round the galleries. An essay on the fire-arms exhibited by all nations will form a separate paper.

Contrivances for preventing accidental discharges of fire-arms are exhibited in great number, all ingenious—some too ingenious. Among the curiosities are a cross-bow of great power, with india-rubber strings, to fire a ball or arrow, and an air-gun of a new construction, in which the operation of cocking compresses sufficient air for one discharge.

DUMB WITNESSES OF OUR COMMERCE.

Our next step, still pressing along the extreme southern gallery, carries us from specimens of the arts of war to examples of the results of peace and the courage of commercial enterprise.

We are in a department of an important raw material. An enterprising firm of Leeds displays, in the convenient form of octavo volumes, neatly lettered, specimens of almost every kind of British and foreign wood used for ship and house building, furniture, or any other purpose, while on the wall hangs a slab four feet in length of mahogany ever imported, side by side with rosewood, Italian and French walnut, from the Leeds library. Passing over familiar British trees, we gather a few hints of the extent of our commerce. From North America, the locust-tree and the hickory, so famous for carriage-wheels; from Valparaiso a fine close-grained wood like oak; rosewood from Brazil; a kind of mahogany from Panama, with which, if worth anything, we shall soon be better acquainted; satin-wood and lignum vitæ from St. Domingo—perhaps this came to pay for the sword-blades in Birmingham for the Black Emperor; pheasant wood for cabinet-work, of beautiful deep colour and broad wave, from the East Indies; king-wood, a rich deep wavy red, from Africa; snake-wood from Surinam; hachmatack, a superior kind of pine, from Canada: and a capital white cedar, like a close grained deal without knots, from New Brunswick. New South Wales has contributed red cedar and red gum; the East Indies some rosewood, while an extremely curious looking book, full of honeycombs, and fit only to burn apparently, turns out to be a piece of a palm-tree.

A capital lesson in geography may be read from this stall of Messrs. Warrissen, without going further. Next to it, Messrs. Holtzapfel, the celebrated turners, who exhibit choice specimens of their lathes and tools in the machine-room, have set out samples of the woods commonly used in turner's work.

A SCOTCH VEGETABLE MUSEUM.

Our next visit must be to a museum prepared by Messrs. Lawsons, of Edinburgh, which illustrates with extraordinary minuteness the vegetable productions of Scotland, comprehending all substances used for food, in the chemical arts, in medicine, in manufactures, in house and shipbuilding. This collection, which occupies the largest space allotted to any one individual in the Building, ought to be copied in every agricultural college, if not in every great educational institution. It is arranged in the following six practical rather than scientific sections:—

No. 1. Plants cultivated for their farinaceous seeds, together with their straw or haulm.—This section is illustrated by nearly 1000 specimens, consisting of sheaves of all the principal cultivated varieties of grain, and samples of the seed; the less important varieties by a few ears of each, and a proportionate quantity of the seed. Peas and beans are shown in wax models of the size and colour of nature.

No. 2. Four hundred specimens of plants cultivated for their herbage and forage, illustrated by dried bunches of all the natural grasses and those termed artificial, in which are included the clovers and other plants, both gramivorous and leguminous, used for the feeding of cattle, with seeds of all species.

No. 3. Plants cultivated chiefly for their roots.—Comprising potatoes, turnips, carrots, parsnips to the extent of 600 specimens: the plants and seeds are dried, the roots, being perishable, modelled in wax. A book lies on the table containing a series of coloured drawings of roots, either the size of nature, or, where that was impossible, drawn to a scale.

No. 4. Plants cultivated for their uses in the arts, manufactures, and economical purposes.—This contains above 400 specimens—plants yielding fibre, as flax, &c., oil, colouring matter, or dyes; plants for miscellaneous purposes, such as the fullers' teazle, &c. The seed is shown; then a dried specimen of the plant in flower, followed by that portion of it prepared for the commercial value, and concluding with an instance of its use and application, such as worsted dyed with wood.

No. 5. Plants cultivated for their medicinal properties.—Six hundred preparations of plants in blossom and seed, and the extracts, oils, essences, powders into which they are prepared for pharmaceutical purposes.

No. 6. Plants cultivated for their timber, includes the seed, the leaf, the blossom, a transverse and longitudinal specimen of the timber in its rough and polished state; also the plants of the principal forest-trees, as raised in various stages of growth.

Thus it will be seen there are all the materials for illustrating practical lectures on the vegetable productions of agriculture and the art of planting. Among the curiosities we must note two specimens of the tussac grass, discovered in the Falkland Islands, and grown in one of the Orkney Islands. Here we must pause to resume next week "on fresh fields and pastures new."

KILBURN'S PHOTOGRAPHIC PORTRAITS.

The readers of the ILLUSTRATED LONDON NEWS must be already sufficiently familiar with the name of Kilburn in connexion with Photographic art. We have frequently taken advantage of the talent and skill of this gentleman, in giving to our artists portraits from which they have made their engravings. He has exhibited a choice screen of the most lovely portraits which this art can possibly supply. Great difference is shown in the manipulation of different persons; and we must remember that the light of London, filtered as it is of its best rays, is but very ill adapted for the purpose of the Photographist, and in this respect the Americans and French have natural capabilities which render the practice of this noble art very much easier than it is in English towns.

Mr. Kilburn has greatly excelled in giving pictures the images of which are particularly clear and very distinct relief. We think that the picture of Jenny Lind standing by the piano with her face to the audience, but at the same time showing the back by the reflection of a looking-glass, is a masterpiece of this art, not excelled, if equalled, by any other specimen exhibited throughout the entire Building. Again, the picture of the child standing beside a young donkey exhibits a group which we can hardly imagine to have been taken from nature, though, from its being thus labelled, there can be no doubt of the fact. His whole collection is contained in a glass screen, but it unquestionably is a screen of surpassing beauty, and we can cordially recommend the visitors to the North-west Gallery to examine it carefully for themselves.

BEARD'S ENAMELLED DAGUERREOTYPES.

Considerable interest has been excited amongst the practisers of the Photographic art by this very important improvement in Daguerréotype pictures. When we compare the first sun pictures which came from France with those which now are made, the difference is striking enough, as extensive improvements have been made in the process. Nevertheless, the liability to tarnish which the plates possess—from the universal presence of sulphur in the atmosphere of this metropolis—was a great drawback against their use, and, further, the absence of colour was very unpopular with the English public. The absence of colour was in some degree remedied by dusting over the pictures with various powders, which much enhanced their beauty. Still, this might be readily rubbed off, and offered no obstacle to the liability to tarnish. After a time, Mr. Beard turned his serious attention to the matter, to endeavour to cover the plate with enamel, and also to give colour to that enamel. This photographist succeeded in getting a transparent material which could be employed hot, and thus form a beautiful covering to the silver plate. But then came the great difficulty of colouring the enamel. Nevertheless, after a certain time and ingenuity, he found that, by grinding the colours with the material and painting the composition, the whole could be fused and form a brilliant enamel, which would resist wetting, would protect the plate from tarnishing in the air, and be in every respect like a miniature painting.

In the North-west Gallery our readers will perceive a case contributed by Mr. Beard. In the first place, he shows three plain Daguerréotypes after the old plan. Then he shows two or three coloured by the powders, and the remainder exemplify this new and great advancement in photographic art. In the first discovery of any invention, it is impossible to tell to what perfection it can be carried; but to us it appears to possess a capability which, should no drawback be found, will give to Photography a far higher importance than it at present possesses, and cause every family to have a photograph of all its members.

LETTERS FROM LONDON
ON
THE GREAT EXHIBITION AND OTHER MATTERS.
ADDRESSED TO HIS UNCLE ENOCH, HIS AUNT HULDAH, DEACON BIGELOW, AND OTHERS.

BY PELEG E WHEELER,
Of Penobscot, State of Maine, U.S., member of the Penobscot Historical Society, and Keeper of its Independent Corps of Boundary Volunteers.

WITH AN INTRODUCTION BY BAYLE BERNARD.

(*Continued from page 497.*)

LETTER II.—TO MR. B B——.
THE GREAT FOCUS AGITATION; TOGETHER WITH THE MAJOR'S "NOTIONS" AND CONTRIBUTIONS TO THE "WORLD'S SHOW."

OLD ACQUAINTANCE!—

Well—I shut off my last by telling you how the news of the World's Show shook us up in old Penobscot; what a quiverin' it gin us, and what we did to start it right away to Mexico; and I darsay you'll conclude that a start was all it wanted, that 'twas like fire on a prairie—one puff would singe a desstrict, and I guess that was the fact. The first grain blazed the barrel, and it's been going ever since, full chisel, like the anti-slave law principle or the tide for Calyforny! Only there's another fact inside on it, and that's just enough to make it plaguy humbling altogether as a dab of tar on a clean shirt. That's the fact, that our town, which begun this noble movement, that was a beacon and a trumpet to our entire and glorious union, all of a sudden stuck as fast as if it had rolld into a quag hole. Didn't go ahead a mossel, but stuck down and lay as flat as a flounder.

Some of us was mad, I reckon, but we stuck down and lay as flat as a flounder.

to a skeleton clock, the parts of which were cast, made, and cut by a clockmaker of this county, in rivalry of the work of those districts in which clockmaking is a special trade. A second prize has been adjudged to a set of small knives, for the skill and ingenuity exhibited in their workmanship. The judges do not consider such ingenuity entirely wasted, since its exertion confers a power on individuals that may eventually be applied to objects of utility; and the same remark is applicable to

1.—ICE VASE—BY MR. DODD.

a prize of the value of 2s. 6d. adjudged to a lad for a puzzle-box that he has exhibited. The judges have further awarded the society's second silver medal (not convertible into money) to an extremely well-executed drawing of a balance apparatus used in the coal-mines of Wales, and applicable, under some conditions, to the Cornish mines. They are satisfied that this society is extremely desirous of encouraging a full and accurate knowledge of the practice and plans of other mining districts, with a view to their adoption, or the employment of such modifications as may be deemed advisable. The judges, with the consent of the committee, have awarded an extra prize of £2 to a small model of a steam-engine, made by an engineman in his leisure hours, which is well executed under circumstances of obvious difficulty, and which must have required a study of the form and proportions of every part of an engine, which must be a very useful exercise to a person to whom is entrusted the constant care of an engine."

The Cornwall exhibitions, like all others (except the house of the London Society of Arts), have partaken of the character of bazaars, since they have included curiosities in natural history from all parts of the world, as well as amateur oil and water-colour paintings. Yet, even under the general head of natural history, we find that the jury paid particular attention to county exhibitors. Thus, the second silver medal was given to William Loughren, of the coast-guard, for ninety species of fishes procured from the Cornish coast, and preserved by himself. "Of less value is the collection of Algæ by Miss Warren, to whom we also award a second silver medal. The specimens are named systematically; and, if they do not form a perfect marine herbarium of Falmouth harbour, they leave but little to desire." Even the Cornwall boys contributed illustrations of the natural history of their county, in the shape of collections of bird's eggs. The exhibition consisted of 612 distinct articles; and the presence of a remarkable number of boys and men of the working classes, attests the spirit of emulation which the Institution has evoked throughout the country. The rich resources of Cornwall are by its agency subjected to a thorough mechanical and scientific examination. Cornwall naturalists are encouraged to class the living creatures indigenous to their county; miners are exhorted to improve the machinery of their mines; amateur artists are offered a public wall for the display of their local sketches; the young ladies of Cornwall, as they pace the shore of their southern county, are reminded that they will receive honour and thanks from their neighbours if they will learn to class the weeds which clutter about their feet and the coast guard, as he wanders moodily along the sea-side solitudes of Land's End, is stimulated to play his part at the local exhibition. The industry, the science, and the natural history of the county find their annual representatives; and the processes which tend to cheapen the production of its embowelled wealth, receive daily new and improved developments.

3.—ORIGIN OF THE QUARREL OF THE GUELPHS AND GHIBELLINES. DESIGNED BY F. R. PICKERSGILL, A.R.A., FOR MESSRS. ROWNEY AND CO.

Next in order of succession, Manchester claims popular notice, for its endeavours after an industrial exhibition. The idea of establishing a collection of "specimens of natural history, works of art, and mechanical contrivances" within the walls of a Mechanics' Institution is attributed, in the report of this institution for 1838, to its President, Mr. Benjamin Heywood; and it was at this gentleman's suggestion, that, in 1837, a circular was issued to the manufacturing and scientific men of the county, which, as it indicates the comprehensiveness of the first Manchester scheme, deserves a verbatim insertion in a History of Industrial Exhibitions:—

2. CLARET JUG—BY MR. DODD.

Sir,—I have the pleasure of informing you, that the directors of this Institution intend, during the Christmas vacation, to open the various class and lecture-rooms for the exhibition of objects illustrative of science, art, manufactures, and natural history, to afford the members of the Institution and the public generally an opportunity of inspecting, at their leisure, the present state of the arts and manufactures of the town; to bring together numerous instances of the practical application of those scientific principles so frequently expounded in our lecture-rooms; and thus, by blending instruction with amusement, to furnish to the great community in which we live a source of intellectual improvement and rational recreation. The following outline will display the principal features of the intended exhibition, and it will, at the same time, be useful as a guide to those friends of the Institution who may be disposed to promote this object by the donation or loan of philosophical instruments, models of machinery used in the various important branches of British manufactures, and specimens illustrative of the several departments of natural history. EXPERIMENTAL PHILOSOPHY.—*Statics and Dynamics:* Instruments to illustrate the laws of equilibrium and motions of solid bodies; elements of machinery, various kinds of levers, wheel and axle, pulleys, inclined plane, screw, and the wedge, their application to modify motion; illustration of centrifugal force. *Hydrodynamics:* Instruments to illustrate the laws of pressure, equilibrium, cohesion, and motions of fluids; hydrostatic paradox, press, bellows, balance, &c.; hydraulic machinery, water-wheels, machines driven by the reaction of water, cicpsydra, hydraulic ram, Archimedes' screw, blowing machines, &c. *Pneumatics:* Instruments for exhibiting the mechanical properties of air and other elastic bodies; air-pumps, condensers, barometers, machines for raising water, various kinds of pumps, syphons, fire-engines, &c. *Heat:* Instruments for illustrating the theory of heat, such as thermometers, pyrometers, parabolic reflectors, &c. *Light:* Sectional and other models of various optical instruments, such as telescopes, microscopes, camera-obscura, camera-lucida, &c.; instruments for exhibiting the polarization of light, optical delusions, machines for grinding lenses and specula. *Electricity:* Comprehending instruments for illustrating the phenomena of electricity derived from friction, galvanism, magnetism, electro-magnetism, and thermo-electricity. *Astronomy:* Models of instruments for the purpose of observations and computation such as mural circles, transit instruments, &c., contrivances for illustrating the motions and phenomena of the heavenly bodies, such as planetariums, orreries, armillary spheres, &c. *Geodesy:* Instruments in use for surveying and

4. GROUP OF VASES, &C.—BY MANSARD.

division of land, theodolites, levels, circumferenters, parambulators, pentagraphs, &c. *Chemistry:* In addition to the apparatus usually employed in chemical demonstrations, it will be desirable to obtain samples of the various drugs used in the arts, particularly in the processes of bleaching, dyeing, and printing. THE FINE ARTS—*Architecture:* Models and drawings of public buildings, specimens of materials used in their construction. Specimens of sculpture, modelling, carving, painting, engraving, &c. THE USEFUL ARTS—*Brickwork, Masonry,* and *Carpentry:* Specimens of building materials, such as stone, marble, brick, lime, cement, &c.; models of roofs, centres for bridges, specimens of various kinds of wood, &c. *Mill-Work:* Models to illustrate the elementary parts of mill-work, the different methods of engaging and disengaging machinery; contrivances for equalising, transmitting, and converting motion from one species to another; models of various kinds of mills, wheels, &c. *Steam-Engines:* Sectional models

5.—STATUETTE FROM VIENNA. BY FERNKORN.

and drawings to exhibit the various parts of the modern steam-engine, under various forms, and their application in the single and double-acting engine, high pressure engine, vibrating engine, &c.; models for illustrating the application of steam power to mining, to navigation, to locomotive engines on railroads and common roads. *Civil Engineering:* Models and drawings of works of public and domestic utility, such as sea, river, canal, railway, and common roadworks, gas-works, water-works, mining, &c. *Manufactures:* Models for illustrating various manufactures from fibrous materials, with specimens in cotton, silk, flax, wool, worsted, &c.; models to illustrate the art of bleaching, dyeing, and calico printing; models connected with the production and manufacture of cast and wrought iron, and other metals; models connected with the manufacture of artificial substances, as porcelain, glass, acids, salts, pigments, &c.; models to illustrate the arts of letterpress printing, by presses and machines, copper-plate and lithographic printing. *Natural History:* Specimens of crystals, minerals, geological charts, fossils; specimens in botany; specimens in entomology, ornithology, ichthyology, zoology, &c.

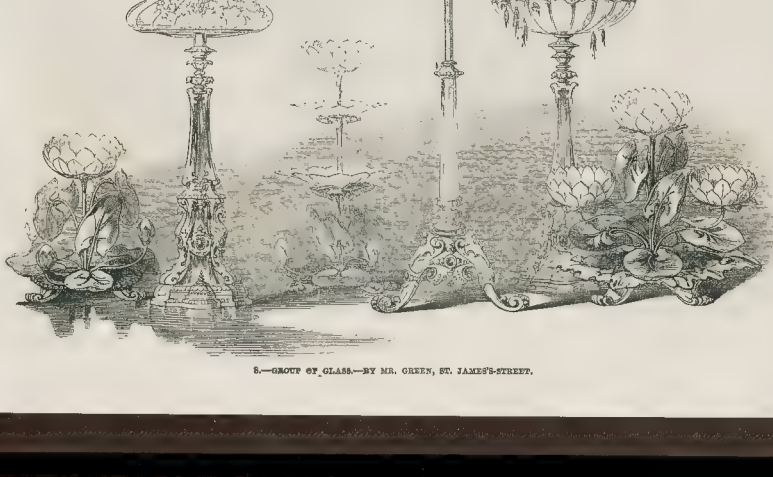
By the united and zealous exertions of the members and friends of the institution, the directors feel assured that a source of rational and agreeable relaxation may be established, and be made the means of diffusing a great amount of useful and interesting information. It will afford our ingenious mechanics and artisans a convenient opportunity of inspecting the practical application of scientific principles in the construction of machinery; of seeing the present state of perfection of our manufactures, and it is hoped it will be the means of stimulating them to scientific research in the improvement of their respective arts, and assist them to contribute beneficial results to this great metropolis of manufactures.

To make this Exhibition useful, attractive, and interesting, great labour will be required, as well as considerable expense. Every exertion will be made to remove the first obstacle; and, with respect to the second, an appeal to our liberal townsmen, who are always willing to support works of public utility, will not be made in vain.

SAMUEL E. COTTAM,
Secretary.

This circular had the effect of concentrating within the walls of the Manchester Mechanics' Institution a very interesting collection of models, manufactures, paintings, and curiosities in natural history from 150 contributors, for the amusement and instruction of the Christmas holyday folk of 1837. The exhibition remained open from the 26th of December till the 3d of February, and was within that space of time visited by 50,000 persons. At the annual meeting, held a few

7. CENTRE-PIECE - BY MESSRS LAMBERT AND RAWLINGS.



8.—GROUP OF GLASS.—BY MR. GREEN, ST. JAMES'S-STREET.

weeks after the close of this experimental exhibition, Mr. Benjamin Heywood referred to it in terms of great gratification:—"For my own part," said this gentleman, "I am free to confess I had no anticipation of the degree of success which has attended it; and I believe I am not very far wrong when I say that its results have not a little surprised my excellent friends near me who worked so zealously in its preparation. How delightful is the contemplation of everything connected with it. Where shall I begin in the enumeration of its happy influences? Shall I speak of the spirit which animated those who undertook its preparation and arrangement? of the days and nights of labour they devoted to it? of the readiness and kindness with which contributions of all kinds were offered? Shall I speak of the gratification afforded by it

6. STATUETTE FROM VIENNA.—BY FERNKORN.

to thousands and tens of thousands who had never seen anything of the kind before? of the new and nobler taste which it has awakened in the minds of many of them? or shall I speak of its value as an example to other institutions, possessing rich and beautiful collections, from which the public have hitherto been excluded? It was delightful to see the countenances, beaming with pleasure, of the working men, their wives and their children, as they thronged through the rooms, and gazed upon the different objects; and I could not help feeling in how many of their breasts a cord must have been touched, the vibration of which will have given life and permanence to new and happier feelings within them. * * * * Let me beg your attention to the personal appearance of your directors and your president this evening: we are all in the livery of the institution; we are all in waistcoats woven at the exhibition, by the silk-weaver whose loom and whose work excited so much interest." On turning to the accounts of the institution, we find that the exhibition realised no less a sum than £1078.

The second Exhibition of Manchester industries, arts, and curiosities, was opened on the 24th of December, 1838, and showed a list of contributors 380 strong, and a list of articles amounting in number to 26,300 Amongst these articles there were 31 models of steam-engines, 73 models of useful machines and ingenious mechanical contrivances, 20 models of ships, packets, boats, &c., 400 specimens of manufactures, 12 models of public buildings, 40 specimens of papier maché and cabinet-work, 90 philosophical instruments, 150 ancient and modern curiosities, 1050 medals, coins, and plaster casts of medallions, 171 paintings, 290 engravings, 10,000 insects, 1120 birds, 7000 mineralogical and geological specimens, and 4000 shells. Not less than 100,000 visitors flocked to this Exhibition, and left in the treasury of the institution about £2320. This sum, together with that realised by the first exhibition, were devoted to the long-cherished object of paying off the debt due upon the building of the institution. At the annual meeting held while the second exhibition was open, Mr. Isaac Newton (who appears, with Mr. Belshaw and others, to have taken an active interest in these exhibitions) threw out some suggestions for future guidance. He said, "It has now been practically demonstrated that the most

valuable depositories may be thrown open, at a small charge (that to the Manchester exhibitions was sixpence), to the public indiscriminately; and that the owner of works of art, of specimens of the productions of nature, and of curiosities in general, may rely with confidence on the honour and good sense of the poorer class of his fellow-countrymen; that he may trust his most rare and valuable articles to their general examination, and have them safely returned, accompanied by the warmest thanks of a grateful public. * * * * Excellent as is our present exhibition, I think that it is yet capable of improvement. I should like to see it descend more into our commoner manufactures for some of its articles. One department of it might be appropriated to what should be termed a sample and pattern-room, in which should be placed specimens or samples of manufactures in general. The different trades might be solicited to exhibit in this room the most important productions of their various professions. I am aware that this is now carried out in a considerable degree, but I would still further extend it. For example, why should we not exhibit samples of dyeing, of calico-printing, of the cotton manufactures in general, of paper for house decorating, improved specimens of boot and shoe-making, of hat-making, of book-binding, or of any other trade, the articles of which are not too large or inconvenient for exhibition? We have already articles, and most beautiful ones too, of the more showy species of trades and manufactures, such as clock and watch-making, of papier maché manufactures, mathematical instruments, philosophical apparatus, &c.; and why not exhibit also improved articles of some of the more humble but more general and useful trades? These are merely hints for next year's exhibition, which may or may not be adopted, as circumstances determine. But I certainly should like to see our exhibitions possess, in addition to the general interest which they must and will always have, a depository in which as many as possible of our articles might view and exhibit the most improved articles on wh ch they are daily employed." These suggestions are worth recording in a history of the development of English industrial exhibitions. In their report for 1848, the directors of the Manchester Mechanics' Institution describe deputations as having waited upon them from several towns for information on the details of the Manchester exhibitions

The Exhibition of 1840 was a comparative failure, having attracted only 43,450 visitors, and realised £938. It consisted principally of pictures, and is remarkable chiefly for the re-appearance of an *Exhibition Gazette*, started for the special purpose of giving critical descriptions of objects exhibited on these occasions. This *Gazette* is a curious periodical to refer to.

The fourth Manchester exhibition was not opened till the 26th of December, 1842. It occupied four rooms, and included some extensive specimens of improved manufactures. Passing by the collection of Chinese curiosities and the picture gallery, we may at once notice the specimens exhibited by various manufacturers as the results of the Jacquard loom. First of these was a *tableau* of the will of Frederick III. of Prussia, surrounded by a classical design, manufactured by Messrs. Meyer and Co., of Berlin, and presented by them to the Manchester Mechanics' Institution. The *tableau* is woven in what is termed a 3600 set reed. It requires in the working the power of eight machines, each machine containing 600 ends of silk, or 4800 ends in the whole. There are about 3730 cards on each machine, or 30,000 cards in the whole. The size of the paper on which the design is given should be 18 feet by 21 feet, whereas the woven silk is not more than some 16 to 20 inches.

A second specimen of Jacquard weaving was a portrait of Jacquard himself, contributed by Mr. Henry Hilton, of Mosley-street, Manchester; another specimen was the "French Conscript," contributed by the Manchester School of Design; and the last specimen represented the will of Louis XVI., and was contributed by Messrs. H. and E. Tootal, of York-street, Manchester.

The Fine Art department included a contribution from the late Sir Robert Peel. Specimens of raw and spun cotton yarn from No. 1 to No 460; inlaid work, plants, and engravings. The mechanical room, as described in the *Exhibition Gazette*, was particularly interesting. "Here we have a glass-blower, a stocking-knitter, a seal engraver, and a likeness cutter; two kinds of weighing machines, at which, for the small charge of one penny, the curious in corporeal gravity, absolute and specific, can have their own proper ponderosity determined to a fraction; divers hydrostatic machines and pumps; some beautiful railway models, of bridges and stations; a glass in which long faces may be pulled any measure; and an antidote thereto, in which the simplicity and strength; and some beautiful working models of calico printing machinery, and of other machines connected with this branch of industry, contributed by Messrs. Thomas Hoyle and Co."

The Fine Arts room included a self-acting pianoforte, exhibited by Messrs. Marsden and Son. It played a number of tunes by the agency of revolving barrels. In this room a specimen of French ingenuity figured, in the shape of a ship carved in ivory, executed at Dieppe. It is possible only to mention other interesting evidences of ingenious industry. Among them were—a hydraulic machine for drawing and sipping; a clock on the principle of an inclined plane, having dials to indicate the progress of time, by the second, the minute, the hour, and longer periods, also the hours and degrees at the various important positions on the earth; specimens of reeds made by a steam machinery; pods of cotton from Egypt; specimens of silk spun by wild worms in Assam; "the mechanical paradox;" patent machine (Edmonson's) for printing railway tickets; a machine for testing thread, "which enables the operator to ascertain the strength of the thread, from one grain to a thousand grains;" specimens of cut, coloured, and stained glass; dinner plates of the time of William and Mary, near the latest productions of Staffordshire skill; specimens of the various stages of the fan manufacture; anatomical cast of a horse; a marriage veil worked in Moroseo by a Jewess; a series of the Poniatowski gems; "and a flower-basket composed of the hair of about eighty family friends at Hamburg."

Nearly four hundred persons contributed to this exhibition. It was open for nearly three months; was visited by about 100,000 people; and realised about £1800.

The fifth Manchester Exhibition, which was opened at Christmas, in 1844, partook of the characteristics which distinguished the previous exhibitions. An over anxiety to introduce all kinds of attractive, but unmistructive entertainment, such as profile-cutting, &c., has somewhat detracted from the high character which these periodical displays might otherwise have held; and too evident a regard for the pecuniary proceeds, rather than for moral improvement, has lessened the estimate which liberal minds would have formed of the endeavours of those gentlemen who have mainly contributed to the success of these exhibitions. No prizes have been awarded at these Manchester exhibitions.

(To be Continued.)

A RUSSIAN YACHT CLUB.—The port of Havre is about to be visited by a flotilla of a novel kind. There has existed at St. Petersburgh, for the last three years, a yacht club, organised on the model of that of London. The most eminent personages and the richest young men of Russia form part of the club, which includes among its members the Grand Duke Constantine, son of the Emperor, and High Admiral. In order to form part of this club, it is necessary to possess at least one yacht or small vessel rigged as a brig, and capable of carrying a crew of 25 men. The Emperor, as a special favour, and in order to encourage the development of ship building, has granted permission to the members of this club to navigate, a certain time, and call at the ports of different countries. The St. Petersburg Yacht Club has consequently decided on sending a deputation of its members to visit the Exhibition in London, and that it shall sail between the 20th and 30th inst. A great number of the other members of the club will join this deputation, and they will together form a small flotilla of from 20 to 25 vessels, among which will be three steam yachts, the *Peter the Great*, the *Nicholas*, and the *Cabriere II.*, the models of whose machines are in the Exhibition. The flotilla will first proceed to Havre, where, in consequence of the present crowded state of the Thames, a part of the vessels will remain, and a division of only six yachts will thence proceed to London.

CULTIVATION OF THE TEA PLANT IN INDIA.—It is stated, in the last advices received from China, that Mr. Robert Fortune, who has been engaged by the Honourable East India Company to procure and transmit to India a selection of the tea plant, for cultivation in the north-western provinces, has succeeded in obtaining from the green tea districts a large number of the finest plants. Mr. Fortune was leaving for Calcutta. He had also secured the services of eight Chinese, from the district of Welchow, who have agreed to serve him for three years, at the rate of fifteen dollars per month each. Six of these are regular tea manufacturers, and the other two are pewterers, whose sole business is that of preparing lead casings to the tea-chests. Mr. Fortune had penetrated into the interior of China about three hundred miles; and during the whole of his lengthened absence from consular ports had never been molested, nor in any way insulted. He expects to have completed his labours in arranging the plantations for the East India Company before September next. The first plants transmitted by Mr. Fortune have flourished as well as could possibly be expected, but under his personal superintendence and the attention of the native tea manufacturers, there is every reason to expect the most favourable results. Probably, in a few years, tea will form an article of export from the Indian presidencies.

A STORY OF THE PRESENT DAY.

BY AUGUSTUS MAYHEW,

ONE OF THE AUTHORS OF "THE GREATEST PLAGUE OF LIFE," "HOW TO GET MARRIED," ETC.

(Continued from page 485.)

CHAPTER IX.

THE pigeon had found its way home, to Joe's great joy, for it had been away so long that he had given it over for lost. Under its little wing was tied a letter addressed to Lamere's daughter, and Joe took it over to her.

"Come by my pest, miss," he said, handing it over with a grotesque bow. "Special messenger from Thomas Bradley, Esqvire." And he told her with a proud air of his pigeon's achievement, adding, "Just see if he mentions the time when he flewed the carrier."

Kitty was enchanted at the idea of receiving a letter in such a delightful manner, and as she flattened out the crumpled paper on the table, declared that the winged postman was "a darling little pigeony," and vowed a piece of bread for its supper.

So as not to appear curious, Joe walked to the window and whistled. He was surprised to find, that, after having gone through "Nix my dolly" twice, Kitty was still silent. At last overcoming his bashfulness, he went back to the table. She was still poring over the letter, but her face was so pale, and her manner so strange, that he was quite startled.

"What's the matter, miss?" he asked. "Tom been up to one of his larks? He is sich a feller for a spree. What's he been a saying?"

Without answering, she pushed the paper towards him.

It was written in pencil, and so rudely that the lad had to hold it in all kinds of positions before he could make it out. "Hang it," he cried, scratching his head, "it's a pity Tom hadn't let the pencil go of itself; it 'ud have done it better. It's so florishy, the writin' looks like bits o' horsehair. Like trying to read a tea-sheet it is—Chinese nothing to it. '*I'm off to—a-u-s—hors—t-r-a-l-i—trait—a—ho—Horstralia.*' What a feller he is for a spree, to be sure! '*God help yer and the old man and the young uns, and*—and, and—*don't*'—whats this—'thuck!' no! that aint it—'thick'—no! that's not it—ah! think, he means—'*think kind of me.*' Ha! ha! what a rum feller, to go writin' that nonsense—aint he?"

"He's gone, I know he's gone, I'm certain of it!" answered Kitty, staring wildly about her.

"Pack o' rubbish," returned Joe. "How's he to go? It takes a forten. Do you think any one has been and fancied him, when he aint shaved for a week?"

"He's gone! I'm sure of it," still muttered the girl. "Now I can see why he was so silent. If he wasn't going, why did he kiss the children so? The way in which he said good-bye, too! Oh, I'm sure he's gone!"

"It's one of his larks: he's always at it—told us he had beef for dinner one day. It's nothing but a spree."

"What will become of us?" sobbed the girl, resting her head on the table; "we shall all die, we shall! Oh! I wish I was dead, I do."

"There, don't take on; he'll be back in an hour."

"No, he won't, he won't, he won't," cried Kit. "How cruel to leave us! O-o-o-o! what will become of us? I wish I was dead—dead—dead!" and the table shook with her sobs.

The poor lad sought to comfort her. It was only a bit of fun—one of Tom's stupid jokes, that was all. Have good cheer, and wait a bit—why not wait a bit? it wasn't much to wait a bit.

But Kitty felt so certain about the matter, that she could listen to no hope. She wept and walked up and down the room, hiding her face in her work, Joe following her, and talking to her, without being able to check her grief; until, at last, as she never even answered him, he thought it better to leave her to herself, and he sat watching her, with a face nearly as wretched as her own.

What was she going to do? She had put on her bonnet and shawl, and, without even noticing him, had rushed down stairs. He followed, and, without even taking off his shirt sleeves, but only just able to keep her in sight—his slippers kept coming off at every step he took. She never stopped until she arrived at the Docks; and, flying through the gates, she went up to the first sailor she met.

"Has a vessel gone to Australia to-day?" she asked the bewildered tar.

"I believe there was one, a very rakish craft, painted white and green—mate got a black eye—that the one?"

"I don't know! I don't know! Oh! I knew he was gone," sobbed Kit, stamping her little feet on the ground in despair.

Here Joe came up, and, taking the poor girl's arm, laden her away, leaving the astonished sailor a long story to tell over his pipe of the next little craft in distress that had hailed him, to say as how she had been deserted by her mate, leaving her in shallow water, without a shot in the locker.

Although she tried her utmost, there was no keeping the sad news secret. For three days Tom never came home, and the children and the old man were continually asking for him, and wondering at his absence. "It must be known by and by," thought Kitty; so, summoning up all her courage, she told her father what had happened.

"He's a scoundrel!" roared the old man, striking the bed. "He's a scoundrel! To leave three children to starve! He's a scoundrel!"

"No, no, no!" muttered Kit. "I know what he means to do."

"Means to do?" shouted Lamere. "He means to shift em off his back on to ours; that's what he means to do. But he shan't; they shall go to the workhouse, they shall."

"Poor little things—the workhouse!" sighed the girl, looking steadily in her father's face.

Illness had made him fretful and petulant. As his leg grew well, and health returned, the restraint of the bed was galling to him, and he would forget to practise the patience he had so often preached. But his child's look rebuked so kindly, that, as if ashamed of what he had said, he could not answer her.

"Poor little things! It's early for misery to sitsak them. The workhouse! What a home to remember and think of in their future struggles! And the remembrance of a happy home does buoy one up so much. You yourself told me so," she added, artlessly. "If your home had been a workhouse, she continued, "you don't think you'd have been able to endure patiently? I have seen you gain strength and courage, as you have told me about those happy days the room with the stuffed birds, and the bright table, and the lily window! Oh! they mustn't go to the workhouse, father! Think, oh! think! Suppose we were mistaken, and Tom should prove himself to be no scoundrel, but a brave fellow, what answer could we make, when he came to ask for his little ones—' Where are my children? Come with them. I have a prosperous home for all!' and should have to point to the workhouse? You know they mustn't go there."

"Bless you, my child," cried the old fellow, gazing for a moment on her pretty earnest face, and then clasping her to him. "No, they shan't go: we will live together, and their little faces will sweeten our sorrows by making us share their cheerfulness. Bless thee, Kit, my noble girl," he continued, gazing on her fondly, "bless thee for thy counsel, for, without it, I, who in my old days have need of kindly acts, should have thrust the fatherless from my door."

Poor girl, how her eyes sparkled with happiness! how hopeful and courageous she looked! How calmly she could now talk over the danger that had startled her, blaming herself for having complained when she had work to do and health to support her; it was weak and cowardly!

A new strength seemed to animate her whole being. The thought that with her hands the sick father and the orphans were to be fed, seemed to force the blood quicker through her frame. Their helpleseness roused up all her love, until her soul seemed to expand within her, gaining fresh life from each object of her care. Her noble woman's nature shone out in all its beauty. Instead of a little selfish compassion, she thought only of soothing the sorrows of others—the noblest privilege of our nature. With what calmness she talked of the future.

By working early and late, she could make her six shillings in the week. But then the fingers must never flag; she must never think of rest. Out of this had to be deducted about sevenpence for thread, sixpence for candles, and two shillings for rent. There was then only three shillings left to live upon. It was less than sixpence a day to support and clothe five people. But then one of them was a mere baby, and she herself would be easily satisfied. They could hope for nothing more than bread, but it would be the sweeter for knowing that they were able to live together.

The doctor had given them hopes, that, in another month, the old weaver would be well enough to take his seat at the loom again. If this should fortunately prove correct, their pains and trials would be but of short duration, for work was getting plentiful again. The old man had begged hard that he might be allowed to amuse himself in making wooden money-boxes—anything that would help to fill the purse, but he had been forbidden all exertion. An unlucky movement of the body might upset the healing work of months, and poor Kitty was quite shocked and hurt at the idea of her father wishing to run such risks when she was willing to work for him.

But it was sad work to keep pace with their wants. The future always seemed brighter than the present; and it was lucky it did, for that was the only comfort allowed them. The rent was the largest item in their expences, and it seemed to swallow up all the earnings. Every penny was laid out carefully, the bread served out in stated quantities, as if among some shipwrecked crew. After herself, she would often share her portion with the hungry little ones, singing and working the harder as if she did not feel the loss. She would be constantly quarrelling with her father for not being hungry, insisting on his eating his allowance, because he assured her that he had dined like a prince. Her only delight seemed to be in making some sacrifice for the benefit of those that were dear to her.

One unlucky week work became scarce, and for three days, though she begged and prayed for something to keep her needle employed, she was forced to be idle. This threw her back so dreadfully, that when on the Saturday the rent was called for, she had to beg for some little time to retrieve her loss. The allowance of bread was lessened, and by saving that way and working an hour later and earlier she reckoned that a month would see them free from debt. Two shillings was an awful amount to replace, but the penny a day would soon mount up.

It is astonishing how nerves will spread among the poor. It seems to help them or their own difficulties if they talk of the misfortunes of others. It is always a comfort to know that there is some one more wretched than yourself.

The story of Bradley's departure was soon known up both sides of the street. Every one in their pity added a little more misery to the already heavy load. On the Saturday night, the meeting at the "White Horse" was the fullest of the season. Each sucker had come armed with the latest intelligence: all trying to cap each other in swelling to the utmost the calamities present and to come, until, at last, it was only with the greatest difficulty that old Lamere could be allowed to go to the workhouse, and Kitty was positively obliged to jump off Waterloo Bridge, before anything like satisfaction could be given to the assembled friends.

If the matter had ended here it would not have signified much; but in the end, rumour, whose speaking-trumpet is always sounded loudest during the storms of life, reached the ears of Lamere's only creditor—the landlord. The rent was already in arrear, and, growing doubtful of the solvency of his tenants, he came to the conclusion that the wisest thing he could do would be to get rid of them.

It was a duty he owed to his large family; charity ought to begin at home; he should be just before he was liberal; the shirt is nearer than the coat; and a host of wise and noble maxims came flocking in to strengthen his resolution, and next week, if the arrears were not paid up, the old weaver must find out credit elsewhere.

When the time came round, instead of sending his little girl as he usually had done to fetch the two shillings, the man went himself. It required strength of mind, he thought, when a child was not stern enough. As he had expected, he was brought to grant a little time for the outstanding week, and in a fortnight he should be paid. But he was not going to be put off, and declaring that he had a bill to meet, insisted on the payment. Little Kit begged and prayed of him to be merciful. She had the money, and she showed it him, but it was all they had to live upon for seven days, and if he took it, they must starve. He was very sorry—very; and, in fact, wished he could make them a present of the debt—nothing would have pleased him better—but he must be paid.

And so he was, for he began talking so loudly, and threatening so heavily, that the girl, fearing that he might rouse her father, and a quarrel take place, at last parted with her store.

Now, next week came round, and the same reports that had aroused the landlord's fears, had shaken the baker's faith. She would receive no money until her fresh stock of work was finished, and until then, how were they to manage? She knew the answer well enough, but did not dare to speak it.

Before the week was half over they were penniless. She had eked her little stock with all her care, scarcely touching food herself, until so faint with hunger, that, for the sake of her work, she was forced to eat. She had laboured so well and successfully that three of the five waistcoats were finished, but at least two days must elapse before she could hope to be paid.

At the usual time the little children stood round her, waiting for their slice of bread. She didn't dare to tell them she had none, for they would run crying to her father, and she dreaded the talking over of their wretchedness more than the enduring of it. Besides, she knew that if she did not take him the bread, he would understand that the cupboard was bare, and the pang of telling him so would be saved to her.

As the little things grew restless with their disappointment, she seated them round her and began telling them fairy stories she could think of, to try and make them forget their hunger. For two hours she talked to them incessantly; for, directly she ceased, the shuffling would begin, and their bright eyes would glance at the bread-pan, as if asking for food.

Unluckily, in one of the stories, she had to describe a Royal banquet and, thinking that a long and minute description of the delicacies might partly satisfy the little things, she showered down before them all sorts of mutton pies browned potatoes, plum puddings, and new bread and fresh butter in such profusion, that the story had quite an unexpected effect; for the auditors, driven almost mad by the tantalising feast, set up so loud a cry, that no promises, threats, or persuasions could stop it.

It was dreadful, her head was aching so that she could scarcely see the work she was slaving at. The little ones, now that the first paroxysm of their grief was over, were huddled up close to each other, sobbing quietly to themselves, and the old man, as if he understood the meaning of their sorrowing, was silent in his bed.

She felt thankful when night at last came. She soon placed the poor washed children in their beds to feast in their hungry dreams; and, lighting her candle, she still plied her needle. All was silent, and the air came coldly through the broken walls, blowing the flame about till she was forced to shield the light with her own body. Sometimes the children would mutter something in their sleep, and toss about restlessly, but she never once looked up from her work, her hand only seemed to move the quicker. Once she thought she heard her father speak, and fancying he had called her name, she listened. He was talking to himself in a low quivering voice, that every now and then burst out loudly with each push. Again and again she heard her name called, the old man praying.

How quickly the time flew by. The clocks seemed scarcely to have finished striking one hour before they sounded two next.

"Are you still up, my child?" asked Lamere, at midnight.

Kitty, without answering him, shaded the candle with both her hands, holding her breath, for fear he should detect the cheat.

"Thank God, she sleeps," muttered the old man.

By this working all night she had got through two days' work; and by the evening there would be food. But when bread is the only sustenance, the body cannot fast long, and when the morning came one of the children was so weak that it could not rise from its bed. It was cruel, thought Kitty, when the fatal symptoms, to be defeated, when a few hours more would have been sufficient.

She felt the little thing all over, rubbing its cold limbs and talking soothingly, to cheer it up. All was in vain; its strength was sinking fast. The tears fell from her eyes as she pressed her forehead in despair. "Food must be got, and quickly."

With the three waistcoats under her arm, she ran from the room, and, in less than half an hour, returned with a loaf under her shawl. There was bread at last, and never had it tasted so delicious. The spirits seemed to revive. The little ones were laughing and prattling once more, and the old man blessed her so often that she almost felt happy. But the waistcoats were gone, and how was she to redeem them?

On the Saturday she must take home her work. She must visit all her friends to raise the few pence she owed to pay back the loan, worked by all—and she shuddered at the thought, and tried to shake it from her.

She now worked with the desperation of fear, never ceasing once. She felt she was ill, each hour growing more and more feeble, and terror struck at last the fever should overtake her before her honesty had been made sound, she did not dare to stop.

She could have cried when, at night, her father, suspecting that she sat up late after they were asleep, made her bring him the candle she had worked by. Luckily, the moon was up, and with standing by the window the light was sufficient. For four hours she managed to continue

her work, straining her eyes, in the half darkness, till they seemed hot as fire. When at last the rising clouds covered the moon, she wept for sorrow that she should be forced to rest. She threw herself on her bed, and, dressed as she was, resolved to watch for sun-rise.

Never once did her eyelids close. The fear of her father hearing what she had done drove away all sleep. Her temples beat against the pillow, and her cheeks burned with the fever of anxiety.

With the first ray of light she was up, and having bathed her head, stood at a window waiting patiently for the darkness to cease. How slowly the blue light of day seemed to steal over the sky. How often would she try to begin, bending her aching head down, and moving her stiffened wrist, slowly and cautiously, as to begin evenly with two.

The chirping of the birds, and the cool morning air, soothed and refreshed her. Why should she fear? her work would be done in good time yet. Four, or at least five hours, would see her at ease.

Oh! how ill she felt; how her brain swam, and her legs tottered. If she had not clung to the window-sill, she would have fallen. All was over now: nature was sinking within her. The father must be told—all she had feared and suffered for, would come to pass. In her agony, she tried once more to finish the hated waistcoat. Propped up in her bed, and leaning against the wall, she raised her hands. Poor girl; she was so weak, they sank and sank, until, nearly fainting with the exertion, the needle dropped from her hold.

Her brain was on fire. Strange indistinct forms seemed to float across the room, until, growing afraid of looking at them, she forced her eyelids down and tried to sleep. It was the rest that nature wanted, for as she lay quietly in her bed her head grew cooler, and she was soon in a deep sleep.

Old Lamere had wept like a child, when, making the children draw aside the curtains, he saw his pale girl slumbering. The unfinished work was beside her, just where it had dropped from her hand. He saw how she had struggled to continue it, and he beat his breast with anguish to think that a mouth must pass before he could rescue her from her slavery.

It was late when the girl awoke, for the children had sat quietly around their little mother, scarcely moving lest it should wake her. Evening was closing in, and the lamps in the street were shining in at the window. She felt quite a new creature, and was able to cook, for a time she had forgotten her fears. There was only a nervous feeling hanging over her, as if something was going to happen.

The sight of the waistcoat, however, soon remedied her of her sufferings. The next day was Saturday, and then all would be discovered. Why had they let her sleep so late? why not have roused her up before it was night? And yet it would have been useless; for, though the fever had gone, she was as weak as a child. The trial she needs to sit up to her work, she sank back exhausted on the pillow. A sullen despair seized upon her. Let the worst come—let them seize her and put her in prison. It had been done to save life—she would have been guilty had she acted otherwise. Every exertion had been used, every muscle strained, to ward off the blow, and now she was prepared for all. It would kill her the quicker, and so end her suffering the quicker too.

But, after two nights' rest, her failing strength was so completely restored, that, in the few hours that were yet left, she vowed to make one more effort. There was only one waistcoat to half finish, and why despair. So much grief could be prevented, that it was well worth the endeavour.

The needle once more glided through the satin, slowly at first, but increasing till it seemed almost to fly. With what rapidity would she thread it, her eye, as she looked up, almost fierce with desperation!

When the time which the waistcoat ought to have been at the workroom was past, she shook with nervousness. Each moment she expected that Mrs. Lucas, angry with being disappointed, would enter the room. What should she do then? She would be dragged to prison, pass her birthday—her only birthday—in a prison! Horrible!

The door of the room was opened that she might hear the better. If a footstep sounded on the stairs, she would start with alarm and listen attentively. One of the children was posted on the landing, to let her know. Suddenly a tall woman, with a red shawl, was seen mounting the steps. She only asked for another hour—one little hour—and all would be saved.

Not a step was that? It was light like a woman's. It was mounting higher and higher. Oh! she had come at last. She went to the door to listen. No; thank God! the footstep had ceased at the first floor. To work—to work.

Half-an-hour, and she was free. How her hand shook—she could scarcely thread her needle. No, they would never come now; Providence would never allow it. Another tread on the stairs: but she didn't mind it—like all the others, it would cease on the first floor. There was only the collar to finish now; then she would hurry out, borrow the money, and off to the workshop.

But the sound, instead of stopping, as she expected, still ascended. Its for the second floor—second she counted; but it was the better; though by her lifting her eyes so often to the door, it was clear her alarm was far from quieted. Good Heaven! the tread had passed the second landing. Yes, it was for her. They had come to fetch her at last.

She ran to the window, and pulled the child that watched, pushed the door to violently, and double locked it.

Her father, alarmed at the noise, started up in his bed and asked the reason of it. On hearing his child's voice, the poor frightened thing rushed to him, and clinging to his neck, begged of him to protect her, weeping and sobbing between her words. As he soothed her he drew from her the cause of her fear; and she told it so prettily, excusing herself by such kindly reasons, that he not only loving her for her transgression.

Just then came a tap at the door. How she shook with fear, and hid her face in her hands. The knock again: she could have screamed for help.

"Open the door," shouted Lamere.

"No! no! no!" shrieked Kitty, stopping his mouth with her hands, whilst her eye looked wild with terror.

"Come in," continued Lamere.

The handle trembled violently for a second or two, but the lock was too strong to give way.

"It's Joe! It's Joe!" cried one of the children, who had peeped through the keyhole. "It's Joe," and the little thing clapped its hands to think that their little mother would not be taken away.

"It's a good sign for a poor man," said the pigeon-fancier, stepping into the room, "when he looks his door. We lost the key to ours just six year ago, and, as the plate is of the willer pattern, we have bought a new un. I've brought yer over a present of a bit o' meat for to-morrow, miss; had a go of luck, and got six shillings for a pouter from a young gent: it's as nice a bit o' flank as ever bled in a pot."

"Will you come and speak, lad?" said Lamere. Pointing to the loom, he said, "It must go at last: and I want you to take it"

"What! going to sell the old un?" cried Joe in astonishment. "Dear, dear! I am sorry for it, mother. I hope you'll be fewer weavers as works at the beams their fathers did. Is it really going?"

"And quickly too," continued the old man, "the business is rather pressing."

The screws were quickly undone, and the pests lashed together. They watched the lad in silence, sorrowfully taking a farewell glance at the dearest object of a weaver's pride—his father's loom.

So the waistcoats were redeemed, and taken home. One of them was, however, thrown back upon the young seamstress's hands as damaged. It was stained in two places, where the tears had dropped.

"I'll wear that waistcoat, Kit," cried the father, proudly; "to think that they could call it spoiled!"

(To be continued.)

MR. F. TUPPER'S HYMN FOR ALL NATIONS, 1851. Translated into Hindostanee language. Published.—This hymn is a short and simple song of praise, to be used ideally in relation to the Great Exhibition and gathering of all peoples. Brief as it is, however, we object to one verse of its composition—

"May we, with fraternal mind,
Bless our brothers of mankind."

There appears to us to be a pleonasm in "fraternal" and "brothers;" some other epithet, and of more emphatic strength, is required.

THE MARBLE ARCH.—*(To the Editor.)*—Sir: Observing a correction in the LITERARY GAZETTE of the 24th ult. of a statement in an article which appeared in the preceding Number, I beg to state that even the correction is in error, Flaxman not having been the designer of any portion. The south front was designed, executed by myself; the north by Sir Richard Westmacott.—I am, sir, your obedient servant, E. H. BAILY, R.A.

SIGNOR BOSCO.—The concert-room of the Princess' Theatre was made, on Wednesday week, the arena for prestidigitation of a remarkable kind. Signor Bosco, from Turin, presented many astonishing examples of illusion, executed with incomparable dexterity—birds' heads cut off, replaced, and substituted, and articles of all descriptions abstracted and returned, with wonderful celerity. As the performances, however, are announced to be changed on every representation, description is useless, and our readers must be referred to the magician's programme and his actual feats, which only when witnessed can be appreciated.

TO CORRESPONDENTS.

DIPLOMATIC PRINTING.—We have received a letter from Messrs Radcliffe and Co. of Birmingham, stating that the patent for that process was taken out jointly by Mr Steward and Mr Lyons, and that the patent was assigned to Messrs Radcliffe and Messrs Elkington conjointly. It appears to us that the ILLUSTRATED LONDON NEWS should contain the statement, and whether Mr Lyons has or has not a right to exhibit the process, as we have only to make the public acquainted with the operation as long now carried out at the Crystal Palace. The process as if is a very important one in its results, as it enables the manufacturer to do, pecuniarily, what he does not require to be furnished. The nature of the operation is very mysterious and the scientific man has at present not the faintest idea of the manner in which the bisulphuret of carbon acts to produce this singular result. It is well worth the attention of the investigator; and, when it is thoroughly worked out, the most distinguished electro-metallurgists consider that it will lead to great results

A W. OLIVE LEAF should be sent, although its use has been somewhat anticipated

J. W. Carlisle.—The announcement will be duly made

CLOTTEY.—Any shemnick who will pay, we cannot afford space to do so

SCRUTOR and P. W. S.—Davidson's system of Short-hand

SAM K.—The address of the Sacred Harmonic Society is Exeter Hall, Strand

H. W. B. Bristol.—The season tickets will, of course, admit till the close of the Exhibition next.

G. G.—We cannot enter into the "Surplice" question

CLERICUS may obtain the work from Wonder Vol. Wesle, Holborn

X. Y. Z. Sofar.—The German edition of the ILLUSTRATED LONDON NEWS is 6d per copy, and will be forwarded on the receipt of the cost

H.—One of Mr Tate's useful books contains the money, weights, and measures of all different countries

A. B. Tunbridge Wells; J. B. E. Carmarthen; and F. A. E. Great Yarmouth.—We regret that we have not room

J. L. Berwick-upon-Tweed, and M. W. St Albans.—The "National Illustrated" Library edition of Boswell's "Life of Johnson" will be published in October

T. G. Manchester, should apply to a publisher

CURIOUSLITE.—See Hume's works, or "Hicuscian," published by Longman and Co

ANNIGALLAH presents the "Diary of Henry Teenge," long out of print. Apply to the "Publisher's Circular," 7 Set-street

AMATEUR PICTURE-CLEANER.—See the "Sailing Handbook of Oil painting," 66, Fleet-street

AN EVERY-DAY NIGHT READER.—See "Davidson's System of Short-hand"

R. S.—Address a note to the President's Privy secretary

UNION FELLOE.—A list of the commissioned officers is given in the "British Almanack"

E. E. W., Jersey.—Queen's College, 87, Harley-street, London, is for general female education; and for governesses a government certificate of qualification

M. A. R. I. Dunkerque.—Rubbish in a vegetable

A PLEVART, Warsaw.—We cannot compel the parish authorities to enter into the proposed arrangement

AN OLD SUBSCRIBER, Birkenhead.—See Sydenham's "Guide to the Great Exhibition

AN INVALID, Ilford.—We cannot speak as to the qualifications of medical advisers

F. H. M., Taunton.—The fee at the College of Chemistry are for the session, daily attendance, 3l.; four days in the week, 1l.; one day in the week, 5s

R. J. F. near Exeter.—Apply at the office of the Great Exhibition

A PRIVATE SUBSCRIBER, Woolwich.—Recent Travels in Russia

JOHN D. S. 32 new vessels, at least, have been launched

A SUBSCRIBER.—The recent announcement of the expected 3000 Parisian National Guards was unauthorized

A. CONSTANT READER.—The first Number of the ILLUSTRATED LONDON NEWS was published May 14, 1842

C. U.—See the account of the East India Company, in the "East India Directory" for 1851

J. J. H. Bilston.—We regret that we cannot find room for the illustration

A. B. (Wandle).—Insert a case for a court of law

E. P. A.—A practical book on bill stamps is published by Simpkin and Marshall

A. A. ARTIST, Southampton.—Your suggestion for a Camera-Obscura apartment is already erected in the Crystal Palace, "to all friends, parents, and children, who may occasionally lose each a bet"

JULIAN WARD is thanked, but we have not room for his letter

SCOTLAND will find additional information in Black's "Picturesque Tourist of Scotland"

H. B.—Apply for fancy rabbits in Leadenhall Market

C. E. B. Cardiff, is thanked, though we could not avail ourselves of his obliging offer

R. S.—Edmund Burke was tried by the Dublin Corporation, in the Irish Queen's Bench, May 22, 1686, for an Engraving of the Court-house in No. 318 of the ILLUSTRATED LONDON NEWS

A SUBSCRIBER, Dorset.—Apply for Pembroke's "Arcadia" to Mr. H. Bohn, York-street, Covent-garden

A LADY, Louth.—We regret that we are not in possession of the required information

MARIE Birmingham.—Walker pronounces the *r* feeble

CAMERA may obtain a list of the Directors at the Company's offices

A CONSTANT READER, Camberwell, Grosvenor-terrace.—See

A. B. (Dublin).—Apply at the Poor-law Board for a case for counsel

HENRY, Dublin.—Apply at the Poor-law Board

DENIS.—See "Notes and Queries" for 1850, and the Second in "The Illustrated Year-Book" for 1851

A SUBSCRIBER, Carlingford.—At the Royal Naval School, New Cross, Deptford, there are reduced and gratuitous scholarships, respecting which application should be made to the Secretary

CANTAB is thanked, though we had not room for it. Ibi

LEARNER, Dublin, is unlucky; not seven out of the nine in his eight queries would occupy half a column of our Journal

QUERY, Hertford.—Apply at the Prerogative Will-office, Doctors' Commons

R. B.—See the small volumes on Emigration, now published, by Chambers, Edinburgh

H. S. B., Liverpool.—See Beckwith's "Card Parties"

D. G. G. Lothian.—The best means of colour for a black-and-tan terrier are, the black intense, tan rich, and the line well defined

A REGULAR SUBSCRIBER, Bodmin.—A pyramid, geometrically speaking, has one of its sides, the base, a plane figure, and the other sides three triangles having a common point at the top, termed the vertex. An obelisk is a truncated, quadrangular, and slender pyramid

A LABORIOUS STUDENT.—See the Old Bailey Sessions Paper, 14, Fetter-lane, and 3, Paul's Alley, Paternoster-row, and 3, Paul's Alley, Paternoster-row, and 3, Paul's Alley, Paternoster-row

9 & 10.—PAPER PATTERNS. BY TOWNSHEND, PARKER, AND CO. Two very agreeable designs for paper-hangings.

11 & 12.—CANDELABRA. BY POTTS, OF BIRMINGHAM. The reputation of Birmingham art is creditably sustained by these productions, in which simplicity of composition is happily combined with exquisite finish of workmanship. The stork candelabrum is especially beautiful.

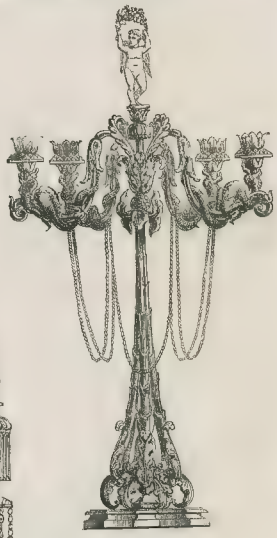
13.—CHANDELIER. BY PERRY.

All previous productions in this line are probably eclipsed by the magnificent crystal chandelier, manufactured by Mr. Perry, which is a conspicuous object in the gallery over the north-west corner of the Transept, in the immediate neighbourhood of the carpet worked for her Majesty by the hundred and fifty ladies whose names are recorded in connexion with it in the official Catalogue. This chandelier, which is a dozen or more feet in height, is intended for 144 candles: its design shows the style of glass-cutting of the eighteenth century, with the modern improvements. The colour and quality of the glass is no less remarkable than the massive elegance of the composition.

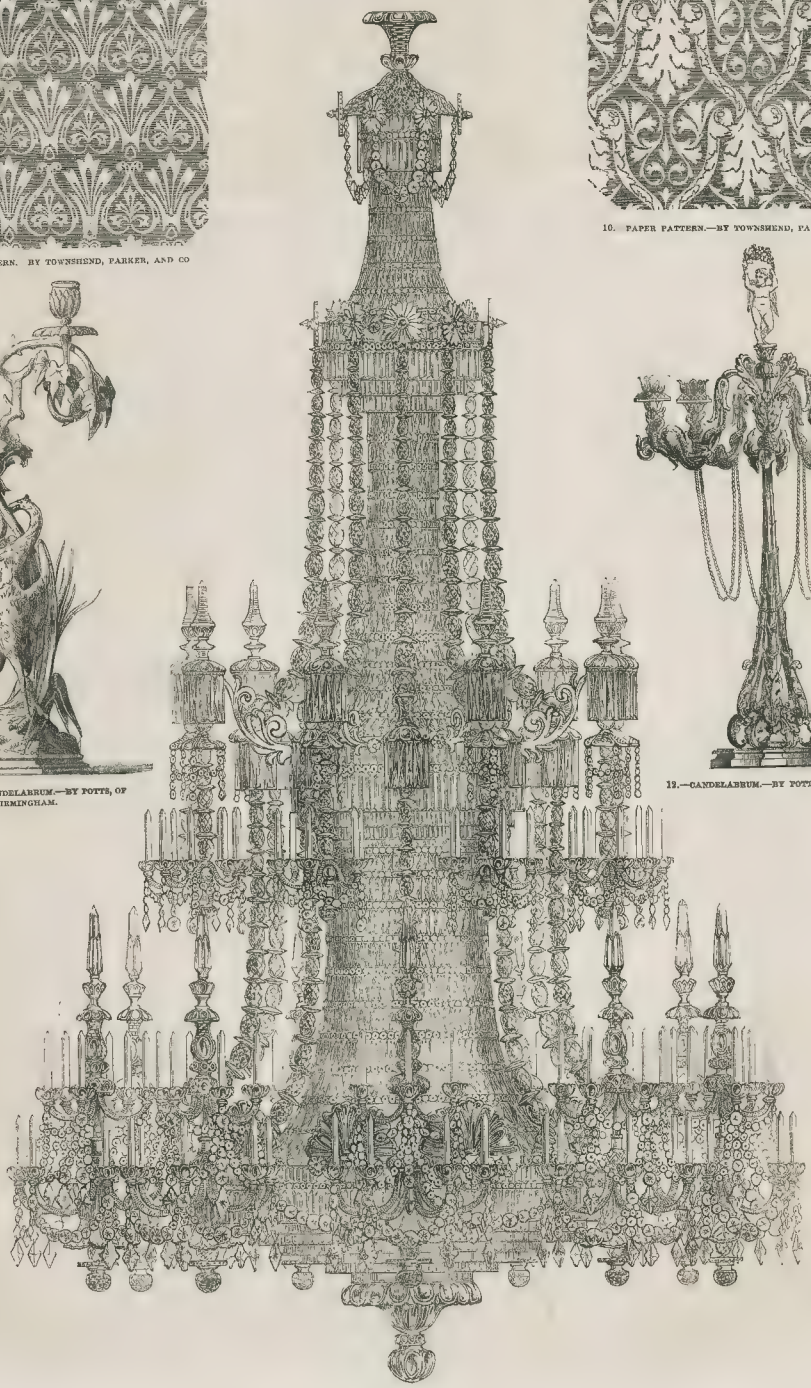
9.—PAPER PATTERN. BY TOWNSHEND, PARKER, AND CO

10. PAPER PATTERN.—BY TOWNSHEND, PARKER, AND CO.

11.—STORK CANDELABRUM.—BY POTTS, OF BIRMINGHAM.



12.—CANDELABRUM.—BY POTTS, OF BIRMINGHAM.



13.—CHANDELIER.—BY PERRY, BOND-STREET.

London: Printed and Published at the Office, 198, Strand, in the Parish of St. Clement Danes, in the County of Middlesex, by WILLIAM LITTLE, of 198, Strand, aforesaid.—SATURDAY, JUNE 7, 1851.—SUPPLEMENT.

THE ILLUSTRATED LONDON NEWS.

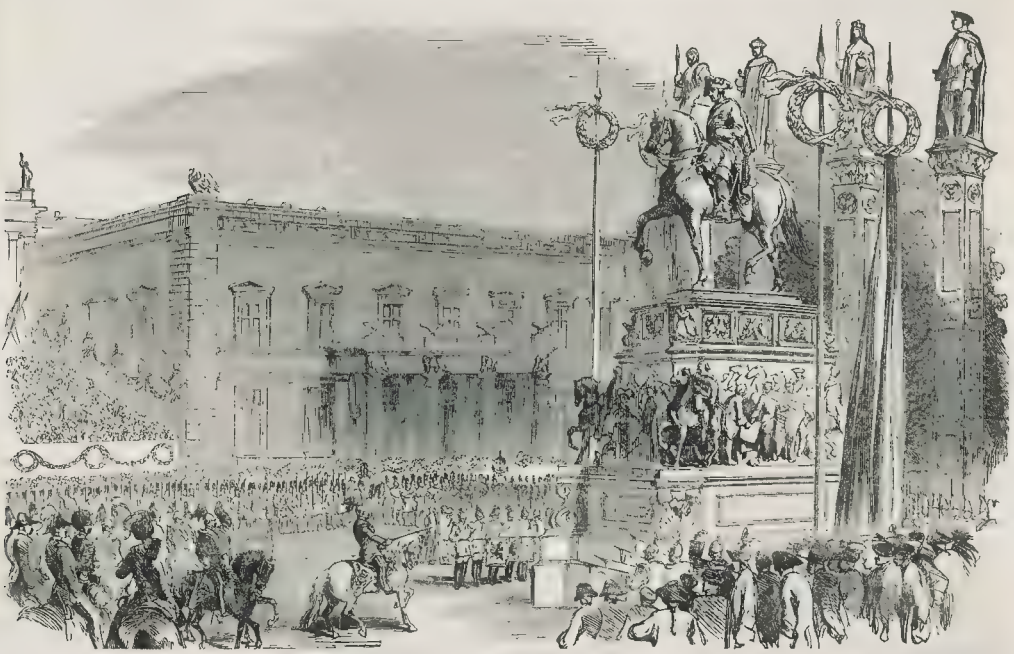
No. 493.—VOL. XVIII.] SATURDAY, JUNE 14, 1851. [TWO NUMBERS, 1s.

AMERICAN NOTIONS.

THE present is said to be an age of great ideas; and, without flattering the age unduly, it must be admitted, that, in some respects, it deserves the appellation. The splendid achievements of modern science—which allows the man of the nineteenth century to see as much of the world in a day as his forefathers could see in a fortnight, and which promises, by means of electricity, "to put a girdle round the earth in five minutes," and thus do in sober reality what the dainty Ariel of the poet's fancy suggested as within the power of the fairies, but not of men to perform—accustom the popular mind to the reception of great ideas. The way is thus prepared for the realisation of many projects which, in an age less educated, would be scouted as altogether fabulous and impossible. Steam and electricity are great and practical teachers. They abolish distance; they virtually bring the ends of the world together; and if they do not render the estranged and divided nations one great family, they take the first step towards that happy consummation. Great ideas are ever the forerunners of great facts; and, as there is a predisposition in the public mind of Europe and America, at the present time, to give such ideas a fair reception—to examine them without prejudice—and see what practical value there is in them, we are desirous to take advantage of the opportunity to bring under the notice of our readers two ideas deserving to be called great, for which we are indebted to the genius of our transatlantic brethren.

The first and elder of the two, a scheme for an "Ocean Penny Postage," was suggested to Mr. Elihu Burritt by the successful operation of Mr. Rowland Hill's plan for a uniform penny postage. Mr. Burritt, enlarging upon this realised idea, is of opinion that what is good and feasible upon the land might also answer upon the sea, and that the people of Europe and America might be made to hold communion by letter, at as cheap a rate as London and Dublin, or

HER MAJESTY'S COSTUME BALL.—COSTUME OF THE RESTORATION.—FROM A PICTURE B H. JANSSEN.—(SEE NEXT PAGE.)



INAUGURATION OF THE STATUE OF FREDERICK THE GREAT, AT BERLIN.—(SEE PAGE 545.)

John o' Groat's house and the Land's End. By the term "Ocean Penny Postage," Mr. Burritt means, that the service of transporting a letter, weighing under half-an-ounce, from any port of the United Kingdom to any port beyond the sea, at which the British mail-packets may touch, should be performed by the British Government for one penny; or, in other words, that the charge upon a letter transmitted from any town in the United Kingdom to any port beyond the sea, either in the Old World or the New, should be twopence—one penny for the inland and the other for the ocean postage. The notion appears somewhat startling at first sight; but when its dimensions are taken, although it loses nothing in that grandeur which recommends it to the enthusiastic, it gains a great deal in that clearness and practicability which recommends it to men of business. When the first disinclination to receive any new idea has been removed from an Englishman's mind, he is apt to ask if the project which it embodies will pay; and, if it will not, to pass on to other matters. To this point Mr. Elihu Burritt has lately addressed himself. Encouraged by the brilliant and increasing success which has attended the experiment of Mr. Rowland Hill, he has made calculations, upon which he grounds his belief, that a correspondence between Great Britain and the Continent of Europe of three times its present amount, and between Great Britain and America of four times its present amount, would pay as much as the British Government now receives for the transmission of the Ocean mails. Mr. Burritt's arguments are forcible; but, what men of business will like far better, his calculations are moderate and satisfactory, and understate rather than exaggerate the amount of postal communication which would in all probability result from the great change which he advocates. Sooner or later this idea, which in itself is not more destructive of all preconceived notions upon the subject of postage than Mr. Rowland Hill's was when first promulgated, will, we have little doubt, work itself up into a fact, to the great honour of Mr. Burritt who started it, and to the great benefit of all civilised nations.

The second idea, also an "American notion," is more original and striking than Mr. Burritt's, and embodies the most gigantic project ever yet broached by a sane and cool-headed projector. Mr. Asa Whitney, a citizen of the United States—a man of enlarged ideas, if ever there was one—has laid a scheme before the Government of his own country, which he has explained by his letters to the people of this, for the construction of a railway about two thousand miles in length, to connect the Atlantic with the Pacific Ocean. It is not enough for Mr. Whitney that the electric telegraph should convey messages under the sea, or enable us, as it probably will before the world is much older, to send an order to China in ten minutes, and to get an answer in ten more. He would send goods and people across the world, as well as messages. He would open up the continent of North America, from Lake Michigan to California; and from California, by a line of steam-packets, he would visit and trade with the Chinese and Japanese. He would construct a new and great highway for all nations to use in their wealth, the resources, and enterprise, as well as the labour of the Old World, will," as he says, "be drawn off to the New World, where man's real as well as imaginary wants can be supplied from his toils and his efforts. These movements can be directed, but cannot be stopped. Their course is onward, till man's destiny is fulfilled; the wheels cannot be turned backward; commerce, civilization, and Christianity must encircle the globe." Mr. Whitney, having these enlarged ideas, endeavours to give them a practical value, by showing the world how they are to be realised for its benefit. He has no money for such a gigantic project; the United States Government has none; and he does not propose to raise it by allotment of shares. His method of constructing his line is as novel in its conception as the line itself, and is enough to take away the breath of the ordinary-minded relics of a past age who yet survive amongst us and have energy sufficient to listen to his project. Mr. Whitney simply asks the Government of the United States to cede to him a belt of land 60 miles wide for the whole length of this railway; or, in other words, 120,000 miles, or 78,000,000 acres of good, bad, and indifferent soil, for which he undertakes to pay 10 cents an acre, or a fraction less than 800,000,000 dollars. Lord of this territory, he would engage to provide for all expenses of the construction of the line, out of the sale of the land upon each side of it. He argues that towns and villages and a busy population would, in the course of time, cluster along the whole route; and that his railway would not only reimburse him, and be a benefit to the United States, and to Europe and Asia, as well as to the daily augmenting swarms of emigrants that rush from the Old World to the New, but that it might, after an inconsiderable interval, become the property of the nation, free from all tolls, except such as would be necessary to keep it in repair and pay the expenses of management. Mr. Whitney believes, that, if the cession were made to him, he would be able to sell the first five miles of land upon his road for as much money as would suffice for the construction of ten miles of railway; and that the scheme would thus feed itself.

Whatever may be thought of the project in England, its novelty and greatness have not startled our friends on the other side of the water. Twenty-one of the States of the Union, to whom it has been formally submitted, have promised through their Legislatures in its favour; a committee of the General Senate of the United States, to whom it was referred, have presented a report in which they strongly recommend it to the Government; and a bill has been introduced into Congress, of which the object is to confer upon Mr. Whitney the privilege which he demands. But, as it appears, notwithstanding all these circumstances in his favour, that there is a doubt whether the best and most saleable parts of his great belt of land have not already passed into private hands, and that, consequently, they are beyond the power of the Government to cede to him at the price named, or at any price at all, Mr. Whitney has resolved to broach his project to the British as well as to the American Governments. "Although," he says, "it has been the hope and desire of his heart, as well as his incessant toil for the best part of his life, that his own country might own and for ever possess the glory of having achieved this work, still, without the lands, which are the only possible basis of means and facilities, it would be impossible; and should it appear, as he fears, that they are already occupied, he has no hope but in England." Such a line, carried through Canada and the British possessions in North America, would, he imagines, be somewhat more difficult to construct, but would, in a commercial and cosmopolitan sense, be quite as good as the other.

There was a time—not very distant—when such a scheme would have been received with shouts of derision. Though it may excite wonder in the present day, it would not unmingled with respect. Whatever may be the result, the world is indebted to Mr. Whitney for a great suggestion.

HER MAJESTY'S COSTUME BALL.

While the music of the lordly Corante or the courtly Saraband is resounding through the brilliant *salons* of Buckingham Palace, whither the beauties of the Merry Monarch's Court seem to have flocked to her Majesty's *Bal Costumé* descending from the cold walls in King William III.'s bedchamber at Hampton Court, to spend one more evening, and dead, like exhausted Sylphs, at dawn with the gallant Sedley, the witty Rochester, the splendid Buckingham, and the rest—while rank and beauty, royalty and fashion, are thus uniting to resuscitate the gay glories of the past, the sputtering steam and the clanging engine are working their minions with our "eye painting" of the week's history. To describe a ball which is being danced where see are as prose is impossible; although, had we the gift of prophecy, we might perhaps point out a Quadrille of Amazons—that is, ladies dressed *à la Mademoiselle de Montpensier*—led by the Duchess of Sutherland, all wearing white satin skirts, embroidered deeply with gold, jackets of the fashion of our modern riding-habits, with green velvet profusely laced with gold, each lady with a hat and a large waving feather, and carrying a riding-whip in her hand. You may see just such a figure in Mr. Ward's sketch of his own picture of the "Fall of Clarendon," at the Queen's Palace, two years ago (a fine, TRACED NEWS some years since), and fancy it *La Belle Stuart*, as she stands proudly yet prettily and piquantly forward in the foreground. We might, too, in the mirror of our fancy, see the Venetian Palatinate in a costume *à la Hollandaise*, of yellow silk, with body and sleeves and robe of black velvet, and the long stomacher ornamented with jewels, and gaily pranked up the centre and down the sides with pink ribbons. Nor should the "Spanish Quadrille" be wanting in our praise, led by the Marchioness of Aliesbury; though it should rather have been styled "The Portuguese," out of compliment to the Queen Catherine of Braganza, whom, by-the-bye, the ladies of that day, we are sorry to say, were not always too ready to compliment. There the pink skirts and the white watered silk robes, the pink bodies trimmed with pearl beads or pendent strings, the pink *bonefon* turnnungs, the lacing of the ribbons, and the whole we might prophetically pronounce delightful. We might tell, also, how Lady Diana Campbell will flourish in green satin and gold, with sleeves slashed in white satin; and Mrs. Bulteel, in silver brocade; and how the Duchess will be another Maria Theresa of Austria. But these are matters which we shall postpone until our artists can speak to the eye by sketches taken from the dresses as worn, and tell of the scene as they saw it in all its Royal splendour.

The period of the Costume of the Ball has been limited by her Majesty to that of the Restoration, which may be considered as extending from 1660, when the King was recalled, to 1680, when General Monk, Duke of Albemarle, the minister to his Restoration, died. During these twenty years, there were two, if not three, changes in the fashion of dress. The style in vogue when the King came over was, for gentlemen, that of the old Cavalier, slightly modified by the gay extravagance of the Puritans. The short jacket and petticoat trouser, with the gally embroidered cloak, returned with the King, as did the broad-brimmed hat which he brought with him from Spain, with its flowing feather. The full, puffed out, fine shirt, the short full sleeve, the lace ruffles round the knees, and spreading out like fans, the rich falling collar, the lace cravat, all came over to Dover with the Merry Monarch. But soon the French Court added their gay streaming ribbons from knee, shoulder, and waistband; soon, too, the broad bandelier, with its pending tassels of bullion and its gold lacings; soon the good one and much be-buttoned waistcoat swept their away; the petticoats withdrew, leaving the under drawers, that formerly just peeped out, now full-blown and valorously prominent, as knee-breeches. Then the stockings became less fine and glaring and more light and gentle, until, finally, the picturesque dress of the Vandyke period, having been loosened by the somewhat too easy style of the Restoration (witness Lely's portraits), both as regards men and female dress, ran right off into the close extreme, and degenerated into the "coat, waistcoat, and breeches," the whole suit (which we hear of first as of one pattern in 1670); and coming out lastly in the full ugliness of the periwig, powder, pig-tail, and bobtail coat of George I.'s time.

Lady Fanshawe, in her memoirs, gives us a fond and therefore exact description of her husband Fanshawe's dress, which was given presented to the King of Spain, at Madrid, where he was Ambassador, as follows

"Sir Richard Fanshawe having audience of the King, was dressed in a very rich suit of tissue, of a dark Rhenish colour, embroidered with silver and gold lace nine laces, every one as broad as my hand, and a little silver and gold lace laid between them, both of very curious workmanship; it had was trimmed with perfect taffety ribbon, and his stockings of white silk upon long scarlet silk ones; his shoes black, with scarlet shoe-strings and garters; his band very fair, used with very rich Flanders laces, of black silver, buttoned on the left side with a jewel of £1200 value; a rich chrons wrought gold chain made in the Indies, at which hung the King his master's picture, richly set with diamonds, on his thumb were two rich rings; his gloves trimmed with the same ribbon as his cloth's."

We have a portrait of Lady Fanshawe, also (about 1660) thus described:—"You must notice the King's fashion of wearing down the hair, which was the worn afterwards black wigs, tapering upwards like the famous *pears* of Louis Philippe, whose vanity it was to look like the Grand Monarque); observe his black, broad-brimmed hat, with its gold band and feather, his full, puffed out shirt and the Russells of his day wore theirs, some, reminding the matter—the feathers lying on the brim, and flowing over it on each side at the head—his short jacket reaching but little below the chest—its sleeves very short like a boy's, open sleeves. The fine Holland shirt is shown almost from the upper part of the arm, tied up fancifully in four or five places with ribbons, so as to make four or five puffs in the arm reaching to the elbow; this, by the bye, was the fashion in ladies also, save that the puffs were always large in size and less in number, as the ribbons broader. The shirt shows itself as very prominent by between the jacket and the trunks, which are gathered up with almost a fringe of ribbons, and end in white linen or silk drawers, tied also, and trimmed fantastically with ribbons coming down half way to the knee, leaving their chief almost alone. The reports from all quarters state that the Kaffirs are tired of the war, and are anxiously sueing for peace. The *Singapore* had arrived with 300 troops, and were going on board the *Sir*, which saved immediately for Algoa Bay. This reinforcement, with the early expectation of others, gave great satisfaction to the colonists, as the Kaze lency Sir Harry Smith would then be able to resume offensive operations.

The group which furnishes the subject of our Illustration is taken from a painting by Hieronymus Janssen, in the collection at Windsor Castle. It forms the centre of the picture which illustrates a Grand Festival given to Charles II. at the Hague, just previous to his departure for England to resume his crown. Little is known of the picture: it was discovered in 1825, at Warcheren, through a mere accident, by Mr. Smart, the father of Mr. H. Smart, now of Tichbourne-street, and afterwards sold to Lord Ravensworth, who presented it to George IV. in 1826. In the account of the "Reception of Charles II.," published in 1660 at the Hague, and afterwards in London, by Sir John Ogilby, "Master of the Revels in Ireland," we find an illustration of a famous

[illegible] May, to Don Estevan de Gamarra, the Spanish E[illegible]

which were present have Charles the Queen of Bohemia, the [illegible]

Royal, the Princess of Orange, her son and daughters; Lords Digby, Croft and Taff; Lord Clarendon; the Dukes of Brunswick-Lauenburg, O'Neal and Killigrew, Mrs. Howard, the Countess of Stanhope, &c. The rooms are decorated in a similar style, and the party sit at supper, as they are to be seen in the left-hand corner of the picture, which is omitted in our sketch. In the portion here given the King is dancing—a minuet it may be, for mirth were then very new—with his cousin, Elizabeth, the Princess Palatine. The future group is formed by the Duke of York, the Princess Sophia (youngest daughter of Elector Palatine, afterwards mother of George I.), the Princess of Orange, her young daughter Mademoiselle d'Orange, and the Queen of Bohemia (daughter of James I.) To the left of the King stand either the Grand Pensionary or the Duke of Brunswick-Lauenburg and the young Prince of Orange. Killigrew, the Duchess of York (then only known as Anne Hyde), and Madame Howard, complete the group on the right. These are, of course, the exact costumes of the period; indeed, there cannot be a better authority, especially as this was a state occasion. The King wears, it will be observed, the Spanish sleeve; and the robes of the ladies are not open, with the exception of that of the Princess of Orange, who may be presumed to be in the latest fashion. The other ladies, in their dress, partake of the then decent propriety of English costume, and the sober richness peculiar to the Hollanders

Next week we shall illustrate certain of the most picturesque Costumes worn at her Majesty's Ball last evening. Meanwhile, we present our readers with an Engraving from one of the highest authorities which has been followed by the *Costumers*.

FOREIGN AND COLONIAL NEWS.

FRANCE.

The general tenor of the accounts from Paris this week shows that however greatly the National Assembly, or the large section of it known as "the party of order," may condemn Louis Napoleon's speech at Dijon, that outburst has raised him considerably in public estimation throughout the country; to which fact is attributed the vast amount of numerously-signed petitions presented during the past week to the Legislative Assembly, praying for a revision of the Constitution in the Bonapartist sense, viz. the retention of Louis Napoleon at the head of affairs by the prolongation of the period of his Presidency.

On Thursday not less than forty members of the Assembly presented petitions for a revision *à la Bonapartiste*. Those already signed contain, it is said, 800,000 names; and when the whole are presented, it is expected that they will reach 2,000,000.

The Committee on the revision of the Constitution have chosen M. de Broglie for chairman, and M. Moulin for secretary.

The Budget committee have resolved to recommend the refusal, for next season, of the grant to the Italian Opera and the Odéon. It also intends to suggest a reduction of 800,000f. in the grant to political refugees.

M. Persuade, editor of the *Messenger*, has been sentenced to three months' imprisonment, for the publication of an article tending to disturb the public tranquility.

Marshal Narvaez had left Paris for the London Exhibition.

Accounts from Algiers notice two more engagements between the French troops and the Kabyles, which ended in the defeat of the latter. It is added that General St. Arnaud had retaken Djidjeli, having succeeded in reuniting three great tribes. Eight out of the sixteen small tribes had submitted, and the remainder were expected immediately to follow.

PORTUGAL.

We have intelligence to the 4th inst., direct from Lisbon, by the *Teviot* Royal mail steam-ship.

The advices thus received contain no account of the counter-revolutionary movements said to have broken out in Portugal, the news of which had been transmitted last week *via* Madrid and Paris.

Portugal generally was tranquil. The army appointments, embracing few Progressistas either, had not met with any decided opposition, though they seem to have created dissatisfaction in a portion of the army. Saldanha had conferred the chief commands upon his more immediate partisans, while Progressistas were introduced into the administrative departments.

The Cabinet had repudiated the idea of a stoppage of payment, and supported the continued payment of dividend revenue to the Board of Public Credit.

The Duke de Saldanha, as well as the Count de Pinheiro, the chief of his staff, had been much indisposed, but both had recovered when the *Teviot* left, and there was no truth in the report of poison having been administered to [illegible]

Later accounts from Lisbon, up to the 5th, have been received since the above.—Things continue quiet under the new Government. The Electoral Law Bill was still in committee, but it had almost brought its labours to a close. As far as could be ascertained, the suffrage would be of an enlarged kind.

Sixteen out of the twenty-seven Royalist peers who by a decree of the 23d ult., are permitted to resume their seats in the Upper Chamber, have positively refused to accept the favour granted.

A loan of £.00,000 was required by the Minister of Finance, and the shareholders of the bank were to [illegible] on the 7th.

UNITED STATES.

Accounts from New York to the 29th ult. have been received, but they contain scarcely any news of interest.

A serious riot, attended with loss of life, had occurred at Hoboken. The Germans of New York were celebrating a festival at that place, when a disturbance took place with some New York men, resulting in the loss of several lives. Upwards of 60 Germans had been arrested.

Cholera had again made its appearance in Cincinnati and the neighbourhood.

CANADA.

By the *Franklin* steamer, which arrived on Thursday, with advices to the 31st of May, and New York, we learn that the Governor-General had refused to produce the correspondence with the American Government relating to the reciprocity of trade, and recommending the closing of the canal against American vessels as an act of retaliation.

WEST INDIES.

According to the intelligence received this week from Jamaica, dated May 14, the cholera had re-appeared in some of the agricultural districts, but not to any very considerable extent.

His Excellency Sir John A. B. Murray M'Gregor, Bart., Governor of the Virgin Islands, died at Government House, Tortola, on the 11th ult., having held the sun administration of affairs only a few weeks. Sir John M'Gregor was the eldest son of Sir G. M'Gregor, formerly Governor-General of the British Windward and Leeward Islands.

By the Trinidad papers we learn that the Council of Government had passed a series of resolutions forming a board of education, and establishing training and primary schools from the public revenue in the country, to which admission would be gratuitous, and where the instruction given should be secular and without direct religious or doctrinal teaching.

From Barbadoes we learn of the death of Lady Colebrook, and that the smallpox has just broken out there.

INDIA.

The telegraphic despatch, *viâ* Trieste supplies us with an outline of the forthcoming Overland Mail, which had arrived at Bombay from Calcutta of May 3; Bombay, May 14; and Hong-Kong, April 23. With the exception of the western frontiers of the Punjaub, which were infested by robbers, all India was tranquil per letter. The dates were to April 30. The general State at Bombay have at length been discovered. The North-West Bank deficit was estimated at £80,000.

CAPE OF GOOD HOPE.

By the Royal mail screw steamer, *Sir Robert Peel*, we have accounts from the Cape to the 2d ult. The intelligence thus conveyed is of a more encouraging nature than could have been anticipated. The combat may had been engaged during the previous month in a series of successful skirmishes with the enemy, in which a number of cattle were captured. The British troops killed and wounded were few; but the Kaffirs sustained considerable loss. We regret to learn that in an affair of this kind, on the 16th of April, Lieutenant Fletcher, of the 73rd Regiment, was killed, he having been pierced with 70 assagais, and that Captain Morris, of the Levies, was severely wounded. The fact of Kreli and his tribe having gone over to the enemy is fully confirmed; they took part in some of the late operations, but have since retired with a force of their chief's almost alone. The reports from all quarters state that the Kaffirs are tired of the war, and are anxiously sueing for peace. The *Singapore* had arrived with 300 [illegible]

LETTERS BY THE BRAZILIAN PACKETS.—Instructions have been forwarded to the British Minister at Brazil, empowering him to instruct the vessels employed as to the ultimate result of the treaties which are taking place. The population of Old Calabar, watching for a favourable opportunity, have broken out against the constituted authorities, and taken possession of everything on shore. The following is the form in which the news was posted in the rooms of the Underwriters' Association, at Liverpool, on Monday:—"Cameroons, Feb. 9. —A boat from Fernando Po just arrived, brings intelligence of the slaves at Old Calabar having revolted, and being in possession of everything on shore. Her Majesty's ships *Gladiator* (6) and *Arabus* (14), being in Clarence, went over immediately, and a despatch was sent to Mr. Bicroft to bring him down from the Dolony country. The result it is feared, will entail serious damage to the British vessels trading there, the slaves being in possession of everything on shore

---

THE ST. ALBANS ELECTION.—The hitherto large lace of the witnesses in the St. Albans case, for whose apprehension the Government some time since proclaimed a reward of £50 each, has been discovered. Inspector Beckerson, of the A division of the metropolitan police, has traced [illegible] one of the missing parties to Glasgow, where he found them living at their ease, and evidently well supplied with funds. Inspector Beckerson having introduced himself to the Glasgow into the necessity of their return to their native shore [illegible] French authorities, it was intimated to Mr. Beckerson that if he persisted in appre[illegible]ding them, they would be rescued from his custody and set at liberty. Under these circumstances the inspector has returned unsuccessful [illegible] quarters, and thus ends this matter at present stands.

IMPERIAL PARLIAMENT.

HOUSE OF COMMONS.—THURSDAY.

The House re-assembled after the Whitsun recess.

NEW MEMBER

Mr. HALLIWELL took the oaths and his seat for the borough of Newry.

IRISH POLITICAL EXILES.

On the motion for going into Committee of Supply,

Mr. ANSTEY moved as an amendment, a resolution condemnatory of the conduct of Sir W. Denison, Lieutenant-Governor of Van Diemen's Land, in the matter of the revocation of the tickets of leave lately held by Messrs. M'Manus, O'Doherty, and O'Donohue.

Mr. HUME seconded the amendment.

Sir G. GREY defended the conduct of the Government in the matter. He could see nothing in the facts of the case that should induce the House to pass a vote of censure upon Sir William Denison, for he had done nothing more than his duty under the circumstances, while it would have been highly censurable in him had he abstained from doing that which the hon. and learned member complained of.

Mr. HUME thought that the hon. member had, perhaps, better withdraw his motion after the statement of the right hon. gentleman the Secretary of State.

Colonel THOMPSON was of the same opinion.

After a few words from Sir LOUIS O'BRIEN in reference to the dismissal of Captain Laffan, who had been in charge of Mr. Smith O'Brien when he attempted to escape, the motion was negatived without a division.

SUPPLY.—NAVY ESTIMATES.

The House then went into Committee of Supply, when several votes were taken on account of the Navy estimates.—Adjourned.

OBITUARY OF EMINENT PERSONS RECENTLY DECEASED.

SIR JOHN GRAHAM DALYELL, BART.

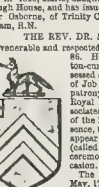
SIR JOHN GRAHAM DALYELL, or Menteith Dalyell, Bart., of Binns, county of Linlithgow, was the sixth baronet, and eighteenth in lineal descent from Walter, the third son of Walter, the High Steward of Scotland, by Beatrix his wife, daughter of Gilchrist, Earl of Angus. He is the family of Menteith, Earl of Menteith, and not of the Grahams, also Earls of Menteith, that is family of Montrose. He married, 1688, James Menteith, of Auldcathy, a lineal descendant of Walter, Earl of Menteith and Binns, son of the celebrated General Thomas Dalyell of

Dalzell, one of the heroes of Scott's "Old Mortality."

This gallant Cavalier soldier was a Major-General at Worcester during the Commonwealth. He also entered the service of the Czar of Russia; and at the Restoration he was made Lieutenant-General of Scotland. In the civil war General Dalyell raised, at his own charge the Scots Greys, and another regiment. Sir John Graham Dalyell, the subject of this notice, was the second son of Sir Robert, who married, 2nd September, 1773, Elizabeth, daughter of Nico, Graham, Esq., of Gartmore, by the Lady Margaret his wife, eldest daughter of William Cunningham, twelfth Earl of Glencairn. Sir John Graham was a member of the Faculty of Advocates, President of the S.A. of Scotland, Vice-President of the Royal Society of Antiquaries of Scotland, and also author of many works on science and history. His name frequently appears among the contributors to the "Encyclopædia Britannica;" and his last work, the "Rare and Remarkable Animals of Scotland," is considered a most valuable addition to the curious branch of science of which it treats. Sir John Graham died on the 9th inst., at Edinburgh, and is succeeded by his next brother, now Sir William Cunningham Cavendish Dalyell, a distinguished officer in the navy. Sir William married, in 1830, Maria, daughter of Anthony Teixeira Sampayo, Esq., of Peterhouse, Hoxne, and has issue, besides two daughters, two sons, Robert Alexander Osborne, of Trinity College, Cambridge, barrister-at-law; and Osborne William, R.N.

THE REV. DR. STAUNTON, OF STAUNTON, NOTTS.

THIS venerable and respected gentleman died at his seat near Grantham, aged 86. He was Rector of Elston-super-Montem and of Staunton-cum-Kelvington. The Staunton estate he became possessed of through the marriage of his father, Captain Staunton of Job Brough, Esq., and, in consequence, changed his patronymic, Aspinlawe, to that of the name of Staunton, by Royal licence, in 1807. There is an ancient custom associated with the property, which enjoins that, when any of the Royal family journey by the road which skirts their property, the chief of the Staunton family should personally appear and present the key of the stronghold of the castle (called Staunton's Tower) to the Royal visitor. This ceremony Dr. Staunton performed on more than one occasion.



The Doctor was born in May, 1765, and married in May, 1793. By Elizabeth his wife, he leaves, besides two daughters, one son—the Rev. W. Job Charlton Staunton, who is married to the only daughter of the very Rev. Dr. Gordon, Dean of Lincoln.

LIEUTENANT-GENERAL SIR JOHN GARDINER, K.C.B., COLONEL OF THE 67TH REGIMENT OF FOOT.

The death of this gallant and distinguished officer occurred on the 6th inst., at his residence, 23, Eaton-place.

Sir John, who was the son of the late Captain John Gardiner, by his wife, a daughter of J. Allison, Esq., of Durham, was born in 1777, and entered the army in 1791. His services extended over an important period of our military annals. He was under the command of the late Duke of York, on the Continent of Europe, and subsequently proceeded with Sir Ralph Abercrombie, to the West Indies, participating in the storming of Fort Royal, Grenada. In 1805 he embarked as Assistant Quarter-master General to the Walcheren expedition, and finally did good service in the Peninsula, receiving a medal and one clasp for his gallantry in command of a brigade at Nivelle and Orthes. In 1838 he was invested with the insignia of a Knight Commander of the Bath, and, in 1841, attained the rank of Lieutenant-General, being appointed in the same year Deputy Adjutant-General to the Forces.

Sir Gardiner married, 1st, Robert William Gardiner, K.C.B., also gained high military distinction, by his eminent services in the Peninsula and at Waterloo.

SOPHIA LOUISA HENRIETTA, WIFE OF COLONEL LLOYD VAUGHAN WATKINS, OF PENNOYRE, CO. BRECON, M.P.

This lady died on the 27th ult., in her 49th year, so universally beloved by all who knew her, that she will belong deeply regretted in the county of Brecknock, where her charities and kindly disposition endeared her to every class. She was third daughter of the late Sir George Pocock, Bart., of Orlean's-house, Twickenham, and married, in 1821, to Colonel Lloyd Vaughan Watkins, M.P. for Brecknock, M.P., and Lord-Lieutenant of the county of Brecknock, by whom she leaves no issue

THOMAS NORTHMORE, ESQ.

THE gentleman, who died on the 20th ultimo, at Fursebrook-house, near Axminster, in his eighty-fifth year, was a native of Cove, in the county of Devon. His name was twice married—first to Penelope, eldest daughter of Sir William Earle Welby, Bart., of Denton-hall, county of Lincoln; and, secondly, to Emmeline, fifth daughter of the late Sir John Eden, Bart., of Windlestone Park and Beamish-hall, both in the county of Durham. Mr. Northmore had by his first wife one son, and by his second wife a numerous family. His eldest son, Thomas Welby, married his cousin, Katherine, third daughter of the present Sir William Earle Welby, Bart., and died before his father, leaving two sons—Thomas Welby, who succeeds his grandfather in the paternal estates; and John, who is in her Majesty's Civil Service in Ceylon.

Mr. Northmore, whose death we here record, was descended from a very ancient Somersetshire family, which migrated into Devonshire in the early part of the fifteenth century. The deceased gentleman was the learned author of the "Typhaedeia" and other classical works.

THE LAST MOMENTS OF MR. SHEIL.—Mr. Sheil was in his bedroom, and had just finished dressing for church, when he told Mrs. Oliver as she felt a spasm in his stomach, fainted, and lay upon the bed. He recovered, and took some colchicum, which he had generally at hand, fainted again, recovered, and took a little brandy and opium. He fainted a third time, and expired in the arms of Mrs Sheil. He was sixty-two years of age. He often expressed his wonder that O'Connell should have turned towards Italy in his decline. They both died in the month of May.

THE BRITISH ASSOCIATION.—The British Association commences its meetings, which this year are held at Ipswich, on Wednesday, the 2d July, when Professor Airey, the president, will, after the reception of the report, deliver an address to the members. On Thursday Prince Albert will visit the town as a member of the association, being for the occasion the guest of Sir W. T. Middleton, at Shrubland Park; and in the evening there will be a grand full dress soirée at the Corn Exchange. The next day (Friday) his Royal Highness will visit all the sections, and in the course of the afternoon return to London. Saturday will be devoted to excursions; on Monday there will be a discourse on the forthcoming eclipse; Tuesday the sections assemble for the first time, the dinner to the President being given in the evening; and on Wednesday a general meeting of the members will be held, to select the place of meeting and to elect a President for the ensuing year. It is said that the sitting will terminate with a grand public ball in the evening, in the Corn Exchange.

It is announced that the arrangements are completed for opening the (Irish) Midland Great Western Railway to Galway on the 1st of August. The Earl of Clarendon has expressed his readiness to attend the inaugural ceremony.

THE ILLUSTRATED LONDON NEWS.

CHURCH, UNIVERSITIES, &c.

THE QUEEN'S COLLEGE, BIRMINGHAM.—The Rev. Dr. Samuel Wilson Warnsford has presented to his trustees, the Rev. Chancellor James T. Law, the Rev. Vaughan Thomas, B.D., and William Sands Cox, F.R.S., the sum of £360 towards the completion of the east Mr. Gorsuch donation. He has also augmented to £4400 his endowment for the professorship of Pastoral Theology, in addition to the former endowments of £4000 for the wardenship, the chaplaincy of the College, and the chaplaincy of Queen's Hospital; and £3000 for the endowment of medical scholarships, medical prizes, and a resident medical tutor. The Right Hon. Sidney Herbert, M.P., has contributed the liberal donation of £30 towards the same object.

MEMORIAL TOWER.—Last week the foundation-stone of a new tower and spire was laid at St. Peter's church, Preston. The necessary funds were provided by a bequest from the late Mr. Gorsuch, deceased, from whom some others of the German family, in memory of the late Mrs. Ellen German.

DIOCESE OF EXETER.—The new church of St. Paul's, Charlestown, was consecrated by the Lord Bishop of the diocese, on the 3rd inst. He took the fifth which his Lordship has consecrated in the county during his present visitation, and the third district church consecrated within the parish of St. Austell within the last two years.

REFUSAL OF LICENSE.—The Rev. H. Newton has been refused by the Bishop of Exeter a licence to the curacy of St. Thomas's Church, Exeter, in consequence of his having given replies unsatisfactory to the Bishop, of the following question:—

"Does our Church hold, and do you hold, that all infants, duly baptised according to the offices of baptism in the Book of Common Prayer, are therein born anew of water and of the Holy Ghost?

"Does our Church hold, and do you hold, that all infants, so baptised, are in baptism made by God members of Christ, children of God, and inheritors of the kingdom of heaven.

PREFERMENTS AND APPOINTMENTS.—The following recently received testimonials of esteem and affection:—The Rev. R. Crowe, from the parishioners of Kirkburton, West Yorkshire; the Rev. Thomas Linton, vicar of Sotheringhay, Northamptonshire, from the pupils of the Sotheringhay National School; the Rev. John Dalton, from the parishioners of Kelsall and Duddon; the Rev. George Martin, on his resigning the principalship of the Exeter Diocesan Training College, from the pupils; the Rev. John Macnaughten, from the confirmation class of the Widworthy, Devon; the Rev. Charles Eyres to Melton St. Mary and All Saints, Norfolk; the Rev. George Davies Sparkes to Llansantffraed, Monmouthshire. *Vicarages:* The Rev. Alexander Bean Rosamond to Bunbury, county Chester; the Rev. James Carter to Brideskirk, Cumberland; the Rev. Henry Jones Davies to Capo Cunwyl and Llansewel, Carmarthenshire

TESTIMONIALS.—The following gentlemen recently received testimonials of esteem and affection:—The Rev. R. Crowe, from the parishioners of Kirkburton, West Yorkshire; the Rev. Thomas Linton, vicar of Sotheringhay, Northamptonshire, from the pupils of the Sotheringhay National School; the Rev. John Dalton, from the parishioners of Kelsall and Duddon; the Rev. George Martin, on his resigning the principalship of the Exeter Diocesan Training College, from the pupils; the Rev. John Macnaughten, from the confirmation class of the Widworthy, Devon; the Rev. Charles Eyres to Melton St. Mary and All Saints, Norfolk; the Rev. George Davies Sparkes to Llansantffraed, Monmouthshire. *Vicarages:* The Rev. Alexander Bean Rosamond to Bunbury, county Chester; the Rev. James Carter to Brideskirk, Cumberland; the Rev. Henry Jones Davies to Capo Cunwyl and Llansewel, Carmarthenshire

STEAM COMMUNICATION WITH AUSTRALIA.

A report of the Committee on Indian Steam, &c., containing the reasons on which they recommend the Cape route for the mail service to Australia, has been made public. The witnesses examined consisted of persons connected with the colonies and nautical authorities, and the points kept in view were speed and certainty of postal communication, accommodation and rates of fare for passengers, facility and cheapness in the transmission of merchandise, and independence as far as possible from political objections frequent on routes through foreign countries. Three plans have been for some time in competition, which are described by the con mittee in detail, and for each of which tenders have been made. The first is from Marseilles to Alexandria, Ceylon, Java, Australia to Sydney; the second is the Cape line to Port Philip and Sydney, with branch steamers to Swan River, Van Diemen's Land, and New Zealand; and the third is the Overland Indian line from Point de Galle to Sydney, and Swan River. A summary of these gives the subjoined results:

Route.	Company.	Vessel. Size, Horse-Power, and Speed.	Cost.	Course of Post.	Proposed Fares.
Panama ..	Pacific.	Screw. 1000 tons, 900 horses, 8 knots.	£50,000	125 days, allowing 8.	£195 and £60
Cape ..	General Screw	Screw. 1400 or 1700 tons, 350 or 300 horses. 8½ knots.	£90,000	135 days, allowing 3.	£75, £53 10s, and £37 10s.
India ..	Eastern Steam.	Paddle 1200 tons, 400 horses, 10½ knots.	About £60,000	109 days' allowing 3.	Not stated.
	Peninsular and Oriental	10½ knots.	Ditto.	118 days' allowing 3	Not stated.

The present course of post by sailing-vessels is 207 days, without allowing any interval; and it will be seen, that, by the Indian Overland route, this might be reduced to 109 days, with an allowance of three days. The committee, however, do not regard rapidity of transit as constituting the only element to be superseded by everything else, but have endeavoured to ascertain the balance of advantages. Against the Indian route, the inconvenience of three transhipments, the charge to passengers, which would be such as to render it unavailable in all ordinary cases, its inapplicability for goods, and the fact of its traversing the heart of Europe and Egypt, and thus being greatly dependent upon our relations with foreign Powers, were considered to present insuperable objections. With regard to the line by Panama, a tranquil and secure passage is admitted to be readered certain; but the inconvenience of crossing the Isthmus (although to be lessened by the projected railway), and the fact of that transit being through a foreign State, seem to have deterred the committee from recommending it. The Cape route, therefore, has been decided upon as the only one presenting a decided combination without any change of vessel, and as being entirely independent of other countries, while at the same time it is the cheapest for passengers, and peculiarly adapted also for merchandise. The committee consider it possible that in this line there may be an uncertainty at first of six or seven days in the homeward mails, but feel satisfied, from the evidence of navigators, that when the experience of well found screw steamers shall have been sufficiently tried, there will be little doubt of their maintaining their engagements.

It is satisfactory to observe, that, in coming to the determination in favour of the Cape route, the committee, looking at "the prospect of remuneration which it holds out to its promoter, and likewise at the great changes rapidly taking place in the requirements and commercial communications of those distant parts of the world," recommend that whatever arrangements may be entered into, should be for as short a period as possible. The advocates of the Panama line will find nothing in the report to weaken the points on which they have of late so strongly insisted, and it is well, therefore that its possibi ies should not be shut out by the indiscretion of a lengthened contract elsewhere.

SUPPOSED TRACES OF SIR JOHN FRANKLIN.—A morning contemporary gives circulation to a report as to some supposed traces of Sir John Franklin. These traces are said to consist "of the remains of a little further progress and future intention." We wish we could join in the belief.

THE PRUSSIAN POST-OFFICE.—The Prussian Post-office has suddenly, and without notice, raised the postage on foreign newspapers more than threefold the former amount. It is as well to state that the postage of a London journal to Berlin is nearly three times the price of it. As the English postage on a foreign journal is only a halfpenny, something should be done respecting this enormous difference.

Advices from Melbourne, Port Phillip (Australia), have been received to the 10th of February. Very destructive bush fires raged in the neighbourhood of the Barabool hills and Moorabool valley, and besides the loss of general property, the crops were entirely swept away. The wife and four children of a settler named MacLelland, residing on the banks of Diamond Creek, had been burnt to death, and several other persons were missing. In the forests, also, near Cape Otway Coast, Portland, and Port Fairy, fires had taken place, causing considerable damage Subscriptions had been opened at Geelong for the sufferers, and in the course of a few hours about £1120 was collected.

The 18th of the present month, the anniversary of the battle of Waterloo, has been fixed as the period for the opening of the Vale of Neath Railway. This anniversary has likewise been chosen as the opening day of the South Wales line from Gloucester to Chepstow, so that the junction between the former city and Swansea will then be completed.

THE GREAT EXHIBITION.

Whitsun week, which even the most determined believers in the capacity of the Crystal Palace to "hold any number" of persons thought would try its dimensions, and the powers of the Executive and the police in controlling and arranging, has passed without anything more extraordinary than the fact, that the Londoners who visited the Exhibition appeared to be utterly hidden and lost sight of amidst the influx of "country cousins," whose appearance on the scene gave a new feature to the interior, and one not the less touching from the amount of thorough earnestness brought to bear by them in the examination of all they had come so far to see.

The great mass of the visitors of this week were those who have already been educated, in a measure, to a small extent, by means of the instructive features of such a day as that now afforded them. The Manchester people, and those from the West Riding of Yorkshire, have long had their Polytechnic Exhibitions in connexion with their Mechanics' Institutions, and were, therefore, better prepared for making the most of the short space of time which their annual holiday afforded them, hence the practical manner in which large groups of them proceeded about the work. They had evidently studied the localities beforehand; and when once the first effect of so startling, and, as a whole, novel sight was over, their individualising propensity returned, and they sought out everything be t calculated to instruct them: determined to make the largest number of observations in the shortest amount of time and at the smallest possible cost. Any doubtful improvement and new invention or adaptation was quickly seized upon by the exhibitors, if present, cross-examined by rough tongues, and their handy-work overhauled by equally rough, but withal skilful hands, a judgment pronounced, and then for the next.

The entrance of the people by the Building on Monday was characterised by a quiet and earnest bearing. We stationed ourselves in the Transept, under the equestrian statue of the Queen, so as to observe the visitors as they came from each side of the grand entrance. All were earnest and subdued. This moment seemed to be the realisation of much which they had been looking forward to for more than a twelvemonth; and the staid expression of thought and concentration of mind in the early comers showed that they were there for something more than for the gratification of idle curiosity.

Her Majesty's visits to the department of machinery commenced, as announced, on Saturday morning last, when the cotton machinery was carefully examined by the Royal party, and the deepest interest displayed in the various processes, as machine after machine was visited and explained. The varied adaptations of power-looms, from plain weaving to pattern producing Jacquard, received especial attention. On Wednesday morning, the 11th, the Queen visited in the Machinery Court at an early hour, and inspected the woollen and flax machinery and weaving machines. The lace machines are to be examined this day (Saturday). It is needless to say how much gratified all the exhibitors in this department are at being called upon to explain the various processes of their ingenious production, upon which so much of the wealth, comfort, and happiness of the people of this country depends.

It is useless to record numbers and the receipts at the doors, now that the problem of Whitsun week has been duly solved. It may, however, be curious to note, that on the Ascot Cup-day, Thursday, the 5th—a day on which, from its nearness to a holiday week, together with the attractions of the above race, according to ordinary calculations, comparatively few persons would have attended—was the most crowded day since the opening, there being 55,029 admissions. The cold, gloomy, and wet weather of this past week has, doubtlessly, influenced the attendance very much, and has been unfortunate for those who were compelled to pay their visit during this period or probably not see the Exhibition at all These belonged to the veritable working classes; and certainly, from this fact proof of their fitness for the boon to be admitted to such privileges, we hope to be spared the shame of seeing them again complimented upon their good behaviour, when those who knew them best never expected anything else of them.

The Russian department has been opened, but is not yet complete. Many of the works exhibited are highly interesting, and those in malachite attract great attention. When the remainder of the Russian articles are to come, no one seems to know, for the elements appear to have conspired against them The display of Mr. Hope's jewels, with the great pearl, and other equally interesting matters, has given a new subject for the jewel hunters; and it is strange to see people crowd around a point at which so little of real utility is to be seen.

The entertainments in preparation for the Royal Commissioners, Executive, the Jurors, and all concerned in the leading features of the work, are now attracting attention. We hear that the Birmingham *fête* is to be postponed. The Guildhall entertainment has been changed to the 5th of July, in consequence of the 2nd, the day originally named, being the anniversary of the death of the late Sir Robert Peel.

An experimental system of guides for visitors is about to be instituted in the Building. This, if it can be fairly carried out, will be valuable, since it will promote a double object—instruct the people, and save their time. There are, however, many difficulties and practical objections in the way, which a few experiments may suggest modes of overcoming; but we confess that we are not over sanguine of success. Half a dozen guides, really worked up for the purpose of showing people the way, and explaining briefly what to see, and how to see it, would do more service; but then these must be sold in the Building, and at the points described in each.

A CURIOUS INCIDENT OF THE EXHIBITION.—The madmen in Lincoln asylum, during the past week, have, through one of their number, applied to the Royal Commissioners for a jury to investigate their cases, in which behalf they are mad. One of them sent a pen and-ink sketch of the Asylum and Lincoln Cathedral, stating that he had never had a lesson in drawing, and that was his first attempt. He says, "Will the Royal Commissioners please to have the kindness to condescend to send for A. B.; and let him stand alongside of the Americans, and let the impostor I write of have for life to the Americans. I am a prophet. My discharge I will demand, and let the men of all nations come and see a man that have been dead." The letter was accompanied by a complete plan of the Asylum, part of the city, setting forth that in 1833, a friend in the United States, he had been bled to death, and after a long stay in heaven had been sent back again to earth as a prophet. His urgent request, that his case should be given to the Queen, was complied with, and her Majesty, expressing her sympathy, said it afforded a curious instance of the universal interest excited by the Exhibition, when it reached even those whose sufferings so entirely secluded them from the world.

The *Cork Reporter*, in remarking upon the practical advantages of the Great Exhibition, states that it was mentioned, at the meeting of the Cork Harbour Board, on Wednesday, that "the committee of the Exhibition have awarded a prize of 100 guineas to a ship-carpenter named Walsh, a native and resident of that port, for a model of a life-boat recently constructed by him on an entirely new principle."

UELLING ON THE CONTINENT.

From time to time, in several countries on the Continent, particularly in France, a series of duels take place successively, like gusts of wind at the Equinox.

The present appears to be one of those stormy periods. Last week we noticed the frequency of hostile challenges amongst members of the French Legislative Assembly of late, and we have this week to chronicle a number of duels.

On Saturday morning a hostile encounter took place at Versailles between the Prince d'Aunay and Count Edward Rosier, son of the late Baron Rosier assassinated in the "Eternal City." They fought with pistols. The first fire was at thirty paces, when both missed. They then fired at a distance of fifteen paces from each other, but missed again. The seconds then interfered and declared that the affair should go no further. The Prince de Canino then advanced and declared that in connexion with respect to his participation in the death of Count de Rossi was a disgraceful calumny, upon which M. Rossi expressed his regret for the error into which he had been led, and the attack which was the consequence of it. The seconds were MM. Cleary and Lopio for the Prince de Canino, and MM. Jalonques and de Rosiers, for M. Rossi.

On the next morning (Monday) a duel was fought in the Bois de Boulogne, by Count Alexandre Walewski, Director of the Museum, and Pierre Bonaparte, one of the representatives of the people for the Ardèche. The dispute arose out of the duel fought on Saturday between the second son of the late Count Rossi and the Prince of Canino. Pierre Bonaparte is the brother of Canino, both being sons of Lucien, brother of the Emperor. The parties fought with the small sword, and after Count Nieuwkerke had received a wound in the thigh, the seconds declared the affair at an end.

At Munich, in Bavaria, a duel took place on the 2nd instant, between Prince Wrede, aide-de-camp of the King of Bavaria, and First Chamberlain von Lerchenfeld, also a member of the First Chamber, which ended in the latter receiving his adversary's ball in the left side, without, however, producing a mortal wound. The distance was fifteen paces. Upon hearing these words, Prince Wrede demanded an apology or satisfaction, both of which were refused by M. de Lerchenfeld, until it was at length agreed that they should meet. Anthe wounded senator refused to withdraw his expressions, or to shake hands, it is not impossible that they will commence *de novo*.

INAUGURATION OF THE BRONZE EQUESTRIAN STATUE OF FREDERICK THE GREAT, AT BERLIN.

(From our own Correspondent.)

THE idea of raising a monument of the Great Monarch in the capital which owes so much to his genius and munificence, has long been harboured by Prussians of all classes. Even during his lifetime his generals and statesmen conceived the plan, raised the funds, and applied for the Royal permission to erect a statue; but the King would not consent to

have a monument set up in his lifetime. His successor, Frederick William II., took up the matter, ordered plans to be made, and named the site where the new statue now stands, at the end of a fine avenue of trees leading from the Brandenburg Gate through the finest street and chief promenade of the town; with the Royal Academy, University, Guard-house, and Arsenal on the left; the Royal Library, Opera-house, the late King's private residence, and residence of the military governor on the right; and in front, at a distance, the spacious *place* bounded by the great Castle, the Cathedral, the Exchange, and the Museum: a finer view is nowhere to be found in any European capital. The disastrous political events at the close of the last and the beginning of this century were unfavourable to the execution of great works of art. In 1830, however, the late King determined to delay no longer the fulfilment of the wish so long cherished in his family. He commissioned Professor Christian Rauch, who had already distinguished himself by his exquisite marble monument for the tomb of Queen Louise, to prepare plans, several of which were presented for approbation. The late King selected an equestrian statue, the model of which was shown in the exhibition of 1839. In the following year, feeling his end approaching, he ordered the foundation-stone to be laid by his son, to whom he committed, but a few days before his demise, the duty of raising a monument worthy of the great ancestor of the house of Hohenzollern. The present King, less mindful of expense than fond of magnificence, extended the plan, and ordered that the statue of Frederick should be placed upon a pedestal representing the great men whom that Monarch assembled round his throne. Thus a work of art has been produced, which, for extent of design, stands unrivalled amongst modern works. The colossal equestrian statue is 16 feet 3 inches high; the bronze pedestal 21 feet, upon a socle of polished granite 5 feet 9 inches high, thus giving a total height of 43 feet. The chief compartment of the pedestal is flanked by four natural-sized equestrian statues, representing Duke Ferdinand of Brunswick, Prince Henry of Prussia, General Zieten, and General Seydlitz; and on the four sides, characteristically grouped, are the full-length statues of Prince Augustus of Prussia, Generals Huelsen, Lestwitz, Prittwitz; Colonel Heyde, Marshals Dessau and Gessler, Generals Goltz and Wartenburg, Colonel Wedell, Generals Winterfeldt, Tauentzien, Desskau, Kleist, Eugene of Wurtemburg; and in the background, in relief, are seen on horseback Marshal Keith, General Count Brandenburg, Schwerin, Marshal Leopold, Prince of Dessau, Marshal Schwerin, Prince Frederick William of Prussia, and General Belling.

One of the sides of this compartment, devoted to civilians, contains the statues of the ministers Schlabrendorff and Finckenstein; the great jurisconsult Count Carmer, the musical composer Graun, the critic Lessing, and the philosopher Kant. Each of the twenty-six full-sized bronze statues is in itself a complete work of art, executed with the greatest care in all its details. The four corners of an upper division of the basement are occupied by four allegorical female figures in a sitting posture, representing Strength, Wisdom, Moderation, and Justice, as the most eminent qualities of a great monarch. This compartment, forming a sort of frieze, is embellished with scenes from Frederick's life in bas-relief. The drawings which we give will furnish some idea of the magnificence of the work and its total effect.

The 31st of May, the anniversary of Frederick's accession to the throne, one hundred and eleven years ago, being fixed for the ceremony of uncovering the statue, the city of Berlin offered, at a very early hour of the morning, a most animated appearance. The King had decided that the day should be made prominently a military festival; deputations from every regiment of the army from all parts of the realm had been called to Berlin; thousands of picked men, in every diversity of uniform, were drawn up in the fine space in front of the statue; on either side were immense scaffoldings erected, seat rising above seat, where thousands of ladies and the civil authorities viewed the ceremony. At eleven o'clock, the King appeared on horseback, attended by the princes of the royal house and a magnificent suite of general officers. All the flags and standards of the Prussian army were unfurled to the sun, which this day shone with genial brightness. On his Majesty reaching the site of the monument he was addressed by the Prime Minister, M. Von Manteuffel, who passed in review the progress of Prussia since the days of the Great King; and, after alluding to the restoration of the true Prussian spirit of loyalty, begged that his Majesty would command the work now completed in honour of his renowned ancestor, to be revealed to the eyes of the people, as a token that only by mutual attachment between King and nation a state can rise to greatness and preserve its eminence. The King waved his sword, the drapery fell, the shouts of assembled thousands pealed, the cannon roared, the bands resounded, the flags waved. As soon as the commotion had somewhat subsided, the King said, with his peculiarly clear and melodious voice: "With my sword I salute these flags and standards, which have been presented to the army, some by the Great King himself, some by his ancestors, and which have been borne aloft as well in all his victories, as in those of my beloved late father and King. I salute, too, with my sword the deputies who have assembled from all parts of my army; I greet in them my whole army, which I congratulate on this day, devoted to its honour; for as such do I regard this day. My army, which, thank God, is still worthy of being called the host of the Great King, has preserved in good and evil days the soldier's highest treasures—valour, discipline, honour, and fidelity; and I rejoice in this moment, that I am able on this spot, and, as it were, in presence of this great man, to offer my army my solemn thanks. Even in the most recent time, when all the country around seemed covered with black night, my army rose like a mountain of the Lord, above the poisonous mist to the pure ether of heaven, radiant with the bright sunshine of unsullied honour and fidelity. I pray to God to bless, now and in future, this matchless army, for the welfare of Prussia and the honour of the German name."

Then, after having ridden round the statue, and viewed it from all sides, the King, on remarking the municipal authorities of Berlin, said: "I congratulate the representatives of the municipality with all my heart on the acquisition of this new and beautiful ornament of the town. It was a good custom of ancient days to erect a monument on a spot where a people had enjoyed peculiar benefits, or celebrated some great act of reconciliation. May this be such a monument. But I earnestly pray to God that it may be something more than this; not only to all a token of reconciliation, but to many a signal for returning from the path of error."

The cost of the monument is reported to be no less than £120,000.

STATUE OF FREDERICK THE GREAT, AT BERLIN.

STATUE OF FREDERICK THE GREAT.—SIDE OF PEDESTAL.

STATUE OF FREDERICK THE GREAT.—END OF PEDESTAL.

DEPARTURE OF THE RENEWED BRANCH EXPEDITION IN SEARCH OF SIR JOHN FRANKLIN.

SANTAREM.

ıs district of Portugal was the scene of one of the most important ases of the late revolutionary movement, and is likewise a locality considerable historic note.
Santarem lies in the province of Estremadura, extending for nearly thirty miles on both sides of the Tagus, which intersects it from north-east to south-west. The capital, Santarem, is situated on the right bank of that river. In former times it was surrounded with thick walls and strong towers, built by the Arabs, during their occupation of the Peninsula; but no trace remains at present of the ancient fortifications, except the five gates, which serve as entrances to the town, and a ruinous old castle, the residence of the Mahommedan governors. The Roman name of the town is believed to have been "Scalobis," and "Præsidium Julium," which the Arabs changed into *Skantarem*, whence Santarem. Alfonso VI., King of Castile, the famous conqueror of Toledo, was the first to wrest Santarem from the hands of the Moslems, in 1093. It again fell into the hands of the Almoravides, and was retaken by Alfonso Henrique, King of Portugal, in 1147. Yusuf Ab Yakub, the second of the Almohades, besieged it in 1184 with all his forces, but was defeated, and died of wounds received in the siege. Near this town the great French army, under Massena, remained for some time, unable to penetrate to Lisbon.

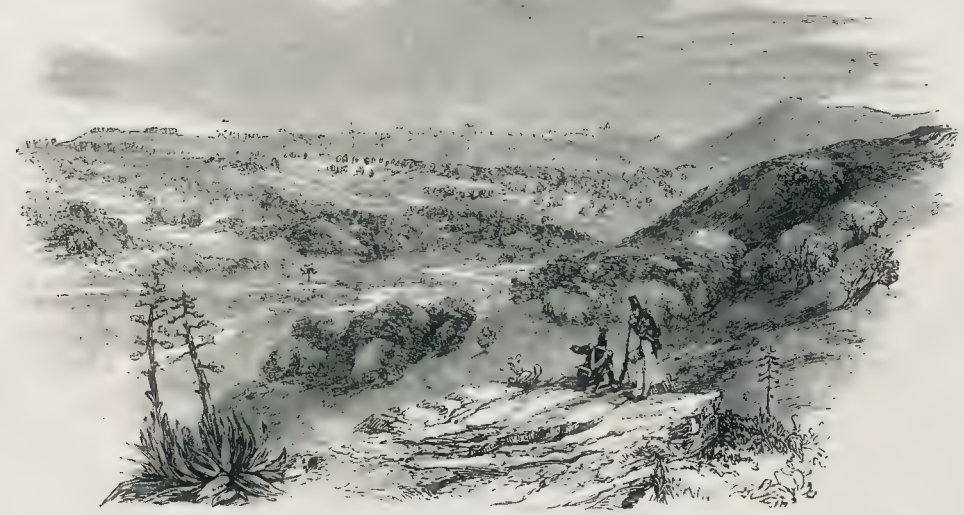
CHUI-A-POO, THE CHINESE PIRATE.—(SEE NEXT PAGE.)

DEPARTURE OF THE RENEWED BRANCH EXPEDITION FOR THE ARCTIC SEAS.

THE *Prince Albert* ketch, of 80 tons, which last year performed so remarkable a voyage, reaching the Wellington Channel and returning home in four months, sailed from Aberdeen on the 22nd ultimo, the crew all in the highest spirits. In compliment to M. Bellot, who has so nobly embarked in Lady Franklin's vessel, the national flag of France was flying at the fore as she stood out of the harbour, the whole of the wharves and quays being thronged with people, who lustily cheered her as she passed along in tow of the *Victory*. The scene was of an animating description, and many a prayer was offered up for the safety and success of the voyage of this little vessel. Mr. Kennedy, who commands the expedition, is instructed to proceed, if possible, to Griffith's Island, to learn intelligence of Captain Austin's squadron, before he proceeds up Prince Regent's Inlet.

The expense attending the expedition is, we believe, very great; and all friends of Lady Franklin, and such as admire her zeal and devotion in the sacred cause, should not leave her to bear the ruinous expense. No one who has read the grounds of argument she has just put forth can doubt the necessity of the search assigned to the *Prince Albert*. Subscriptions are still received by Messrs. Drummond, Charing-cross, and many good names have already been sent in. Amongst others, we cannot omit to mention the very generous donation of the Hon. H. Elliot (a son of Lord Minto), who has subscribed 50 guineas; Sir Francis

THE LATE RICHARD PHILLIPS, F.R.S.—FROM A DAGUERREOTYPE, BY CLAUDET.—(SEE NEXT PAGE.)



SANTAREM.—FROM AN ORIGINAL SKETCH.

Beaufort, 20 guineas, Capt. W. A. B. Hamilton, 20 guineas; Mr. Barrow, 10 guineas; the Rev. Dr. Scoresby, 6 guineas; Lieut. Halkett, R.N., 10 guineas, &c.

M. Bellot, of the French marine (Chevalier de la Légion d'Honneur), the gallant young officer who has so nobly embarked on board Lady Franklin's little vessel, met with the most enthusiastic reception from the crew of the *Prince Albert*, by whom he was loudly cheered on joining. M. Bellot, who is highly distinguished in his own service, has acted on more than one occasion with officers and seamen of the Royal Navy of Britain. He was wounded at Sebastopol, and in the combined operations of the French and English, and was also in the River Plate during the whole of the operations when the fleets of the two nations, under Admiral Trehouart and Sir Charles Hotham, were co-operating. This young officer will be the first of his nation who (as far as we know) has ever crossed the Arctic circle; although some of the French ships of war have visited Iceland, which is close upon it, and have made a beautiful and elaborate survey of that interesting island. The loss of the *Lillois* off the coast of Iceland—which vessel was never again heard of—must be fresh in the recollection of some of our readers, and the diligent search which was made for her by the *Recherché* and other French ships of war during 1834, the year following that in which she was supposed to have been lost in the ice.

RICHARD PHILIPS, F.R.S., F.G.S.

On Sunday, the 11th of May, the day before the opening of the New Museum of Practical Geology, Richard Philips, chemist and curator of the museum, died. For nearly half a century he had been an incessant worker in the fields of science. He first attracted attention in 1805, by the publication, in the "Annals of Philosophy," of an analysis of the Bath waters, and which he speedily followed up by a complete examination of the whole of the mineral waters of the kingdom, and of several curious and rare minerals. He was one of the founders of the Geological Society in 1807. In 1817 he was appointed Lecturer on Chemistry at the London Hospital, and shortly afterwards Professor of Chemistry at the Military Academy at Sandhurst, and Lecturer on the same subject at Grainger's School of Medicine in Southwark. In 1821 he undertook the sole editorship of the "Annals of Philosophy;" in 1822 was elected a Fellow of the Royal Society; and in the same year published, jointly with Faraday, a paper in the "Transactions," of which he always felt proud, not on his own account, but because it first made Faraday known to the Society. In addition to his labours at the London Hospital, Sandhurst, and Southwark, he delivered several courses of lectures at the London Institution, was also appointed Chemical Lecturer at St. Thomas's Hospital, and in 1824 published a translation of the "Pharmacopœia Londinensis," which, and the fame meanwhile gained as a pharmaceutical chemist, led to his being employed by the College of Physicians to test the chemical preparations described in the edition of that work published in 1836, and which he also translated, with the addition of valuable notes. In 1836 he was appointed Chemist and Curator to the Museum of Practical Geology. He was author of the chemical articles in the "Penny Cyclopædia;" and the abundant produce of his always careful and able pen is to be found during a period of more than forty years in the "Annals of Philosophy," the "Transactions of the Royal Society," the *Philosophical Journal*, and other scientific periodicals

During the last year Mr. Philips devoted a large portion of his time to experiments in connexion with the forthcoming edition of the "Pharmacopœia," for which he had collected copious additional notes, embodying every recent discovery. He had looked forward anxiously to the opening of the New Museum; was diligently engaged at the preparations for that event on Wednesday; the 7th ult., and there worked the same night upon the "Pharmacopœia." On the following day he was seized with illness, and died on Sunday, the 11th; and on Friday, the 16th, was buried in the Cemetery at Norwood.

Our portrait is from a daguerréotype by Claudet.

CHUI-A-POO, THE CHINESE PIRATE.

This celebrated Chinese outlaw and pirate chief first became known to the foreign community of China in connexion with a most melancholy tragedy the wanton murder of two British officers, Captain Da Costa, of the Royal Engineers, and Lieutenant Bryce, of the Ceylon Rifle Regiment, whilst strolling on the sea beach, on a Sunday afternoon, in the month of February, 1849, near a pleasant little hamlet known as Hong-maow-Kok, situated on a peninsula of the island of Hong-kong, and not two miles distant from the anchorage of the British fleet. The notorious miscreant, of whom the accompanying Sketch is a faithful likeness, was at once declared the murderer, and fled from the island immediately upon the discovery of his dreadful crime. From that time nothing was heard of him until the 30th September following, when he was found at the head of a formidable pirate fleet of twenty-three sail, averaging 900 tons each, and mounting 12 to 18-pounder carronades. This squadron had just run down one of his numerous victims on the China coast, aptly designated "Pirates' Cove," not 80 miles distant from Hong Kong. "The track of this desperate buccaneer," says a narrative of that day, "was marked along the sea-board by smouldering towns, smoking villages, scuttled corpses; stranded fishing craft and trading junks burnt to the water's edge, and houseless villagers grouped upon the surrounding hills, looking down upon their roofless homesteads and ruined harvest." On the hour of retribution was at hand. On the 7th September 29, 1849, the principal squadron of Chui-a-Poo, consisting of 23 piratical junks, three new ones on the stocks, and two dockyards, were destroyed by fire; and, of 1500 men who manned them, about 1400 were killed, the rest being dispersed without resource. The whole service being performed by her Majesty's steamers *Columbine* and *Fury*, assisted by the Oriental Steam Navigation Company's vessel *Canton*.

After the destruction of his fleet, the pirate chief fled into the interior of China, and nothing whatever was heard of him up to February of the present year, when he was unexpectedly delivered, bound and gagged, on board the Inn. Company's war-steamer *Pihgetchin*, Captain Niblett, then lying in Canton river; his capture being, as report has it, some of his former followers, seduced to the act of treachery by a reward of £100 sterling put upon his head by the Hong-Kong Government. at the time he fled from the island after the murder of Captain Da Costa and his companion.

He was tried for the murder at a special sessions of the supreme court of that colony on the 10th of March last, and found guilty of manslaughter, the evidence (after such a lapse of time, and the death and absence of important witnesses) failing to support the capital indictment, and sentenced to transportation for life. Unable, however, to support the prospect of prolonged misery, so opposite to the habits of his starving and adventurous existence, he strangled himself in his cell in the Hong-Kong prison, the night before he was to have quitted China for ever, and while the convict-ship was waiting to convey him to the penal lines of the island of Penang, thus crowning, perhaps, as desperate a career as history records of any of the old corsairs of the Spanish Main.

DESTRUCTION OF THE "MARY WHITE," SYDNEY PACKET-SHIP, BY FIRE.—The intelligence of a deplorable loss was received on Monday, at Lloyd's. The *Mary White* was a fine barque-rigged vessel, nearly 400 tons burden, commanded by Captain T. H. Walker. She was from Sydney, New South Wales, with a general cargo and several passengers for London—a small mail being also on board. It is surmised that the fire was caused by spontaneous combustion of the cargo. Among the articles there was a great quantity of wool, and hinged on it is the fact that the wool had, by a leakage of one of the oil casks, got saturated, and being closely pressed in bales, soon heated, and eventually burst into flame. The fire was first discovered about midnight on the 14th of May last. The boats were got ready, and mentioned in case of emergency, while the scuttle and fore-hatch were closely fastened down. The ship was then in lat. 37 2 N., lon. 29.30, the nearest port, Terceira, being 240 miles distant. The weather was fine, with a strong breeze, and all sail was made for the land. During that and the succeeding night and day the smoke and heat increased tenfold, indicating too clearly that the fire was gaining rapidly. The pumps were kept going all the time, and tons of water were discharged into the hold. By ten o'clock on the night of the 17th of May the heat and smoke became intolerable. For safety the boats were got out and provisioned, and every one stood by to jump into at a moment's notice. Another night was passed in awful suspense. About five o'clock the crew joyously descried a sail astern. Signals of distress were made, and in a short time she came up to the burning ship. She proved to be a Russian brig, called the *Precosa*, M. Weikman master, from Rio to Abo, in Finland. The moment she came up, Captain Walker sent off the chief officer to communicate the perilous condition of his vessel, and to ask if they would take the passengers on board. The mate had scarcely reached the brig before the fire burst forth from the fore part of the vessel. As quickly as possible the passengers were placed in the boats, the females being soon first in, and were taken to the brig forthwith. The crew were compelled to abandon the vessel within a quarter of an hour afterwards, and sent refuge on board of the Russian brig. Her decks, as it were, blew up, and she appeared in flames from stem to stern. The Russian brig landed the shipwrecked sufferers some days after at Fayal. The ship and her cargo were insured. The loss is said to exceed £35,000.

NEXT WEEK WILL BE PUBLISHED

THE ILLUSTRATED LONDON NEWS.

LONDON, SATURDAY, JUNE 14, 1851.

IN the perilous position of France, pending the discussions upon the revision of the Constitution, the true policy of the present occupant of the Presidential chair was to keep silent. Weak as his position was, it was immeasurably stronger than that of any other candidate for power, whether Monarchical or Republican. But Louis Napoleon has imprudently permitted his feelings to overpower his judgment. Carried away by the fervour of enthusiasm with which he was greeted at Dijon, and strengthened in his conviction that he was the most popular man in France, he uttered some truths, which, for the moment, he would have acted more wisely and patriotically to have said nothing about.

The result is a perfect *imbroglio* of politics and parties, and a crisis in the fate of the President and in the history of the French nation. The factions that had apparently united to revise the Constitution, in obedience to the generally expressed sentiments of all sober-minded people in France, have, under the influence of the angry feelings excited by the onslaught of the President, separated into their elements. It is now more than probable, unless some unforeseen accident should intervene to change the relative position of parties, that the Constitution will not be revised, and that the supreme power will be ere long in the gift of the army. The feud between the President and the Assembly appears to be irreconcileable, and the giant shadow of a new revolution looms visibly upon the horizon.

The catastrophe has long been foreseen. It required all the tact of the cleverest, and all the coolness of the most experienced men in France, and many painful mutual sacrifices to avert it. But it has come at last, and, however much M. Louis Napoleon Bonaparte may have been to blame for his onslaught upon the Assembly, it must be admitted that the Assembly itself has been the more guilty. It has acted a dangerous part ever since it has been in existence. The majority never cordially or honestly worked with the chief magistrate, who was at all events placed in that high position by the same power and the same law which placed them in theirs. They thwarted his foreign and domestic policy, without leaving him any other possibility of allowing the country to know his real sentiments than the one he has adopted, and they took every opportunity to render his position not simply uncomfortable, but degrading. Elected by universal suffrage, they abolished universal suffrage. Though the paid servants of a Republic, they openly declared their intention to put an end to that form of government in favour of various pretenders; not one of whom, if successful, could hope to preserve the country from a new revolution. They constantly talked treason if they did not act it, and loosened the foundation of all order and stability. Orleanists and Legitimists alike decried the Republic which they were bound to serve, and united their voices against the man who occupied its chief place—who never by word or deed did anything to injure it, and whom they only hated so intensely because he happened to be the most formidable opponent to the new revolution which they severally wished to accomplish. These facts should not be forgotten when Louis Napoleon is blamed for his imprudence. He may have been impulsive and hasty when he ought to have been reasonable and cool; but the anti-Republican factions in the Assembly have, during the last three years, been deliberately guilty of a series of attempts to render the Republican form of government impossible, and to launch their unhappy country into a new and troubled sea of futile experiments.

The situation is exceedingly critical. "There is not," as M. de Lamartine truly says, in his recently published and very able letter, "only the Republic on one side and Monarchy on the other, but there are on the one side two or three distinct Monarchies, and on the other three or four feeble Monarchies. Out of the detestable anarchies would inevitably surge the strong-handed despotism of the most unscrupulous soldier, or most popular name of France; and out of the feeble Monarchies would as inevitably surge a speedy, and perhaps bloody, revolution."

Either one or other of these results, the Assembly, if allowed to act as it has hitherto acted, would drive the country; whereas the prolongation of the powers of M. Louis Napoleon—that project which excites so much hatred and opposition among these warring factions, is precisely the solution of the difficulty that would preserve France from the horrors of both. To refuse the revision of the Constitution—so as to prevent Louis Napoleon from legally becoming a candidate in 1852—is virtually, when his popularity and influence are considered, to place the fortunes of France on a desperate hazard. But, if there be any real patriotism left in the Assembly—if the members of the majority prefer the well-being of France to their own parishiics for this King or for that King, they will yet proceed with the task reserved for them, and patiently revise the Constitution, in obedience to the urgent necessities of the case, and the strongly expressed wishes of all classes of the people. They should have dignity enough to take no notice of the President and his recent verbal *escapade*. To allow a personal ill-will to sway their judgment at such a time, is not to punish the President, but to imperil the best interests of their country. When they have handed it over to the tender mercies of some Dictator Changarnier, or other dragoon as heavy-handed and unscrupulous, it will be too late for repentance.

SIMULTANEOUSLY with the presentation to the House of Commons of the estimate for the expences of the Kaffir war, we have late advices from the Cape. Neither the estimate nor the news is of a very consolatory character. Sir Harry Smith, it is true, seems to be in a somewhat better condition than he was, and to be ready to make a combined movement with General Somerset upon the strongholds of the Kaffir chieftain, among his native mountains This movement will in all probability be successful, but it is extremely doubtful whether it will put an end to the war.

It is not only the one chief Sandilli, but many other leaders of the Kaffirs that are up in arms; and the last mail brings the unwelcome intelligence that a Kaffir Potentate, named Kreli, a man of great influence with his people, and who was supposed to be a firm ally of the British, has gone over to the enemy, with from 5000 to 7000 men—one-half of them mounted, and one-third armed with guns. That we shall ultimately subdue these savages, does not admit of doubt; but we much fear that the prospect of any immediate or speedy termination of hostilities is not very bright. With such foes, the close of the war would be almost the close of embarrassment and anxiety with regard to the future well-being of the colony. Our landward frontier in South Africa is by far too extensive to be cheaply defended; and it will, we expect, very soon become a question in England, whether the old limits of the Cape Colony would not be in every respect more profitable as well as pleasant to be restricted to, than those larger boundaries to which within the last few years we have unfortunately pushed ourselves. The possession of all Africa would not be worth what the Cape and Kaffraria threaten to cost us.

THE GREAT EXHIBITION.

ROYAL VISIT TO THE PRINTING MACHINE OF THE "ILLUSTRATED LONDON NEWS."

THE frequent visits of her Majesty and the Prince Consort, not only to those departments of the Great Exhibition in which objects of decorative art invite inspection, but also to those more important sections in which the display of the productive powers of a great nation's science and skill attracts the intelligently-curious mind, indicate how fully the Royal pair appreciate the extraordinary opportunities which the vast collection, as well of the results, as of the "ways and means," of industrial enterprise brought together in the Crystal Palace presents of studying the sources of national prosperity, and of noting the progress of the world in material civilisation.

We thus find that the department of "Machinery in Motion" has this week engaged the attention of the Royal visitors; and on Wednesday the Vertical Printing Machine, invented by Mr. Applegath, and constructed by Mr. Middleton, and exhibited by Mr. Ingram, for printing the ILLUSTRATED LONDON NEWS, was examined in detail by her Majesty and Prince Albert, who were accompanied by the Duke and Duchess of Saxe-Coburg-Gotha, and Duke Ernest of Wurtemberg. Mr. W. Cubitt, Mr. Paxton, and Mr. Hensman were in attendance upon her Majesty and the Prince.

The complex machine, with its manifold power of production, was at the moment at work, throwing off the pictured sheets with a rapidity and accuracy of impression that excited in a high degree the surprise and admiration of the Queen and the Prince Consort, both of whom accorded marked and interested attention to the explanations of the mode of operation which Mr. Ingram and Mr. Applegath had the honour of communicating to the Royal visitors.

Her Majesty and the Prince watched the progress of the paper through the machine, from its entrance as a blank sheet, to its exit as a "pictured page" of current history; the Queen graciously accepting a copy, which Mr. Ingram had the honour of presenting. By a fortuitous coincidence, it happened that the portion of the impression which was being printed at the time was the SUPPLEMENT for this week, the front page of which contains an engraving of PRINCE ALBERT'S MODEL LODGING-HOUSE, which faces the south entrance of the Crystal Palace. Her Majesty and the Prince having expressed themselves pleased at the incident, and also in terms of commendation of the style of drawing and beauty of the engraving both of that and of the other illustrations in the paper, proceeded to inspect a number of wood-engravings which Mr. Ingram brought under their notice; and in which the Royal connoisseurs were pleased to recognise great beauty in the designs, and in the elaborate finish of detail in the engraver's work.

Her Majesty and the Prince, on their departure, took occasion again formally to express the gratification which they had derived from the visit.

At an earlier period of the morning the Princess Royal and the Princess Helena, attended by Miss Hildyard, also paid the ILLUSTRATED LONDON NEWS printing machine a visit.

The Royal party were in the Crystal Palace from nine o'clock to half-past eleven o'clock in the forenoon, and extended their inspection also to other objects of attraction in the Exhibition. There were in attendance on the Queen and the Royal circle the Hon. Matilda Paget, Baroness de Wangenheim, General Wemyss, Colonel Bouverie, and M. R. de Teukow.

The Prince of Wales, attended by Mr. Birch, visited the Machine last week; as did also his Grace the Duke of Wellington, and the Marchioness of Douro. The noble Duke sat down to watch the working of the Machine, and expressed himself highly gratified.

[A full description of the Machine appeared in the ILLUSTRATED LONDON NEWS for May 31.]

COURT AND HAUT TON.

THE COURT AT BUCKINGHAM PALACE.

The Court returned to Buckingham Palace from Windsor Castle on Friday week. On Saturday morning her Majesty and his Royal Highness Prince Albert, with the Princess Helena and Louisa, accompanied by the Duchess of Saxe-Coburg-Gotha and the Duke Ernest of Wurtemberg, visited the Exhibition in Hyde-park, and inspected the department of the Machinery in Motion. His Royal Highness the Prince of Wales and the Prince Alfred also visited the Exhibition on Saturday.

Her Majesty and the Prince, with their illustrious visitors, have made daily visits to the Exhibition during the past week, and on several occasions have remained some hours in the Building.

On Monday the Queen and the Prince, with the Royal children, and accompanied by their illustrious visitors, paid a visit to the Zoological Gardens, Regent's-park. On the same day Prince Albert honoured Sir Edwin Landseer with a visit, at his residence in St. John's-wood. In the evening the Court honoured the Royal Italian Opera with their presence.

On Tuesday the Queen received visits from her Royal Highness the Duchess of Kent, the Countess de Mauilly, and the Duke and Duchess de Nemours.

On Wednesday Lord Strangford had an audience of the Queen, at Buckingham Palace, to present some presents from Newab Nezim, of Bengal, to her Majesty. The articles consisted of an elephant's state trappings of velvet and gold. The howdah, framed of ivory, inlaid with gold, with coverings of gold and silver embroidery. A state palkee, or palanquin, also of ivory, inlaid with gold; the covering of similar rich materials to the howdah. A throne, or state reading couch, of crimson velvet and gold, with a canopy richly embroidered with the precious metals, and supported by silver columns. A pair of gold moorchhals, or emblems of rank, and a pair of gold chauri, or chaunjin, for evening conveyance. These presents were brought from India under the charge of Dr. Young. In the evening her Majesty had a dinner party, the company at which included the Duchess of Kent, the Duke and Duchess of Saxe-Coburg-Gotha, the Duke Ernest of Wurtemberg, and the Prince Gustavus of Wasa, his Serene Highness the Prince of Lehuingen, the Marquis and Marchioness of Donegal, the Marquis of Westminster, Lady Fanny Howard, Baroness de Wangenheim, Baroness de Speth, the Earl of Aberdeen, the Earl and Countess Granville, &c. After dinner, Herr F. Kauffman, from Dresden, with his son and daughter, attended in the Palace, and had the honour of performing before her Majesty and Prince Albert, and their illustrious circle, with novel musical instruments; viz the Harmonichord, Chordanleidon Symphonion (the Seb-bstsindan Kanstwerke), and Orchestrion; also the Trompet Automa

The Duke and Duchess of Saxe-Coburg-Gotha, and Duke Ernest of Wurtemberg, took leave of her Majesty and the Prince Consort on Thursday, on their return to the Continent.

The Queen held a Court at a quarter to three o'clock on Saturday afternoon, at Buckingham Palace. His Royal Highness Prince Henry of the Netherlands, attended by Baron Strasenus, Netherlands Chargé d'Affaires, the Chevalier van Rappard, Chevalier de Casembroot, and Captain May of the Netherlands Royal Navy, had an audience of the Queen to take leave of her Majesty. His Royal Highness the Prince of Wasa, attended by Baron Koller, Austrian Chargé d'Affaires, had an audience of her Majesty, on his arrival from the Continent. The Chevalier Marquis Lebon, the Brazilian Minister, had an audience of the Queen on his return to this country, after a temporary absence. The Right Hon. Sir Richard Pakenham, K.C.B., her Majesty's Envoy Extraordinary, and Minister Plenipotentiary to the Court of Lisbon, was presented to the Queen at an audience, by Viscount Palmerston, to take leave on proceeding to Lisbon. The Lord Mayor, the Recorder, Mr. Sheriff Hodgkinson, Sir Sheriff Carden, and the City Remembrancer, had an audience of the Queen, to invite her Majesty to an entertainment in the City, at Guildhall. Her Majesty was graciously pleased to accept the invitation, and appointed Wednesday, the 9th of July, for an evening entertainment.

THE KING OF THE BELGIANS.—His Majesty the King of the Belgians is expected to arrive this evening (Friday) on a visit to her Majesty and the Prince Consort.

THE KING OF HANOVER.—A report reached town on Monday that his Majesty the King of Hanover was considered to be in a precarious state of health. Much anxiety is said to have been felt on the subject in high quarters. Yesterday (Friday) it was reported that news of his Majesty's convalescence had reached London

PRINCE HENRY OF THE NETHERLANDS.—On Thursday last, his Royal Highness Prince Henry of the Netherlands, accompanied by Chevalier van Rappard, Chevalier Casembroot, Captain May, R.N., and suite, after a sojourn of seven weeks, left Mivart's hotel for Blackwall, to embark on board a Dutch steamer of war, on his return to the Hague.

We regret to say that the accident which a few days since happened to the Marquis of Londonderry is likely to be attended with more serious consequences than were at first anticipated. The noble Marquis is still confined to a sofa, and Dr. Ferguson and Mr. Lawrence, the eminent surgeons, who are in attendance, are unable to state with confidence that an operation will not be necessary.

Lord John Manners was married on Tuesday last, at All Souls Church, to Miss Marley, a rich heiress.

The marriage of the Lady Harriet Anson with the Hon. Augustus Henry Vernon was solemnised on Saturday last, at St. James's Church, Piccadilly.

EXHIBITION AT THE BRITISH INSTITUTION.

THE Directors of the British Institution have the satisfaction, they inform us, "of offering to public view a collection of pictures of the highest importance, and of equal merit with any which have ever adorned their walls." There is no doubt of it. The present exhibition is by far the best display of the works of the old masters which the Directors of the Institution have succeeded in procuring for public instruction and amusement during at least the last ten years

The principal contributors to the collection are the Earls of Carlisle and Suffolk, Lords Northwick, Colborne, and Overston, Lady Dover, Mr. Holford, and Mr. Hope. The masters best represented are Mabuse, Leonardo da Vinci, Annibale Caracci, Holbein, Hobbema, Rembrandt, Vandyck, F. Mieris, Terburgh, De Hooge, Adrian Vandervelde; and, among the English school, Sir Joshua Reynolds, West, Harlow, Jackson, and Collins.

Lord Carlisle has sent from Castle Howard, in Yorkshire, four of the finest pictures in the rooms—the "Adoration of the Magi," by Mabuse; the "Three Marys," by Caracci; the portrait of Snyders, by Vandyck; and the full-length portrait of Lady Caroline Howard, by Sir Joshua. Lord Suffolk has sent from Charlton, Wiltshire, his noble and but little known Leonardo da Vinci. Lady Dover contributes two of the finest portraits Rembrandt ever painted—the "Burgomaster Six and his Wife." Lord Colborne has sent a magnificent study of an old man's head, also by Rembrandt. Lord Northwick exhibits a portrait of Fisher, Bishop of Rochester, unquestionably from the easel of Holbein. Mr. Holford has sent the Hobbema for which he gave 3000 guineas; and Mr. Hope has entrusted the Directors with his "Trumpeter," by Terburgh, and his "Fiddler," by F. Mieris—two of the best examples of the Dutch school to be seen in this country.

And the collection, "The collection," "The Adoration of the Magi," by Mabuse, is hung in a place of honour at the end of the great North Room. This is a picture which will make the Pre-Raffaelites run wild with delight, and will give their principles a lift. It is the finest work of the master, and, for warmth of colour, delicacy of finish, quantity of detail, and curiosity of costume, is not to be surpassed. But it has other excellences. There is an exquisite modesty of look about the Virgin, rarely to be seen to such perfection in the works of the German masters. The rich gold cups are the choicest models of the goldsmith's art.

The "Three Marys," by Annibale Caracci, enjoys a European reputation. It is an Orleans picture, and has, perhaps, been praised beyond its merits. The grief is somewhat vulgar, and the drawing a little questionable; yet the story is well told.

The portrait of Snyders, by Vandyck, a three-quarter portrait in black, is one of the best examples of the best period of the master. It hangs you wherever you go; such truth, such breadth, such masterly and broad treatment of detail, so thoughtful, so dignified. It is of the same time with the Gervatius in the National Gallery, and should be compared with it, as with the Earl of Northumberland, of the same master, in the adjoining room.

The full-length portrait, by Sir Joshua Reynolds, of Lady Caroline Howard when a girl of eight or ten, is a most graceful example of Sir Joshua in his best mood. She is seated in a garden in a dress of black and white, and is plucking a rose from a bush by her side. The colour is rich and warm—the flesh most truthful—the whole air innocent and graceful.

Rembrandt is seen as a portrait-painter to great advantage: coarse, broad, and life-like, in Lord Colborne's (19) "Head of an Old Man;" smooth, broad, and truthful, in Mr. Holford's "Martin Looten" (13); and in middle style between these, in Lady Dover's "Burgomaster Six and his Wife" (89-91). The Burgomaster is a miracle of art. A sandy-faced man, with sandy eye-lashes and very sandy hair, with no good feature in his face, is made by the genius of the painter into a very remarkable person. In the portrait of his wife there is an elegance not very frequent in Rembrandt's works. Her dress, too, is treated in a manner that will supply a useful lesson to many a portrait-painter.

Lord Suffolk's Leonardo, "La Vierge aux Rochers," is not a picture to win one at first sight; yet it gains on acquaintance, and one leaves it reluctantly, saying, "What a noble fellow was Leonardo—what divinity he put into his heads—what exquisite drawing into every limb!"

Lord Northwick's "Portrait of John Fisher, Bishop of Rochester, with the Cardinal's hat in his hand, which had been sent him by Pope Clement VII.," is a capital specimen of the master—fine in expression, fine in drawing, fine in colour. The very hands seem to convey the sentiment of the head. Let the portrait-painter examine the Fisher with care, and try and catch its excellences without its severity.

Of the new fine Hobbema's, we are inclined to prefer Mr. Holford's to Mr. Ford's. Mr. Holford's is a clearer, brighter, gayer picture, Mr. Ford's is perhaps a little too brown; but still, how fine it is! What lessons may Creswick, and Lee, and Redgrave read in every part of it!

Of the "Trumpeter," by Terburgh, Wilkie puts it "in the manner of Introduction." Wilkie has more character and equal finish; Terburgh, more elegance and finish, and a happier description. We ought to have had the Wilkie here: the two should have hung together.

The example of F. Mieris contributed by Mr. Hope was painted when he was only twenty-six years old, and is one of his great masterpieces. The picture is small in size, and insignificant in story—a fiddler at a window, with his fiddle on one side, some shrimps at the other, and a woman with her back turned scoring his reckoning. Something out of the picture has engaged his attention, and thought of the peculiar character was never better expressed.

The English school, we are sorry to say, is very badly represented. There is one very fine Sir Joshua, and another "Master Bunbury" that is good—two out of at least six specimens. The Richard Wilsons are equally bad examples. The Lawrences are poor almost beyond belief; and Wilkie is not fairly represented by his Spanish pictures, which injudicious friends are too often re-dragging into notice. Yet there are a few fine English pictures: the best specimen, though in a dirty state, is Jackson's (we have seen for some time the large Gainsborough-like picture of his best period); and the portrait of Flaxman, by Jackson, full of fine qualities, and very like the great sculptor.

In our notice of the opening of the Exhibition of the British Institution, we thus characterised the gem, "The Jewess," the only picture by Mr. F. Goodall in the collection. Its appearance in our columns has been unavoidably delayed until this occasion:—"The scene is a cottage interior, peopled by a humble family group. The children are hushed to silence. The matron listens with downcast eyes, while the patriarchal grandfather offers thanks for the meal. The details of this exquisite little work are as highly finished as the most delicate miniature; yet the individuality and expression are fully preserved, while the sweet pensiveness of character which attaches to the work gives it an additional claim upon admiration."

EXHIBITION OF THE ROYAL ACADEMY.

WE have had occasion, in former years, while noticing the exhibitions of the London season, to introduce our readers to the facile pencil of Mr. Solomon. This year he has chosen an incident in the life of Goldsmith for a subject, and has sought to embody the following passage in the life of the delightful novelist:—

Oliver Goldsmith, towards the close of 1762, removed to "Merry Islington," then a country village, though now swallowed up in omnivorous London. In this neighbourhood he used to take his solitary rambles, sometimes extending his walks to the gardens of the "White Conduit House," so famous among the essayists of the last century. While strolling one day in these gardens, he met three damsels of the family of a respectable tradesman, to whom he was under some obligation. With his prompt disposition to oblige, he conducted these about the garden, treated them to tea, and ran up a bill in the most open-handed manner imaginable: it was only when he came to pay that he found himself in one of his old dilemmas—he had not the wherewithal in his pocket. A scene of perplexity now took place between him and the waiter, in the midst of which came up some of his acquaintances, in whose eyes he wished to stand particularly well. When, however, they had enjoyed their banter, the waiter was paid, and poor Goldsmith enabled to convoy off the ladies with dying colours."—*Washington Irving's Life of Goldsmith*

Mr. Solomon would have found the incident related in a manner equally true, and in a way still better suited for the pencil, had he consulted Mr. Forster's admirable life of the great novelist and

post. But he has made out the incident by what he calls "An Awkward Position," with artistic skill more worthy of the occasion.

The illustration on page 541 is Mr Hardy's only contribution to the present Exhibition: it shows us the interior of a country church, with an exemplification of "the Pharisee and publican" personified by a [illegible] of the picture; and on the left kneeling in fitting humility a hardy son of toil. The contrast of affectation and simplicity is good, and the scene is altogether an impressive illustration of the sacred precept.

THE BRIDGEWATER GALLERY.

(*Continued from page 482.*)

The history of the acquisition of the Orleans collection—the choicest portion of the Bridgewater Gallery—deserves to be told.

At the outbreak of the French Revolution, under Louis XVI., the Duke of Orleans, the wretched Philippe Egalité, to raise money for political purposes, sold the Italian portion of his pictures for 750,000 francs £18,500), and the Flemish and Dutch pictures for 350,000 francs—about £9000, or something less than half their then value. M. Laborde de Merville, the purchaser of the Italian portion, conveyed his rich acquisition to England, and, after a time, was reduced to mortgage it in this country for £40,000 to Harman's bank. From Harman's house they were bought by the Duke of Bridgewater, at the instigation of Bryan, author of the "Dictionary of Painters," for £48,000. The pictures, amounting to 308, were then valued, separately, by Mr. Bryan, at £72,000; and from the 308 the Duke selected 94 of the finest, at Bryan's prices, making, in the whole, for the 94, 39,000 guineas. The Duke subsequently admitted his nephew, the first Duke of Sutherland, and the Earl of Carlisle, to share his acquisition; resigning to the former a fourth part, and to the latter an eighth of the 94 pictures. The exhibition and sale of the rest produced £41,000; consequently the speculation turned out most profitably; for the 94 pictures, which had been valued at 39,000 guineas, were acquired, in fact, for £2000. The Duke bought with spirit and taste, and well deserved to obtain his 47 pictures for so insignificant a sum.

The Spanish school, in the Bridgewater Gallery, is not represented by more than one specimen, and that is a fine one—the full-length, by

THE BRIDGEWATER GALLERY.—"THE HAY CART."—PAINTED BY PHILIP WOUVERMANS.

Velasques, of a natural son of the Duke d'Olivares. How elegant! how Spanish is the whole bearing of the figure! how easy and nobleman-like and admirably painted is the whole picture! As indifferently represented as the Spanish school is the great school which gave us Rubens and Vandyke. To see Rubens to advantage in England, the student must go to Blenheim or the Grosvenor Gallery; to see Vandyke, he must run to Windsor or to Wilton. To understand and appreciate the Dutch School, there is no occasion to go out of England—the private collections in this country containing nearly the whole of the best examples of the school. Jacob Ruysdael, from the Queen's collection at Buckingham Palace, at Lord Ashburton's, at Sir Robert Peel's, at Mr. Hope's, at the National Gallery, in the collection of the Earl of Ellesmere, and in other private houses throughout England. What a school for study is to be found in every picture-gallery in Sydney Cooper has built his style on Cuyp, and our water-colour painters are under infinite obligations to Wouvermans. The pastoral sunshines of the former, and the hay-yards and river scenes of the latter, have supplied subjects and hints to thousands of artists—many artists living by skilful repetitions and adaptations of their beauties.

The works of Philip Wouvermans are well worthy the attention and close examination of a painter. One of the pictures in the gallery, which Sir Joshua admired, in his journey through Flanders and Holland, was the "Hay-cart"—a similar subject to the picture by the same master, now in the Bridgewater Gallery, and engraved in our present Number. Wouvermans has three distinct manners of painting: his middle manner is his best; his early and late styles wanting that liquid softness of touch so characteristic of his middle period. He drew horses to great perfection—with equal correctness and spirit—of a beautiful form, and always in unison with their forms. The favourite grey horse is to be found in almost all his works; and many young collectors and connoisseurs have had a picture imposed upon them as by Wouvermans, from the fact that a grey horse formed a principal object in the foreground. Wouvermans was born in 1620, and died in 1668; and the collections in this country are especially rich in his best works. Her Majesty has a fine "Hay Harvest" of his middle period; Mr. Hope, one of his finest works, in a different style; and Sir Robert Peel, the last picture he ever painted. Peter Wouvermans was an inferior artist to his brother Philip.

MUSIC.

PHILHARMONIC SOCIETY.

At the seventh concert, last Monday, the symphonies were Haydn's No. 2 (grand) in D, and Beethoven's No. 7 in A; and the overtures were Beethoven's "Coriolanus" (encored), Weber's "Ruler of the Spirits," and Mozart's "Zauberflöte." Here was a magnificent assemblage of instrumental inspirations, eminently calculated to display the powers of the fine orchestra under Costa's direction to the highest advantage, and great was therefore the enjoyment of the auditory: Beethoven's wonderful conception, the No. 7, being the prominent item of attraction. Its execution was unprecedentedly grand, finished, and imposing: the pianissimo won from the players by the skilful conductor, and the management of the crescendo in the allegretto in A minor, must be quoted as the triumph of executive feeling and precision, and great was the sensation. Mr. Henry Blagrove, who is the first English violinist, performed Spohr's second concerto, with his well-known purity of tone and faultless mechanism; he was immensely applauded, both by his colleagues and the company. Mdlle. Charton sang effectively the grand scena from Weber's "Der Freyschütz," and Queen Elizabeth's air from Ambroise Thomas's opera, "Le Songe d'une Nuit d'Été, in which her Majesty avows her affection for the poet Shakspeare in these strains:—

> Mon Dieu! laisse à mes âme
> Sa douce et pure flamme;
> Du haut de ma grandeur,
> Veux-tu sur lui baisser

Mr. Thomas makes the Queen depict her emotions in a series of vocal variations, precisely as he has done with the *gruelle* in the "Café." It is possible that the French composer never heard Mendelssohn's music to the "Midsummer Night's Dream."

M. Stockhausen gave artistically an air from Boieldieu's "Red Riding Hood," and Herr Formes sang the "Non più andrai" of Mozart, having been engaged in the absence of Mr. Sims Reeves, who had a severe cold and hoarseness. The final concert of the series will be on the 23rd of June.

MUSICAL UNION.

At the fifth meeting, on Tuesday, the scheme comprised Mendelssohn's Quartet in E flat, No. 5, Op. 44, and Mozart's Quintet in G minor, finely executed by Ernst, Deloffre, Hill, Webb, and Seligmann; Beethoven's pianoforte trio in D, Op. 70, played by Halle, Ernst, and Seligmann; and the "Ave Maria" of Schubert, exquisitely rendered by the new violoncellist, M. Seligmann, a player of great and deserved repute in Paris. The fourth extra meeting will be next Tuesday; and the Director's annual *matinée* is fixed for the 24th, at which there will be the "lions" of the season combined in one programme.

BEETHOVEN QUARTET SOCIETY.

At the ninth performance, and sixth evening meeting, last Wednesday, at the Queens Anne-street Rooms, the quartets were No. 5, in B flat, Op. 18, and No. 11, in F minor, Op. 95, besides Mendelssohn's quatuor, No. 5, in E flat, Op. 44, and the andante in E, and scherzo in A minor (encored), of his posthumous works. These classic productions were finely executed by Ernst, Cooper, Hill, and Rousselot. No. 14 of the Beethoven set has not yet been performed. The tenth meeting of the season will be on Wednesday evening, the 25th, for the benefit of M. Rousselot, the director, who has ably and unostentatiously exerted himself for the society.

SOCIETY OF ARTS.

At the fifth "conversazione," held on Thursday evening, at the rooms in the Adelphi, which were filled with a numerous and fashionable assemblage, including several foreigners of distinction, in addition to the display of divers works of art, a performance of English glees and madrigals took place. The scheme comprised Sir H. R. Bishop's "Breathe, my harp," and "Oh! bold Robin Hood;" Webbe's "Discord, dire sister;" Callcott's "Would you know my Celia's charms;" Horsley's "Nymphs of the forest," and "By Celia's arbour;" Calcott's "With sighs, sweet rose;" W. Beale's "Come, let us join the roundelay: Danby's "When Sappho tuned," and "L. Venosta's "Wreath now your Christmas sleigh ride." This second treat of English music seemed to be highly appreciated and relished by the company. The singers were Mr. Danby's "When Sappho tuned," and "L. Venosta's "Wreath now your Christmas sleigh ride." This second treat of English music seemed to be highly appreciated and relished by the company. The singers were Mr. Hatton, with his clever and character-ic accompaniments, was much admired.

We are glad to perceive that our native artists are not altogether supine during the Great Exhibition. Under the patronage of her most gracious Majesty, it has been resolved that our foreign visitors, as well as the amateurs at home, shall have the opportunity of hearing selections of the finest English glees and madrigals, one of the great specialities in art in this country, conducted by Mr. Pearsall, of her Majesty's Chapel Royal. The first of the series of performances will take place this day, at Wilis's Rooms, and our principal singers are engaged as executants.

WORCESTER MUSICAL FESTIVAL.

The honorary secretary of the grand gathering in this ancient and interesting city, during the last week in August next, has had the good fortune to engage the rival *Fachesi*, Mdlle Parodi (of Her Majesty's Theatre), and Signor Tamberlik (of the Royal Italian Opera) together with Miss Birch (our eminent soprano), Misses Williams and Dolby (the fine contralto), the two great English tenors, Lockey and Sims Reeves, and the famous Herr Pischek, the Austrian basso. Nothing disparaged by the attractions of the Exhibition, twelve gentlemen of the county and city have come forward in the cause of charity and art to officiate as stewards.

MUSICAL EVENTS.

Mr. Frederick Chatterton, the harpist, gave his seventeenth annual concert on Monday morning, at Willis's Rooms, St. James's, assisted by Mdlle. Coulon (piano), Herr Goffrie, and Miss R. Collins (violin), M. Rousselot (violoncello), Regondi, Oberthür, and the Lockwood family. Mr. Chatterton's pupils, Misses Lockwood, who played Mr. F. Chatterton's "Introduction" and "Grand March," composed in honour of Prince Albert. The vocalists were the Misses Birch, S. and C. Cole, Messers. B. Young, H. Rose, Sanctis, D. Sutton, Mdme. Lemaire, Mdlle. Rummel, Signor Arrigotti, and Mr. F. Bodda, with M. Kiallmark as accompanyist.

Miss Clari Allen had an evening concert last Tuesday, at Crosby-hall, aided by Miss Catherine Hayes, Miss Poole, Miss Rafter, Misses S. and C. Coles, Miss M. Collins, Miss Dora Mitchell, Herr Hengis, Messrs. F. Bodda, Rafter, G Perren, Ellis, Drayton, Camus (flute), Vioti Collins (violin), Madame Parish Alvars (harp), with Messrs. Lavenu and Gilbert as conductors.

The Russian Fandango Sentisteach de Beulpz, gave a morning concert on Tuesday at the Queen Anne-street Rooms, with the co-operation of Mr. F. Chatterton, Herr Hausmann, Don J. and R. Cobos, and Signora Nappi. Miss Emilie and Miss Catharine de Beulpz (eight years of age) were pupils, the latter playing Meyerbeer's "Robert, toi que j'aime." Miss Sophia is a pianist; Messrs. Lavander and Nicolai are singers, the latter being also a pianist. The Family Band of Beulpz, as well as executants, is composed of the same performers.

The Royal Society of Female Musicians, established in 1839 for the relief of its distressed members, held their annual concert for the benefit of the institution on Wednesday, at the Hanover Rooms, under the patronage of her Majesty, and the Duchesses of Kent and Cambridge. Mr. W. S. Bennett and Mr. L. Sloper were the conductors, and Mr. H. Blagrove the first violin. The solo players were Madame Parish Alvars (harp), Herr Tauer (piano), and Signor Bottesini (contrabasso), and the vocalists Misses Birch, M. Williams, Dolby, Nearne, Pyne, Mrs. Wilde, and Miss Louisa Pyne, Mdlle. B. Johannsen, and Mdlle. Zerr; Messrs Manvers, Lawler, and A. Braham, Herr Formes, Herr Reichart, and Herr Pischek.

Mdlle Coulon, the clever pianist, had her annual morning concert on Wednesday, at the Hanover Rooms, with the co-operation of M. Jaques Herz (piano), M. Frelon (organ), Mr. F. Chatterton (harp), M. Sainton (violin), and M. Rousselot (violoncello); with Messrs. L. Sloper, Biletta, and Frelon as conductors, and Misses Birch, E. Birch, Messent, Mdlle. Graumann, Mr. Herbert, M. Jules Lefort, Signori Marchesi and Tamberlik, vocalists

Miss Emma Busby, the pianist, with the aid of M. Tellefsen (piano), Herr Dieshmann (violin), Signor Piatti (violoncello), Mdlle. Johannsen, Mdlle. Graumann, and M. Stockhausen, gave a *matinée musicale* on Thursday, at the Beethoven Rooms, Harley-street.

M. Szekely's (pianist) evening concert took place on Thursday, at the Queen Anne-street Rooms, aided by Miss Bassano, Herr Reichart, M Remyndi, the Hungarian violinist; Piatti, and Hausmann.

Mrs Sinclair, at the Music Hall, on Friday night, presented a new entertainment, "The Jacobite Bridal," entitled "Mrs Sinclair sans Culotte," with herself as pianyist

Mdlle. Graumann had a *soirée* on Friday, assisted by Mdlle. Johannsen, Mrs. Endersohn, Sig. Marchesi, Herr Stockhausen, Herr Ernst, Sig. Piatti, Herr Eckert, and Sig. Biletta.

Mr. W. Binfield gave a morning concert, at Willis's Rooms, on Friday.

The Sacred Harmonic Society performed at Exeter Hall, last night, under Costa's direction, Haydn's "Creation." Miss Catherine Hayes, Miss Birch, Mr. Sims Reeves, and Herr Formes were the principal vocalists.

A grand subscription concert, under the patronage of the Lord Mayor, was given last night at the City of London Literary and Scientific Institution, at which Miss Catherine Hayes, Mr. Sims Reeves, Miss Poole, Miss Dyles, Miss Woolf, Mr. Augustus Braham, Mr. G Buckland, and Herr Mengis appeared

The musical arrangements for the ensuing week comprise the annual concert of the excellent institution, the "Choral Fund," on Monday evening, at which Mr Joun Parry's "Notes;" and, in the morning, the first grand concert at Her Majesty's Theatre, with all the resources of the establishment, and Sworl, who will play Paganini's celebrated violin concerto. At Mr Distin's quartet concert, and M. Billet's *soirée*, will also be held on Monday.——On Tuesday, Miss Dolby and Mr. Lindsay Sloper will have a morning concert; and the "Musical Union" will have a meeting.——On Wednesday, Mr. Hullah's eighth and last concert of ancient and modern music will take place, at which new works by Mr. Frank Mori and M. Charles Gounod will be executed, and M Stanislas Bavid's "*Matinée Littéraire et Musicale*," with the aid of Madame Viardot, will be given at Stafford House, by the kind permission of the Duchess of Sutherland.——On Friday, Mrs. Anderson's annual grand morning concert will be given, at the Théâtre de l'Opéra Italien Opera, with the entire vocal and orchestral resources of the establishment, and other *artistes* of note. Mr. G. Case will have a concertina *matinée*; and Messrs. H. and F. Blagrove a quartet *soirée*, on Friday.——A grand festival of military music, including 350 players, will be given on Tuesday and Wednesday, in the gardens of Chelsea Hospital, in aid of the funds of the Brompton Hospital for Diseases of the Chest. The *matinée* of Miss Kate Loder, and of Regondi and Kiallmark, take place this day.

FOREIGN MUSICAL NEWS

The three-act comic opera, "Raymond; ou, le Secret de la Reine," the libretto by MM. Rozier and Leuven, and the music by M. Ambroise Thomas, was very successfully produced in Paris, on the first inst., at the Théâtre de l'Opéra Comique; the Man with the Iron Mask is the hero of the story. Auber has just received from the King of Prussia the Cross of the Order of Merit in Science and Fine Arts.——Standigl has been singing lately at Leipsic.——Liszt is to be the new Intendant General of the Grand Ducal Weimar Theatre.——The new Intendant of the Berlin Royal Theatre has resolved to abolish the *claque*, all persons receiving orders are prohibited from expressing approbation or disapprobation.——Four works by Frederick the Great have just been published for the first time in Berlin.

THE THEATRES.

HER MAJESTY'S.

The Queen and Prince Albert, accompanied by the Duke and Duchess of Saxe-Coburg-Gotha, and Duke Ernest of Wurtemberg, Prince Leiningen, Prince Edward of Saxe-Weimar, and the Duke of Cambridge, honoured the second representation of Donizetti's "Don Pasquale" with their presence on Saturday night. The acting and singing of Madame Sontag and Lablache were immensely applauded, and the lively opera went off with the greatest animation. The ballet, "Le Diable à Quatre," concluded the entertainments, Carotta Grisi appearing for the last time but one: she danced with more than ordinary grace and vivacity

On Tuesday night "Fidelio" was repeated for the fifth time, followed by the Waltzen ballet "L'Île des Amours."

On Wednesday, for the first time in England, the last appearance of Carlotta Grisi, the inimitable *danseuse* danced in selections from "Les Metamorphoses," "Le Diable à Quatre," "Esmeralda," and "Les Cosmopolites" "Norma" was the opera, "with the "Se fatal" duo by the two Lablaches, and the air from "Gustave" sung by Mdlle. C. Duprez.

The Italian adaptation of Scribe and Auber's "Enfant Prodigue," under the title of "Il Prodigo," was produced on Thursday. This five-act lyrical drama was brought out at the Academie Nationale de Musique, in Paris, on the 6th of December last. The director and lessee of Her Ma,esty's Theatre had made some arrangement for bringing out the opera in London, in 1850, but, owing to the delay in its production at the Parisian Grand Opera, his intention was frustrated. This, however, has proved to be a fortunate circumstance for the London manager, as the opera *de genre* of the Opéra Comique will be a cast which completely extinguishes the French one, as will be seen by the annexed names of the *artistes* of

	LONDON.	PARIS.
Jefiele	Madame Sontag	Mdlle Dameron.
Nefte	Madame Ugalde	Madame Laborde.
Lia	Madame Castellan	Mdlle Flenkell.
Azaele	Signor Gardoni	M Roger.
Reuben	M. Massol	M. Massol.
Boccorra	Signor Coletti	M. Obin.

To appreciate the value of the magnificent disposition of characters at our Italian Opera-house, beginning with the incomparable Sontag, it must be recollected that Madame Ugalde is the *prima donna* of the Opéra Comique, who acquired European fame as a singer of the florid school, and that she sings also the complete of the young camel-driver, given in Paris by Mdlle. Fetit-Brière. Of Roger, Gardoni, and Coletti it is only necessary to say that they are on a par comparison with the French cast; but Mr. Lumley in securing Massol made a veritable coup de théâtre, for there are not a few amateurs in Paris, who prefer and that to play the "Enfant Prodigue" without Massol, would be to give "Hamlet" without the *Prince of Denmark*. Massol, in fact, created such a sensation in Paris by his singing of *Reuben*, that the opera was mainly owing to him and the *divertissements*: here his glory will in no way be diminished; but the two *prime donne* must share largely the honours of the splendid *ensemble*. The minor parts of *Anancphis*, *Nemoel*, *Gompsay*, *Dantonie*, &c. Mr. Marshall has painted some beautiful scenery, and the genera *mise en scène*, under Mr Harris's skilful and tasteful decoration, has worthily rivaled the famed one of the Paris National Opera.

The dramatic and musical situations in "Il Prodigo" are briefly as follow — The scene opens in the Valley of Gessen, with a picture of patriarchal life, as in the parable of the Prodigal Son. *Reuben* is the master of the flock; his son *Azaele* is betrothed to *Jefiele*; an unalloyed happiness is in store for the united family, but for the appearance of *Anancphis*, the Egyptian adventurer, who poses as brother and sister, and who infuses in the imagination of *Azaele* with such a glowing description of the glories of Memphis, that he is raving to visit the famed city, and *Jefiele* persuades her father-in-law to allow him to depart with *Amenophis*. In this act there is a fine prayer for the chorus a beautiful melody for Massol, with delicious accompaniments; a brilliant solo for Madame Ugalde, with a cavatina for the tenor; a dramatic duet for Madame Gardoni and Massol; a touching romance, in six-eight time, for Madame Sontag, with a clever instrumental under-current and a spirited finale depicting the sun's departure and the night.

In the second act we are in Memphis. *Azaele* is already plunged in dissipation, tempted by *Amenophis* and *Nefte*, and allured by *Lia*. In a chorus and solo, *Azaele* expresses his love for pleasure; the glorious march and procession of the bull Apis takes place, and is followed by an air of the High Priest (Coletti), and the entrance of the Almees, with the *pas de la séduction d'Io*, and the *pas des pagnotes*, for which Auber's music is especially beautiful. *Reuben*, with *Jefiele*, visit Memphis, to seek for *Azaele*, who is unrecognised by them in his rich attire. Here Massol sings the touching romance in G major with such sublime effect as to take the house by storm. In the march of the bull Apis, the ophicleide imitates the low bellowing of the bull ingeniously. The procession on the banks of the Nile, and the chorus to Isis, conclude this act.

In the third act are the orgies of *Boccorra* and his followers. Mdme. Sontag has a grand duo with Gardoni, besides a romance; and there is a concerted piece, in which *Azaele* is thrown into the Nile, after having saved *Jefiele* from the fangs of *Boccorra*. The *mise en scène* of this act defies description

In the fourth act, which opens in the desert, *Azaele* is seen in the lowest state of degradation and misery: Madame Ugalde sings the touching romance, "Tire, tir," with the quaint accompaniment of the bells; *Nefte* has another piece of exhilarating brilliancy, which displays the singer's vocal powers; and Gardoni has a grand scena, combining first an air of despair, and succeeded by a dream, in which there is his once happy home promised to him, and he resolves to return. Auber has been wonderfully successful in this scena, which is a perfect gem

MR. THACKERAY'S THIRD LECTURE.

This lecture, deferred from Thursday week on account of Ascot, was delivered last Thursday to a very numerous and highly respectable audience. The subject was R chard Steele. Mr Thackeray began with stating that a perfect man would be intolerable. He could not love, for an entirely just man could not love one better than another—a beautiful. vacuum better than a hunchback. To him the mental gift in loving would be absurd. He could not love, for he could not die. Selfishness is expedient, and faults are the conditions of character and conduct. Why not acknowledge at once that light is the cause of darkness, and death of life! With this tragical web of joy and grief lies the business of the humourous writer. Steele was far from perfection as a man and an author; weak and gentle, an easy prey, his life was endangered by the strange variety of good and evil fortune. At the Charter-house the lecturer had seen the furrule with which, no doubt, Dick Steele was corrected when a naughty boy. His little cane, with the crook the head boy of the school was as a demi-god. Joseph Addison was this object of wonder and admiration to poor Dick Steele, and continued to be such in the world. Steele commenced authorship as the fervent writer of "The Christian Hero," an amused his friends by the assumption of devotional seriousness—and truly, continued Mr. Thackeray, "a theologian in liquor is not a respectable object." From the rapture of Steele was not exempt. Steele's "Tatler," in their pleasant wit, were equal to Addison's

"Posterity," said Mr. Thackeray, "had been kinder to Steele than his contemporaries." The women should especially be his advocates, for he was the first writer who treated them with becoming respect. Mr Thackeray hinted that Shakespeare was deficient in this grace—a heresy we know once uttered, but which the more accurate criticism of modern days has disproved Swift scorned, and Addison laughed at, women. Steele it was who first paid a manly homage to their quickness and their understandings. His correspondences with his wife is as charming as it is artless.

But he was always in debt, and indulged in the gross manner of living common to the age in which he flourished. Mr. Thackeray drew a picture of a sort of "Barmecide Banquet" for eight people, which might serve to justify Steele on the objectionable points of his biography. He likewise compared passages from the essays of Swift, Addison, and Steele, to distinguish by the styles and dispositions of the three men. Not the deepest of thinkers, not the most brilliant of wits, Steele is our friend, and it is this which commends this kindest of writers to the affections of his readers.

Mr. Thackeray has very much improved in his delivery, and was sufficiently audible: but the change in his position is not an improvement. Sound radiates, and it requires much more force to project the voice from one end to the other, of so long a room, than from one of the sides to the opposite.

NATIONAL SPORTS.

Ascot and Hampton being over, the home spring circuit may be said to have closed, for we see nothing at all calculated to attract the metropolitans before Epsom. The provincials, therefore, are coming into play, and for some time to come, we shall have six or eight meetings every week. For that ensuing, there are six on paper, viz. Newton and Bibury, on Wednesday; Stockbridge and Barn-taple, on Thursday; and Lenham and Winchester. The following razettas also take place:—On Monday, at Lambeth and Chelsea: on Tuesday and Wednesday, at Henley; and on Wednesday at the Temple; besides three for near smaller affairs. The cricketing calendar shows the following matches:—Monday, at Lord's, Banbury, Wickham, and Stonbridge; Tuesd y, at Woolwich and Wickham; Wednesday, at Oxford, and the Oval, Kennington; Thursday, at Lord's, at the Oval, and Canterbury and Ross.

TATTERSALL'S

MONDAY.—There was an immense crowd in the room this afternoon; but, owing to the time necessarily occupied in settling the Ascot accounts, very l tle business was done on future events. Enough, however, was got through to admit of the following quotations:—

WURRY AND MIDDLESEX STAKES		
4 to 1 agst Abdallah		
NORTHUMBERLAND PLATE.—4 to 1 agst Udali.		
GOODWOOD CUP.		
10 to 3 agst Ephesdale]	10 to 1 agst Wat-Horse]	] 10 to 1 agst Montes
	10 to 1 —— Young Aislaidara]	
	ST. LEGER.	
7 to 2 agst Aphrodite]	7 to 1 agst Hernandez	] 10 to 1 agst Miserrima
	DERBY	
15 to 1 agst Brother to Elf-	20 to 1 agst Yorick (t)	] 33 to 1 agst Clarendrace

28 to 1 —— Rome-brawcal (t)	33 to 1 —— Daniel O'Rourke	40 to 1 —— Augur (t)
	(t)	

THURSDAY.—No betting.

HAMPTON RACES.—WEDNESDAY.

The commencement of Manchester races, on the same day, by drawing away several patrons, either owners of horses or members of the ring, to some extent prejudiced the gathering on Wednesday on Moulsey Hurst. It happened fortunately, however, that after two wretchedly cold wet days the weather proved extremely favorable. This, and an unusually good list, the results of an improved and more liberal management, attracted a large company, the attendance, although it evidently lacked something in fashion, being in numbers fa.ly up to what we have usually seen on the first day.

The racing does not call for a very lengthy report.

The Grand Plate of £50, added to a Sweepstakes of 5 sovs each.—Mr. Goodman's Lollipop, 1. Mr. Merry's Ironmaster, 2.

The Surrey and Middlesex Stakes (Handicap) of 50 sovs each.—Mr. R. Barrow's Abdallah (G. E. Sharp), 1. Major Pitt's Vamypre (Sly), 2.

The Innkeeper's Purse of 30 sovs added to a Sweepstakes of 5 sovs each.—Mr. Payne's Fawn Pas (T. Smith), 1. Mr. F. P. Rolt's Preslaw (Sharp), 2.

The Claremont Stakes of 10 sovs each. Major Martin's Lady Isabel (W. Adslade), 1. Captain Lowther's Barbara Bell (Thompson), 2.

A Plate of £50, given by the South-Western Railway, added to a Sweepstakes of 10 sovs each.—Mr. J. G. Douglas's Leybourne (Hammond), 1. Major Martyn's The Moor (W. Adslade), 2.

TUESDAY.

The extremely wretched state of weather caused a very thin attendance; everything looked gloomy and desolate. The horses, however, started punctually at the appointed times.

The Richmond Stakes (Handicap) of 10 sovs. each, with 50 added.—Abdallah (Gregory), 1. Harry, 2.

The Queen's Plate.—Mr. Bewley's Presto (Sharpe), 1. Mr. Goodman's Chaddington, 2.

The Secret Stakes (Handicap) of 10 sovs each.—Mr. May's Reindeer (Mr. Bevile), 1. Mr. Carew's Eva, 2.

MANCHESTER RACES.—WEDNESDAY.

The Biennial Stakes of 10 sovs each, and 50 added. For two-yr-olds.—Mr. J. Osborne's Merry Bird, 1. Mr. Folley's Trousseau, 2.

The Pandora Stakes of 10 sovs each, with 100 added.—Mr. Halford's Prime Minister. 1. Mr. Critchley's Kingfisher, 2.

The Union Cup of 200 sovs, added to a handicap of 5 sovs each.—Mr. J. Osborne's Ta Ta Girl, 1. Mr. W. Mosley's Alonzo, 2

The Biennial Stakes of 10 sovs each, and 50 added. For three-yr-olds.—Mr. Saxon's The Black Doctor, 1. Mr. J. Lillie's Queen Bee, 2

TUESDAY.

Handicap Stakes.—Le Juif, 1; Aristocrat, 2.

The Two Years Old Stakes.—Paddy Bird, 1; High Sheriff, 2.

The Trades' Cup.—Paquesta, 1; Black Doctor, 2.

Novel Theatre in Paris.—A new theatre has been built in Paris, the interior arrangement of which is of an entirely novel construction. It is situate in the Rue Neuve St. Nicolas, and has been built under the direction of an enterprising gentleman named Barthélemy. The form of the interior is that known as the horse-shoe—it is sufficiently capacious to contain 3000 spectators, and from every part of the house a good view can be obtained of the stage without the least inconvenience. The roof is entirely round, the centre being so arranged that the sound can be transmitted to all parts of the theatre, and that so easily, that, with a smaller number in the orchestra, and with less exertion to the singers or actors, much greater effect is produced. One of the most striking of the changes presented to the eye of the spectator is the situation of the orchestra; instead of being, as is at present the case, placed in front of the spectator, where often times, if they do not obstruct the view of those on a level with them, they frequently divert the attention by a moving forest of fiddlesticks, they are placed over the front of the stage, in a manner out of sight. The *chef* alone retains his place, where he can at once direct the singers on the stage and the instrumentalists. Another alteration, and in this case an undoubted improvement, is the removal of the foot-lights, thus at once clearing away an obstruction to the spectator, and a great source of annoyance to the actor, by the constant dazzling of the lights in his face. The effect of throwing a strong light on the stage is amply provided for by a different arrangement of a sort of chandelier in the roof, by which the strongest light is thrown on the necessary parts, without at the same time causing the slightest annoyance to that portion of the spectators who are in the upper portion of the house. The curtain, too, instead of falling from the roof, are made to revolve on a pivot in the most satisfactory manner. They are not at opaque, as in other theatres, but, by a peculiar arrangement, and by adopting different degrees of transparency, some good illusions are produced. A public experiment of the changes in the new building is shortly to take place, in the presence of a commission named by the Minister of the Interior, at which a great number of the members of the National Assembly are to be present.

The Emperor of Russia had a narrow escape from destruction on a railroad near Cracow, when returning from Olmütz to Warsaw recently. Notice had not been sent up the line of the intended departure of the Imperial train, and when near a station the carriage of the Emperor's was saved from collision with another train solely by the presence of mind of the engineer who drove the locomotive of the Emperor's carriage. By an extraordinary effort he brought the locomotive to a stand, and the signals to the approaching train were in time for its speed to be relaxed, so that no accident occurred.

CHESS.

TO CORRESPONDENTS.

J C W—The pieces are terribly crowded Can you not dispense with some of them?

Sir Edmund.—Your suggestion is quite impracticable at the present moment

Pawnpots, Lonelinster—You can refer to Staunton's "Chess Player's Handbook," published by Bohn, of any bookseller. The price is 5s

Moor Park.—You can castle your King "with a Castle that is in prize of your adversary's Queen"

B B, Torquay.—You are quite mistaken. Look at the position again attentively

Judy.—Many thanks for many obliging communications

Juvenile.—We have not time to wade through your interminable variations at this bustling period

Rhuvo.—Simply because they did not stay until after our account was sent in

Argus.—Your subscription to the Tourney.st is in good time, as the list will not close till the termination of the contest Send by Post-office order, payable to Robert Longbottom, Esq 2c, George's Club, Cavendish-square "Chess Player's Handbook," published by Bohn,

A Merchant.—I Subscribers of one guinea and upwards, are entitled to a copy of the whole of the games played in the Tourney.st Matches. 2. A list of all subscribers will be given shortly, but we have not room for it just now

A Continental Player.—The 'h back volumes of the *Chess-Player's Chronicle* may be got of Hastings, publisher, Carey-street, Lincoln's-inn-fields

S S H—The word "chess" in the last sentence of the paragraph giving an account of the Tournament in the preceding Number of our Journal, is, as you suggest, an obvious misprint for "sing)

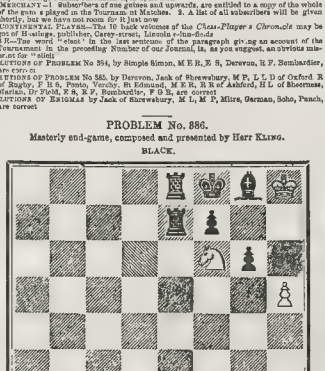
BLACK.



WHITE.

White to play, and mate in four moves.

GAMES IN THE CHESS TOURNAMENT.

The following well-fought games form part of the spirited Joust between Mr. Wyvill, M.P., and Captain Kennedy:

(Irregular Opening.)

BLACK (Mr. W.)	WHITE (Capt. K.)	BLACK (Mr. W.)	WHITE (Capt. K.)
1. P to B 4th	P to K 3d	19. Q to Q 3d (*d*)	Kt to K R 6th (ch)
2. Kt to Q B 3d	P to Q 4th		
3. P takes P	P takes P	20. B takes Kt	Q takes B
4. P to Q 4th	K B to Q Kt 5th	21. B to K B 4th	Kt to Q B 4th
5. P to K Kt 3d	Kt to K B 3d	22. Q to her B 4th	Kt takes K P
6. B to K Kt 2d	P to Q B 3d	23. Q takes Q R	P to K Kt 4th (*e*)
7. P to K 4th	Castles	24. P takes Kt	P takes B
8. K Kt to K 2d	B to K 3 4th	25. Kt takes P	Q to her 2d
9. Q to her Kt 3d	P to Q R 4th	26. P to K 6th	B to Q B 2d
10. P to Q R 3d	B to Q Kt 2d	27. Q to Q 4th	B to Q B 3d
11. Q takes Q Kt P (*a*)	Q R to his 3d	28. Q R to Q sq	R to Q sq
12. Q to her Kt 3d	Q Kt to Q 3d	29. Kt to K 2d (*f*)	R to K sq
13. Castles	K Kt to K 5th	30. B to Kt 2d	R to K 3d
14. Kt takes Q P (*b*)	Q to K Kt 4th (*c*)	31. Kt to K B 4th	R to K R 3d
15. Q Kt to K B 4th	Q to K R 3d	32. P to K 6th	Q to Q Kt 2d
16. P to K B 3d	Kt to K Kt 4th	33. P takes K B P (ch)	K to K B sq
17. P to K 4th	B to K 3d	34. Kt to K 6th (ch)	R takes Kt
18. Kt takes B	Q takes Kt	35. Q takes R	

And White surrendered.

(a) The books hazardous, but we believe it is quite sound.
(b) A remarkable move; as, as it is remarkable.
(c) If he had taken the Kt, the following moves will show that Black must have gained more than an equivalent for his Kt:

BLACK.	WHITE.	BLACK.	WHITE.
14.	P takes Kt	18. B takes Kt	Kt to K B 3d
15. Q takes P	B to K 5th	17. Q to her 4th, &c.	
(d) Winning a piece			
(e) Mere desperation			
(f) We should have preferred the more expeditious route of P to K 6th; for suppose—			
BLACK.	WHITE	BLACK.	WHITE
29. P to K 6th	B takes Q P (ch) (best)	32. P takes B, B P (ch)	K takes P (best)
30. R takes B	Q takes R (ch)	33. Kt to K 3d (dr covering ch and winning the Rook)	
31. Q takes Q	K takes Q		

BETWEEN THE SAME PLAYERS.

(Sicilian opening.)

WHITE (Capt. K.)	BLACK (Mr. W.)	WHITE (Capt. K.)	BLACK (Mr. W.)
1. P to K 4th	P to Q B 4th	17. P takes K B P	K R takes P

9. K to K R sq	Kt to K 2d	25. R to Q 3d	Q R to Q Kt 3d
10. Q to K Kt 4th	Castles	26. K R to B 2d	K to Kt sq (a)
11. Q to K 4th	Q R to Q Kt sq	27. Q R to K Kt sq	R to K 4th
12. P to K B 4th	P to Q 4th	28. R to K 3d	P to Q 5th
13. P to K Kt 4th	P to K B 4th	29. Kt to Q Kt 3d	R to K Kt 4th (*b*)
14. P to K 5th	P to Q B 3d	30. Q to K sq	Q to her B 2d (*c*)
15. P to Q Kt 3d	P to Q B 4th	31. P takes R	R takes It
16. K B to K 2d	Kt to Q B 3d	32. Q takes R	
	And wins in a few more moves.		

(a) The books like less time; but the tempting move of R takes K P would have been unwise. For example—

BLACK.	WHITE.	BLACK.
26.	R takes K P	26. Q to K Kt 5th
27. P takes B	R takes Q (ch)	27. Q to Q Kt 6th (ch)
28. Q takes R	Q takes P (ch)	28. Q takes Q B—and wins

(b) He should rather have played P to K 4th we think, and, in that case, White would have had a very difficult game to play

(c) This was an obvious oversight, and of course lost the game.

THE CHESS TOURNAMENT.

The world-absorbing attraction of the Exhibition has not been without its influence upon the votaries of Caissa, and a sensible diminution of playing has been evident on the five days of the past week. The culminating point of interest in the matches now appears to be the coming struggle between the last pair of competitors, and the promised after-match for 100 guineas aside, between the victor and any combatant who may dare him to a final contest for the honours of the championship. The following is the result of the play, up to the time we write, in the second section of encounters:—

In the match between Messrs. Andersen and Szen seven games have been played,

Andersen winning	4
Szen "	2
Drawn "	1.

In the match between Mr. Wyvill, M.P, and Captain Kennedy, eight games have been played;

Wyvill winning	4.
Kennedy "	3.
Drawn	1.

In the match between Messrs. Williams and Mucklow four games have been played, the former winning the whole.

In the match between Messrs. Staunton and Horwitz, four games have been played, each party winning two.

We have not space this week to give any detailed account of the progress of provincial contests. It must suffice to state, that, of the ten principal opponents Messrs. Brian, of Oxford; Baden, of Hull; Rauker,, of Oxford; and Hodges, of Reading, have been declared prize bearers, and have now to contend with one another in the second series of matches.

NAVAL AND MILITARY INTELLIGENCE.

Cavalry Regiments for the Cape.—It is reported that another cavalry regiment, in addition to the 9th Lancers under orders, will go to the Cape of Good Hope, in consequence of the unsatisfactory nature of the last Lieutenant. The 6th Dragoon Guards (carabiniers) is the first cavalry regiment which stands for foreign service, and will probably be selected.

The New Zealand Command.—It is understood that the late Major-General Pitt will be, anceeded by Lieut.-Colonel Wynyard, of the 58th Regiment, serving at New Zealand, and that no general officer will in future be appointed to this command.

The Infantry Reinforcements for the Cape.—Five hundred men of the 2nd Queen's Infantry are to proceed, about the end of this week, to the Cape in the *Megæra*, which steamer was ready for sea at Sheerness on Saturday: the remainder of the regiment, about 100 men, together with drafts from the *depôts* of the 6th, 45th, 73rd, and reserve battalion 91st regiments, will proceed to the colony in the Summer freight ship.

Strength of the Military Force in Ireland.—It appears from an official account, that the number of troops serving in Ireland have, in consequence of the quiet and improved condition of that country, been reduced from about 26,000 to the present strength of 18,000 men.

Leave of Absence to Officers of the Marines.—Colonels Commandant of the Portsmouth, Plymouth, and Woolwich divisions, have been authorised to grant leave of absence, not exceeding one week, between the 6th and 30th of this month, to such officers of the respective divisions as may wish to visit the Exhibition in Hyde-park

Settlement of Officers in the Colonies.—A memorandum has just been issued from the Horse Guards, which contains some deviations from the terms of settlement in the colonies hitherto in vogue For instance, the clause which gave to officers on half-pay residing in the colony where they proposed to settle all the privileges of military and naval settlers, without referring to this country for testimonials, has been altogether omitted. A claus has at the same time been added, fixing the upset price of land, at the Cape of Good Hope, at 2s per acre in the old colony, and 6s. per acre in the district of Natal.

The Paymasters and Pursers of the Navy.—The Admiralty have appointed a committee to inquire into the operation of the new pay and provision system, so judiciously introduced into the navy, as it affects the losses sustained by the paymasters and pursers; and the amount of compensation, and the mode in which it shall be granted, to this class of officers. The chairman of the committee is Vice-Admiral Sir Thomas Hastings Maitland, K.C.B., and among the members are Rear-Admiral Collier, C.B.; Captain Sir R. Grant, Captain Plumridge, Captain the Hon. F. Pelham, &c. We understand that the principal questions for the committee will be whether the paymasters and pursers shall be paid as at present or by a fixed salary.

SCHOOL FOR THE INDIGENT BLIND, ST. GEORGE'S FIELDS, SOUTHWARK.

The annual examination of the pupils of this excellent institution took place at the Institution on Friday, the 6th inst., under the presidency of the Bishop of Chichester. As it was found impossible to include all the subjects in one day, the pupils had been tested as to their attainments in secular knowledge on the previous Wednesday, by the Rev. G. E. Tate, Incumbent of St. Jude's, Southwark, and the Rev. Christopher Crofts, Head Master of Camberwell Collegiate School. These gentlemen attended the meeting on Friday, and delivered in their reports, which were highly satisfactory. They stated that the pupils had read, by means of the raised type, with perfect fluency; that the upper classes were thoroughly acquainted with arithmetic, and had worked difficult problems by means of the pentagonal arithmetic board; that they were able to write with facility, by means of an apparatus invented for that purpose; and that they displayed a very competent knowledge of etymology, English history, geography, and the use of the terrestrial globe.

The Rev. Jeffery R. Foot, the chaplain, then gave in his report of the state and progress of the Institution during the past year. He stated that the general health of the pupils had been excellent, no death having occurred during the year; and that the conduct of the inmates had been, with scarcely any exception, exemplary

The Bishop then proceeded to examine some of the pupils in portions of the Gospels of St. Luke and St. John, which they had committed to memory. Every portion for which he Lordship called was repeated with perfect accuracy, and a number of searching questions which he proposed were all answered promptly and intelligently.

The meeting was subsequently addressed by the Rev. J. W. Cunningham, Vicar of Harrow; the venerable Archdeacon Robinson, Master of the Temple; the Rev. C. B Dalton, Rector of Lambeth; and the Right Hon. Lord Radstock. After which the Bishop proceeded, in a very kind and condescending manner, to distribute some prizes which had been adjudged by the committee to the most deserving among the pupils.

During the examination, Mendelssohn's choruses, "For He the Lord our God," and "Holy, holy," from the "Elijah;" and Purcell's anthem, "Oh, sing unto the Lord," were effectively performed by the choir, which is wholly composed of blind persons; and at half-past five the company separated, highly gratified with all they witnessed and heard.

The School for the Indigent Blind was opened in the year 1799, and the number of pupils, which at first was 12, has gradually increased to 150, the number of inmates at present: 408 persons have been returned to their families, able to earn a livelihood, or, at least, a considerable portion of it, according to their abilities.

The male pupils are taught to make baskets of all descriptions, rugs, mats, cocoa-nut matting, shoes, and brushes. The females learn to knit, and execute every kind of needle work. The fine basket, a kind of rope of peculiar strength and utility. All the junior pupils are instructed in such branches of useful knowledge as are consistent with their position and prospects in life

The institution is open to the public every Thursday afternoon, between the hours of three and five. On other days, admission may readily be obtained by application to the chaplain or superintendent. There is also a public performance of sacred music on the third Wednesday in each month, at three o'clock P.M., tickets of admission to which may be obtained at the Institution.

A general court of the governors and friends of the Institution was held, on Thursday, at the London Coffee-house, Ludgate-hill; the Right Hon. Lord Radstock in the chair. It appeared from the report, that artiles manufactured entirely by the pupils had realised upwards of £1300 during the year. The receipts for the last quarter were £3384 19s. 4d., and the disbursements £3546 7s. 7d., leaving a balance of £838 11s. 9d. The accounts were adopted, and the meeting separated.

THE PHILANTHROPIC SOCIETY'S FARM, REDHILL.

The quarterly general court of the governors of the Philanthropic Society was held on Wednesday week, at the London Tavern, Bishopsgatestreet; Mr. William Gladstone in the chair. The Secretary stated that the number of inmates in the farm-school, at Redhill, was at the present time 80; 31 had been sent out as emigrants to Port Philip and New Brunswick, and 40 others had been provided with places in England. Since the 1st of January of the current year, 32 inmates had been admitted into the Institution. The total receipts to the 31st December, 1850, from all sources, was £16,410 1s.; and, after all expenses had been defrayed, there was left a balance in hand of £2084 2s. 7d.

We avail ourselves of this opportunity to introduce our readers to the economy of the Society in its new location at Redhill, an Engraving of which, on the occasion of the visit of his Royal Highness Prince Albert, appeared in the Illustrated London News for May 3, 1851.

The celebrated Mirabeau, some sixty years ago, urged with his natural vehemence the importance of placing all schools and institutions of benevolence at a distance from large towns and cities, and of making country and out-door occupations the staple of their training and employments. He grounds his arguments on the many disadvantages both as to health and economy which such establishments have to contend with when placed in populous and crowded neighbourhoods, where the children cannot have free exercise; where at every turn they must be met by some of the infectious influences and examples to which they owe their depravity or destitution—and where they can be reared only in the same spirit, and with the same aims and habits, as the miserable parents or associates who have deserted or corrupted them.

Just as this view appears, strengthened as it is by the importance of checking, in every way, the evident tendency of the rural population to locate itself in towns under the attraction of higher wages or less arduous occupations, very few of our schools or charities appear to have acted on it. The idea seems but rarely even to have been entertained, and, when canvassed, to have been almost immediately abandoned. Some approach to it was made in the planting of the St. Anne's Society Schools, at Brixton; a nearer one in the admirable but short-lived establishment of the Children's Friend Society, at Hackney. But it was not till public interest and public attention were aroused by the successful progress of the great French Convict School and Agricultural Colony, at Mettray, that any earnest effort was made to realise the view in England. In 1849, the Philanthropic Society, an ancient and respectable charity, incorporated for the reformation of young offenders, removed its establishment from Southwark to a farm of 130 acres at Redhill, the junction station of the Brighton and Dover Railways, and avowedly adopted a system of

THE PHILANTHROPIC SOCIETY'S FARM, AT REDHILL.

arm and garden employment for its young inmates, on the twofold ground that this would conduce most to their immediate improvement, both physical and moral, and be most ultimately useful to them as preparing them for emigration, an end to which they are trained to look as the great prize of their attainment.

This curious experiment has been commenced about two years, Prince Albert laying the first stone of the buildings represented in our Illustration, in April, 1849. But it can hardly be said to have had a fair trial till within the last few months, when the additional buildings being completed and the requisite machinery of masters, &c. being obtained, the Society began to work upon a larger scale. At the period of our visit the establishment at Redhill contained about 100 lads, varying from 11 to 20 years of age, almost wholly employed (under the superintendence of common country labourers) in the usual farming occupations. Some forty or fifty were pointed out to us as preparing to go abroad in the course of the spring and summer, as thirty-one had done during the year 1850. The farm appeared in good cultivation, several considerable portions being already under the spade. The stock included a score of good cows and fatting bullocks, a small flock of sheep, three horses, and from 100 to 200 pigs, of all ages and dimensions.

The boys appeared remarkably cheerful and healthy. We were assured that their employment on the land had presented much fewer difficulties than had been anticipated; and the vigorous way in which three or four comparatively little fellows were handling their spades and mattocks in the course of trenching a piece of stiff clay land, gave us good evidence that many of them at least had become useful and willing labourers. A curious feature of the School is the entire absence of walls and mere discipline officers. The boys are scattered in small parties over the farm, and seemed to have ample opportunities for making their escape. The discipline, however, appears to be well maintained and steadily enforced. It is, of course, grounded on moral influence and inducement; the officers being wholly educational, and the boys being treated on a strict system of personal responsibility. They have generally, we were assured, answered fully to the confidence placed in them; few, comparatively, having deserted from the school; little or no annoyance having been experienced by the neighbourhood; and the various penalties and corrections with which their faults have been visited having been borne with cheerful submission. The chief punishments appeared to be loss of diet, forfeiture of their little weekly earnings, and short solitary imprisonment.

On the whole, we were much struck by the evidence which the School afforded to the force of kindness, the beneficial influence of real country training, and the degree of self-regulation to which young natures can be brought; and we could not help joining in the wishes which the Chaplain (who is its immediate superintendent) expressed to us, that ere long more moral discipline and more industrial instruction might be introduced into our national and British schools, to the amendment of the system of mere mental and intellectual excitement which is still miscalled education; and that especially our pauper schools might be placed upon a similar footing, and the managers of our various charitable schools and asylums in London be induced to follow the good example which the Philanthropic treasurer (Mr. Gladstone) and his colleagues have set, and to transfer their various institutions also to a country site.

SCHOOL FOR THE INDIGENT BLIND.—EXAMINA[illegible] OF THE [illegible]—SEE PRECEDING PAGE.)

THE SISTERS CRUVELLI.

OUR Artists have given the portraitnre of the sisters Cruvelli, now engaged at Her Majesty's Theatre. Mdlle. Cruvelli, the contralto, has not yet made her *début*. she has only sung at Madame Puzzi's morning concert, on the 26th ult. Mdlle. Sophie Cruvelli, the *prima donna*, made her appearance in *Fidelio*, on the 30th ult., which part she has repeated five times, and *Norma* thrice.

The sisters were born at Bielefeld, in PRUSSIA, and are daughters of a Protestant clergyman. The remarkable talents displayed by the demoiselles Cruvelli, at an early age, for music, was the inducement to send them to Paris, SIX years since, to complete their education under Fermarini and Bordogni. Mdlle. Sophie Cruvelli sang for the first time in public at the concert given by the *Revue et Gazette Musicale*, in Paris, September 12th, 1847. It was Bordogni, the famed professor of singing at the Paris Conservatoire, who advised that she should essay the lyric stage: her original name Cruwel, was forthwith Italianised into Cruvelli; and from Paris she went to Milan, and presented herself to Merelli, the director of the Scala; but on the journey she had lost her voice, and was on the point of returning to Germany, when Lamberti, a *maestro*, was consulted, and in a little time her voice returned fresher and stronger than before. Before the close of 1847, Mdlle. Sophie Cruvelli made her *début* on the lyric stage, at Venice, as *Elvira*, in Verdi's "Ernani." She was then engaged for the London season of 1848, at Her Majesty's Theatre, and on the 15th of February she appeared for the first time in this country in the same part, an account of which, with her portrait, were published in the ILLUSTRATED LONDON NEWS of Feb. 16, 1848. She sang *Elvira* five times; *Abigaille*, in "Nino," twice; *Lucrezia*, in "I Due Foscari," four times; *Odabella*, in "Attila," five times; *Lucrezia Borgia*, three, *Rosina*, in "Il Barbière;" and the *Countess*, in Mozart's "Nozze di Figaro," to Lind's *Susanna*, several times. The star of the Swedish Nightingale was so completely in the ascendant during the season, that the promising indications of Mdlle. Cruvelli in the various characters she delineated were overlooked, and the young *artiste* returned to Germany, where she gave dramatic performances and concerts in divers places, appearing at the Berlin Royal Italian Opera just prior to the Revolution. From the Prussian capital she went to Trieste, playing Verdi's *Lady Macbeth*, *Norina* in "Don Pasquale," *Norma*, &c. Last year she sang, at Milan and Genoa, *Lucrezia Borgia*, *Norma*, &c., with the greatest success. Her last part was in a new opera, "Gondoliere," by Sig. Chiaramonte, a Neapolitan composer. In the second week in April last, Mdlle. Sophie Cruvelli made her first appearance at the Théâtre Italien, in Paris, under Mr. Lumley's direction, as *Elvira* to Mr. Sims Reeves' *Ernani*. Her reception was most enthusiastic, and she repeated the character several times to crowded houses. She is now in her twenty-second year: her face is of the Teutonic mould, and her figure of the middle height; her manner dramatic, and style energetic. Her voice is of extraordinary compass; and when she will have acquired the complete management of her vocal resources, and will abandon some youthful exaggerations, she bids fair to occupy the highest position on the operatic stage.

MADEMOISELLE CRUVELLI.

SCENE FROM "FIDELIO," AT THE ROYAL ITALIAN OPERA.—THE PRISONERS' CHORUS.

GRIEVE and Telbin's courtyard of the Spanish state prison, with the principal entrance in the background and the dungeons right and left, is an effectively arranged *tableau*, the effect of which is increased by the coming in of the prisoners, after they have received permission from *Rocco*, the gaoler (Formès), to take some fresh air in the garden, yielding to the earnest solicitations of *Fidelio* (Mdme. Castellan) and *Marcellina* (Mdlle. Bertrand).

SCENE FROM BEETHOVEN'S "FIDELIO," AT THE ROYAL ITALIAN OPERA.

EPITOME OF NEWS—FOREIGN AND DOMESTIC.

On Monday, his Royal Highness Prince Henry of the Netherlands, accompanied by Chevalier Van Rappard, Chevalier Casembroot, and Capt. R N., and suite, after a sojourn of seven weeks, left Mivart's Hotel, on his return to the Hague. Prince Edward of Saxe-Weimar and Baron Stratenus, Dutch Chargé d'affaires, accompanied his Royal Highness to Blackwall

The Prussian Minister of Trade, M. Von der Heydt, has proposed a congress of postal commissioners from all European Governments, in order to concert general arrangements for facilitating the conveyance of foot mails, eventually reducing postage, and drawing up uniform regulations for the communication of telegraphic despatches. He is said to contemplate a postage of twopence-halfpenny as the highest rate for a single or half-ounce letter within the contemplated great postal union of European states.

The funeral of Mr. Shell took place on the 28th ult., at the church of St. Michale Vestionni, at Florence. It was attended by the whole of the *corps diplomatique* and the Austrian and Tuscan generals and staff.

The Clackmannan and Kinross election has terminated in the return of Sir Ross-itude candidate, Mr. Johnstone, by a majority of 65 over his competitor, Mr. Adam.

Argyllshire election took place on Friday week, at Inverary. There being no opposition. Sir A. J. Campbell was returned.

A petition has been presented to the House of Commons, complaining of the return of Mr. Crawford for the borough of Harwich.

There is a Government Bill in the House of Lords which has just been printed, to amend the acts for granting of sites for churches. By the present law, the land for such purposes in a parish is limited to one acre, which limitation it is declared, where the population is large, "is found to be productive of inconvenience and to prevent the extension of the education of the poor." The word "parish," it is proposed, shall signify an ecclesiastical district in any divided parish, so as to increase the number of sites for the education of the poor.

Some very heavy falls of snow have taken place in the north of Ireland within the past week, and several districts, especially the hills, have been covered with snow some inches deep.

The Exeter protest against the prolonged Synod has received 67 signatures, including 11 who had already signed a similar protest which originated at Plymouth. Upwards of a hundred clergymen have thus already formally protested against the Synod, and the example will be followed by many more. The last day for receiving signatures will be Tuesday, June 17.

In a curious book on the round towers of Ireland, published some years ago, the origin of the term Taxkes-foodle was traced to the Persian phrase, "Taski doorlah," or "Inhabitants of the New World." Layard in his book on "Nineveh and its Remains," also mentions "Yanghi-dunia" as the Persian name of America.

The whole number of lunatics in the United States is 21,979, of which number New York has 4374, Massachusetts .040, Rhode Island 113, Pennsylvania 1739. It is estimated that, supposing 979 to have retired from practice, the annual emoluments of each practising lawyer are upwards of 1300 dollars, making the total income of the profession to be 21,500,000.

From a return which has been obtained at the instance of Mr. Anderson, it appears that the number of steamvessels that were registered at the port of London on the 1st January, 1851, was 392. At Newcastle, 138; Liverpool, 91; Shields, 70; Hull, 34; Sunderland, 33; Bristol, 31; Southampton, 24; Glasgow, 85; Leith, 23; Aberdeen, 21; Dundee, 19; Dublin, 44; Cork, 20, Belfast, 10, &c.

The Glasgow Police Statistics for the month of May show that no fewer than 823 *persons* were brought before the magistrate, charged with every conceivable crime and contravention—from child-murder and serious assault down to hanging clothes outside the windows. Out of the above total, the numbers brought up on criminal charges were 187, viz., 116 males and 71 females; and these were disposed of either by the sitting magistrates or remitted to higher courts the great majority of the prisoners, viz. 130, being accused of thefts. These criminals are not the deplorably ignorant beings they are generally supposed to be. Out of the 187 (many of them being under 13 years of age), 136 are able to read, and 79 able to read and write.

A whale of very large dimensions was taken on Friday week in Great Man's Bay, on the coast of Connemara (west of Ireland), and his capture was effected in rather an unscientific manner. The huge creature pursued some fish into a narrow creek where it was not wide enough to give him turning room, and there he stuck, and whenever he opened his immense jaws his assailants poured into the cavity large stones until they filled him so that teeth with grinder, an operation that took them a whole week to accomplish. In the end, however, they got a good supply of blubber for their labour.

Messrs. Russell, of Limerick, are about to commence the erection of an extensive flax factory adjoining their ship-building yard. The estimated outlay is £35,000.

In Cork, as well as in other ports of Ireland, a great diminution has occurred in the number of emigrants proceeding to America. The very favourable harvest prospects have probably had some effect in checking the emigration, which had been upon a scale of magnitude wholly unprecedented.

Mr. Somers, the banker for Sligo, who has been thereto opposed the Ecclesiastical Titles Assumption Bill in all its stages, appears, by the division list published on Saturday morning, to have committed the strange blunder of voting for Sir H. Willoughby's amendment—one of the most arbitrary and objectionable. The honourable gentleman has felt it necessary to explain the mistake. "I fell into the error," he candidly acknowledges in a letter to a contemporary, "from sheer inadvertence, being under the impression that I had passed into the lobby to which the opponents of the bill have invariably withdrawn

The new Property-Tax Act, which received the Royal assent on Thursday week, is only for one year from the 5th April next. The three former acts were for three years each, commencing from the 5th and 6th Vict. The powers contained in the acts are continued, and there is a new provision in the present respecting taxation. It is enacted, that, if at the end of the year of assessment any person occupying lands for the purpose of husbandry assessed under Schedule B shall find and prove to the Commissioners that the profits and gains have fallen short of the assessment, it shall be lawful for the Commissioners, on an appeal to them within three months, to cause an abatement to be made, and, in case the money should have been paid, to cause the same to be returned to the tenant-farmers.

Eleven sermons were on Sunday last preached in connexion with the Early Closing Association, by various ministers of dissenting chapels throughout the metropolis, on the spiritual and other evils of oppressive shop labour.

Mr. Alexander Henry Hastings Berkeley has been transferred from the post of *attaché* at Lisbon to a similar position at St. Petersburg.

Messrs. W. S. Shuttleworth and Co., of Fenchurch-street, have taken the contract to supply 48,000 lb. of tea for the use of her Majesty's navy, to be delivered at Deptford, Gosport, and Plymouth.

Her Majesty Queen Mary Adelaide of Sardinia was safely delivered of a Prince on the night of the 2nd. The christening took place on the following day, when the Royal infant received the following names:—Charles Albert Ferdinand Maria Eugene Odoacre Clarence. The Duke and Duchess of Genoa were sponsors, and represented by the Queen Dowager and Prince Eugene Carignan.

The following is an abstract of the grants for the civil services for the current year, as compared with 1850 and 1849. 1851, £3,948,102; 1850, £4,065,642; 1849, £3,988,904. The separate votes for the present year being as under:—Public works and buildings, £506,503; law charges and courts of judgments, £998 855; law and justice, £1,097,611; education, science, and art, £430,920; colonial, consular, and foreign service, £424,638; superannuations and charities, £107,798; special and temporary objects, £197,662; civil contingencies, £100,000.

On Saturday Colonel Sibthorp's bill for further "improving" the police in the metropolis and City of London was printed. The preamble proposes to prohibit advertising vans, and also poor musicians from playing in the streets, under a penalty of 40s., and, of course, commitment. A police constable sends such parties to be summoned (if Parliament should approve of the suggestion) to take the offender into custody.

A magnificent service of plate, for which upwards of 500 gentlemen of all shades of political creed, was presented on Tuesday last to Mr. Duncombe, Wednesday week, at the Council-house, as a testimonial of respect and esteem

On Saturday last, the anniversary banquet of the Eton Club took place at Soyer's Universal Symposium, Gore-house, Kensington; Lord De Tabley presided. Among the company present were Lord Vernon, Lord Grosvenor, Sir William Fraser, Sir Henry Wheatley, Dr. Harrey, &c.

The bill brought into the House of Commons by Major Blackall and Mr. Sadlier, to extend the remedies provided by the Renewable Leasehold Conversion Act for the recovery of fee-farm rents under that act to all other fee-farm rents, and to other rents in Ireland reserved upon grants of land, in which the granters have no reversion, has passed through committee, and has had added to it a more elaborate specification of terms, and an exception to the effect that nothing in the act should give any remedy by ejectment for non-payment of rent in the case of any fee-farm rent, or rent reserved upon any grant or agreement for a grant in fee, &c.

Three large steamers, the *Ganges*, *Teviot*, and *Trent*, from different and opposite parts of the world, viz. from Egypt, the West Indies, and from Brazil, came up Southampton Water, one directly after another, yesterday morning. Such a sight is rarely witnessed. To see these immense steamers rounding Calshot Castle was a novel and interesting sight. They brought mails and news from the East Indies, West Indies, Mexico, Portugal, Spain, and an exception to the effect that nothing in the act should give any remedy by ejectment for non-payment of rent in the case of any fee-farm rent, or rent reserved upon any grant or agreement for a grant in fee, &c.

It appears by a Parliamentary return, printed at the instance of Mr C. Lewis, that the total number of gallons of spirits distilled in Ireland in 1849 was 8,350,383, of which 603,333 paid duty for home consumption, and 8,90,031 were imported into England. In 1850 the quantity distilled was 2,993,034 gallons, 7,408,086 of which paid duty, and 828,138 were imported into England

The Messrs. Grierson, of Dublin, the Crown printers, are now preparing for publication 21,000 copies of the Book of Common Prayer; viz. 9000 copies, 24mo, minion size; 6000 ditto long primer size; and 10,000 copies 32mo size

METROPOLITAN NEWS.

THE QUEEN'S VISIT TO THE CITY.—On Saturday last, the Lord Mayor and Sheriffs (Mr. Alderman Cardea and Mr. Hodgkinson) waited upon the Queen at Buckingham Palace, for the purpose of receiving her Majesty's answer to the humble application of the citizens of London, that her Majesty would be graciously pleased to visit the Guildhall upon the occasion of the celebration of the Grand Exhibition of All Nations. His Lordship and the Sheriffs were most graciously received by her Majesty, who was pleased to state, that, from respect to the memory of a late statesman, the day of her Majesty's visit to the City should be postponed from Wednesday, the 2nd, to Wednesday, the 9th of July. It will be remembered that the late lamented death of Sir Robert Peel occurred on the 2d July, 1850.

GRAND BANQUET AT THE MANSION-HOUSE TO HER MAJESTY'S COMMISSIONERS OF THE GREAT EXHIBITION. On Saturday, the 28th instant, the Lord Mayor and Lady Mayoress will entertain the Royal Commissioners, the Foreign Commissioners, the Executive Committee, and their ladies, at dinner at the Mansion-house, in honour of the Great Exhibition of Industry of all Nations.

BRITISH ORPHAN ASYLUM.—The anniversary dinner of the British Orphan Asylum was held on Tuesday, at the Albion Tavern, Aldersgate-street. This institution was established in 1827, and since its establishment 344 orphan children have been under its care and training, of whom 106 are still within its walls. These orphans are the children of parents who once moved in the respectable circles of society. To these a sound and useful education is imparted, which enables them on quitting the asylum to seek a subsistence in those walks of life in which they would have moved had their parents lived. As one strong proof of the value of this institution, it may be recorded that three of the governors, who are at the present time on the Board, received as children the benefits of this institution. It appears, however, so many demands have recently been made on the funds, that it is necessary to draw the attention of the wealthy and benevolent to the fact, in order that its beneficial influence and unquestionable usefulness may not be contracted. H. Kemble, Esq., V.P., presided. Subscriptions to the amount of £672 were announced.

THE ASYLUM FOR FEMALE ORPHANS.—The annual general meeting of the friends and subscribers of this institution, which was founded in the year 1819, in memory of the late Princess Charlotte, was held on Monday, in the rooms of the mansion-house, Cambridge-heath, Hackney Park; Mr. James Bell in the chair. The report of the committee alluded to the loss which the institution had sustained during the past year in the death of the Marchioness of Cornwallis, who had been lady president for twenty years. Lady Mary Ross had accepted the office held by her mother, and Lady Elizabeth Cornwallis had been elected a member of the committee. The subscriptions during the year had been of the average amount. The number of orphans in the wards is now 41, and there are at present in the junior ward 35 inmates. A public examination of the wards by the Bishop of Ripon had taken place in the presence of the Duchess of Kent, which was in the highest degree satisfactory. The total receipts from all sources (including the balance of £990 13s. 1d. from the last account) during the year had been £3841; and, after defraying all the necessary expenses, there was a balance in favour of the institution of £338 14s. 3d.

SOCIETY OF FRIENDS OF FOREIGNERS IN DISTRESS.—The forty-fifth anniversary of this institution was celebrated at the London Tavern, on Wednesday; his Excellency the Prussian Minister, Chevalier Bunsen, in the chair. It had been arranged that Lord Ashley should preside; but, in consequence of the sudden death of the Earl of Shaftesbury, that nobleman was not present. Among the company were M. Stratman, Senator Janisch of Hamburg, M. Th. de Bethmann Hollweg, Mr. Alfred Beneke, Mr. R. Bickett, Mr. Blumerg, Mr Ambrose Boyson, Mr. B. B. Cabbell, M.P., Rev. Dr. Goble, Mr. Russell Sturgis, Mr. William Tuttle, Mr. Regnar Westenholt, Mr. R. H. Brandt, and Mr. Huth. According to the statement of the chairman, no less than 82 deserving foreigners had received pensions of 5s. a week; the youngest in the list being 70, and the eldest above 90 years of age. Allowances had also been made during the past year to 91 aged persons; the youngest being 64, and the eldest 97 years of age. Casual relief to the amount of £1000 had been extended to other claimants to the amount of £314 8s. 6d.; and £144 6s 9d had been paid as the passage-money of 108 persons returning to their native countries. There were no candidates for the ensuing year under the age of 70 years of age, and among those who had been unsuccessful last year £38 had been distributed. The total amount thus absorbed had been, for the year, £2443 3s. 3d., and the balance in hand was £2460 9s. 9d., but from this property must be deducted £410 1s. 6d., the produce of stock sold out. The chairman, in conclusion, warmly commended the proposed almshouses. The secretary read a list of the following donations in favour of £100 (fourteenth donation), H.R.H. Prince Albert, £26 5s. (eleventh ditto); H.M. King of Prussia, £20, Miss Burdett Coutts, £20; the Spanish, the Greek, and the Belgian Ministers, for various sums. The names of the proceedings nearly £1200 was thus announced.

ROYAL WESTMINSTER OPHTHALMIC HOSPITAL. — The annual meeting of this institution was held on Friday week, at the hospital, Charing-cross; his Grace the Duke of Richmond in the chair. Amongst the noblemen and gentlemen present, we observed the Earl of Stafford, Lord Audley, Lord Enfield, the Right Hon. Sir James Graham, Bart., M.P., Sir G. J. Guthrie, Mr. C. G. Guthrie, the Hon. R. Trevor, Mr. Wakley, M.P., &c. The report stated that the number of patients admitted during the past year amounted to 3054, of which 166 were in-patients, an increase of 14 in-patients over the preceding year. Of the principal operations, 98 were for cataract; 35 for the formation of an artificial pupil, 104 for squinting; and numerous other operations. Nearly all of these operations had been entirely and permanently successful. Since the year 1817, 82,725 persons have availed themselves of the benefits of this charity: of these, 1945 have been restored to sight, and 3791 relieved by the formation of an artificial pupil. The appearance of 3791 persons had been altogether improved by the operation for the removal of squinting. The amount of stock at present is £4,000 in the three per cents. Including the annual sum of £12,000 was required to carry the views of the committee into full effect. The receipts for the year amounted to £931 9s. 4d.

MIDDLESEX HOSPITAL.—On Saturday last, a very interesting ceremony of distributing the prizes of the medical school attached to the Middlesex Hospital took place in the board-room; Sir Robert H. Inglis, Bart., in the chair. On the evening of the same day the anniversary of the charity was celebrated at the Freemasons' Hall, and presided over by Captain Maude, R.N. The gallant chairman, in the course of the proceedings, stated that he had been over the most celebrated hospitals on the continent of Europe, and that they nearly all laboured under the disadvantage of Governmental influence or support, he had seen none more efficient, and none more excellently conducted than the Middlesex Hospital. The latter institution had now been established upwards of 100 years, and by successive improvements and additions had been brought to its present state of excellence and perfection—only requiring more adequate funds to meet the wants of the numerous applicants. The treasurer having announced £103 from her Majesty, and several other handsome contributions, the usual compliment was paid to the chairman, and the meeting broke up.

SOIREE AT THE ROYAL COLLEGE OF SURGEONS.—The president and council of the College of Surgeons gave the first of their *soirées*, on the occasion of the Great Exhibition, on Wednesday evening; when Professor Owen delivered a lecture to the élite of the profession and to the distinguished foreign surgeons, upon certain resemblances in the organization of plants and animals, as also upon two peculiar phases of organic existence—metamorphosis and metagenesis. Amongst the company present we observed—Dr. Alexedes, a distinguished Turkish physician; many French and German surgeons; Mr. Arnott, President of the College; Mr. Guthrie, Sir Benjamin Brodie, Bart., Mr. Lawrence, Mr. South, Mr. Cæsar Hawkins, Mr. Bishop, Mr. Hodgson, Dr. Grant, Archdeacon Hale, Mr. Paget, Mr. Campbel de Morgan, Mr. Gould, Mr. Hancock, &c.

ROYAL BOTANIC SOCIETY.—The principal general show of the season, embracing an exhibition of fruit and flowers of all kinds, took place on Wednesday, and was in all respects a most successful one. In some departments of the gathering at any previous show. Roses, rhododendrons, pelargoniums, and other varieties of flowers, were represented in great vigour and variety. The grapes, as big as plums, were also conspicuous for attracting the attention of friends —many of whom were present—accustomed only to the small and insignificant-looking fruit of their own vineyards. The pine-apples, too, and the peaches, looked well. The assemblage of company was very great. The exhibition of American plants took place on Saturday.

THE HORTICULTURAL SOCIETY.—The second flower show of this society took place on Saturday, in the grounds at Chiswick. The grounds were in excellent order, and the display of fruits and flowers extremely rich and varied. One of the new features of the show, the introduction of music, around which the rhododendrons and all the other American flowering shrubs are collected, was in bloom. Mr. Hoare had a very attractive and interesting display of these flowers. The bands of the Coldstream, Royal Horse Guards, and 1st Life Guards were in attendance, and contributed by their exquisite taste to the enjoyment of the visitors. Among the company we observed the Duke of Devonshire, the Duke and Duchess of Northumberland, the Duchess of Orleans, with her two sons and the Count de Paris, Lord Ashburton, Sir Henry Fazakerley, Sutherland, the Duke and Duchess of Argyll, Lord and Lady Blantyre, the Marquis of Winchester, the Marquis of Tweeddale, Lord John and Lady Russell, the Bishop of Winchester, Lord Palmerston, Sir Robert and Lady Harry Inglis, Lord Grosvenor, Sir Philip and Lady Egerton, Hon. Mr. Strangways, and a large number of distinguished foreigners. There were between 10,000 and 12,000 persons in the gardens.

GARDENERS' BENEVOLENT INSTITUTION.—The eighth anniversary of this benevolent institution, was celebrated on Monday by a dinner at the London Coffee-house, Ludgate-hill. The chair was filled by Joseph Paxton, Esq., who, in proposing the toast of the day, "The Gardeners' Benevolent Institution," referred to the ancient history of the Greeks and Romans, to show that, as the civilization of the country progressed, gardening became the favourite creation of its people. Mr. Charles Dickens proposed the health of the chairman, to whose genius, as evinced in the designing and carrying out of the Great Exhibition, he paid a high compliment

METROPOLITAN WATER SUPPLY.—The Marylebone Vestry, at their weekly meeting on Saturday, resolved to offer every opposition to the Government bill for consolidating the water companies of the metropolis, and appointed a committee to carry the resolution into effe

BANQUET BY THE MERCHANT TAILORS' COMPANY.—Wednesday being St. Barnabas Day, the annual examination of the Merchant Tailors' School was held, according to custom, in the presence of Dr. Winter, the master, and the senior fellows of St. John's College, Oxford, and other distinguished visitors; and in the evening the master and wardens gave their annual dinner to the examiners and their friends. The opportunity was at the same time taken of inviting a number of the distinguished foreigners who are at present in this country to partake of the magnificent hospitality of the ancient and distinguished civic company. The banquet took place in the hall, and all the resources of the company were expended in an entertainment which should do honour to the company, and enable our foreign guests, who have come over to attend the Exhibition, to appreciate the munificent hospitality of the great trading companies of this metropolis. W. Robinson White, Esq., master, was in the chair; and there were also present, his Royal Highness the Duke of Cambridge, President and Senior Fellow of St. John's College, Oxford; the Marquis of Douro, the Earl of Sheffield, Earl Howe, Lord Viscount Strangford, Lord Viscount Hardinge, Lord William Paulet, Lord Bishop of Oxford, Lord Sidmouth, Lord Radesdale, Lord Colchester, Lord Feversham, Lord Stanley, Lord Leigh, the Hon. Charles Hardinge, Captain the Hon. Arthur Duncombe, R.N., M.P.; the Right Hon. Sir George Clerk, Bart; the Right Hon. Henry Goulburn, the Right Hon. William Ewart Gladstone, the Right Hon. Vice-Chancellor Knight Bruce, Mr. Justice Patteson, Mr. Justice Crompton, Mr. Baron Platt, Mr. Baron Martin, the Hon. Arthur Hardinge, Baron C. Dupin, Chevalier de Burg, Dr. Schaffhausen, Captain Adolf Hamed, M. Stallaerdorse de Lamermaix, *Professor* Gorrid. M. Von Captain Adolf Hamed, M. Stallaerdorse de Lamermaix, *Professor* Gorrid. M. Von Vehalm, M. Salewski, E. Johns, Esq., M. Cayllix, M.P. Rall, M. G. de Kamensky, Chevalier de Louise, Dr. Seyfarth, Don M. de Yasu, Dr. Bailey, Signor Hanala Elmkadden, M. Santillana, Dr. Steinheis, M. Roesnier, M. Schlichmith, M. Nobach, Signor Carlo Trebbie. Charles Tottie, Esq., Poor Ibraheem Khan Bahadoor, Syed Abdoolhak, an Indian chief and his secretary, from the Punjaub. The head of her Majesty's Commissioners and the Foreign Commissioners for conducting the Great Exhibition, was responded to by Lord Stanley and Baron Dupin; the latter addressing the company in English.

DINNER BY THE EAST INDIA COMPANY TO SIR RICHARD ARMSTRONG.—On Saturday morning, Lieutenant-General Sir Richard Armstrong, who had been nominated by his Grace the Commander-in-Chief to the command of the troops in the Madras Presidency, took the oaths of office at the India House, and in the evening the directors gave a grand farewell banquet to Sir Richard, at the Albion Tavern, the large room of which was decorated with a profuse and dazzling display of gold plate for the occasion. Mr. Shepherd, the chairman of the East India Company, presided, having on his right hand Sir Richard Armstrong, the guest of the evening. There were also present, Lord Hardinge, Earl Granvil e, Sir James Weir Hogg, M.P., deputy chairman; Right Hon. W. E. Gladstone, M.P., Hon. J. E. Elliott, M.P., Lieutenant-General Sir Willoughby Cotton, G.C.B.

FOREIGN CLERGY.—Preparations are making for a *conversazione* at Willis's Rooms, on Monday, the 16th inst., on a large scale, to afford foreign pastors, and other dignitaries of the clergy of becoming acquainted with the clergy, and such lay members of the Church of England as take a special interest in its affairs. The Archbishop of Canterbury, the Bishop of London, and many other dignitaries of the Church, clergy, foreigners of distinction, are expected on the occasion. Bibles and prayer-books in all languages, together with school-books and materials, and plans of churches will be exhibited; and several gentlemen and gentlemen acquainted with foreign languages have undertaken to act as stewards.

At a numerous meeting of the Commissioners of Lieutenancy for the city of London, held on Tuesday, Alderman Wilson was elected Lieutenant-Colonel of the Royal London Militia, in the room of Alderman Thompson, appointed to succeed the late Sir Claudius Stephen Hunter as Colonel of the Regiment.

THE HARROW ANNIVERSARY.—The Harrovians celebrated their anniversary festival on Wednesday evening, at the Thatched-house Tavern in St. James's-street; Henry Drummond, Esq., M.P., in the chair. Among the company were the Bishop of Rochester, Lord Poltimore, Lord St. John, Hon. F. Fonsonby, Hon. R. Grosvenor, Mr. C. F. Leslie, M.P.; Sir Charles Douglas.

THE ROYAL ITALIAN OPERA.—ROYAL HORSE GUARDS.—Yesterday a full meeting of the Board of Management was held at the Hospital for Consumption, Brompton, relative to the forthcoming grand musical festival, on behalf of the charity, a scene which has not been hitherto unknown in this country. The arrangements of the concert are under the management and control of a committee of the following general and field officers; namely, Field-Marshal Viscount Combermere, G.C.B., General Lord Seaton, G.C.B., Lieut. Sir Thomas Downman, Col-Commandant of the Royal Artillery, and Lieut-General the Earl of Westmoreland, G.C.B., together with other distinguished officers connected with the first and second Life Guards, the Royal Horse Guards, the Scots Fusilier Guards, and Lieut. Upton, of the Coldstream Guards. In addition to this the band of the Royal Artillery, from Woolwich, will perform in connection with the most eminent composers. With regard to the bazaar, the following ladies have consented to preside at the stalls: Her Grace the Duchess of Sutherland, the Marchioness of Salisbury, the Marchioness of Sligo, the Countess of Harrington, the Countess of Antrim, the Viscountess Combermere and daughter, Ladies Louisa Pole, Southampton, Leigh, and Shelley, and many others of rank and distinction. The programme of all the music has not yet been completed, and it is thought that this effort on behalf of the charity will have the desired effect. The number of out-patients prescribed for during the year has been 3176, being an increase of 211 over the preceding year. We shall engrave the above *fête* next week.

ST. PANCRAS EXTENSION FUND.—The annual meeting of the friends and supporters of this institution was held on Thursday, at the St. Pancras School-room, Southampton-street, Euston-square; Lord Robert Grosvenor in the chair. The report stated that the population of St. Pancras was about 201,800, and there was already accommodation in permanent buildings for 24,500, and in temporary church for 2960. Two new districts had been constituted during the past year, and the number of parochial districts is 19. There were 39 clergymen, 9 Scripture-readers, and 7648 children attending schools. The amount of grants towards churches and sites was £9663. The report concluded, and—Col. Chesney moved a vote of thanks to the chairman, and a vote of thanks to the Duke of Bedford, for his gift of a site for the parsonage house of St. Matthew's district, as well as the church, were carried, after a few words of thanks to the chairman, the meeting separated.

VISITORS TO WESTMINSTER ABBEY.—During the first three days of the present holiday week, upwards of 15,000 persons have visited Westminster Abbey, for the purpose of inspecting the tombs of that magnificent temple and the many splendid monuments with which it abounds. On Thursday morning there was a grand choral service in aid of a fund for the benefit of distressed choristers, clerks, and others connected with the Abbey. The musical arrangements were on a scale of unusual splendour, rehearsals having been frequent for many days previously. The public were admitted to the choral service, at a quarter before twelve o'clock, at the northern and eastern doors. It is announced that on Tuesday next another grand service will take place, on which occasion the Bishop of London will preach on behalf of the Church in the colonies and dependencies of the British Crown.

SUPPLY OF WATER TO THE METROPOLIS.—A public meeting was held at the Town-hall, Southwark, on Tuesday afternoon, for the purpose of taking into consideration the Bill now before Government to consolidate all the existing water companies, without the power of municipal or parochial control. Mr. Pritchard, the High Bailiff, presided; and amongst the gentlemen present were Sir W. Molesworth, M.P., Mr. Henry Evans, M.P., and Mr. Mowatt, M.P. Dr. Challis moved the first resolution, to the effect, that, considering that the bill of the Government to perpetuate the monopoly of a supply of water to the metropolis, by consolidating in perpetuity nine existing companies, was unjust in principle, and subversive of all sanitary improvements, more especially as the public trusts devolved upon those companies had been most grossly violated by their total neglect of water totally unfit for human consumption, and productive of disease and death, as incontestably proved by the investigations of the Board of Health; that the meeting, therefore, deprecated in the strongest terms to prevent the measure passing into a law. (Cheers.) Mr. Day seconded the motion. The resolution was carried unanimously. Mr. Pollard objected to the exercise of London Bridge Water-wheels, and advocated Mr. Mowatt's measure, on the ground that it gave the ratepayers themselves the control over the supply of water. He then moved, "That, considering that the water service of London could never be effectually accomplished, either as regarded cost, uninterrmitent supply, or purity, until it was placed under the control of a representative body, to be chosen by the ratepayers of the several metropolitan districts, and being of opinion also that the Bill introduced into the House of Commons by Mr. Mowatt contained the clauses required to carry out this purpose, the meeting pledged itself to assist to the utmost of its power in effecting the principles of the hon. gentleman's bill." (Cheers.) Mr. Collinson seconded the resolution, which was carried. A petition to the House of Commons, embodying the before-mentioned resolutions, was then agreed to, Alderman Wilson being requested to present it, and Sir William Molesworth to give it his support. A vote of thanks to the High Bailiff for presiding terminated the proceedings.

ROYAL LONDON YACHT CLUB.—The second match of the season took place on Tuesday. The yachts entered were:—the *Mouse* (50 tons, the property of G. E. Browne, Esq.); the *Whisper* (19 tons, T. Evelegh, Esq.); the *Pandora* (21 tons, S. Lane, Esq.); the *Gem* (28 tons, Mr. Read, Esq.); and the *Gnat* (4 tons, H. J. Smith, Esq.) The race was from Erith to Chapman's Head, and back to Erith. The *Secret* won by ten minutes The *Whisper* was second.

THE NEW EQUESTRIAN RIDE.—The new ride recently established for equestrians in Kensington-gardens is entirely closed to horsemen on Sundays. From the great number of visitors to the gardens on Sundays, in connexion with the other days of the week, it has been deemed prudent to make this arrangement in deference to the wishes and convenience of the public. As it is not usual to ride on Sundays, the restriction will not be felt to any great extent, while the advantage of the new ride to pedestrians is very considerable.

IMPROVEMENTS IN WESTMINSTER.—The formation of the new streets in Westminster having been seven years in progress, the delay in their completion has become a source of serious grievance to the inhabitants of the neighbourhood, who complain of the injury thereby done to their trade, and the annoyance resulting to themselves. A society has been formed to protect the interests of those having property or carrying on trade in the neighbourhood, and a meeting was held on Friday evening week, at the Prince's Head, Princes-street, to organize measures for protecting their interests, and for calling the attention of Government and the Legislature to the subject.

ASSEMBLAGE OF SUNDAY-SCHOOL CHILDREN.—On Tuesday evening, the Church of England Sunday-school Institute assembled 3000 of the children taught in the Church Sunday-schools of the metropolis, in Exeter-hall. The chair was taken by the Right Rev. the Lord Bishop of St. Asaph, who was accompanied by three of his nieces and a few clergymen, and the remainder of the orchestra was occupied by the teachers of Sunday-schools. The proceedings were opened with prayer, the collect for the second Sunday in Advent, and that commencing the communion service, with the Lord's Prayer, being selected. The children then repeated the *Te Deum Laudamus* as a creed, after which the bishop delivered an address, in the course of which he said that he had been all his life a Sunday-school teacher himself; and although he had grown so old a man, his interest in Sunday-schools was as warm as ever. The only proof of which he mentioned, that not long ago he had published some lessons for Sunday scholars, and he distributed a number of copies amongst those who were nearest the platform. After some general remarks upon the advantages of religious education, and the great debt of gratitude owing by the nation to Sunday-schools for that religious training of its lowest grades in which our exemption from political convulsion might be traced, and the claims which the "Institute" as the representative of Church Sunday-school instruction, had in particular upon the support and encouragement of the wealthy members of the Church, his Lordship proceeded to address his remarks more directly to his auditory, and enforced admirably in riveting their attention while he enforced upon them the wisdom of making great account of the opportunities afforded them of learning at this Sunday school the way to eternal life. The children next sang a hymn, "Come let us join our cheerful songs," &c. The meeting was afterwards addressed by the Rev. G. Fisk, incumbent of Christ Church, St. Marylebone; Rev. C. Jackson, incumbent of Park Chapel, Chelsea; and the Rev. P. B. Power, minister of Woburn Chapel, Tavistock-square. Hymns were sung between the addresses, and the Bishop concluded the proceedings with the customary benediction. Lastly, "God save the Queen" was performed with great earnestness as the children departed; and as they passed through the doorway, each was presented with a bun. The committee of the "Church of England Sunday-school Institute" took this opportunity of circulating a statement of the claims of their society, according to which their grand aim and object is to promote the efficiency of Church Sunday-schools, and to raise the qualifications of the great body of teachers engaged in them. The means adopted are lectures, conversational meetings for the interchange of experience, on subjects of Sunday-school management, a central library of theological and general literature, normal classes for elucidating the best methods of imparting instruction, and the publication of tracts and systems especially adapted to the use of Sunday-schools. In the successful pursuit of their labours, however, the committee are very much impeded for want of the necessary funds, the subscriptions being barely sufficient to meet the current expenses of the Institute.

BLACKFRIARS-BRIDGE.—The works to secure the defective arches of Blackfriars-bridge are completed, without any hindrance to the navigation. The centre arch, which has been stopped for nearly four months, is now open. The plan adopted is the formation of an inner arch composed of massive timbers, over which is spread a ceiling of zinc, to prevent the gear of sailing vessels or the funnels of steamers striking against the arch.

RAILWAY EXCURSION TRAINS.—The influx of visitors in the metropolis this Whitsuntide has been enormous. Throughout the whole of Monday the wharfs of the Boulogne-square terminus of the London and South-Western Railway presented a very bustling appearance; for, besides the ordinary trains, which were much crowded, there were as many as twenty excursionist trains from the various town and thickly-peopled districts on the line, sent to Hampton, from Oxford, Northampton, Rugby, Birmingham, Wolverhampton, Manchester, and Liverpool. The fare for a third class, with a return ticket, from Liverpool was 25s., and the visitors had a choice of starting at any hour between four in the days. The fares on the shorter trips were proportionately low. Numbers arrived early in the day, but it was towards evening that the great mass came in from the long journeys. Omnibuses, cabs, and every vehicle that could be made available for travelling, were brought out for distribution of the excursionists. On the Great Western the Exhibition trains were well filled. Early in the day a heavy one arrived from Bristol and Bath, the passengers being charged but 5s. for the double journey. The Great Northern brought up a fair portion of visitors from the Yorkshire and Lincolnshire districts, London being represented by a York with a return ticket, and an opportunity of staying in the metropolis some days, for 18s. 6d. third class. By the Eastern Counties line, trains from Colchester, Peterborough, Ely, Norwich, and Yarmouth, brought several parties to the metropolis. The inhabitants of Dover, Ramsgate, and other towns reached by the South-Eastern line, availed themselves of a train up to London to view the Exhibition, at a cost of 5s. there.

AFFAIR OF HONOUR.—A hostile meeting took place between two of the Sunday morning, between Lieutenant S. M. Hawkins, of the 97th Foot, and Viscount Maldon, Royal Horse Guards Blue, the former attended by Lord St. Leger, the latter by Captain Brownrigg. Lord Maldon received the fire of his adversary, and discharged his pistol in the air. Thus far the affair terminated.

CORONER'S JURISDICTION.—A bill framed by a select committee of the House of Commons by the Earl of Shaftesbury (late Lord Ashley), the Marquis of Blandford, and Mr. Slaney, for the well ordering of common lodging-houses, has had a clause added to it by the select committee to which it was referred, by which it is provided that the expenses of and incident to the executing of the act should be borne and paid:—1st. With respect to the metropolitan police district, as part of the general expenses of the metropolitan police force. 2nd. With respect to the district of a local board of health, as part of the expenses of the local board of health. With respect to an incorporated borough, as part of the expenses payable out of the borough fund. 4th. With respect to any place within the limits of an improvement act," as part of the general expenses of carrying the act into execution. 5th. With respect to any parish this act would be executed by justices in petty sessions, the expenses should be borne and paid as part of the general expenses of the constablewick of the place.

BIRTHS AND DEATHS IN LONDON.—The number of births in the week ending Saturday, June 7th:—Males, 735; females, 711: total, 1446. Deaths during the same period:—Males, 510; females, 451: total, 961. The mortality of London continues to be of greater amount than the experience in the first week of June might have been anticipated. In the ten years 1841-50, which corresponded in the week ending last Saturday, the average number of deaths was 864, and, with one exception, the number in the ten in any case exceed 941; but the present return shows that 961 deaths were registered in the week, making an increase of 97 above the actual average, and of 18 above the average corrected for increase of population and mean temperature. The results of the preceding week (end ng May 31st), the present return shows a small decrease in the total number of cases produced by epidemic diseases, but an increase in those arising from affections of the respiratory organs. In the former class the principal complaints are measles, which carried off 39 children in the week, hooping-cough, which was fatal in 47 cases, scarlatina in 18, and typhus in 46. These epidemics show rather more than the usual amount of fatality, with the exception of scarlatina, which does not seem to have been prevailing much of late. The number of deaths assigned to small-pox is 12, nearly all of these having occurred under three years of age This is not more than the average mortality from small-pox in the metropolis generally; but it will be seen that Mr. Hems, a registrar of Westminster, reports that the disease is exceedingly prevalent and fatal in Charlotte-court, situated in his sub-district, that "five children have died there during the last three weeks, and many others are now suffering." The registrars also complain of typhus and of scarlatina as not having been occurred during the week in various localities, where over-crowding, inadequate drainage, and noxious smells are complained of. In the previous week the number of fatal cases arising from diseases of the organs of respiration was 136, in the last week 161; this latter number being considerably in excess of the corrected average, which is 106. This class comprises laryngitis and laryngismus stridulus, which number 7 cases; bronchitis, of which there were 58 cases, pleurisy to 6, pneumonia to 71, and asthma to 9. From phthisis or consumption, there were 146 deaths, an amount of mortality which much more preponderates relatively to that produced by other causes, but is not greater than is usually observed in the week occurred to arise from this disease. That week the deaths of two centenarians are registered; the particulars in either case are registered as follows:—"At 103, Hackney-road, in the East End Town, on the 4th of June, a superannuated officer of the Customs died of old age, at the age of 103 years" "At 2, Weaver's-court, Old-street-road, Shoreditch, on the 1st of June, the widow of a salesman died of natural decay, at the age of 100 years."

METEOROLOGICAL OBSERVATIONS.—At the Royal Observatory, Greenwich, the mean reading of the barometer was above 30.168 in. on the Sunday, the mean of the week was 29.840 in. The mean daily temperature on every day, except Monday and Tuesday, when it rose to 58 deg. 5 min. and 60 deg. 8, was under the average of the same day as derived from the results of 15 years. On Wednesday and Thursday it was respectively 11 and 18 degrees below the average. The mean temperature of the week was 56 deg. 2 min., which is 3 deg. below the average. The wind was generally in the north-east and north on Sunday and Monday; and afterwards was for the most part in the south-west.

MANIFESTO OF THE EUROPEAN CENTRAL DEMOCRATIC COMMITTEE.—A short time since a manifesto was published with the signature of MAZZINI, which was afterwards disavowed by him. The *Free du Proscrit* of 7th June contains the real manifesto of the committee, the most prominent features of this document are these:—A Holy Alliance of Nations, the device of which ought to be "Liberty, Association, and Employment." "The mission of the Central Committee is European, and its work is the conquest of universal character." "Democracy has only one logical form, that of the Republic; and the Republican principle cannot be said to be applied to a nation if it does not embrace, by binding them together, all the branches of human activity, all the aspects of life in the Individual and for association." "It is necessary to open to the people the great roads of liberty. It is necessary, in order that noble and great ideas should arise in their hearts, to efface from their forehead the degrading mark of slavery. Their intelligence must be imbued with the enthusiasm of a collective life, of joint responsibility, and of sovereign liberty. The Central Committee occupies itself the more with this, as it is the initiative power." The men who compose it, and those who labour with them, do not think of consecrating to it a solitary production of their own intelligence; they think of stirring up the intelligence of all, and calling it into the arena. They do not contest themselves with thinking—they think of acting. That ought to be now the *mot d'ordre* of every patriot."

WOOLWICH DOCKYARD.—The number of visitors to Woolwich Dockyard during the past week, both of foreigners and of inhabitants of this country, has been very great: they appeared highly gratified with the magnitude of the works, and power and perfection of the machinery in the factory and at the saw-mills. The *Royal Albert*, of 120 guns, building in the yard, was also a great object of attraction.

THE ILLUSTRATED LONDON NEWS.

COUNTRY NEWS.

FATAL RAILWAY ACCIDENT.

A short train, which left Brighton for Lewes at half-past twelve o'clock on Friday week, ran off the line at about two miles from Lewes, dragging with it two carriages through the side of a bridge wall, and fell down an embankment of about twenty feet. The engine, a locomotive, was thrown on its side, and the fireman, George Chase, a young man, age unknown. The dead bodies were all removed for interment. Mr. Langhorne's body was identified on Saturday by Mr. Bellingham, a lodging-house keeper at Brighton, at which place the deceased arrived about a week ago upon a visit which was intended to be the forerunner of a permanent residence. His brother, Mr. John H. Langhorne, No. 19, St. Paul's Churchyard, London, and his brother-in-law, Mr. Richard Archer, of No. 6, Warwick-place, Grove-lane, Camberwell, also identified his remains

An inquest has been commenced, and from it it seems to appear that there is some ground for supposing that an obstruction on the line, which caused the accident had been placed upon the line, though without malicious intent, and that it was done by some children belonging to labouring people who live close to the scene of the catastrophe

A boy ten years of age, named Boakes, is especially mentioned as having been in all probability the person who threw a sleeper lying close at hand upon the rails.

FATAL BOILER EXPLOSION.—On Saturday, a frightful boiler explosion, attended with loss of life, occurred at Mr. Braire's colliery, Kingswood, about seven miles from Bristol. The Starvedl pit, together with several others, is worked by the steam-engine, the coals of which are raised by means of a steam-engine. At about seven o'clock in the morning, between twenty and thirty men were employed to remove the old boiler, which was to be replaced by a new one, when, without any warning, the steam to the boiler, some of them commenced put ing down the masonry. Suddenly the boiler burst with a terrific explosion; it was completely blown out of its bed, and huge fragments of it, together with the surrounding stone and brickwork, were scattered around in all directions, the boiling water and red-hot cinders, were scattered around in all directions, falling on several of the men, and scalding them in a fearful manner. Mr. Braine himself was precipitated by the violence of the explosion, but fortunately he escaped without serious injury. During the day four of the poor fellows died, with subsequently three others. The names of the men at present dead are—Francis Brewer, aged 54, who was dreadfully scalded and received two severe cuts on the head from portions of the masonry, W. Burchell and John Burchell, junior, sons of the former. Daniel Mountain (who was so shockingly scalded at. over his person that portions of his flesh came off with his clothes); James Ricketts, Joseph Long, t e bailiff of the pit, and Samuel Bryant. With one exception they were all married men, and have left families. The inquest on five of the seven bodies was commenced on Monday at the Rose and Crown Tavern, St. George's, before W. Joyner Ellis, Esq. The coroner, after the jury had been sworn, said that by a recent Act of Parliament coroners were prohibited from proceeding with inquests on the bodies of persons ki ied in connexion with the working of collieries, until they had given two days' notice of the same to one of her Majesty's Inspectors. Sergeant Cox, of the police, as soon as the occurrence of the explosion was communicated to him, he at once addressed a letter to Sir George Grey, who, he doubted not, would send down a Government inspector to attend the inquiry. Pending the arrival of that officer or the expiry of the notice allowed by law, he could not take any evidence, and their proceedings that day would be limited to viewing the bodies, and making a minute and careful examination of the boiler and the scene of the explosion. The jury, after being discharged, he should adjourn, so as to afford time for the attendance of the inspector. The jury then proceeded to view the bodies of the sufferers and the works, one glance at which sufficed to show the terrible violence of the explosion. The engine-house was reduced to a heap of ruins, the boiler torn to pieces, and fragments of the masonry and ironwork scattered in all directions.

COAL-PIT EXPLOSION.—A fearful explosion from fire-damp took place about a mile from Barnsley, on Monday last, at the works called the Ardsley Colliery, belonging to Messrs. Firth, Ridsley, and Co. This colliery was the scene of the disastrous explosion which took place about four years ago, when upwards of 70 poor fellows paid the forfeiture of their lives; and since that period a partial discontinuance of the works has taken place until recently. Three men only have, however, been working in the pit from time to time; and on Monday they pursued their occupation as usual until the shift arrived at 13 o'clock. The three men were being let down the shaft, which is 264 yards deep, and when about 30 yards from the bottom a terrific explosion suddenly took place, the fire-damp rushed up the shaft with frightful violence, and issued at the top like the eruption of a volcano. Two of the men on the top were thrown to the ground violently hurt, and quite dead. Their companion, however, had been thrown from the shaft and precipitated to the bottom, whence there is little hope of his recovery, at all events for some time to come. The explosion is more than 12 feet deep. The former have left wives and families unprovided for.

INVESTIGATION OF BATH.—The canvass of Captain Scobell goes on most favourably. Since the last election, Bath has lost two members, one of whose address has so much displeased his own party, that one or two private meetings have been held by them, for the purpose of nominating another candidate on the Protectionist side.

The Ryde bench of magistrates have committed a man, named Alfred Pressley, to the Winchester Assizes, for the manslaughter of Mr. Cole, on the first day of polling at the recent election for the Isle of Wight.

LOSS OF THE "NEPTUNE."—This first-class iron steam-vessel known as the London and St. Petersburgh steam-ship *Neptune*, has been wrecked on a reef in the Sound of Elsinore, while on her voyage from the Thames to the Neva. She had a population, consisting of numerous packages of Russian manufacture and produce for the Great Exhibition, which are now in the course of arrangement in the Building, and with a valuable cargo was on her return voyage when the unfortunate accident befal her. She left the Thames on Saturday week, and shortly afterwards struck on the rocks off that part of the coast called Swine Bottom, off Lagunas. The engines were backed, and every expedient was resorted to to get her off, but without avail, the wind and sea acting on the vessel so as to drive her further on the reef; and in less than half an hour the water had burst through her compartments, and her hold was full up to within a foot of her main deck. The crew and passengers escaped. She was handsomely fitted up, and she was a very fast steamer, having 250-horse power engines. She was built at Sunderland, and was nearly 500 tons burden. It is reported at Lloyd's that the vessel and cargo were insured in several marine insurance companies in the City to a great amount.

A telegraphic despatch, dated Hamburgh, Monday morning, says:—"A sanguinary conflict has taken place between the soldiers and the Austrian soldiers. Six persons have been killed, and a considerable number wounded. The Senate has declared itself *en permanence*."

MONETARY TRANSACTIONS FOR THE WEEK

(From our City Correspondent.)

The settlement in Consols which took place on Tuesday has been the only subject of any interest during the week. Quotations on Monday stood at 99¾ ⅞, but on Tuesday, for a short time, declined to 99⅝, returning, however, to the former position before the close of business. The settlement was effected quickly, but the fluctuations during the last month have been so trifling that the settlement was comparatively unimportant. Money was readily obtainable from 2½ to 3 per cent., and the market was well supplied with capital. Wednesday was the last open day for transfers, and some large purchases, aided by the operations of the Government broker, gave an impetus to prices. Consols improved, and closed at 99¾ ⅞ sellers, buyers; and for a time. This advance was well maintained on Thursday by an active business on behalf of the public. The unfunded debt is former, with a trifling advance; India Bonds are also a shade dearer. At the close of business the market was firm, prices standing as follow:—Bank Stock, 213; Reduced, 97⅞; Consols, 99¾; New 3½ per Cent Annuities, 99¾; Long Annuities, to expire January, 1860, 7 8-16ths, Ditto, 30 years, Jan 5, 1860, 7 9-16ths; India Bonds, £1000, 21 p.; Consols for Account, 99¾; Exchequer Bills, £1000, 63 p.; Ditto, £500, 63 p.; Ditto, Small, 4s p

There has been rather an active demand for Foreign Stocks during the past week, Peruvian not on-y maintaining its former advance, but all the securities in Mexican some fractional fluctuations have occurred, price closing rather better than last week. The settlement has commenced favourably. Mexican quoting 34⅛ ⅜. Spanish has advanced to 20¾ ⅞ for the Five per Cent Bonds. At the close of the week the market was buoyant, but no speculation of any importance for the account has developed itself. The following are Spanish Bonds, New, 1829 and 1839, 87½; Equador Bonds, 3¾; Mexican 5 per Cent, 1845, ex Jan. Coupons, 34⅛; Ditto, Account, 34⅛; Peruvian Bonds, 5 per Cent., 97⅜; Ditto, Deferred, 43; Portuguese 5 per Cents, 1841, Russian Bonds, 4½ per Cent., 102½; Spanish 5 per Cent., 1840, 20⅛; Ditto, Account, 20⅛; Ditto, Passive, ⅜; Ditto, 3 per Cent., 40½; Venezuela Bonds, 2½ per Cent., 29½; Belgian, 4½ per Cent., 91½; Dutch, 2½ per Cent., 59⅜.

Although the Railway Market is firmer, the advance in prices is but fractional, notwithstanding the better returns of the past week displaying such marked improvement. The North-Western declared the second dividend on the corresponding week of last year by £10,000, the Great Western by £8000; the South-Western, £4500; the Brighton, £1000; and the South-Eastern, £4000. This increased traffic has failed in creating business, which continues to be very limited. Closing quotations are—

ORDINARY SHARES AND STOCKS.—Aberdeen, 12; Ambergate, Nottingham, Boston, and Eastern Junction, 4¾; Bristol and Exeter, 79½; Caledonian, 13; Chester and Holyhead, 18¾, Eastern Counties, 6¾; East Lancashire, 10½, Great Northern, 17⅜; Great Western, 69; Ditto, Ex. 4½; Lancaster and Carlisle, Thirds, 85 pm.; Lancashire and Yorkshire, 55; Ditto, Fifths, 4; Ditto, Thirds, 10; London and Blackwall, 7¾; London, Brighton, and South Coast, 56¾; London and North-Western, 123½; London and South-Western, 83; Manchester, Buxton, and Matlock, 1¾; Manchester, Sheffield, and Lincolnshire, 27¾; Midland, 51½; Ditto, £10, 18¾; North British, 7¾; North Staffordshire, 9¾; South Devon, 10; South-Eastern, 30; York, Newcastle, and Berwick, 50; Ditto, Extension, 14¾; York and North Midland, 29½.

LINES LEASED AT FIXED RENTALS.—Buckinghamshire, 17¾; Lowestoft Guaranteed, 14; Newport, Abergavenny, and Hereford, 50; Scottish Central, 56; Reading, Guildford, and Reigate, 21½; Wilts, Somerset, and Weymouth, 45.

PREFERENCE SHARES.—Eastern Union, 15½; Great Northern, 5 per cent., 13½; Great Southern and Western (Ireland), 35; Manchester, Sheffield, and Lincolnshire, New, £10 11½d.; Oxford, Worcester, and Wolverhampton, 8½; Shrewsbury and Birmingham, 0¾.

FOREIGN AND COLONIAL Railways and Annuities, 3¾; Central of France, 18½; Luxembourg (£10 paid), 2¾; Namur and Liege, 1¾; York and North, 8½.

THE MARKETS.

CORN-EXCHANGE.—During the present week a very limited supply of Engl ah wheat has been received up to our market, coastwise and by land carriage. For all kinds the demand has ruled relative, at an advance on the quotations of last week, for the quantity of which good clearances have been effected. From abroad the imports of wheat have fallen off. In all articles a good business has been doing, at an improvement in the value of fully 1s per quarter. The stocks of all sperling corn in this country being now unusually small, even for the time of year, prices have improved. Barley and oats, as well as beans and peas, are fully 1s per quarter higher, with every prospect of further enhanced currencies. No change to flour.

English.—Wheat, Essex and Kent, red, 57s to 59s; ditto, white, 59s to 61s; Norfolk and Suffolk, red, 54s to 55s; ditto, white, 56s to 58s; rye, 34s to 36s; grinding barley, 3s to 30s, distilling ditto, 32s to 35s; malting ditto, 34s to 37s. Norfolk and Lincoln malt, 56s to 58s; brown ditto, 45s to 48s; Kingston and Ware, 56s to 58s; Chevalier, 54s to 58s. Yorkshire and Lincolnshire feed oats, 19s to 21s; potato ditto, 22s to 24s. Youghal and Cork, black, 2s to 22s; ditto, white, 23s to 25s; sleek beans, new, 37s to 39s; ditto, old, 39s to 41s; grey peas, 34s to 36s; maple, 36s to 38s; white, 37s to 39s per quarter. Town-made flour, 35s to 38s; Essex, 36s to 37s; Stockton and Yorkshire, 37s to 38s per 280 lbs.

Foreign.—Wheat, Dantzic, new, —s; old, —s; Konigsberg, —s; Pomeranian, —s; Rostock, —s; Danish and Holstein, —s; Petersburgh, —s; Archangel, —s; Marianopoli, —s; Taganrog, —s; Egyptian, —s; Surat, —s; Bombay, —s; Adelaide, —s; Port Philip, —s; Spanish, —s; Tuscan, —s; Roman, —s; Leghorn, —s; Trieste, —s; Salonica, —s; Smyrna, —s; American, —s; Canada, —s; Barley, —s; Oats, —s; Beans, —s; Peas, —s; Flour, —s per barrel.

The Seed Market.—The general demand is in a ve y inactive state, at last week's quotations.

Linseed, English, sowing, 60s to 62s; Baltic, crushing, 48s to 50s; Mediterranean and Odessa, 42s to 46s. Hempseed, 34s to 36s per quarter. Coriander, 16s to 24s per cwt. Brown mustard seed, 9s to 10s; white ditto, 8s 6d to 9s 6d. Tares, 40s to 42s per quarter. Rape, 34s to 36s per ton. Cakes, 5l 5s to 5l 10s per thousand. Linseed cakes, English, £7 0s to £7 10s; Baltic, £6 10s to £6 15s; Mediterranean, £6 5s to £6 10s; Odessa, £6 0s to £6 5s per ton. Canary, 42s to 45s per quarter. English clover-seed, red, —s to —l; extra, —s to —l; white, —s to —l; extra, —s to —l. Foreign, red, —s to —l; extra, —s to —l; white, —s to —l; extra, —s to —l.

Bread.—The prices of wheaten bread in the metropolis are from 6d to 6½d; of household ditto, 4½d to 5½d per 4lb loaf.

Liverpool Corn Trade Average.—Wheat, 40s 6d, barley, 24s 6d; oats, 20s 6d; 27s, 28s 6d; beans, 30s 10d; peas, 30s 10d.

The Mark Lane Average.—Wheat, 38s 10d; barley, 24s 2d; oats, 19s 6d; 27s, 26s 10d; beans, 32s 0d, peas, 30s 5d.

Dublin.—Wheat, last week, 1s; oats, 1s; rye, 1s; beans, 1s; peas, 1s.

Tea.—The public sales have passed off heavily, on somewhat lower terms. Privately, very little is doing. The enormous second Congou may be had at 10d to 11d per lb. The stock on hand is exceedingly large.

Sugar.—The most moderate business is doing in East India rum, at 1s 2d to 1s 3½d per gallon proof; Leewards, 1s 4½d to 1s 6d proof. Brandy moves off slowly, at further reduced rates. In other spirits no change has taken place.

Coals.—Carr's Hartley, 13s 6d; Chester Main, 12s; West Hartley, 12s 6d; Harton, 13s 6d; Eden Main, 9s; Lambton, 13s; Relton, 12s per ton.

Hay and Straw.—Meadow hay, 72s to £4 0s; clover do, £3 3s to £4 10s; and straw, £1 15s to £1 17s per load.

Oils.—We have an improved demand for common fish oils, at full prices. Seal oil is brisker to purchase. Rape and olive depressed. Linseed firm.

Provisions.—The demand for Irish provisions is only moderate in our market, and in some instances the quotations have an upward tendency.

Wool.—Since the close of the public sales, scarcely any business has been doing in the private market, and we have sellers on lower terms

Potatoes.—All kinds (the supply of which is large) move off heavily, at further reduced rates.

Hops.—The market has been reasonably well supplied with each kind of fat stock, in which trade has ruled heavy, at barely Monday's quotations.

Coffee.—Fine and middling qualities have been tranac ed, at full prices.—

Provisions.—Beef, from 3s 4d to 4s 10d; mutton, 3s 6d to 5s 2d; lamb, 4s 4d to 5s 6d; veal, 3s 6d to 5s 10d; pork, 3s 8d to 5s 8d per 8lb. by the carcase.

SCOTCH SEQUESTRATIONS.

A GALLOWAY, Glasgow, merchant. D STEWART, Inverness, silk mercer. J D and T M'LEAN, Dundee, cabinet-makers. J GLASS, Newburgh, Fifeshire, spirit dealer.

BIRTHS.

On the 5th inst, the wife of the Rev John Taylor Plummer, of a daughter stillborn.—On Whit-Sunday, the wife of the Rev George T Coleridge, Hackney, of a daughter.—On the 7th inst, the lady Guernsey, of a son.—On the 7th inst, Lady Ada Goff, of a son and heir.—On Sunday, the 8th, at Bath, Mrs. Deeks, the wife of R D Atkinson, Esq, of a son

MARRIAGES

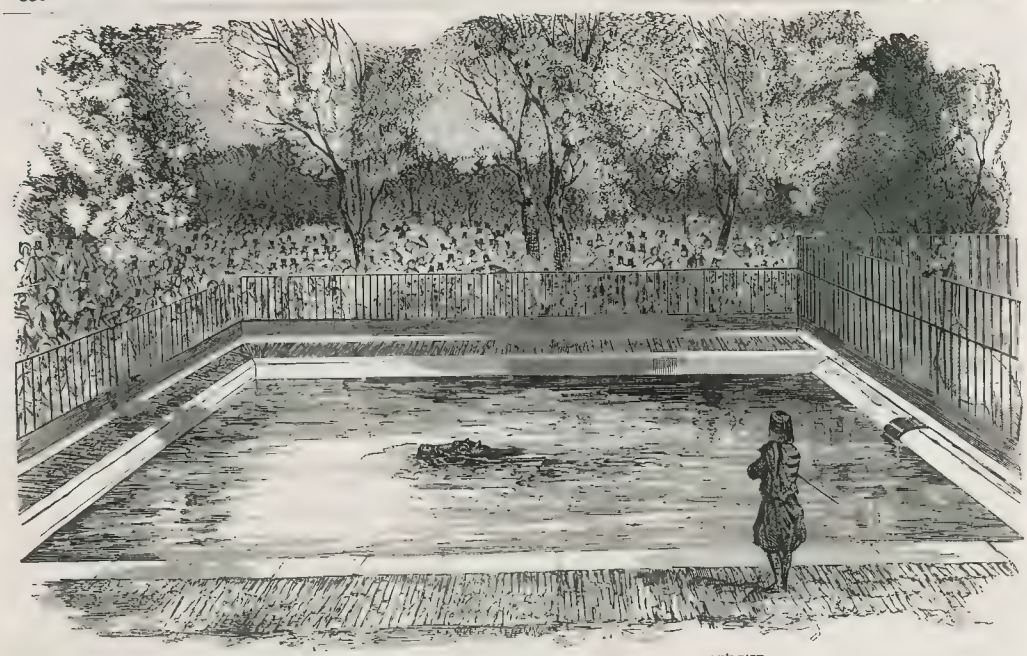
On the 27th ult, the Rev Henry Danpier Phelps, vicar of Stirling, Kent, to Frances Jane daughter of the late Rev Thomas Wilkinson, formerly of Lincoln Cathedral.—On Tuesday, the 3rd inst, at Oxon.—On the 4th inst, Lieutenant-Colonel Gore Browne, C B, to Harriet Louisa, daughter of James Cavendish, Esq, of Cragie.—On the 7th inst, at New Windsor, by the Rev Isaac Gossett, Arthur Rolls, Esq, of Camden-square, to Caroline Rachel, of Queen's-terrace, Windsor, eldest daughter of the late Charles Frederick Baxter, Esq, of Long-acre, London.

DEATHS.

Hannah, second daughter of John Calsher, Esq, of Boston, Lincolnshire.—On the 5th inst, the Rev John Farrer Brabazon, M A, fellow and late Mathematical Lecturer of St Peter's College, Cambridge.—On the 6th inst, Lieutenant-General Sir John Lambert, K C B, colonel of the 63rd Regiment of Foot.—On the 6th inst, Lieut-Colonel W T Baker, of the Madras army, aged 52, at his residence, in Fordcombe, in Penshurst, on the 18th of May, aged 65, the Honorable George Shore, formerly a Captain in her Majesty's 104th Regiment, and for many years a member of Council and Adjutant-General of the Militia in the province of New Brunswick

THE HIPPOPOTAMUS IN HIS NATIVE HAUNTS.

TWELVE months ago we gave our first Sketch of this illustrious stranger, who not only took the town by storm, but achieved a reputation for himself and the Zoological Society which reached to the most remote nooks of the civilis.d world. Fifteen hundred years had passed since an animal of this remarkable form had been seen in Europe; and the one now before us had reached the country in the wild sway without producing one; if the Viceroy of Egypt had not been induced to assist the Society by his ardent desire to contribute towards the advancement of science in all its bearings. More than one European power has possessions in Africa where this almost fabulous animal yet lingers; but up to the time of Mr. Murray's first suggestion to the Viceroy, no serious step had ever been taken by any of these governments to procure the physiologists and zoologists of Europe an opportunity of studying, or even of forming a correct idea of one of the most singular animal which possesses a degree of archæological and physiological interest entirely unsurpassed by any other. And here a very singular reflection arises. A self-supporting Society, subject, consequently, to every possible fluctuation to which bad management or the caprice of the public taste can give rise, has not only succeeded in raising itself to the character of a truly national Institution, but has succeeded in effecting much more than the cognate Institutions of other countries, supported by their respective Governments. The annual statements of accounts, published by the Zoological Society, exhibit the



THE HIPPOPOTAMUS IN HIS NEW BATH IN THE ZOOLOGICAL SOCIETY'S GARDENS, REGENT'S PARK.

almost incomprehensible fact, that, between the time of its foundation and the 31st of December, 1850, a period of only 22 years, there has been paid to the Government of this country a sum exceeding £20,000, on account of rent, rates, and taxes. We believe that this fact, if it could be brought to the knowledge of the thousands of foreign visitors who daily repair to the Gardens, would appear to them infinitely more wonderful than even the collection itself Such, however, is the self-relying character of the Anglo-Saxon race, that its undertakings seem to flourish most when most left to their own resources, and most independent of the trammels of official machinery

It is a most gratifying and instructive point, which will be obvious to every observer, however careless, that many of the most valuable animals in possession of the Society are the gift of her Majesty the Queen, who has invariably given to this society her steady and most gracious support, and who has thus emphatically signified her approbation of the gradual progress of the institution towards its present successful condition. The example which her Majesty has afforded has been very extensively emulated by other Sovereigns; and it is gratifying to notice, in the Reports of the Society, that the Governors of our Colonies in their individual capacity, native Princes of India, and many individuals of less exalted degree in almost every country in the world, are springing forward to assist in maintaining and aggrandizing the collection for which the Society have been so wisely extending their buildings.

To maintain exotic animals gathered from every region of the earth in a fair condition of health, to keep the native of New Guinea and the native of the Arctic Circle within a few yards of each other, to compensate each for the deficiency of food and climate to which he is unavoidably subjected, is not so easy a matter as it may at the first glance appear. We rejoice, therefore, to notice that in the buildings which have of late years been erected by the Society, a singular degree of thoughtfulness has been exercised in providing against difficulties of this nature; and that, as far as we can judge, an equally singular degree of success has resulted from it. As the revenue of the Society increases in proportion to its activity and to this success, there is nothing too sanguine in the expectation that a few years of continuous progress will push its prosperity and its usefulness to a point as considerably in advance of its present state as it now stands in relation to the past. One of the great difficulties with which the Society has had to contend—the excessive dampness of the locality—is now fortunately about to be ameliorated by the avowed intention of the Commissioners of Woods and Forests to effect the drainage of the Regent's Park; and the swampy land which bounds the Gardens to the south, and which has, on this account, we presume, hitherto been unoccupied for any useful purpose, will, in future years, become available for the general purposes of the establishment.

The great popular interest which is attached to the Menagerie and Gardens of the Zoological Society has enabled them alone among the exhibitors of London, not only to maintain, but to increase the usual number of their visitors since the opening of the all-absorbing Crystal Palace; and we believe that this fact is the best possible proof of the deep hold which the increasing taste for natural science has taken upon the educated classes of the country.

The new bath which has been opened for the Hippopotamus in the open air, affords a perfectly new idea of his activity, from the great scope for action which its limits admit of It is 35 feet square, and of considerable depth All the inconveniences to which visitors were subjected last year from the bath being within doors are now obviated, and the platforms afford good accommodation for about a thousand spectators at the same time.

ASCOT RACES.—"WOOLWICH," THE WINNER OF THE EMPEROR'S PLATE.

WE have engraved a Portrait of the winner of the magnificent group at Ascot, "The Emperor of Russia's Vase," engraved in our Journal of last week. The race is soon told Little Jack made all the running, Woolwich waiting on him into the distance, and winning cleverly by a length, amidst loud cheers from a division of the "Ring," and a profound silence amongst the aristocracy. Woolwich is understood to be the property of Messrs. Bland, Saxon, and Barber.

"Some speculation was afloat as to the probable fate of the Emperor's Vase, it being presumed that neither Mr. Bland, Mr. Saxon, nor Mr. Barber would feel inclined to place it on their sideboard as a trophy worthy of their possession. It may now find its way by some circuitous route to be again contended for over the same ground. It will be an admirable opportunity for the Railway Companies in conjunction to become its purchaser, and to present it as a railway plate to be run for in 1852, when it is hoped it may fall into the hands of some one who will appreciate it as a work of art."—*Bell's Life in London.*

"WOOLWICH," THE WINNER OF THE EMPEROR'S VASE.

EXHIBITION SUPPLEMENT
TO
THE ILLUSTRATED
LONDON NEWS.

No. 494.—VOL. XVIII.] SATURDAY, JUNE 14, 1851. [TWO NUMBERS, 1s.

THE GREAT EXHIBITION.

MODEL HOUSES FOR THE WORKING CLASSES.

THE countless visitors to the great international Exhibition will not pass unnoticed the contributions of Prince Albert to the World's Show, if they are but made acquainted with the fact that his Royal Highness, who seems to unite goodness of heart with clearness of head in no usual degree, has exhibited, without the walls of the Crystal Palace, a contribution not less important, and in many respects far more interesting than most of the works of art and utility within. The contribution of his Royal Highness is a block of model houses, erected at the Cavalry Barracks, Hyde-Park. The houses are designed for the accommodation of four families, and were erected by the Prince at his own expense with the view of conveying practical information calculated to promote an improvement in the dwellings of the working classes, and of stimulating visitors to the Exhibition, whose position and circumstances may fit them for the task, to imitate his example.

In its general arrangement, the building, as we learn from the explanatory document which has been put into our hands, is adapted for the occupation of four families of the class of manufacturing and mechanical operatives, who usually reside in towns or in their immediate vicinity; and, as the value of land, which leads to the economising of space, by the placing of more than one family under the same roof, in some cases renders the addition of a third, and even of a fourth story desirable, the plan has been suited to such an arrangement, without any other alteration than the requisite increase in the strength of the walls.

The most prominent peculiarity of the design is that of the receding and protected central open staircase, with the connecting gallery on the first floor, formed of slate, and sheltered from the weather by the continuation of the main roof, which also screens the entrances to the dwellings. The four tenements are arranged on precisely the same plan, two on each floor. The entrance is through a small lobby, lighted from the upper part of the door. The living-room has a superficial area of about 160 feet, with a closet on one side of the fireplace, to which warm air may be introduced from the back of the range; the corresponding recess may be fitted up with shelves; and on the opposite side of the room a shelf is carried above the doors, with a rail fixed between them.

The scullery is fitted up with a sink, beneath which is a coal-bin of slate. A plate-rack at one end, drained by a slate slab into the sink, covers the entrance to the dust-shaft, which is enclosed by a balanced self-acting iron door. The dust-shaft leads into a closed depository under the stairs, and has a ventilating flue carried up above the roof. At one end of the scullery is an inclosure forming a meat-safe, ventilated through the hollow brickwork: shelves are fixed over the doors, and a dresser-flap against the partition wall.

The sleeping apartments, being three in number, provide for that separation which, with a family, is so essential to morality and decency. Each has its distinct access, and a window into the open air; two have fire-places.

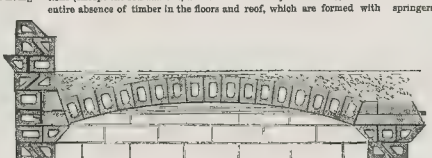
The children's bed-rooms contain 50 feet superficial each; and, opening out of the living-room, an opportunity is afforded for the exercise of parental watchfulness, without the unwholesome crowding of the living-room by its use as a sleeping apartment.

PRINCE ALBERT'S MODEL LODGING-HOUSE.

The parents' bed-room, with a superficial area of about 160 feet, is entered through the scullery—an arrangement in many respects preferable to a direct approach from the living room, particularly in case of sickness. The recess in this room provides a closet for linen; and a shelf is carried over the door, with a rail fixed beneath it—a provision which is made in each of the other bed-rooms.

The water-closet is fitted up with a Staffordshire glazed basin, which is complete without any wood fittings, and supplied with water from a slate cistern in common of 160 gallons, placed on the roof over the party and staircase walls. The same pipes which carry away the rain-water from the roof serve for the use of the closets.

The peculiarities of the building in constructive arrangement are, the exclusive use of hollow bricks for the walls and partitions (except the foundations, which are of ordinary brickwork), and the entire absence of timber in the floors and roof, which are formed with flat arches of hollow brickwork, rising from eight to nine inches, set in cement, and tied in by wrought-iron rods connected with cast-iron springers, which rest on the external walls, and bind the whole structure together; the building is thus rendered fire-proof, and much less liable to decay than those of ordinary construction. The roof arching, which is levelled with concrete, and covered with patent metallic lava, secures the upper-rooms from the liability to changes of temperature to which apartments next the roof are generally subject, and the transmission of sound, as well as the percolation of moisture, so common through ordinary floors, is effectually impeded by the hollow brick arched floors.



SECTION OF HOLLOW BRICKWORK

The external and main internal walls are of patent bonded brickwork, which has the important advantage of securing dryness and warmth, with economy of construction. Another important benefit arising from the use of hollow bricks is, that, where they are laid double, in parallel courses, without headers,

as in the patent bonded brickwork, the internal face of the wall is sufficiently smooth to render plastering unnecessary. In the present instance, where plastering has been resorted to, it is confined to one side of a thin partition, or to partitions formed with bricks not intended for the situation in which they are used.

In regard to some other parts of the brickwork, it should also be observed, that, owing to the erection of the building having been determined on late in the winter, many difficulties had to be contended with in obtaining a sufficient supply of hollow bricks; and, from accidental circumstances, disappointments were experienced in reference to a considerable number, on which account the structure should be regarded rather as the pledge of future excellence in hollow brick construction than as its full accomplishment.

The coarse surface of the bricks used in the two upper-floor living-rooms and at the foot of the staircase may, however, be referred to as a specimen of what can be accomplished by the skilful adaptation of fitting materials, and as highly creditable to their maker, Mr. Ridgeway, of the Staffordshire Potteries. Specimens of glazed bricks of clay from the north of Devon are also exhibited

Internally French plaster has been used, as drying quicker and having a harder surface than ordinary plaster. The floors, where not of Portland cement, are laid with Staffordshire tiles, except to the right-hand room, first floor, which is of Java, by Orsi and Armanie. The coping is in Portland cement. The external stringcourse and internal cornices are the patent bonded bricks set in Portland cement with the splayed side outwards.

The advantages of the hollow brickwork and its various applications, especially when formed with a longitudinal bond, as adopted in the construction of these houses, are expained, in another private paper, to be dryness and warmth, as well as economy of construction—considerations which recommend them as a preventive of the evils which result from the absorption of moisture by common bricks and other porous materials.

For agricultural buildings, and for inclosure, park, or fence walls, they are particularly adapted, as well as for the ordinary dwellings of the labouring classes, for schools, and for houses generally of moderate height, and with the usual weight of roofs and floors, rendering internal battening unnecessary. Their strength may be adapted to circumstances, and where necessary be rendered equal to that of solid bricks.

When used for partitions, or for roof and floor arches, they are fire-proof, deaden sound more effectually, and are considerably lighter than solid brickwork. As a lining to stone or flint walls, they supersede the necessity for battening, and the consequent risk of the stone and dry rot is avoided. For cottage floors they are also well adapted.

The various forms of hollow bricks proposed, prior to that which has been patented by their inventor (Henry Roberts, Esq., F.S.A., Honorary Architect to the Society for Improving the Condition of the Labouring Classes), are all, particularly in reference to external walls, more or less liable to the objection, that they either will not properly bond together, and form a substantial wall, or else that the headers and the vertical joints afford a medium for the transmission of damp from the exterior to the interior.

"By the form adopted in the patent hollow brickwork, a perfect bond, running longitudinally through the centre of the wall, is secured; all headers and vertical joints passing through it are avoided; internal as well as external strength is obtained; and every facility is given for the fixing of floor-plates and other timbers; whilst, by the parallel longitudinal cavities, ample security for dryness is afforded, and great facility presented for ventilation, as well as for the conveyance of artificial heat, and for the transmission of bell-wires, pipes, &c."

His Royal Highness, who is President of the Society for Improving the Dwellings of the Working Classes, could have devised no more appropriate contribution to the extraneous utility of the Exhibition than this unpretending block of buildings. It needs but to show the working classes that they pay higher rents for wretched hovels than they would be called upon to pay for such comfortable homes as these, and to prove to the capitalist that such buildings would yield a fair return for the money invested in them, to make the dwellings of the bulk of the people more worthy of the intelligence and good feeling of the age than they now are. Hitherto, although considerable attention has been directed to the subject in several of our great towns, the promoters have neither reconciled the people to their new abodes nor induced capitalists to embark largely in such undertakings. It is likely, however, that the subject will grow in favour as well as in importance.

THE FOOD OF MAN.

ANIMAL SUBSTANCES AND SUBSTANCES DERIVED FROM ANIMAL BODIES.

THE three great physical wants of man are Food, Clothing, and Habitation. We propose to consider what specimens of each are provided in the Great Exhibition. We begin with Food, as the more essential of the three. Considering that, for some thousand years, successive generations have had ample opportunity of testing the values of different kinds of food, it might be supposed, that, both in theory and practice, our knowledge of alimentary substances is more complete than that of any other subject. Yet the whole question, in a philosophic point of view, requires a high amount of knowledge, and is so recondite, that, even at the present time, it is very imperfectly understood. The researches of modern chemists and philosophers have clearly indicated that the operations of nature and the operations of man are conducted according to the same laws, and that man has only the power of discovering the principles of nature, and adapting them to his use. According to this view, organic beings, and even man himself, are mere elaborate contrivances, exhibiting the perfections of nature, but in no whit differing, in the laws under which they act, from the steam-engine, the battery, or the candle. From this cause, as organic beings are continually exhibiting force or capacity to change the arrangement of matter, it follows that, according to the universal law of nature, some other matter must be changed within their bodies, and hence, for that change, food is required. The human body falling within the class of warm-bodied animals, requires matter to be changed or enter into new attractions for the production of its natural warmth. It requires other matter to be changed for the capacity of exercising its muscular force; and neither the slightest action of the finger, nor even the winking of the eyelid, can be exercised without a corresponding demand for food. Lastly, although the production of blood and generation of force require the greatest amount of food, yet materials are required to build and support the frame of which the human body is made up. Not a thought can arise, nor a dreamy vision appear, nor a determination be arrived at, without a waste of material. In considering alimentary matter, we shall have to consider substances to maintain the warmth of the body, then other matter to maintain the muscular action, then that food which is required to excite the brain; and, lastly, other substances required to build up the structure which evinces these various properties.

Although it is manifest that we must take care to supply food adequate to these purposes, yet, even by the advances of modern chemistry, we are not able to point out precisely the manner in which every kind of food acts; and hence we must group a mass of foods together according to their composition and such effects which experience has taught us of their action.

But even in estimating the values of food by their action, instead of their composition, we are met by many difficulties; for food, to be useful, must be digested—must be assimilated or taken into the blood; and the same material which is easily digested and assimilated by one person, is absolutely poisonous to others; and there is even one case recorded of an individual in whom mutton, the most wholesome and lightest of meats, invariably, under every form of disguise, acted as a poison, and produced diarrhœa and dysentery, &c.

The changes which take place in all organic bodies, including man himself, take place in fluid mixture. The digested food is absorbed by vessels in a fluid state and taken into the blood. The changes of the body which produce the forces occur also in materials in a state of solution; and, lastly, the excretion of the changed matter is also effected through the kidneys, skin, alimentary canal, and lungs, from fluid.

The supply of water or diluent fluid is hence of great consequence; and for this reason we shall first consider the contrivances by which good wholesome water can be obtained for dietary purposes. The quality of water used for food is of the highest importance. At certain times, any contamination with putrid matter acts as most virulent poison, and at all times is liable to produce diarrhœa. During the prevalence of cholera, the ever-memorable mortality of Albion-place was produced by a drain having effected a communication with the well. At one house every individual perished. The inhabitants of the other houses supplied from the same tank were also great sufferers; and thus it is of great importance for every person to examine the character of the water which he employs.

Chemists have discovered, that, when water freezes, the ice, in the act of solidification, squeezes out all other foreign matters, so really nothing can be purer than the water from thawed ice. In London, where the water supplied is but indifferent, and the springs are contaminated with the oozings of animal matter, perhaps no better course can be adopted, by those who are in a position in life to afford it, than, to use that solid ice which has been recently imported, for not only might it be employed to cool wine, and keep the ordinary provisions, but when thawed, would form an excellent beverage. All artificial contrivances for freezing water are, doubtless, not so economical in their application as the simple mode of importing it from colder climates. At the present day, ice may be obtained in the high-roof manner. But the best plan, which exists at the Crystal Palace, is that devised by Mr. Masters, and by which we have seen very beautiful blocks of ice prepared. Next to the purification of water by freezing, that by distillation demands attention. In London many persons have an apparatus which is attached to their kitchen-ranges, and which is capable of giving a considerable quantity of a bright fluid. In this case some empyreumatic oils are very apt to come over with the water, and give it an unpleasant taste.

As far as the mechanical impurities of water are concerned, they may be removed by filtration, and large quantities of dead and putrifying animal and vegetable bodies may be separated by this simple process. There can be no more simple mode of filtration than by using a piece of blotting-paper placed in a funnel; and, in this mode is adopted by chemists, even for their more delicate operations. At the Exhibition many mechanical filters are shown, the majority of which are so contrived that a pressure assists the more rapid action of the water. The filters exhibited both by Mr. Stirling and Mr. Slack are said to have the power of filtering very large quantities of water.

In many cases filtration may be employed, either through animal charcoal, or that peat charcoal which has been recently found so effective to deodorise and absorb putrid material. This process is so effective, that Dr. Garrod has lately pointed out that the most deadly vegetable poison may be removed from water by animal charcoal.

In using water as a diluent some precaution must be taken, for, after great fatigue and exhaustion, a sudden draught of cold water is attended with serious consequences. Quintus Curtius records that Alexander the Great lost more men by this means than he had ever lost in any battle—an observation sufficient to warn those, who, tired out and exhausted by studying the objects exhibited, seek to recruit their exhausted powers by a draught from the filtered water of the Western Nave, which Mr. Forster prepares for their convenience.

The active substances which are used for food must consist of various elementary bodies: we principally use compounds of hydrogen, carbon, nitrogen, iron, potash, soda, and phosporus; as all of these elementary matters are the subjects of changes, or enter into new attractions, which produce the forces which the human organization manifests, and may then be detected in the changed materials which are excreted.

Of all foods, perhaps, those derived from other animals deserve our first consideration. Every surgeon knows the beneficial influence of a generous diet in developing a highly organised individual. At the London dispensaries and workhouses the baneful influence of an imperfect diet is shown by a debilitated body and feeble mind; and the railway labourer is known to require a large amount of animal food to enable him to follow his avocation. We have ascertained from many calculations, that amongst the middle classes the value of the average amount of flesh meat eaten in London amounts to about sixpence per head *per diem*, where the party is left to follow his own inclinations, without restriction or guidance. Upon this average, the butcher's bill for ten persons amounts to about £90 a year. If we consider that this amount of flesh meat is the proper quantity, we perceive at once the importance of the subject under consideration. And though a small section of the population are *physiophagi*, or vegetable-eaters, such individuals form the exception, and not the rule; and to preserve the integrity and enterprise of the Anglo-Saxon race, the first medical authorities declare that a full meat diet must be used.

In the South-west Gallery we have various samples of milk preserved for voyages. First of all, there is a concentrated preserved milk canned before us, with a good appearance and excellent testimonials from various surgeons who have reported upon the subject to Sir W. Burnett. Again, we observe milk prepared by other processes. Mr. Fadeuilhe has exhibited consolidated milk, of a buttery appearance. Some preserved cream is also shown; and a single bottle of artificial milk, composed of yolk of egg and other materials, to partake as near as possible the properties of that fluid, is contributed by Mr. Prosse. Milk being designed for the growth and nutrition of the animal body, must be prepared for that purpose, and hence is complete in itself, at any rate for the infant state.

Butter—the fatty portion of milk separated from it—is poorly represented at the Exhibition; nevertheless, the Americans have contributed tubs of this article of food. Butter, being composed only of hydrogen and carbon, is insufficient of itself to maintain the vital functions. The more important constituent of milk, which are separated from it and solidified into cheese, form a concentrated kind of food, which is so well adapted for keeping, so easy of transport, and yet withal so well calculated to indicate skill in its manufacture, that we might reasonably expect that the Crystal Palace would have been inundated with examples. Strange to say, we have not found a single cheese: the Americans have certainly not contributed one, and at present we have not seen a single specimen over the whole Building; from which we may infer, as any rate, that their number, if any, is exceedingly few.

Next to milk, blood must be regarded as a material having all the constituents requisite for food. It is but little used in any country; even the Levitical law so strictly forbids its use, that it orders it to be thrown upon the ground. This is carried out to the present day by those who hold the Jewish faith, and we can but think there is some medical reason for its not being used. To our mind, there is something revolting in the use of blood, and we should be very indisposed to eat any boiled bread of either the ox, cow, calf, lamb, or sheep, all of which are exhibited by Mr. Bocchiere. Amongst these articles of food, and placed in the section for food, are specimens of the preserved blood of healthy men and healthy women, for the excellence of which, as articles of diet, we must rely upon the statements of such cannibals as shall come over to witness the Exhibition. These last specimens we consider not only as a disgrace to the Building, but also a disgrace to the nineteenth century: for who shall say that the abstraction of the vital fluid from a healthy man or woman may not lead to disease or premature death? and we therefore trust that those who examine the section of human food may be spared the observance of such abominations, by the Executive removing them from their present situation. We have no experience of the use of blood to any extent as an article of food, and, therefore, would not recommend it even under the title of blood bon-bons, which are shown amongst these articles. Of course, in times of famine they might possibly be of great assistance.

From the consideration of the blood foods, we now pass to the more pleasing profusion of materials derived from the muscular fibre, or meat. In this department the Americans have shown large barrels of beef and pork prepared for ship purposes. The same country have shown specimens of hams and spiced beef; and our Irish neighbours, represented by Mr. Smith, have carved a whole pig, to exhibit their skill in this department of the preparation of food. A few other hams are shown, but in this matter the display is not good. In these cases salt is used in considerable excess, and it has become a matter of great importance to prepare meat so that it will keep without that material. Napoleon offered a large reward for any person who should provide this desideratum, which we believe was first discovered and carried out in France. Subsequently, Mr. Cooper, by dint of perseverance, also succeeded in finding out how to conduct the same operation, and his discovery was rewarded by a handsome fortune by the sale of the preserved meats for ship crews. Neither he nor his descendants have contributed specimens to the Exhibition, although Capt Parry and Capt. Ross have spoken of them as being "in flavour and quality superior to every other." This important department of preparing provisions is still extremely well represented. Messrs. Gamble have sent, amongst a large number of hams, one canister of boiled mutton supplied to the Arctic expedition in 1824, and found by Sir James Ross in Prince Regent's Inlet, in 1849, in a perfect state of preservation. Mr. Leonard has shown beef said to keep good for any time; and a large quantity of foods from New South Wales are also exhibited. The principle of the preparation of the foods is the total exclusion of the air, and hence no putrefaction or other change occurs. It is impossible to tell to what extent this manufacture will eventually be carried, for in some parts of the world animals are alone kept for their skin or fat, the meaty, or nutritious part, being useless for any purpose. We are told that the large navy contracts for these preserved meats are taken by persons who procure the substances from foreign countries, and thus are enabled to supply them at a very moderate price. We see no reason why thousands of tons of such provisions should not be imported for the use of our industrial classes; and already their excellence is well known to the bachelor students of the inns of court, who keep a supply by them to use when required. This invention will doubtless, by degrees, amply develope itself. Of course, of the relative excellence of the things exhibited we have no means of judging from simply looking at the canisters. Mr. Whitney has shown beef preserved in a dry state, in face as a powder, without salt: doubtless, if well prepared, it might become a good breakfast viand. A more important material is exhibited by Mr. Warriner and Soyer. It consists of the gravy of meat, and containing, probably, all its soluble matters, in a concentrated form. It is procured from Australia, where the carcases of sheep are positively worthless: and, if it be but good, it requires to be extensively known and universally kept, as it would form an excellent mode of making beef tea quickly. In the department of chemicals, Mr. Bullock has furnished a beautiful specimen of kreatine, or kreatinine, two of the alkaloids which Liebig has lately discovered in the flesh of animals. Perhaps we dare affirm that such specimens as these have never been produced before, and that they are the largest and finest examples that have ever been made, and, therefore, well deserving of careful study

Madame St. Etienne has shown specimens of combinations of animal food with vegetable; so has also Mr. Gentile, apparently from the same works, at Totnes; and the Americans have sent over some meat biscuits. These latter we have had an opportunity of tasting, and they appear to be a very excellent compound of flour with the gravy of meat. The whole question of the preparation of food is but in its infancy—a mere germ, which, perhaps, in future years, will be fully developed.

The flesh of meat is particularly valuable as an alimentary matter, inasmuch as it supplies the substance which enables us to evince muscular action; and, though we shall hereafter point out that some vegetables contain a similar principle, yet animal foods seem, upon the whole, with due deference to the vegetable feeders, to be the best substance which can be employed for that object.

Fish is somewhat less digestible than meat. Preserved salmon and various other fish are exhibited by the same persons who have shown the preserved meats. We need hardly remind our readers that we owe isinglass to fish. This material is well represented by Mr. Sumpson, who has shown the excellent case of isinglass of this material. By the machines it is cut up into fine ribbons, such as those which are sold in the grocers' shops. Amongst the Indian curiosities a fish is shown which also yields a good isinglass; and the visitor may see a number of shark's fins which are also prized by the natives for a similar object. Of late years, gelatine has been procured not only from fish but also from animal substance, and various specimens of gelatine are shown. In purchasing this substance the public must rely upon the honesty of the vender; the shavings are a good or stronger than isinglass, others are almost as bad as the better sorts of carpenter's glue. Mr. Batty has shown some beautiful glasses of calves'-feet jelly, which will keep for any time, and have been in our larders while we have been imparted to them. In England fish does not form so essential an article of diet as formerly, when indentures of apprentices made in the towns on the borders of the Severn contained stipulations as to the number of days to which the eating of salmon was to be restricted, or in those ancient periods of history when Herodotus records that there were two or three races who lived exclusively on fish, and hence were called Ichthyophagi

We very nearly passed some curious dried viands shown in the Swiss department. Differently dried trout, dried mutton chops, cutlets, &c., are exhibited; but, in common with every other department of the Exhibition, insufficient information is given to render an exact description very difficult. In the French department various articles preserved in this are shown, but they do not deserve any special description.

The preparations of gelatine were formerly in high repute; but modern discovery seems to indicate that they are unfavourable for the tendons, fascia, and skin, and do not communicate to the system matter which supplies the changes which are required for muscular action; and certainly the practical surgeon knows that they are incomparably inferior to the soluble parts of muscular fibre, or flesh meat, for restoring strength and muscular energy.

Amongst preparations from fish, we must not omit the fish oils. These have been much into use as a medicine, though, perhaps, they must be regarded more in the light of a food than a remedial agent.

By the use of the fish oils, such as cod-liver oil, and the oils of a similar character, many cases are on record which may be observed in the South-west Gallery, the surgeon can fatten his patient at discretion, and can even, by their agency, remove the tubercular matter which, when deposited about the joints, constitutes scrofula—when deposited in the lungs, constitutes consumption. The judicious use of these oils, combined with other proper treatment, has so very much increased the duration of life in consumptive cases, that this malady is now, in the great majority of instances, curable, and, if it does progress, many years before it fatally disorganises those organs so absolutely necessary to the right performance of the vital functions.

Amongst the articles of food, there are some furnished by the Chinese and Indian Empires which are brought over to England—these are edible slugs. They have a most uninviting look, and are large, dried, black masses, which are eaten by Eastern nation; but with their excellence, flavour, and properties we are not acquainted. In mentioning these slugs, we cannot pass over the interest which the East India Company have taken to furnish the Exhibition with everything which is interesting; nor can we omit to mention the manner in which Professors Royle and Solly have conducted the arrangements and the selection of the goods, and who, from their high scientific standing and urbanity, have rendered the collection doubly valuable to those who study the objects exhibited. Amongst, also, the Chinese and Indian collections, we have seen a display of edible birds' nests as we never saw before in this country, and in the Chinese department we strongly recommend our readers to observe the manner in which the nests are attached to the rocks. These nests are in two, if not in three varieties: the first being quite white, and somewhat resembling dried white of egg; the second being mixed with feathers. These are used for soup, and, according to the analysis published by modern chemists of nearly the highest amount of nutritive ingredients; in fact, containing a highly nitrogenised substance, they must be rendered as being one of the most concentrated kinds of food which can be employed. Amongst the luxuries which doubtless in time will be rendered more familiar to us are the preserved turtle, and we see no reason why the delicious calipash and calipee should not be abundantly prepared in regions where these creatures abound, sealed up in tins and sold at a price which should bring it within the means of every person. It is most largely used to a great extent in relating to its excellence.

Perhaps there is no more curious feature connected with animal food than the economy which is practised with such portions that are unfit for food. The very refuse in making candles fetches comparatively a high price in the shape of grawes, which are not exhibited; and, in fact, every portion is turned to some account. Some time ago, when experimenting on various foods, we called at a large retail shop, and offered to purchase all the rejected pieces of cheese which necessarily occur in cutting it. The man asked what seemed to be a preposterous price; but, whilst debating the matter, a respectable-looking female, who overheard the conversation, turned round and exclaimed, "Ah, sir, you little know the value of those fragments; if you had a family like mine, you would be glad indeed to get pieces of such good cheese for supper!" Of good food every fragment is sold; and when animal matter is unfit for food, it passes into the manufacturers hands to be changed to other substances, and the exhibitor in the South-west Gallery may observe some of these transformations in those gaudeous and stupendous crystals of the yellow and red prussiates of potash which have been shewn.

Having a review of the animal substances used for the food of man, it will be seen, that, without there being anything positively new, yet there are many materials which are but very little known, not only to the public, but even to those who have deeply studied these subjects. The most important and suggestive examples are, doubtless, those in which meat is preserved to keep for any period, and is capable of being transported to any distance. The Legislator and the philanthropist must for ever regard the proper supply of the industrial classes with nutritious food as a matter of the utmost importance. Our workhouses are filled with inmates on account of bodily maladies produced by insufficient or improper food. Our hospitals and dispensaries are crowded with supplicants for aid from the same cause. For the full development of the intellectual faculties adequate nourishment is absolutely necessary; so, physically and morally, there is no subject of more importance at the Crystal Palace than those specimens of food which have been exhibited, which are likely to tend to the more extensive supply of animal food to the industrial classes.

ROME.—MOSAICS.

THE small space set apart for Rome, in the grand arena of the peaceful competition of all nations in the arts of civilisation, and the comparative paucity of the articles of display, contrast strongly with the mighty memories which the name of Rome is so calculated to inspire. In that narrow compartment, or its contents, we see little to recal a limitless dominion and sculptural glories of the Imperial epoch, or the exuberant genius and grand results of the era of the Revival, with their enduring fame and wide-spread influence. In the Palace of the Crystal Palace" we cannot have those monuments of art, those relics of antiquity, which throw such a charm around the "Eternal City" itself, and which, if they cannot conceal, at all events modify the criticism of that drooping of material civilisation which seems to manifest itself in the outward aspect of things there; and hence, in this representative Rome," a feeling somewhat akin to disappointment arises, on first entering to view her array of objects of ornamental art. This sentiment, however, quickly yields to admiration on closer inspection. The want of that crowded profusion of display which more prosperous nations present, is compensated for by the beauty and unique character of the predominating features of the collection—the mosaics and the cameos.

Amongst the mosaics there is a table by the Cavaliere Barberi, on which the Bay of Naples, the Bay of Genoa, the Coliseum at Rome, St. Peter's, and other celebrated views, are represented with the truth of perspective, the rich tone of colour, the accuracy of delineation, and the perfect finish to be found only in the most exquisite miniature oil paintings; and the spectator may perhaps require to satisfy himself by microscopic examination that the work of art before him is not the production of pencil and pigments, but of some things widely different.

There is another mosaic to which we would also direct attention, if it were not invidious to particularise where all are excellent of their kind; but we mention it, partly because it is a copy of a *chef d'œuvre* of Italian art Guercino's "John the Baptist"—and partly because it has been produced in the great parent school of Roman mosaic art, the studio of the Vatican. It is the work of Signor Filippo Belle Castelli.

The mosaic-work of which these pictures are specimens is of comparatively modern invention, and is usually composed of *tesserce* or tablets of opaque glass, of different colours. The mosaics of the ancients consisted of party-coloured marbles, stones, or tiles, and were applied generally to the formation of tesselated pavements; with the style and character of which, the ruins of Pompeii, and various relics of the Romans in Great Britain, France, and other countries of Europe, we made the moderns well acquainted. Those inlaid pavements usually consisted of compartments, containing some subject or device depicted in the centre, and encircled by borders, in red, black, and white. Walls were also decorated in this way. And when, with the loss of power and wealth, luxury and the arts began to decline in Rome and in Italy, the Byzantines and people of the Lower Empire perpetuated the art, and by them the knowledge of it was re-conveyed to Italy in the middle ages. The Byzantines, adopting, in some degree, the polychromatic embellishments of the Greeks of an earlier period, introduced the use of blue, gold, and other brilliant colours; but there is not wanting authorities who maintain that the Italians never altogether lost the knowledge and practice of the art of mosaic decoration—that the Venetians especially, from a very early period, were well versed in it, and that the mosaics of the cathedral of St. Mark, at Venice, are the work of native and not of Byzantine artists. Whatever probability there may be in this theory, the direct evidence of history goes to show that the Florentine school of mosaic decoration was founded in the 13th century by pupils of Byzantine or Greek artists, who were brought into Italy to beautify the churches of her great cities.

The *tesserce* is only glanced at to indicate the source whence the modern art, which is so vast an improvement on that of the mediæval epoch is derived

The Moors, both of Spain and Africa, were also great adepts in mosaic decoration; but there was this characteristic difference between the Moorish and other kinds of mosaic, that in the designs of the former no human or animal form was represented, the law of the Khoran, adopted from the Bible—"thou shalt make to thyself no image"—being strictly adhered to the letter; and the embellishment was confined to intricate geometrical patterns, displaying infinite variety of combination and configuration. Foliage and scroll-work were also not uncommon amongst the patterns depicted.

This ancient mosaic, whether Byzantine, Italian, or Moorish, however aimed at perfect pictorial effect, exhibiting no attempt at perspective, shading, colouring of many tints and tones, and the various other constituents of a picture, like the mosaics of modern times. They were rude designs of hard outline, with the junctions of the *tesserce* conspicuous, as in any other marble pavement—a species of *parqueterie*, as it were, in marble.

MOSAIC PICTURES, such as those in the Exhibition, may be said to date their origin from a period little earlier than the year 1640, about which time copies of the paintings of the great Italian masters began to be made in mosaic. But there are other instances to show, that long prior to that period attempts at finished pictorial effect in mosaic were made, as may be seen in the mosaic over the Porta Santa, in the nave of St. Peter's, at Rome, which is a fac-simile, by Arpino, of an ancient mosaic picture of St. Peter holding the Bible and the keys of heaven in his hands. The *tesserce* are large and rough, and the rudeness of the original work is intentionally preserved in the copy. It is a picture, however; and, as evidence that pictorial representations in mosaic of a character similar to these of modern times, were attempted in Italy long prior to the stimulus given to the art by the decoration of St. Peter's, there mosaic embellishment of the very highest order is so predominant, both of good and bad drawing, by contrast, the great progress of improvement in the art from those early times to the present.

Mosaic pictures are usually fac-similes or exact copies of original paintings, in oil or fresco, and their highest excellence only aims at imitating, with the greatest truth and accuracy of the copyist's skill, the pictorial effects of the original. The result, therefore, would be very inadequate in proportion to the great cost and immense labour of the production. If it were not for its durable nature.

Once finished, no length of time, no excess of heat or damp, can injure or make the colours fade; the picture can only perish with the destruction of the mosaic structure. Hence, it is of the utmost value as a medium for preserving copies of the great *chefs d'œuvres* of genius, which, if depicted on the perishable materials of canvas, board, or plaster, may, in the lapse of a few centuries after the period of their production, be lost altogether to the world. How valuable, for instance, would be a first-rate copy in mosaic of the last supper of Leonardo da Vinci, representing not only the drawing, but the tone of colour, which cannot be conveyed by an engraving. It is in this sense that mosaics are truly valuable.

THE CONSTRUCTION OF MOSAIC PICTURES is a most elaborate and tedious operation, requiring the utmost nicety of work and painstaking skill. The *tesserce* of which the work is composed are small squares or oblong pieces of opaque glass, of every variety of hue and of different tints and shades, amounting to between 20,000 and 30,000 in number. In the studio of the artist specimen pieces of all those various colours and tints are placed under a full light in frames, assorted and arranged on the board gradually ascending scale of shade, from the deepest to the lightest, each having a particular number attached to it, which corresponds with the number of a drawer in the repositories in which the mosaic materials is kept. The artist, by this simple arrangement, can at once procure the minutest variety of tint of any colour which he may require, having possessed himself of the colours which he may require, his *modus operandi* is as follows:—A mosaic table is to be formed. He takes a slab of cast-iron, the surface of which is divided into square sections by little metal partitions, for the purpose of holding securely the cement in which the mosaic is embedded. This cement is of a most adhesive character, and is composed of lime and a concrete volcanic stone, reduced to powder, which has the property of attaining the very utmost hardness and durability when in contact with water, and hence is especially fitted to be an ingredient in a cement required to be of a very lasting character. This stone is usually known in Italy by the name of *peperino*, from pepe (pepper), the grey granulated colour of which it very much resembles in appearance. This powdered *peperino* and lime, when combined with linseed oil, and the compound made to a proper consistence, constitutes a cement having all the qualities needed for mosaic work. The artist, with the painting which is to be copied placed before him in a suitable light, spreads the cement over a small portion of the iron slab in sufficient thickness to cover the square compartments on its surface by an inch or two. He then inserts the mosaic *tesserce* or glass cubes in the cement, having first, by means of a tool-lathe, with wheels of different kinds attached, shaped each piece to the exact form requisite for the delineation of the particular fraction of the original painting which he is at the moment copying. The mosaic picture is thus wrought piecemeal as it were, with the most patient and elaborate skill, each different gradation of tint being effected by a separate piece of the mosaic material. The surface, when completed, presents a dull, rough, and jagged appearance very unlike that which the final operation of polishing communicates to it. This polishing, which brings out the beauty of the work in such perfection, is effected in the same ordinary manner in which marble slabs are polished, viz. by the friction of a heavy stone moved backwards and forwards either by the hand or by machinery

In the formation of mosaics of a large size, such as those magnificent specimens to be seen in St. Peter's, at Rome, it is not usual to employ a cast-iron plate as the sub-structure of the work. A large slab of *peperino* is found to answer all the purposes required, the natural inequalities and roughness of the surface presenting an effective grasp for the cement

Although the *Studio de Mosaici* in the Vatican, which is maintained at great expense by the Papal Government, chiefly for the purpose of decorating churches with mosaic copies of the masterpieces of Italian art, must be regarded as the great parent establishment which has developed to its present state of perfection the art and mystery of mosaic painting, there are, nevertheless, private establishments which produce works of great beauty for the decoration of mansions and palatial residences, and of these the mosaics in the Exhibition are less than a year and a half. remarkable instance of this celerity of operation was recently manifested at his studio, where a copy in mosaic of the St. Nicholas in the church of St. Peter, which had been ordered by the Emperor of Russia, was made in something less than two years, although a similar work at the Vatican occupied from four to five years

The pavement above referred to took three years and a half in its execution. But these are works on a great scale, to which the mosaics in the Exhibition only bear the relation of miniatures to full-length paintings. The latter, however, are well calculated to impress on a mind hitherto unacquainted with mosaic works, a correct idea of this peculiar and beautiful branch of art.

BELGIUM.

THE produce of the little constitutional kingdom of Belgium lies next to France, occupying the bays on both sides, and a slice of the northern galleries of the Eastern Nave. It includes specimens of almost every branch of industrial occupation. agriculture, commerce, manufactures, mining, and fine arts, in many subdivisions, are all represented in a very creditable manner. Belgium, under different names, has contrived to maintain a manufacturing and agricultural position for more than four hundred years, in spite of wars of which it has been the battle-field, of revolutions, of parcellings of territory, and changes of government, until, twenty-one years ago, at a fearful sacrifice of material wealth, it settled down as an independent state under a limited Monarchy.

Even in the time of the Romans, the Flemish cities were celebrated for their woollen cloths. In the time of Charlemagne, Liège largely manufactured both woollens and linens; therefore, the flax cultivation, which forms so important a part of Belgian agriculture, must have been extensively carried on at that period. In the latter part of the fifteenth century, Brussels, Antwerp, Louvain, and Ghent employed an immense population in woollen manufactures: Ghent alone had upwards of thirty thousand looms; the weavers of that city once mustered 16,000 men in arms under the banners of their trades. Thread lace originated in Flanders, at Mechlin and Brussels, where it is still an important branch of commerce, and the capture of Antwerp by the Duke of Parma, in 1785, ruined great silk manufactures, although Antwerp black silk is still famous, and drove a number of artisans to England, by whom our own manufactures were greatly improved. Flanders suffered grievously under the persecutions of Spanish masters; the Netherlands of Maximborough and Louis XIV. and XV.; the wars of the French Revolution, which ended in incorporating what is now called Belgium with France; the wars of Napoleon, which ended in taking it from France to add to Holland; and finally by revolution, which deprived the Belgian manufacturers of a large share of the commerce and consumption of Holland. But still the people struggled on with a patience and industry deserving of success. Belgium was thus thrown upon its own resources, as a manufacturing country, with only forty miles of coast and two indifferent ports. Great efforts were made to open foreign trade; consuls were appointed all over the world, rather as commercial travellers to create, than as diplomatic agents to protect trade already existing; and public money was largely and not very successfully invested in propping up establishments in which the King of Holland had taken a large pecuniary interest. But the wisest and most successful step of all, was the construction, long before any other Continental state had ventured upon such a novelty, of a complete network of railways. These railways, among more solid advantages, made Belgium the high-road to the Rhine and Germany, and attracted and detained a share of the travellers to the pretty miniature capital of Brussels, who had formerly flocked to Paris alone. These railways, no doubt, contributed powerfully to raise Belgium from the state of depression into which its manufacturing interests fell after the separation from Holland, and, by cheapening the cost of raw and manufactured produce, to render possible the varied exhibition we have had the pleasure of examining.

The arrangement which renders France and Belgium next-door neighbours here, as they are when at home, suggests a question which the Ministers of Commerce would be rather puzzled, we think, to answer.

Between France and Belgium there is a war of custom houses and an interchange of smugglers, chiefly in the shape of large dogs, which carry Belgian tobacco and lace into France, and bring back French silk or some such article. Every French *douanier* is provided with a thick volume of instructions on the art of stopping, seizing, detecting, poisoning, and shooting Belgian smuggler dogs. Nevertheless, day and night, especially at night, large packs of contraband hounds, heavily laden, rush past the bewildered officers.

Now, when Belgium was part of the French empire, its manufactures, its coal, its cattle, its corn were all freely admitted into France; nothing was taxed, nothing was prohibited: since the disjunction everything that is not taxed is prohibited, and yet the line of division between the two countries is purely imaginary, and the people who, under Napoleon, were free to interchange their goods, must have had just the same wants the day after the custom-house division made it unlawful as the day before. Why, then, was interchange useful before Napoleon's last campaign, and baneful after his dethronement?

But to begin our walk. We will first enter the southern bay. There we find a varied display of textiles of every kind, which seem very little visited by the curious crowd, although, no doubt, our manufacturers in the same line will give them a close examination. There we find the cheap mixed fabrics of woollen and cotton, the fine kerseymeres in which the Belgians can undersell our Gloucestershire and West of England men, also capital stout canvass and damask linen from districts of Flanders which grew flax and weaved linen long before Belfast was founded; printed silk handkerchiefs in praise of which nothing can be said, and woollen shawls of very dull, dowdy patterns. In this department almost every kind of woollen and mixed woollen is to be found, including a lot of coloured flannels. The outside of the bay facing the Nave is adorned by a mirror in gilt frame of allegorical figures very beautifully carved. The sides of the next section by the stairs leading to the gallery are hung with carpets from the Royal Belgian manufactory of Tournai, which, like the French Gobelins and Beauvois manufactories, is carried on with Government money, as a school for the purpose of improving native taste. Proceeding onward towards a formidable stand of arms, we pass between a collection of saddlery on one side and boots and shoes on the other. The saddlery is respectable, but will not stand comparison for a moment with either English, or Irish work in finish. The same may be said of the harness. The buckles are very clumsy. The patent leather boots are as good as French, and probably cheaper; among them a pair of capital lace shooting boots in brown leather are excellent; and a pair of long boots in brown Russia leather, the sides of which come off like gaiters, should be looked at by those who shoot in woodland and thick hedge countries. A set of dark brown seal skin furs deserve notice, from the perfect manner in which the skins have been prepared, soft and without any disagreeable smell.

Liège sends a most formidable collection of arms, of every kind and calibre. Liège is the only place which can compete with Birmingham in supplying cheap guns. The specimens sent include the most expensive and the commonest. The bright-barrelled musket and bayonet of the pattern made for Schleswig-Holstein, and the muskets with sword-bayonet affixed, which are used in almost every corps of the Belgian army and in our Engineer corps. To pass any opinion on such articles from their outsides, would be impossible; we can only say that some stocks are beautifully carved, some barrels beautifully chased and damascened, and many finished as well, externally, as our gunsmiths usually show. The proper plan would be, to have a grand field day, to try the fire-arms of all nations. There is a chess tournament, open to all the world, going on; why not have a series of sweepstakes—one for fowling-pieces, one for rifles, one for muskets, and one for pistols, with rests and without rests, by all the exhibitors of fire-arms? No doubt, a speculator like the host of the Red House would be willing to pay all expenses, and a very useful and interesting series of matches would be the result.

We observe, in one case in this division, a pair of rifles made after the Swiss fashion, over which a paper is affixed stating that one of the rifles, "fired from a rest, at a mark 4 inches in diameter, at a distance of 110 yards, made ninety-five hits out of one hundred." We should like to see this done again, and to know whether more than one man could do the same feat in one day

Behind the arms, next to the external wall of the Palace, is a very miscellaneous agricultural and mineral collection of specimens of flour, millstones, bristles, bricks, tobacco, flax and hemp, and the dried plants in seed, with all sorts of cereal grain, hops and guano, coal, iron, cannon, and agricultural implements, the fleeces of merinoes and cocoons of silk-worms—giving a great idea of Belgian industry and versatility.

The coal reminds us of the difference between the tenure of English and of French and Belgian coal-mines. In England, if you find a coal-mine on your freehold, it is yours; in the other two countries, it is the property of the state: and in France, unless you happen to be a supporter of the Government for the time being, you have no chance of obtaining leave to work it; when leave is granted, it is subject to a royalty to the Government.

In Belgium, the Government compels coal-owners to construct ladders by stages for the miners, men and women, to ascend and descend, instead of using a perpendicular shaft, with an arrangement of chains and pullies. The Belgian Government will not permit the lives of its subjects to be placed on the soundness of a rope or chain. The result is, that Belgian miners, carrying coal on their backs up a thousand steps of six inches risers or stages, are never killed, though strains and ruptures are every-day occurrences. We prefer our system, with a little more care.

Crossing the Grand Avenue, we find the northern Belgian bay, flanked by two carriages, which do very great credit to the coachmaker from Brussels. It is well known that the aversion with which our aristocracy looked upon the project of an exhibition, was communicated to the coachmakers, and the first in that line have scarcely sent anything; they are reaping bitter fruits of their folly now. We do not hesitate to say, that the Belgian phaeton in cane-painted morocne is one of the prettiest and best finished in the Palace. The French exhibit a few carriages, close at hand, which are all very bad in form and finish.

Furniture follows the carriages. We can especially call attention to a sofa and chairs, gracefully carved in walnut, and covered with green velvet. In the opposite bay are two cabinets in oak, of great merit, especially one of a grave, ecclesiastical character, ornamented with figures of angels. Some pianoes and boxes made from Spa wood, which has acquired a slaty ferruginous colour from the Spa waters, would form a good contrast with furniture of birdseye maple or zebra wood. Near this is an extremely ingenious dumbwaiter, like a large paddle-wheel, the shelves of which always keep on a level. It would be very convenient in a library, for a student who had a good many books of reference in use at the same time. The principle would be available on board ship, for glass or crockery ware, fixed by the feet to the shelves. On side of the room are a few philosophical instruments, and a toy showing that "you must not always believe what you see."

The Belgian machinery and agricultural implements are not to be treated lightly; therefore we shall, for the present, pass them by, observing, that the great establishment at Seraing for the manufacture of steam-engines and all kinds of machinery, which was founded by Cockerell, under the patronage of Napoleon, and afterwards supported with capital by the father of the late King of Holland, has sent several specimens of heavy work of a creditable character. The pace approved of on the Belgian railroads, viz. fifteen miles an hour and many stoppages, does not demand the flying engines we impatient Englishmen require. M. Presmany, writing his opinion of England in the Paris paper *La Patrie* says, "An Englishman never saunters, but always rushes forward like a mad dog." If he had said the same of our locomotives, he would not have been far out.

Before ascending to the galleries we would request our lady friends fond of gardening or poultry keeping, or, like good wives, in the habit of accompanying their husbands through the stables and byres to look at the live stock, to examine a collection of wooden shoes of very pretty shapes, some provided with leather fastenings, which seem to us better than the best kind of clogs for country use in muddy weather.

Near these shoes are ponderous spurs, of highly ornamental shape, with rowels the size of a crown piece, bridles and straps to match, manufactured for the Mexican market

We will now walk up stairs, where we are sure to find ourselves in a dense crowd, and look down on a sea of heads running in a very strong current up and down both sides of the central avenue.

The leading articles, as drapers say, are three figures of life size, sent by a Belgian embroiderer of ecclesiastical robes, which he dresses in costumes much finer than anything to be seen at Madame Tussaud's. He began with the Archbishop of Paris, Affré, who was killed in the last revolution at the barricades, a St. Carlo Borromeo, an Italian saint and archbishop, and our English Thomas aBecket. Since the opening, Fénélon, whose "Telemachus" has proved the penance of so many English school-boys, and rendered so many school-girls as impossonable as Calypso, has taken the place of M. Affré, and the Italian priest has been superseded by another dignitary, but Thomas aBecket remains; although, for some reason or other, all three of these lay figures have been provided

THE BELGIAN COURT.

with white gloves, instead of the purple gloves of the bishop and the bright scarlet of the Cardinal. While examining the embroidery of these robes, which the maker warrants to wear a hundred years and *then clean*, we found ourselves side by side with two gentlemen actually wearing the one scarlet, and the other purple, gloves—such are the strange coincidences of the Exhibition! It was Cardinal Wiseman and one of his Bishops examining the costume of Thomas Becket.

In the same galleries will be found a case of medals, cameos, bronzes, a shield, dagger, and other ornaments richly chased in iron, all displaying very considerable taste and executive skill, and maintaining the character in the fine arts which Belgium has deserved by the statuary exhibited, and already noticed in the ILLUSTRATED LONDON NEWS.

To own the truth, neither statuary, nor lay figures of archbishops, nor the large display of Roman Catholic works, nor anything connected with art, science, or literature, creates half the sensation among the ladies, that is excited by the specimens of lace from Brussels, Mechlin, and the other districts where this fragile manufacture has for centuries been carried on. Exclamations of rapture and envy burst forth as female faces squeeze in front of robes, flounces, veils, collars, parasols, and every conceivable article of dress fashioned in thread lace of the most elegant patterns, and hung upon wax figures of fashionable air.

We will conclude by observing, that in the Belgian, as in most, if not all, other parts of the Exhibition, the catalogue is of no more use than so much cheesemonger's paper

THE CEYLON COURT.

THE little Ceylon Court possesses few attractions to compete with those put forth by Hindostan; yet its contents are not without interest, whilst some of them show advances in decorative art highly creditable to the Cingalese. Of mineral productions we find a variety of specimens, in iron, tin, manganese, and plumbago; the ruby, also, with the beautiful earthy substances, zivern, chryso-beryl, and tourmaline. Of vegetable productions we find numerous samples—coffee, cinnamon, tobacco, &c., accompanied by a model of a coffee store and drying plantation. Of other natural products exhibited, we may mention numerous gums and oils, specimens of ivory, buffalo and deer horns, tortoiseshell, and a great variety of woods.

In manufactured products and agricultural tools, there are gold and silver ornaments, lace, cotton fabrics, and cordage, all of which are interesting and creditable in their way. There are also some models of carriages, palanquins, and temples, well worthy of inspection. But the chief art in which the Cingalese appear to excel is that of inlaying on wood, of which there are here several samples: one, an ebony table, inlaid with fifty different Cingalese woods, &c., and exhibited by Mr J. Kitchin, appears in our Illustration.

The Ceylon Court is situated a little west of the Indian Court (northern), and immediately between the compartments allotted to Malta, Jersey, and Guernsey.

THE CEYLON COURT.—FROM A PHOTOGRAPH, BY CLAUDET

THE EAST INDIAN COURT.—NORTH SIDE.—FROM A PHOTOGRAPH, BY CLAUDET.

THE EAST INDIAN COURTS.

THE East Indian Courts are situated on either side of the Western Nave, at its point of junction with the Transept, on one side of which, also, they occupy a considerable space. Their contents are rich and varied, and are interesting in the highest degree, as illustrative of the natural resources of a large territory—resources which, except for articles of show and luxury, have as yet experienced a very slight degree of development. The first compartment, and great part of the second on the south side, are filled with weapons of war, suits of armour, &c., of native make, tastefully arranged; amongst which, a brass gun, with a lion's mouth, is a formidable and conspicuous object. Amongst these more barbarous appliances of assault and defence, are models of European guns, &c., as present in use, so that every stage of progress in the arts of war is faithfully represented. In the next compartment we come to some products in muslins, richly embroidered, a very old established branch of manufacture with the nations of the East, and in which, in many respects, they are still unrivalled. After casually inspecting these elegant productions, we enter the next compartment, one side of which presents a [illegible] stringed and wind, from [illegible] singular and picturesque in appearance, and highly interesting in connexion with the history of that delightful and [illegible]really-loved art. Facing these are a variety of models of the mines, and other works used in the preparation and manufacture of the cotton plant—primitive contrivances of the rudest class, to which, we are sorry to believe, few or no additions or improvements have been made for centuries, showing how much remains yet to be done, when the light of civilisation shall have made its genial influence felt by our Oriental brethren. Upon the same benches are also displayed models of equally primitive and clumsy machinery for the grinding of sugar, the distilling of spirits, and other like purposes. A curious contrivance for casting coin, and used in the Madras mint, will also attract attention. It consists of a battery of ten feeding tubes, or hoppers, which are acted upon by handles, and the means of operation is very fully described in a pamphlet which accompanies the model

Before proceeding to enter the Northern Court, we must pause to gaze in wonder, with the rest, upon the gorgeous collections of jewellery and rich embroidery, and other articles of great value, exhibited by the East India Company, in two glass cases especially erected for their reception. Amongst these also are some very curious carvings in pith; and upon the adjacent counter are some equally remarkable carvings, chiefly models, in various stones. The utensils in brass, copper, and pottery, of which there is a large collection, are highly curious, especially some which are used by the Hindoos in the worship and service of their idols. A remarkable and gratifying instance of the confiding spirit of this humble and primitive race, is found in the exhibition of the self-feeding peacock lamp, in brass, used in the Deorah, or temple of the iron-dealers of the Surrage persuasion, by whom it is held sacred, but who readily contributed it for exhibition in the Crystal Palace, as soon as it was made known of the intended industrial congress. The principle of this lamp is simple enough, the oil being supplied from the breasts of the peacocks into the lamp-burners whenever it is required.

The utensils in iron, inlaid with silver, amongst which is a large

THE EAST INDIAN COURT—SOUTH SIDE.—FROM A PHOTOGRAPH, BY CLAUDET.

hookah, are very elegant in form and of highly finished workmanship. Proceeding to the rear, or extreme north of this department, we are at first struck with a great variety of ornaments, fruit, flowers, &c., in WAX. Two ivory chairs, inlaid, from the Rajah of Vizianagram, stand conspicuously here. At this point and around are glass cases filled with gems of agate and jasper, both in slabs and fashioned into a great variety of objects of adornment and utility. In other parts of this room are some very admirable specimens of carved furniture, in black wood, from Bombay; and of carved boxes and ornaments in sandal-wood, from Mangalore; carvings in ivory, from Morsteadabad; samples of embossed paper and illuminated writings, forwarded by the King of Oude; and a variety of articles of eminent and unique beauty, in which the minute and patient industry of the native Hindoo is pleasingly illustrated. Against the north wall of the inner room are two chairs and a couch, of Rajpootana white marble, the backs of which are remarkably fine examples of this carving. In the centre is a Royal state bedstead from Benares, the curtains of which are of purple muslin, richly embroidered.

One of the most striking features in the Indian collection is a room furnished in the style of an Indian palace, in which all that romance has said of Oriental luxury and gorgeous display is more than realised. But, as this will form the subject of a distinct illustration, we shall not enter upon a description of it at present. Around it, externally, are a large collection of figures, in clay, illustrating the various trades and castes of the Hindoos. The display of rich shawls, carpets, matting, and mixed fabrics, in various portions of this compartment, cannot fail of attracting observation, whilst they will repay the trouble of careful examination. Nor must the various objects of natural produce, vegetable, animal, and mineral, be overlooked; for, though less striking, upon picturesque grounds, than many we have more particularly referred to in the above observations, they are perhaps of even higher interest to the future destinies of our vast Eastern empire.

COSTUME AS PORTRAYED AT THE EXHIBITION.

THE second of man's essential wants is clothing. Having briefly touched upon his food in one of its most important departments, we proceed to consider the Exhibition under its second aspect. Suppose a crowd could be collected, every man and every woman a specimen of some distinct national costume worn by some distinct country or race, or by the same country or race at two distinct periods, how vast would be the multitude, and what a perfect confusion—not of tongues, but of tailoring—would they exhibit! Suppose, further, we indulge a philosopher, hitherto unacquainted with our race, with a passing glimpse of the motley multitude, would he, by any possibility, arrive at the conclusion that we were all creatures of the same species? Would he rank the robed Oriental with the jacketed sailor, the Indian in his war-paint with the powdered Marquis of the old *régime*, the Chinaman in his silk with the crusader in his steel, the ancient Briton in his woad, with the modern Briton in his trousers? Surely he would see less difference between a lion and a tiger (veritable *ferce naturæ*), than between a lion with lavender kids in a cab, and a tiger with tops and buckskins swinging behind it. Would the bird of paradise seem less akin to the raven, than a gay chevalier of the *moyen age* and his black-coated and black-hatted predecessor of the present day? or would an armadillo, with its scales, or a porcupine with its quills, differ, in any more decided respect from a rabbit or a hare, than an old feudal baron, all mail, chain, or plate, in complete panoply of iron,

> Carving the mail with gloves of steel,
> And marking the wine through the helmet barred.

Would the brute animals in question appear to differ more from each other than the human animal described from a peaceable quaker of the present day wending his way from Clapham-rise to a meeting of the Pence Society?

That the Exhibition would have assembled so extraordinary a museum, was not to have been expected. All the costumes in the world would have filled it fuller than a thriving tailor's shop. We could not have turned, for gabardines, doublets, cloaks, kilts, shirts of mail, hot-coseys, and wrap-rascals, not forgetting the more outlandish articles from more outlandish parts and more renowned times. Coats of many colours from Egypt; the regal robes which shone in Nineveh; skins from the north and cottons from the south; buffalo robes from the prairies, and fleeces from the steppes; the benouses of the East, and the paletots of the West; the toga of old Rome, and the trousers of Old England such a thorough exhibition of "Ole clo'" we could not look to have: but, for all that, the articles of foreign costume actually exhibited in Hyde Park, although belonging to a rather confined range of the world, are not so scanty as not to be able to afford some curious hints and useful information. The most characteristic of these specimens come from the East. This was to be expected. In the semi-civilization of all Oriental countries, from the Levant to the Chinese seas, dress is a matter of far more importance than among us civilised Great Westerns. We may make differences of social rank—we may say, such a man is a Duke, and such a man a Baronet, and so far different from plain Jones and Smith, with no handles to their names. Not so the Turk, or the Persian, or the Chinaman; their Pokes and their Baronets are labelled with the visual sign of their position and their importance; they carry their rank on their backs, and their honours on their sleeves—cloth of gold and embroidery clearly marking out the bashaw or the nabob from the fellah, who hoists a single stripe of cloth round his loins, or the black starveling who is not even gifted with the means of indulging that scanty costume. It is to the East, therefore, that we turn instinctively for the materials for the few notes on costume which follow. Our European differences of dress are very minor; coats, waistcoats, and pantaloons are, indeed, endowed with subtle differences of form and cut, but in essentials the garments are the same. The St. Petersburg shopkeeper does not greatly differ from the London shopkeeper. Broadway turns out clumsy imitations of the Boulevards, and the citizen of Copenhagen would not be greatly starred at in the streets of Palermo. No, let us go to the East for novelty—that is, generally to us—for there are no revolving fashions in the stagnant clime of the palm-tree and the date, and the Bedouin of the desert wears the selfsame robe now-a-days as his father in the first generations of Ishmael.

And first let us look to the most worthy part—the head. The tarban is the ancient Eastern costume for the head, and we have very little opinion of the sense or the taste of the revolution which is now, in Turkey, Persia, and Arabia, introducing the fez in lieu of the orthodox swathes of the good old turban. The fez, in fact, is as great a monstrosity as the modern hat. It consists, as most readers will be aware, simply of a skull-cap, of greater or less height, fitting close to the head, and decorated with as ugly tassel like the extremity of a bell-pull. The fez gives neither shelter to the head from the sun, nor shade to the face, and it is as ungraceful as a red nightcap worn in the daytime can possibly be. The article is common enough in London. Most of those shown in the Exhibition are woven in a single piece: some are richly lined; some mere cloth shells. There is, we believe, a great fez factory at Constantinople, where an enormous number are daily turned out; but we believe that the article is also manufactured in different parts of Europe. The Sultan has invested his troops with the abomination in question; and all the "fast" young Mussulmans are assuming the "new style," to the great scandal of the orthodox old Moslems, who stick fast to the turban, and measure their patriotism and their sense of religion by the number of folds of linen they swathe round their bronzed foreheads and above their coal-black eyes. Seriously, however, the slow-coaches are in the right of it. The turban is the natural headdress for a burning climate: it defends the scalp thoroughly from the sun—not, of course, that it does not by its very amplitude produce great animal heat; but it is armour of proof against *coups de soleil*, and probably also exhibits in no small degree the tendency to produce perspiration. But, beyond this, a Mussulman's turban serves him in lieu of pockets: he carries his most precious effects wrapped up in its endless folds; and, with his pipestem deeply sunk in the often-wreathed tiara, goes to sleep in the caravanserai with the snug consciousness that his wealth is under his head, and that the thief will be uncommonly expert who achieves the violation of the turban. The Persian turbans are made upon the same principle as the Turkish; but they are generally garnished with two red stripes of cloth, forming the half of a square edging the crown. Here and there in the Eastern compartment you come upon a variety of the general and national headdress. In Persia, for example, there is a model of a lady attired in a sultan, or enormously high-peaked conical hat, looking very much like a fool's cap, and supporting a streaming array of muslin draperies. To some extent the head-dress in question may be paralleled by the old English style under Edward III., and in the present day by the Normandy female peasant *coiffure*—the source whence we derived the passing peculiarity of costume in the reign of the Plantagenet in question, but which, on the other side of the Channel, still prevails amid the orchards and sunny villages of that fairest and greenest portion of France. Specimens are also exhibited in the Persian room of the same towering conical-shaped sheepskin hat which in some parts of the country forms the national costume, to the exclusion of the turban, the unremoved fleece operating, as a powerful protestor against the fiery darts of the sun, to a certain extent. In some of the temperate countries—particularly among the Moors on the Mediterranean coast of Africa—the face is further protected by clapping over the turban an enormously wide-brimmed straw hat. A great assortment of these broad-brims may be seen in the Egyptian department. On the average, they may measure very nearly a yard across, and must form a very efficient protection to their wearers—principally the agricultural labourers, who are obliged to pursue their unshaded toil in the hot and glaring sunshine. It may be a matter of surprise to many readers to know that the cloth for turbans is extensively manufactured in England. Some years ago, in a large cotton spinning and weaving establishment in Manchester, we were astounded by the information that a vast number of long white bales of cloth then in progress of packing were intended for the Aleppo market, where they would be greedily bought and speedily converted into the national head-dress. It seemed odd that in the blackening smoke and commonplace—to us—associations of the city of dark chimneys, fabrics were being turned out which would figure amid the national costumes of the far East, which would be seen glancing amid date-trees and palm groves, or borne aloft over the ship of the desert, perhaps to be apostrophized by some enthusiastic Arabian, as characteristic features of the land and specimens of the skilful the wise men of the East, produced by their rude looms, worked, perhaps, in the tent of the desert, or by the grateful oases, by the women of some rude nomade tribe.

For a rainy country it is obvious that the turban would never do. An April in England would rot it; but for the common sense application of a sound scientific principle, and also for its graceful picturesqueness in the climes in which it is worn, the turban is an almost unequalled headdress. If we cannot, however, adopt the Moslem style, so far as our resources go, it is high time that the hat nuisance, as it exists amongst us in the present ungraceful times, should be vigorously attacked. The abominable black pots which stick upon our heads are the ugliest and the most senseless of created things, or rather, perhaps, manufactured goods. The common hat has not a single good point to distinguish it. It is clear, as the number of shocking bad hats to be too often seen testifies. It is thoroughly inconvenient, and unpliable, and unaccomodating. The Frenchman can put his hat into his pocket; the Lowland or the Highland Scotsman can, if he chooses, sit upon his bonnet, and no harm done; but the hat is as rigid as a helmet, and almost as fragile as a piece of pottery. A smart blow breaks it, and the look of the article is destroyed. In a crowd you have no means, if you uncover, of disposing of the "tile" with any comfort, and so as to keep it as much as possible out of the way. In windy weather, owing to the comparatively large surface it shows, and the comparatively small hold it has upon the head, it is very apt to be blown off, and once off, it has a mischievous facility for rolling, which is generally productive of more delight to the bystanders than to the ingenused hat hunter. Again, the article affords no shade to the face, and no shelter to the head if the sun be at all powerful. Neither felt nor beaver ever did or ever will ward off a sun stroke, and neither felt nor beaver ever approved the appearance or added to the comfort of man or woman. The wideawake style of hats now coming into a certain faint vogue and occasional use are a great improvement upon the orthodox article; but the individuals strong-minded enough to wear them are few and far between. Many a man who would look into a cannon's mouth gaping over a breach with tolerable composure, would shrink instinctively from being gazed at in the streets because ornamented with an out-of-the-way head-dress. The pioneers in all such little social movements often require more undaunted pluck than the leaders of revolutions or the founders of dynasties; and so it is to be feared, that, until some unforseen convulsion, social, political, or religious, shall have shaken the existing reign of silks to their foundations, we are still likely to languish under the tasteless despotism and the expensive tyranny of "shocking bad hats."

From the head to the feet that range of yellow slippers invites us. Regard their make and peculiarities. The Orientals are a slipshod people; they detest being tight laced about the toes or ankles. You see at once, by the make of their pasoshes—their shoes, and boots, and slippers—that they are sprung from a plantigrade race. A few days' close work of a gouty-postman would tear these flimsy bags of morocco leather into strips. The soles, indeed, in many cases seem no thicker or firmer than the "uppers;" while it is evident that the world of ladies' slippers exhibited are only intended to protect the feet while slipping and shuffling from one room of the harem to another. The principle upon which these last are cut is very much that which has evidently presided at the formation of those triumphs of genius—convenience—called goloshes. The toes are cut large into a little confined space appropriated for them, where they are as much at their ease as the captives in the Black Hole of Calcutta, and to them is entrusted the duty of dragging after them the narrow heel which is left to take care of itself. It is evident that the Turkish ladies must make as little progress out of doors as their Chinese cousins. But what matters that? In the East, unless a lady can ride in her litter, or her palanquin, sh may walk barefooted if she pleases. Bimullah! the inveterate enemy of the pleasures of the world were made for "Lights of the Harem," and Bashaws with three tails, and Pachas of many tails, and not for any draggletailed helpmate of Cassim the cobbler, and Hassan the barber. The majestic breadth of the slippers of the Turkish gentlemen's shoes will call forth a stare of admiration. These are feet peculiarly intended, as it would seem by nature, for the slaughter of black beetles and other unpleasant interlopers of the kind, and of such the East evidently has its fair share. Another class of shoemaker handicraft shows pointed and turned-up toes, very much in the fashion of French sabots. By the way, in recent journeys in France, we have noticed a not inconsiderable improvement in the convenience and appearance of those said sabots, as contrasted with the fashion prevalent some fifteen or twenty years ago. The mass of solid wood attached to the foot seems in the course of being diminished, and the shape of the article is becoming more neat, and the thing can be so, more elegant than it used to be. On the sea-coast, however, the old-fashioned construction is still as general as ever. One reason of the looseness and easy size of the Mussulman slipper is undoubtedly the necessity which arises both from the laws of Mosteimism and the Eastern notions of etiquette, the first of which recognises many spots of haunted holy ground, particularly the mosques, at the entrance to which the covering of the feet must be cast aside; and the last, prescribing to the guests of a distinguished man that they should enter his halls leaving their shoes at the threshold. The Tunisian shoes and boots are made very much after the fashion of the Turkish and Egyptian articles. The prevailing colour of the leather is yellow, precisely that when employed as boots. Many of the ladies' slippers are very gaily decorated with gold embroidery, the lumps formed by the devices and designs in golden lace not feeling, however, as we should imagine, very comfortable to the soles of the fair wearers. They must limp along, like so many pilgrims who have not boiled their peas.

Two characteristics may be at once noted in the general costume of the East—its downright and obvious disposition, its garments being generally so constructed as never to sit close to the person, and the wonderful difference between the style of dress worn by the poor and the magnates of the land. Civilisation invariably, so far as costume is concerned, brings together classes. It undoubtedly was the revolution the sword was the badge of a gentleman; now all such tokens of difference in social rank are disclaimed, and the linen-draper's apprentice has his coat cut in the same fashion as the peer. We may pass a great Duke and an attorney's clerk in the street, and the attorney's clerk may be the more striking personage of the two. Not so in the East. Note the sunburst of "barbaric pearl and gold" which flashes round you as you enter the compartments sacred to the costumes of the richer classes. The taste is one for glittering trumpery, and also, no doubt, for the ostentatious display of riches. Both tendencies are thoroughly barbarian in their origin. The love of tinsel and gaud must clearly be carried to a wonderful extent among people who wear pass a great Duke upon such saddles; the first stiff and lumpy with embroidered gold, the latter gleaming like burnished thrones. Had the glitter been derived from a substance of no particular value, it would, probably, have been still sought after; but, produced by precious metals, the desire to exhibit it becomes redoubled. The eye and mind of the possessor are at once gratified. He looks complacently at the magnificent figure he cuts, and thinks complacently of the evidence of his wealth and power which the figure in question denotes. The golden embellishments upon the Eastern jackets, robes, and doublets are neither very good nor very bad, so far as design and pattern go. Indeed, there is a strong common resemblance between the devices, which principally consist of figures, of flowers, and branches of trees. On some of the saddle-cloths and horse-trappings, foil and spangles of different colours are used to produce the effect of gems, and, seen from a distance, pass very well for amythests and emeralds. The fact of these gaudy cheats being thus employed corroborates our view as to the low standard of taste which presides over the whole tone and style of costume which we are describing. Putting, however, such considerations out of the question, no one will deny the instinctively felt effect of gorgeous riches which these masses of cloth of gold and gold wrought work produce. In parts of the Egyptian and Tunisian collections, gold seems as plenty as in California. It gleams, and glitters, and sparkles before you at every turn; it stiffens the robes, it decorates the slippers, it glances from horse housings and from camel trappings; it shines from the blue steel of the curved sabre, it frets and embosses the elaborately carved pistol; it is inwoven with the cloth of the mantle, it fringes the loose lace of the veil, it is interwrought with the silk sash and blue of the shirt. Everywhere, and on everything, is gold. The notion of splendour has evidently been gold, of power—of beauty—of magnificence, regal or pachalic, has always been, gold—gold—gold. Look, for example, into the grand tent or divan which forms so conspicuous an object in the Indian collection. The eye is absolutely dazzled by the effulgence of the spectacle, and the mind instinctively reverts to the well-remembered tales of Eastern imaginative literature—to the descriptions of the marquees of genii, and the pavilions of enthroned monarchs, in which the daring adventurer, led by some protecting power, was shown, as it were, the riches of the earth, and the glories of them. It will be instructive, after we have finished our survey of the dresses of the rich people in the East, to turn for a moment to those of the little and the humble of the land.

To some extent the cut and shape of the dresses of the more western of the Oriental people assimilates in a greater degree to the European standard than do the costumes of the nations lying still further towards the rising sun. Thus, the Turks wear jackets and tubard-like surcoats, evidently springing from the same general germ as that which in Europe became changed, through the doublet, first into the huge laced coat of the last century, and finally into the more modest dimensions of the present corresponding article. This general form and disposition of the upper garment is very much the same, whatever its materials may be. The coat of the fellah resembles, in shape and mode of putting on, the gaudy surcoat, all "daubed with gold lace," of the Pacha to whom he pays his tribute. The latter is simply a square cut surtout, very loose and full, so as to hang in folds about the body; the sleeves, the breast, which is partially open, the skirts, and, in some cases, indeed, the whole body of the garment plaited over, and stiffened with embroidery and ornamentation in gold thread. A close examination will show that the work is very coarse, the thread itself of spun and irregular, and the effect being very much that which is produced by a near inspection of common theatrical garments, intended only to be viewed in the glare of the footlights. The texture of the cloth, too, upon which all this decoration and glitter is lavished, is often loose and coarse. We observed several garments on which scores of pounds' worth of gold must have been lavished upon a material which had very much the air of having come out of a "shoddy" mill, in other words, of cloth manufactured from refuse and torn-up and linen rags. However, the gold shone just as bravely on the inferior as on the superior texture; and this being the case, it is to be supposed that the design of the workman and the taste of the customer were alike satisfied. It is to be observed that no article of costume intended for the superior classes in the East—we do not, of course, allude to under-dresses—altogether escapes the embroiderer's needle. Occasionally we come upon coats, mantles, and so forth, embroidered with thread the colour of the material, or occasionally with thread of quite another hue. The appetite for personal ornament is universal. Furred dresses are occasionally to be seen, but in no great variety, and the material evidently disposed simply for the sake of ornament. Of the gay and handsome Albanian costume, a splendid example is given upon a lay figure; indeed, we wish that lay figures had been more common in the costume department, for, after all, it is difficult to tell the effect of a garment until we see it absolutely on. In the Albanian dress in question, however, there is the effect of gold: too much gold: we should have preferred a more simple specimen. The costume, however, is tolerably well known—the tight-fitting jacket, open at the breast and sleeves, so as to show a cataract of the whitest linen; the light-coloured kilt, striped and edged, and diversified with gay tints and bars of colouring; the close-fitting leggings, in the present instance lavishly embroidered with gold; the garments, set off with a brilliant finish of warlike accoutrements, certainly make a fine show as ever was turned out by the united efforts of tailor and armourer.

Crossing the Mediterranean (and the Nave), we find the same general characteristics repeated in the richer costumes of Tunis. There is the same blaze of gold and tinsel. In the case of the silk skirts and the outward portions of female costume, the Africans indeed carry off the palm; their needlework being in general more neat and tasty, the devices more graceful, and the effect more artistic than that produced by the Levantine and the Asiatic workmanship. As a general thing, too, the Tunisian jackets are shorter and squarer than the Turkish the skirts frequently not extending below the waist, while the garments of the same species on the opposite side of the Nave descend below the hip. [illegible] the Tunisian dress [illegible] of the Oriental "nuts," but we made a couple of words to the costume of the masses. A great quantity of the fabric used by the lower classes in Egypt and Turkey, both in cottons, woollens, and silks, is exhibited. These stuffs have evidently been manufactured: they are coarsely and loosely woven, and full of fibres sticking up from the surface of the cloth; but the texture is strong, stout, and serviceable, often much better than the woollen cloths on which the gold embroideries have piled their craft. The colour in Egypt and Turkey for the men's dresses is generally sombre; but the women have no want of gay and staring patterns in their linens, cottons, and silks; the designs, although coarse and rough, being often very artistic, and shewing the possession of that native and natural taste for the beautiful in form and harmonious in colouring which all the Schools of Design in the world cannot impart where it was originally wanting. In this respect, indeed, the coarse prints and woven patterns show a taste ahead of the appetite for gaudy metallic decoration to which we have adverted. A couple of the coats—the only garments, indeed—of the fellahs, or agricultural labourers of Egypt, are exhibited. They are made of coarse woollen stuff, with, if we mistake not, some intermixture of cotton, dyed black, and are neither more nor less than huge blouses or smock-frocks, such as are worn by our own and by the French rural population. The style of the three garments is undoubtedly the same. There is in all three a small opening at the neck, worked round with some futile attempt at ornamental needlework—the only point of difference between the Eastern and Western garment being, that the former is made more broad and loose, so as to hang round the person of the wearer. When inspecting these Egyptian blouses, two or three labouring men, evidently from the country, came up, and one of them, fixing his eyes upon the fellah's dress, said, "Whoy, James, if they hasn't regular gabardines!" Somewhat astonished at the use of the word, which we seldom see except in connexion with the old distinguishing garb of the Hebrews under the rule of tyrants, and the "Jewish gabardine," we asked the speaker why he called the dresses before him gabardines: the answer was the unsatisfactory one of "Whoy, measter, bekase they are." But, presently, the man, seeming to guess at our meaning, added that in his part of the country—the south-east of Kent—down Lower and Folkestone way, like," the smock-frocks of the peasantry were still popularly called gabardines. In observing the patterns of the Eastern stuffs, the first tendency which becomes evident is the love of the people for striped stuffs: white and blue, and white and red arranged in broad longitudinal sections are very common patterns. The striped seems, in fact, to be the first arrangement of colours which catches the fancy of a people [illegible] Scotchman, that we heard it conjectured that it could not possibly be anything else than the "set" of the clan tartan of the MacHeasans or the MacSelims. On the Tunis side the rude and dawning taste of the patterns is well worthy of study. A number of the garments here shown are made of exceedingly coarse and strong stuff, which one wonders could be worn in such a climate. Many of these fabrics would make capital shooting, fishing, and yachting clothes, and we presume that they could be imported very cheaply. We repeat this hint for the benefit of gentlemen laying in a sporting wardrobe. An attentive inspection of the clothes of Tunis may also furnish useful

hints to the manufacturers of coarse stuffs at home. The patterns of the edge-ornaments of some of the blanket and cloak-pieces in Tunis well deserve the attention of students of design. The notions are coarse and roughly executed, but the germ of beauty and of feeling for the harmony of colour are never wanting. One pattern repeated in several pieces of very coarse cloth, almost like woollen canvass, put us greatly in mind of a common disposition of straight-lined ornament to be seen upon Grecian friezes and cornices; not, of course, that the patterns were identical, but the same principle and spirit had evidently inspired the leading and pervading idea. Amongst these Moorish mementos, we have numerous specimens of the pure Arabia dress, almost always consisting of snowy robes of spinning white. The primitive distaff, a mantle with a hood, was probably in use in the desert before the founding of the Pyramids. Every one who remembers Horace Vernet's Bedouin pictures will recal the picturesque effect of the fluttering masses of white drapery about the form, and falling from the wearer's face, of Asia. In many cases, the weaver only has been engaged in their manufacture; there has been no tailoring—the costume simply consisting of a web of cloth, orcather a fragment of a web, twisted round the body of the wearer, so as best to suit his convenience or his taste. It will be observed that these pieces of cotton are uniformly the smallest in the cases of those labourers who have to make continuous or violent personal exertion. Thus, while the weaver, or the mechanician, or the carpenter, more or less cover their bodies with coarse cotton stuff, the messenger, the runner, or the palanquin-bearer are naked, except for the slip of cloth arranged round the loins. There is an odd significance and a meaning in the arrangement of this group of figures. All naked the body of half-starved, round the outside of the gorgeous dyan, the interior of which is one mass of burnished gold and silver tissue and brocade.

The juxtaposition tells of the moral and social condition of the vast empire in question as it was under the government of native chiefs. Inside the palaces and durbars, Oriental pomp, luxury, and gorgeousness; outside, Oriental nakedness, hunger, and oppression. Inside, selfish and magnificent despotism, ignorance, and cruelty, clad in purple and fine linen; outside, weak and cringing debasement—the same ignorance and the same cruelty shown in indifference to life and human suffering. The whole spectacle exhibiting two grand phases, necessarily and closely connected with each other—a despotic ruling power, lulled in the lap of blind indulgence, and a submissive horde of mindless population, as brutal as their sovereigns, but not so powerful; showing because deprived of the factitious ornament of wealth, the naked extremity of that degradation over which the barbaric splendour of their superiors casts, as far as regards themselves, a glimmering but deceiving light.

MUSICAL INSTRUMENTS.

(SECOND NOTICE.)

WE resume our remarks on the Pianofortes in the Great Exhibition, and shall direct our attention to some of the beautiful and costly instruments exhibited, of which we now give a more detailed account. We shall, however, offer no opinion of their comparative merits, either as to the mechanical construction (simply noticing that which is new or curious), as each leading manufacturer has his peculiar variety of the former, and for the latter the widely spread reputation of the chief makers is a sufficient guarantee that their instruments are constructed on the best principles, though there may be some trifling differences of application particular to each.

We notice, first, from the prominent position they occupy, the two magnificent grand pianos in the Nave: the one in the English department, by Messrs. Broadwood, is a gorgeous-looking instrument; the sides are shaped out and are of ebony, covered with a running ornament of scroll-work and figures, carved in relief and gilt; the top and front is elaborately inlaid with satin-wood, and the legs are of ebony carved and gilt *en suite*, altogether presenting a rich and imposing appearance. The grand of Erard on the foreign side, is a very chaste and beautiful specimen of the French style of ornament. The cabinet-work, it is of fully wood banded with panels of elegant design, richly inlaid with gold, silver, and tortoiseshell, with ormoulu mouldings, while the instrument is supported by well-executed figures in gilt metal, springing from a stand of the same wood. As a piece of elegant musical furniture it is perfect in design and execution

Returning to the British side in the gallery, Class 10, we find Mr. Wornum sends a piccolo in walnut, and an Albion grand. We may remark, *en passant*, that it is to this gentleman we are indebted for the first introduction of the piccolo or small upright pianoforte, which, from its capability of being produced cheaply, has had considerable influence in promoting the manufacture of pianos, and, indeed, the general knowledge and taste for music. Messrs. Broadwood's three grands are beautiful specimens of amboyna and walnut, and of that quiet and elegant style of cabinet-work which is generally more consonant to our English taste; that our manufacturers seem more desirous of avoiding the concealment of the beauties of nature in the rich and varied figure of the different rare woods, than employing the cesigns of art. This may perhaps account for the comparative absence of buhl and marquetrie work in our pianofortes. Erard, again, exhibits two very handsome upright pianos, one richly carved in walnut in the Elizabethan style, and the other in rosewood inlaid with silver and supported by eight carved legs. One of the most elegant instruments in the Exhibition is the grand by Messrs Collard, in pollard oak, carved and gilt in the style of Louis XV. The design is well carried out, and in admirable keeping. The square in walnut, with shaped sides, is very massive and handsome. There is also a carved cabinet piano by the same firm, which we do not, however, much admire. The oblique pianoforte, in ebony and gold, in the Italian style, with well-designed carved frets, &c., by Messrs. Kirkman, is a graceful and elegant instrument. We next come to Messrs. Stodart, who exhibit a grand piano-forte and a compact square: the peculiarity in the latter instrument is, that the string and sounding-board are sunk in the case, and that the hammers are made to strike down upon the strings instead of striking up as usual: it has a very good tone, and is a convenient instrument, having almost the appearance of a sofa table when shut. Mr. Cadby sends a grand and cottage, in zebra wood, with his patent suspended sounding-board: there seems to be a great deal of machinery connected with effect this, and we cannot say that it is attended with any superior results, as a comparison with other instruments will attest; at the same time it has the disadvantage of increasing the bulk and expense of an instrument, both of which are already great enough. There is a curious-looking instrument in the Grand Exhibition, by M. Griner, professed to be constructed on the principles of the speaking-trumpet, and with an application for tuning the unisons in one operation. There is much ingenuity displayed in this construction, but we do not perceive the advantage to be gained by the tone issuing from the sides of the instrument; and although it would be very desirable to tune the unisons as a single string, as it would obviously save one-half the labour, we are afraid it is not so effectual, but that it requires regulating; and as one wire will always stretch more than another, a tuning-pin to each string seems preferable. This instrument being the first of the kind made, the inventor will, no doubt, improve upon it. Jedcrand Sons exhibit a piano with a moveable front, especially adapted for cabins of ships and yachts, where space is an object. We observe an instrument in the French department, in which the same thing is effected, but in a much neater manner, the unsightly pieces of iron at the side being dispensed with. Mr. Addison sends a transposing pianoforte (No. 487), as also Messrs. Harmer and Towns, and Packer. Mr. Addison's principle is the most original, the others being on plans that have been adopted by different manufacturers for a long period. The carved cottage, in walnut, of Mr. Brinsmead is a very creditable piece of work, and will attract attention. Mr. Allason, and Messrs. Oetzman and Plumb, also exhibit elegant cottage instruments in walnut; and Messrs. Ensor-on and Stedman, a walnut marquetrie cottage of excellent workmanship and design: the colours, however, do not harmonise nicely, and consequently it has a rather gaudy effect. The cottage pianoforte, the case work in papier maché, by Messrs. Jennens and Bettridge, is a novel adaptation of this class of ornament, and is exceedingly showy. The instrument is by Mr. Dimoline, of Bristol. Mr. Hopkinson (No. 500) exhibits a grand pianoforte, to which is applied his repetition action recently patented. Messrs. Rolfe, Mott, Luff, Metzler, Southwell, and others also contribute samples of their respective manufacture; and, taken as a whole, the display of pianofortes from this country fully bears out our superiority in this branch of manufacture.

We now pass over to the pianos exhibited in the Foreign Department. From Vienna we have a beautiful cottage, with buhl-work of excellent workmanship and design, with ormoulu figures on each side. This instrument is placed in the Austrian room, and is grand, in American parlance, with a border of wood mosaic (No. 140 in the Gallery). The other instruments from Germany, of which there are a considerable number, present nothing remarkable in appearance and construction. Belgium sends a number of pianos, principally of the upright kind; but, as they are mostly on the French model, and display nothing very exquisite in their decoration, we need not enlarge upon them. On entering the French Department, the admirers of buhl and ormoulu work will find some elaborate specimens of it. We may mention those in the Nave (No. 1664), who also sends an elegant cottage, in tulip wood and marquetrie, with transposition mechanism; and that of M. Van Ovenburg, which is exceedingly rich and tasteful. This instrument has a double sounding-board; but it does not seem to possess more tone than those constructed in the ordinary manner. Erard, besides his grand in the Nave, sends nine harps, and five other pianos, ordinary enough in their appearance. We cannot perceive the utility of thus exhibiting duplicates of the same article, while in the warehouses of any of our principal manufacturers dozens of instruments could be found very superior in appearance; but we are glad our great English makers have taken a higher view of the matter, being content to be adequately represented without converting the Exhibition Building into a vast warehouse for their every-day productions. M. Hertz (No. 1268) exhibits an organ piano, a grand and semi-grand. M. Pape (No. 845), who sends specimens of his console pianos, is known to be one of the most scientific makers in Paris, having laboured for many years in the improvement of the instrument. He has introduced several inventions, some of which have been adopted in this country. MM. Rollet and Blanchet (No. 1687) exhibit oblique and vertical pianos, some being transposers.

The self-acting piano of M. Debain (1172) is very ingenious, and is one of the best things of this kind we have seen. It has the great advantage of economy of space and very perfect execution. We notice two pianos (No. 475) by an association of workmen; one is in marquetrie, rather pretty. The tone of the French pianofortes, with which many of our readers are doubtless acquainted, is very distinct from the English. It is shorter, more frappant and piercing, requiring much greater force of finger to bring out; and this character of tone, with the stiffness of the touch, may account for the inclination to force or "thrash" the instrument sometimes observable in the foreign guests, who, from being accustomed to these instruments, are scarcely prepared for the self-sustaining tones of our English pianos, with their light and delicate touch. As a general rule, foreign pianos are not admired in this country, and we must ourselves give our own the preference, as possessing sweeter and more musical tones.

We now proceed to notice the American contributons. They show a higher state of excellence and finish in pianofortes than in many other manufactures, which may be traced to the high price they obtain for their instruments, which enables them to employ first-rate workmen, and from their having no foreign competitors; for it is a singular fact, that while we export pianos to India, South America, and Australia, they are unpaid with the best of our own make. Their grands are by no means inferior, though not equal to ours. We have specimens of squares, from Nunn and Clarke, and Meyer; and of grands and squares, from Chickering, Firson, &c. The square by Nunn and Clarke is a noble instrument of its class. We have a novelty in this department in the "Piano Violino," invented by Mr. J. S. Wood, of Virginia. This is a very ingenious and curious instrument; a kind of treadle at the bottom of the piano, near the pedals, sets in motion four bows, which pass over the strings of a violin placed at the back: when in motion, the keys of the piano, when played on, depress these bows, which work in a groove to guide them, and produce the corresponding note on the violin. One is struck with the novelty of the most difficult of musical instruments being played mechanically: but there is a monotony in tone, from the want of expression, common to all contrivances of this kind, in the age of mechanical appliances it is well for art that it is so; and were the invention brought to the greatest perfection, it would at best be an imitation of an indifferent performer; at present it is imperfect.

It may be worthy of observation, in relation to pianofortes at the Exhibition, that Italy, the country in which the pianoforte was first invented (it having been first made in Florence, or at any rate the first piano brought to this country came from Rome), has not contribute a single instrument, while we have Portugal, Spain, Persia, Portugal and Canada. Thus the very invention Italy gave birth to has been reared and brought to perfection by the more vigorous industry of other countries.

ORGANS.

The Organ has been called, not inaptly, the King of Instruments. All other instruments are made; the organ is *built*, and its gigantic bulk is attended with corresponding power. In the grave and solemn rites of the Protestant worship, the organ is the only instrument deemed worthy to accompany the prayers and thanksgivings of the faithful; and the effect of its sublime harmonies, in deepening our feelings of religious awe and veneration, has been felt by every one. Considered, however, in relation to its general utility, and its importance as constituting a branch of national manufacture, the organ holds a place very inferior to the pianoforte. Those powers from which it derives its peculiar value are the result of large size: hence it cannot become a domestic instrument, unless under the lofty roofs of the great and wealthy; while its powers are so limited in variety, that, even in great houses, the pianoforte is much more available for almost every musical purpose. The organ, therefore, is confined almost exclusively to churches and other places of religious worship; being, moreover, very costly, and almost as durable as the edifice in which it is erected, the demand for this noblest of instruments is supplied by a comparatively small number of manufacturers.

The organ is a very ancient instrument. The principle of its construction, notwithstanding the complexity of its modern mechanism, is exceedingly simple. It is, in fact, neither more nor less than a gigantic Pan's pipe, its sounds being produced by wind in the form of tubes of different lengths. When Polyphemus, wishing to serenade the nymph Galatea, exclaims—

> Bring me a hundred reeds of proper growth,
> To make a pipe for my capacious mouth—

we may imagine the giant's pipe, with its hundred reeds, and its sounds like the roarings of the blast, to have been the most primitive form of the organ. It remained to substitute wood or metal for reeds, to blow into the pipes by means of bellows, and to open and shut them by keys; and the instrument became, in its general features, nearly what it is at present.

This appears to have been done a thousand years ago. There is reason to believe that the organ was sent as a present by the Greek Emperor Constantine to King Pepin of France, in the eighth century, and, in the tenth, the Organ was in general use in Germany, France, and England. In those days, of course, it was a rude instrument. An organ erected by St. Dunstan, Bishop of Winchester, in the tenth century, at that city, required seventy men to work its bellows. From Beddoes de Celles' curious work on the Organ, we learn that the organ-keys were at first five or six inches broad, and must have consequently been played upon by the pressure of the finger, but by blows of the fist. We learn also, that, in the beginning of the twelfth century, the compass of the instrument did not exceed two octaves, and that it was not till the end of the seventh century that the machinery for the multiplication of *stops* was invented.

From that time, the cathedrals, churches, and convents of the principal countries in Europe came to be supplied with organs. The organ-builders of Germany and Flanders became the most celebrated, and power of their instruments, and maintained their pre-eminence till they were gradually rivalled and surpassed by our countrymen. The great Haarlem organ, which, within our memory, used to be talked of as one of the wonders of the world, has lost its solitary supremacy, and is acknowledged to be equalled, if not excelled, by the organs of York and Birmingham. The rich ecclesiastical establishements of Italy and Spain are, of course, supplied sufficiently with organs; but it does not appear that the manufacture of the instrument has risen to any great height in those countries. The English organs unquestionably now take precedence of all others; and it is doubtless owing to this, that scarcely any foreign organs have been sent to the Exhibition.

The principal organs in the Exhibition are of London manufacture. There is one, by Mr. Willis, of enormous—we believe, unprecedented—magnitude. It has 77 stops, and 4474 pipes; the greatest pipe being of 32 feet, and giving the deepest note known in music—the C, which is two octaves lower than the note given by the fourth string of the violoncello. It has three rows of keys—the great organ, the chor organ, and the swell; besides pedals extending to two octaves and a half. This monster instrument, though erected in the place assigned to it, is still in an unfinished state.

Mr. Hill, one of the most eminent of our organ-builders, has a great and noble church organ, containing 15 stops, with a corresponding number of pipes, two rows of keys, and pedals. It displays several important improvements in mechanism, which have been made by Mr. Hill. One of these is a contrivance for the important purpose of lightening the touch of the instrument, so as to make the pipes instantly "speak" by a moderate pressure of the finger. We could not easily make the mechanical means of accomplishing this object intelligible in a notice of this kind; but the effect is that this great instrument is almost as easily played upon as a grand pianoforte, and the most rapid passages are rendered clear and articulate. There is also an ingenious contrivance to enable the performer to change the stops without the noise and interruption to his playing that generally attend this operation. In organs made many of the finest effects are produced by constantly changing the stops, and throwing them into new and varied combinations; and, therefore, the means of making these changes easily and promptly is of the utmost value to the organist.

Messrs. Gray and Davison, also organ-builders of much eminence, have a church organ of great magnitude, consisting of 39 stops, with three rows of keys, and two octaves and a half of pedals. Its external aspect is grand and beautiful, the case being of carved oak, and the front pipes richly ornamented.

The remainder of the English organs are chamber instruments; intended, that is to say, for private dwelling-houses, but requiring large and lofty rooms. These are manufactured chiefly by Messrs. Walker, Bishop, and Holdich. There is also what is called an "enharmonic organ," intended to illustrate Colonel Thompson's system of "perfect intonation," by producing those minute divisons of the scale which are necessary in order to play perfectly in tune in all the different keys. This same "perfect intonation" is a thing which has often engaged the attention of speculative men; volumes have been written upon it, bristling with algebraical formulæ, geometrical diagrams, and arithmetical calculations; and Colonel Thompson has only attempted what has been attempted by many before him. But every practical musician knows that it is a chimæra, as impracticable as the quadrature of the circle, and, supposing it practicable, without a use.

There is only one German organ, built by M. Schulze, of Rudolstadt. It is an excellent church organ, of moderate size, having 16 stops, two rows of keys, and pedals. France, too, has only sent one organ, the work of M. Ducroquet, of Paris. It has 30 stops, two rows of keys, and two octaves of pedals, and is a very admirable specimen of French manufacture.

THE NATIVE METALS AND METALIFEROUS ORES.

MANY remarkable and highly interesting specimens of this kind are shown in various parts of the Building, which may be referred to with advantage, as giving valuable information to those desirous of acquiring it on a very important subject. We propose to detail a few of these, with such information as may render them more useful.

One of the first of such specimens that will attract notice is the noble pebble of pure GOLD, from California, exhibited in the South-west Gallery, near the gems of Messrs. Nunn and Rocket, and amongst the various articles of jewellery and plate. This block, weighing above 18 lb. and worth nearly £300, will surprise at first by its apparent smallness; but it must be remembered that gold is one of the heaviest substances known, weighing nearly twice as much as a piece of silver of the same dimensions, and more than six times as much as a common pebble exactly identical in form. Gold, till within the last few years, was obtained almost entirely from Siberia and Brazil, although Africa, the East Indian islands, and even some parts of Europe yielded certain supplies. So much is, in fact, now being diffused through all the earth that this, which is so highly prized and often thought so scarce: but the quantity of a material is not necessarily coincident with its wide diffusion; and while there are, perhaps, very few known districts throughout the earth in which gold might not be found by seeking, yet, in most cases, the search would be so costly, that the material, when obtained, would not at all repay the trouble of getting. Still, large quantities have been introduced into Europe annually for a long time past, and it is a great proof of the wealth of the metal that its price has not yet been affected by all the additions that have been made. The average annual supply for some years before the discovery of the Californian mines and washings was about 80,000 lb. avoirdupois, the value being about five millions sterling. This is now, perhaps, doubled; but hitherto the demand has fully kept pace with the supply. Besides the large block already noticed, which was discovered and brought home by an Irishman, who was on the point of leaving the country in a state of hopeless destitution, when he was lucky enough to turn out this single but valuable pebble, there are several other samples of Californian gold, chiefly exhibited amongst the goods of the United States. They are all nearly pure, and have hitherto been obtained, with very rare exceptions, from a mongst the sand and gravel washed down by torrents from the adjacent mountain country, and accumulated in depressions or natural receptacles, where the progress of the water has been somewhat checked, and the weight of the gold caused it to sink down sooner than the accompanying stones. The largest specimens of gold yet found are from Siberia, whence several lumps exceeding 16 lb. weight have been obtained; and one lump in 1843, weighing no less than 78 lb. avoirdupois, and therefore worth about £3000. In all gold districts, however, such discoveries are rare, the general condition of the produce being rather that of small grains sparingly distributed through sand and rock, and requiring considerable labour to extract and separate. It is estimated that the sands of a river will just pay for gold washing, if they contain at the rate of 24 grains per cwt. of sand. The uses of gold are too well known to require much account; but it may be well to direct the reader's attention to an interesting series of manufactured and beaten gold exhibited in Class 1, near the Sculpture Court (No. 477, 478); and also a series of metallic buttons, showing the different colour and appearance of gold and other metals when pure and alloyed for various purposes (No. 457).

Amongst its uses, the peculiar quality of gold to bear almost any amount of hammering, and yet retain a perfect cohesion in almost any conceivable state of thinness, is perhaps, the most remarkable and important. Owing to this, gold leaf can be produced so thin as to be introduced for the cheapest and commonest purposes, and thus the great beauty and indestructibility of themetal is taken advantage of in innumerable cases where otherwise its costliness would render it unattainable.

SILVER, like gold, is found sometimes native; but this is not the most common form in which the metal occurs. There are, however, some very noble specimens of native silver in the Exhibition, the most interesting being a large block from Chili, weighing upwards of 150 lb. avoirdupois. This, though not quite the largest, in one of the finest lumps of native silver yet brought to this country; and is valued at about £700. Some other extremely beautiful specimens, in a very different state, are exhibited from Norway, and are well worthy of examination, from the crystalline and semi-crystalline condition in which they appear.

Silver is not so widely distributed as gold; but is far more abundant, and its uses more numerous. Mixed with a small quantity of copper, to give it hardness, it enters so largely into use as a coin and for plate, that the consumption and waste from these sources alone must be enormous; but it is also much used in the arts for various purposes, in chemistry and medicine, and lately for electrotyping. The value of the silver annually introduced is estimated at upwards of eight millions sterling; but the relative value of silver to that of the necessaries of life does not greatly alter.

Near the specimens of gold leaf already alluded to in Class 1, will be found a very interesting series of rare metals, exhibited by Mr. Percival Johnson, and including some manufactured articles (No. 477). Of these metals PLATINUM is the one in most general use, and is of great importance in various cases where a material is needed which will resist any known furnace-heat without being affected by acid vapours and without decomposing the atmospheric air.

Platinum is found native in Brazil and Siberia, generally in small lumps, but sometimes in masses of considerable size. Its weight is

BIRD'S-EYE VIEW OF THE CRYST

ACE, AND SURROUNDING COUNTRY

greater in proportion even than that of gold, and it is, in fact, when hammered, the heaviest substance known. It bears welding like iron, and can thus be manufactured without difficulty, as it is also very malleable. Several chemical utensils made of it are exhibited by Mr. Johnson, and a very remarkable platinum dish may be seen among the French goods.

In the same case with the platinum are specimens of PALLADIUM, IRIDIUM, OSMIUM, and RHODIUM—metals for the most part extremely rare and but little used in the arts, but some of them at least worthy of notice. Palladium is more common than the rest, and has lately been employed in electrotyping, for which it seems admirably adapted, as it resists exposure as well as gold, and is far better fitted for various purposes than silver or platinum. In the manufacture of philosophical and surgical instruments especially, this metal may be used with advantage; and it has been employed in dental operations. Iridium and rhodium are chiefly used at present in making nibs for pens, a purpose for which their hardness and indestructibility are useful qualities.

Various interesting samples of MERCURY and its ores (chiefly cinnabar) are exhibited, from Austria, Spain, and America. The former are from the mines of Idria, long known and much worked, and yielding at one time large supplies. The specimens from Spain are from the equally well-known mines of Almaden; while the American ones are chiefly from California, where considerable accumulations of this mineral seem to exist, though hitherto they have been little worked. Mercury is the source of the vermillion colour used in dying, and is a metal of considerable interest on account of its fluidity at ordinary temperatures.

Very fine specimens of native COPPER are exhibited, both from our own country and elsewhere, together with numerous ores of that useful metal. Among the former, Mr. Berger has sent some very fine pieces obtained from a mine in the serpentine rock of Cornwall. The best portions of these are placed in the passage to the North-west Gallery (class), but some are to be found in Class 1, No. 439. Other native coppers well worthy of notice are from the shores of Lake Superior, where a mass of gigantic proportions (estimated to weigh 80 tons) was discovered some time ago; but, owing to the want of sufficient means of communication, it is believed that it still remains, and is of comparatively little value A large fragment of this is exhibited by Mr. Tennant. Besides these, many of the ores of copper are shown, especially the rich and valuable carbonates from South Australia; the poorer but still not unimportant sulphurets from Cornwall and other parts of the British islands; and some less common but interesting ores from Austria, France, Germany, Spain, and South American. Russia has also sent some contributions of great value in reference to this metal, especially by providing several magnificent blocks of malachite (green carbonate of copper), more adapted for ornamental work than for reducing to metallic copper. A large and beautiful vase of hammered copper is also to be noticed, as illustrating both the purity of the metal and the excellence of the workmanship.

LEAD is never found in the native state, or at least is so rare as to have no value in that respect in the arts. The common ore of lead is a combination with sulphur called *galena*, of which several very noble specimens will be found near the eastern extremity of Class 1, exhibited by several persons, amongst whom we may especially notice Mr. Sopwith and the Alston-Moor miners, Mr. Hutchinson, and various exhibitors from Wales, Scotland, Ireland, and the Isle of Man. In most of these cases, the ores in the rough state are the chief objects of interest; but two or three remarkable exceptions occur, in which the complete history of the manufacture of the metal, or some part of the process, is more distinctly indicated. Thus. Mr Sopwith shows samples of lead ore in every stage of preparation, from the rough undressed material as it is brought up by the miner from the bowels of the earth, through the modifications it undergoes by crushing, washing, roasting, &c., until at length it is reduced by smelting to metallic lead. In that state it is still alloyed with a certain percentage of silver, which in the case of the poorer ores was till lately left with the lead, as the means of separation were too costly to be repaid by the silver extracted and the higher price obtained for the purer metal. Now, however, by the method invented and exhibited by Mr. Pattinson, advantage is taken of the tendency of metals to separate while one is undergoing crystallization by slow cooling; and, by means of long ladles, resembling a perforated sugar-scoop on a gigantic scale, the lead, while granulating, is removed from the more fluid part of the molten mass, which is then left with a much richer and more valuable portion of silver, till at length it is so rich that the lead may, without serious loss, be allowed to become oxidised in an absorbent crucible, while the silver remains as a kind of button, of which one specimen is shown, weighing about 12,000 oz. and several others are also exhibited of somewhat smaller proportions, but still sufficiently remarkable to draw special notice. The beauty of this process renders it well worthy of attention, and the whole is fully explained by a series of diagrams and specimens, and a printed account, which may be obtained by any one visiting this part of the Exhibition

ZINC is a metal of considerable interest at present, and admirably illustrated, in various ways, in the Exhibition. Most of the ore of commerce (spelter) is obtained from the ore called calamine (carbonate of zinc), exceedingly abundant in Belgium and Silesia, but also found extensively in the Mendip Hills, in Somersetshire, in Flintshire, and Derbyshire, and other mining districts of the British islands, and elsewhere in Europe. England also contains large quantities of blende or black-jack (the sulphuret), and is capable of yielding a very large supply, though at present the material is rarely worth working. Zinc is now very much used in various constructions, and for domestic and farm purposes; but its applicability for castings on a large scale is also fully proved, by the numerous admirable works of this kind exhibited in the Nave and elsewhere. A block of zinc ore occupies a prominent place amongst the American goods, and is further illustrated by a series of slabs and panels, painted with a material in which zinc takes the place of the lead generally used by us (as white lead or oxide) as the basis of all oil pigments. Owing to the injurious effects arising to painters and others employed in the frequent handling of white lead, it is most desirable that the material should be, if possible, replaced by a less mischievous substance, and thus the subject assumes an importance which would not otherwise belong to it. Zinc is very extensively exhibited by the Vieille Montagne Company of Brussels and Paris, who work the largest and most important mines of this metal; and the efforts made to bring forward the metal and apply it to useful purposes of various kinds are worthy of very special remark. We need scarcely do more than mention the great value of zinc combined with copper in the manufacture of brass.

TIN is a rare metal compared with many others, and is usually found only in the form of tin-stone (an oxide). It is obtained principally from Cornwall and the islands of the Indian Archipelago; and each of these districts will be found to have sent samples of their produce in this respect. The specimens from our own country consist partly of what are called "stream ores," or rolled pebbles of tin-stone, worn by the action of water, and mixed up with sand and gravel, and partly of portions of tin veins, of which there are many interesting specimens, showing the general form, character, and extent in which the ore occurs in the parent rock. In addition to these, will be found models of much interest, which illustrate the mechanical mode of separating the heavier or metalliferous particles from their earthy associates; and also models of the smelting establishments where the tin is first reduced and then refined so as to be in a condition fit for use by the worker in metals. Tin is but little employed as a metal directly; but, as it mixes freely with several other metals, forming valuable alloys, it is often used in the arts. The alloys with quicksilver for the backs of mirrors, with copper to form bronze and bell-metal, with antimony in the manufacture of hard pewter, with antimony, bismuth, and copper for Britannia-metal, and with the same metals combined with lead for type metal, are examples of the uses which will at once show the importance of the subject. In plating the use of tin is not less remarkable as the common tin-plate, which consists of sheets of iron dipped in tin, and the method of lining copper vessels with tin for culinary purposes, will sufficiently illustrate. The salts of tin are extensively used in dying and calico-printing, and in many other ways where the colours obtained from them are required.

NICKEL is a metal not used by itself, but very important in the manufacture of several alloys, well known under various names as imitations of silver. German silver, argentine and other white metals, are thus formed by an admixture in certain proportions of several metals, of which copper nickel, and zinc are the essential ingredients. Nickel is generally found in nature associated with COBALT, or white metal, not used except in its earthy state, in which it affords a blue digment of extreme value for its beauty and permanence and greatly used in all encaustic work of whatever kind where the colour has to be exposed to any surface and therefore to stand exposure to a very high temperature. Nickel and cobalt are not found so extensively in England as in Germany, Norway, and other mining districts on the Continent, from which the greater part of the supply is now obtained. Good specimens of both metals and of the oxides of cobalt (*zeffre* of commerce), and the blue glass called *smalts* used extensively as a colouring material, will be found exhibited in SAXONY (Nos. 9 and 10) and some other countries of the Zollverein, highly illustrative of the nature of the material and the uses to which it is applied. Specimens from Cornwall are exhibited in Class 1 (British) 511 and 512.

BISMUTH, of which a very beautiful specimen is exhibited on a table on the south side of the Nave, near the Austrian department, is a metal which, like nickel, is not used alone, but has considerable value in mixing with other metals, the effect being to render the alloy more fusible. It is found chiefly in SAXONY and associated with cobalt, from which it is separated by a peculiar process of distillation. Lead and tin, combined with bismuth in various proportions, and with the occasional admixture of copper, antimony, and other metals, are used in the arts for various purposes the manufacture of type metal, plumber's solder, pewter, and fusible metal being the principal. The oxides and salts of bismuth, but chiefly the nitrate, are used in dying and calico-printing.

ANTIMONY, like bismuth and nickel, is not used alone as a metal, although very abundantly distributed and easily obtained in the metallic state. Very good specimens of the different conditions of antimony ore (sulphuret) from different localities, and metallic antimony, will be found exhibited by Mr. Hallett in Class 1 (No. 481), and some of these show thecrystalline form in which the surface may be obtained. The ore of antimony in a state of fine powder is used in the East to stain the hair, and the salts are used in medicine and dying. The metal itself is employed in various alloys, some of which we have already referred too. Among other applications not mentioned is that of antimony and lead to produce a harder substance than lead, used in engraving music. The admixtures of antimony with other metals are usually more brittle than the metals alloyed.

ARSENIC is found native, and is very abundantly distributed with the ores of several other metals; but, though extensively used in the arts and in medicine, it is not itself employed directly in the metallic state. In combination with other metals it is frequently present in small proportions, and it is an important ingredient in common shot, the lead running into round drops much better with a proportion of arsenic than without it. Specimens of the oxide of arsenic (white arsenic), as obtained from tin furnaces, are exhibited in Class 1, by Mr. Garland (488); and as this form is the one most commonly employed in the arts and in medicine, it deserves to be noticed. The sulphuret of arsenic, *orpiment*, or King's yellow; and *realgar*, a fine orange red pigment, are a good deal used in giving colour in various ways.

URANIUM and CHROMIUM are two metals rarely or never seen in the metallic state, but not without considerable importance in the arts (especially the latter) as affording valuable pigments. Uranium, and its salts and oxide, are shown by Mr. F. Johnson, in the case already alluded to (No. 477), and chrome ores and oxides are exhibited by one or two British exhibitors, but chiefly from our North American colonies and India. The case exhibited by the Indian Iron and Steel Company, near the TURNSPIT, contains a very good series, showing the colours obtained from the metal

TUNGSTEN is another metal not used at all in the metallic state, but of which the salt are employed occasionally, chiefly in dying and calico-printing. The separation of wolfram (tungstate of iron) from tin, with which it is often found mixed in Cornwall, is a troublesome and tedious process, and is illustrated by a series of specimens exhibited by Mr Oxland (No. 486).

MANGANESE is a metal only valuable in combination with oxygen gas (as an oxide), and in this state it is generally and very abundantly presented in nature. Samples of it will be found in various places in the Exhibition, but they do not require any special notice. They are employed in bleaching to a large extent, are used as a coarse pigment for pottery and also in glazing pottery, and come into use in the manufacture of glass.

In the general sketch here given of the various metals, metalliferous ores, and other substances illustrated in the Exhibition, we have purposely avoided to mention IRON, which, as may be supposed, is neither forgotten nor unimportant. We propose, in another notice, to refer to this metal as the most truly valuable of all our metallic produce, and the source of all our wealth. We have chiefly desired to point out here, in a general way, the things best worthy of examination, with reference to each of the metals and for this purpose have preferred a short notice of the metals, in order to a methodical selection of the more remarkable specimens. Our readers, especially those from the manufacturing districts, who appreciate the importance of metals in reference to the arts, will, we are sure, find much with this attempt to give an idea of the uses of the metals, many of which are not employed in a metallic state, but whose essential properties are all connected with the existence of this important condition.

WOOLLEN AND MIXED FABRICS.

(SECOND NOTICE.)

IN resuming our notice of the important and extensive contributions classified under the above heads, we cannot do better than commence with the products of the West of England, a district so long famous for the manufacture of those fabrics in which it was the pride and delight of all well-to-do people in days gone by to attire themselves; broad cloth being such a distinctive feature in contradistinction to fustian, that the wearing of the one or the other has grown into a sort of proverbial type of the social position of the class who wear them. Cloths of York, of Witney, and of Stroud, are each remarkable for their distinction as a fact, but it still remains in history as a line of demarcation, which, in spite of all the efforts of ultra-exclusiveness, the advancing spirit of the age is fast rubbing out; nor will the Great Exhibition be one of the least of those causes by which this equalising effect will be realised -not, however, an equality produced by the lowering of the few to the level of the many, but rather by a lifting up of the many towards the level of the few. "Broad cloths" rub against "fustian jackets;" and the generosity of the former in providing the means for the display of the ingenuity and industry of the latter, will, we trust, be well understood and acknowledged, to the end that each may benefit out of the superabundant wealth of the one, and energy of the other.

In those portions of the woollen products of the United Kingdom to which we are about to call attention, we have the two great extremes of the very finest products of skill, taste, and ingenuity -the result of the experience and traditionary skill of several generations of manufacturers, on the one hand, and the rude and unsophisticated manufacture of a neglected population on the other; in short, we have to examine West of England broad cloths, by the best makers in Britain, aided by all that modern chemical and mechanical science can do for the perfection of these manufactures; and the Irish friezes of the widow Murphy, of Ballysmulton, who, with the assistance of her family, shears her own sheep, dyes and spins her own yarn, and weaves her own cloth, sending it forth to the World's Fair as an example of a primitive manufacture, uninteresting, perhaps, to the high-class cloth merchant or manufacturer, but possessing many features of interest to the thoughtful observer, or the earnest advocate of national industry wherever it may be found, or in whatever form it may occur.

In parallel case with this come the coarse home-made products of the Highlands of Scotland, laying equal claim to attention in an economic point of view; and though having but a small and insignificant commercial relation to the productions of the manufacturing districts of the West of Scotland, yet of no small importance to the workers in mountain side "shanty," as affording employment at times when it is most needed.

THE WEST OF ENGLAND.

The woollen district of the West of England extends into the counties of Gloucester, Somerset, and Wilts, and combines most of the advantages of a manufacturing with those of a rural locality. The centre may be said to be Stroud, which comprises within its own parochial limits a large proportion of the manufactories in which the woollen cloth trade is carried on. Unlike the great seats of industry in the north of England, there is no crowding together of mills and dwelling-houses—tall chimneys being the exception and no way the rule, and though, as a matter of course, the steam-engine has found its way here; yet the manufacturer has not altogether abandoned the use of that power which first induced the settlement of the woollen trade in the district of Stroud-water, with its streams, hills, and vallies.

Not unlike the towns of the West Riding of Yorkshire, certain localities are noted for the production of a given class of goods, although they all come under the same general category. Thus, Stroud produces the finest black, blue, and scarlet cloth in the world. Trowbridge is chiefly noted for the manufacture of trouserings and narrow goods of all sorts: Frome, and the district around, for the production of medleys and coloured cloths; and Tiverton, near Bath, is celebrated for the manufacture of beaver cloths; whilst Dorchester confines its attention to livery cloths and drab coatings. Then there are the productions of Bradford. (White), Chippenham, Melksham, and Westbury, whilst within the borough of Stroud, eleven parishes are comprised, all dependent upon the woollen trade. With such a district as this to represent, it is to be regretted that the productions displayed on this occasion have been placed in so small a space, or, rather, that an attempt has been made to bring within so small a compass examples of the industry, skill, and enterprise of so important a locality. To have been fairly and fully represented, it ought most certainly to have had at least four times the amount of surface in which its products are now arranged, if, indeed, the latter term ought to be used; since the various articles are placed so close together as not to allow of separation by the eye when looking at them. Of course, the result is anything but satisfactory.

In the notice of the fine woollen cloths exhibited by the London houses, attention was directed to several examples of West of England manufacture, and, amongst the rest, to the black cloth exhibited by Messrs. Bull and Wilson as that for which they had awarded the gold medal offered by them. The manufacturer of that cloth, Mr. William Helme, of New Mills, Stroud (207), exhibits, as one of the representatives of the West of England trade, and displays excellent vestings of a very beautiful character, as also cashmeerettes of silk warp and woollen weft, of excellent fabric. The doeskins and cassimeres are also very excellent in quality of dye and finish. Messrs. S. S. Marling and Co., of Stroud, exhibit a good selection of superfine broadcloths, doeskins, and cassimeres, of admirable colour and finish; and Messrs C. Hooper and Co. (210), also of Stroud, and Messrs Playne (211), of Nailsworth, display some excellent examples—the former, in elastic trouserings and fine cloths, while the latter exhibit a series of specimens of the process of the woollen cloth manufacture Messrs E. Davies and Sons, of Stonehouse Mills, Stroud (214), exhibit military cloths, of various kinds and colours, for uniforms, the scarlet being very brilliant; the hunting cloths of this house are also very excellent. A somewhat similar, though not so extensive, contribution from Mr. N. Partridge, of Trowbridge (212), and Mr. W. Pulling, of Painswick (213), goes still further to illustrate the productions of the West of England in army cloths. The latter also exhibits billiard cloths of a superior make and finish. The dyes of some of these examples are very beautiful: a green of a most brilliant hue will not fail to strike even the unobservant in such matters. Mr. T. Sampson, Lightfoot Mills, Stroud (216), displays a very excellent selection of shawls, of a tasteful and somewhat novel character; and the vicunna wool is here shown wrought into glove cloths of a very superior quality. Mr. Josiah Overbury, of Wotton-under-Edge, has a very admirable exposition of superfine Saxony woollens, of the usual colours. The dye and finish of the blacks, rifles, and olives being first-rate in every respect: and these are fitly accompanied by examples of a similar class, by Messrs. Phillips, Smith, and Phillips, of Melksham, in which many, if not all, the excellences of the traditionary skill of this district are displayed.

In finishing this examination, we must repeat our regret that products of so much importance, and such sterling excellence of their kind, as those of the West of England, should not have had a larger amount of space, and one better suited to display the peculiar character of the goods. As it is, they are certainly not shown to advantage, apart from the fact that many of the exhibitors are distributed about the neighbourhood in a manner analogous to the scattered character of the localities of manufacture, and so far may be illustrative; but it would have been infinitely better had all been brought together in one group—a system which has prevailed in almost every other case. We, therefore, find fragmentary portions of the manufactures of Gloucestershire and Wiltshire, in addition to the group of exhibitors from Stroud. Thus, Messrs. J. Edmonds and Co., of Bradford, Wilts, exhibit waterproof woollen cloth: Mr. R. Chick, of Chard, Somersetshire, show specimens of power-loom drab cloth; and Messrs. Stanton and Son, of Dorchester, exhibit examples of drab milled waterproofed cloths of a good and serviceable character. These are all placed in the general group; but Messrs. S. Salter and Co., of Trowbridge, who exhibit admirable specimens of fine woollen trouserings, are in an isolated position, though their goods can be well seen when once discovered, which is more than can be said of some of the examples. Mr. W. S. Wheeler, of Frankford, near Bath, and 4, Ludgate-street, displays a very excellent assortment of fancy doeskins, of excellent dye and finish, as also examples of patent dress beavers, together with vestings; and Messrs. Wm. and W. Carr, also of Bath, show specimens of cloth manufactured from German wool, dressed pieces of fine Australian wool, and summer coatings; and these, with the broad and narrow cloths made entirely of British wool, the produce of Wiltshire, manufactured and exhibited by Messrs. Fox and Co., of Devizes, complete the display of West of England fabrics, of which, as a whole, the respective manufacturers may be proud, as evidencing skill and experience of no mean order

In addition to woollen cloths, another important contribution from Stroud ought to be noticed as being connected with the manufactures of that place. Mr. W. Grist exhibits specimens of mattress wools, flock, and woollen mill-puffs, of a very superior character, prepared and purified by machinery.

OXFORD

The woollen manufactures of Oxfordshire are represented by the valuable contributions of Mr. William Bliss, of Chipping Norton, and the house of Messrs. John Early and Co. and Mr. Edward Early, of Witney. Mr. Bliss (270) makes a very remarkable display of kersey checks for winter horse-clothing, a department of the woollen trade established at Chipping Norton by the progenitors of the exhibitor for more than 100 years, and is interesting in a national point of view, as intimately connected with that love of horses and our national sports in which every Englishman prides himself In addition to horse-clothing, Mr. Bliss displays some excellent specimens of the vicunna shawls already noticed as manufactured by him for Messrs. Barber, House, and Mead, together with beaver of the same material for ladies' cloaking. These, with Angola shawls, and railway wrappers, form the leading features of a highly creditable exposition.

Witney has long been celebrated for its blankets, and those exhibited by Mr. Edward Early (269) fully sustain its ancient reputation. These examples are all manufactured of selected materials, as specimens of the various English wools, their texture being very fine, and substance perfect. Those exhibited by Messrs. John Early and Co. (268) come more within the ordinary productions for the market, but are exceedingly good specimens of an indispensable article

In connexion with this notice of blankets, it may be as well to mention those exhibited by Mr. Nicolls, of Cork (261). These are good examples of Irish manufacture, and are evidences of a revival in industrial pursuits, which, together with very excellent and honest, though rough-looking friezes by the same exhibitor, deserve attention as an encouragement to a spirited effort on the part of those who seek to develop Irish resources, more particularly in their application to the remunerative employment of the people.

KENDAL

The woollens of Westmoreland have been noted for a period beyond any very certain record; and "the knaves in kendal green," whom Shakspeare depicts as assaulting *Falstaff*, were doubtlessly supposed to have been customers of the woollen manufacturers of the period in which he wrote. In the lists of the exhibitors at this Exhibition, Kendal woollen loses nothing of its character, although the adaptation to modern purposes is most complete

Messrs. J. Ireland and Co. make the largest display of railway travelling-rugs, horse-blankets, alpaca cloths and saddle cloths, together with other articles of coarse woollens, all of a most useful character, and in the manufacture of which excellence combined with considerable taste is shown. The lesser displays of Messrs. J. and W. Wilson and Mr. G. Coody are also very noticeable for a tasteful selection of colours, and the patterns in which the articles are woven. The productions of these three houses, in conjunction with those of Mr. Bliss, of Chipping Norton, prove to what an extent the manufacture of the coarser kind of woollens for horse-clothing and other purposes is carried on in this country, and how much skill and taste may be displayed therein. Railway wrappers show the wealth of a trade which has only sprung up of late years, and one which has entirely developed itself out of the immediate requirements of the recent change in travelling; for though such articles are at all times useful, they have only arisen out of an universal want.

FLANNELS.

There are several excellent displays of this very useful and, in a climate like ours, indispensable article; the contributions of Messrs. Belsale and Bartlemore, of Rochdale, being of a very superior character, particularly in the dyed and fancy-coloured specimens. There are Lancashire flannels, and imitation Welsh, together with swanskins, medium, and gauze. The wools are selected according to quality, of English, Saxony, and Australian, and altogether the contribution is a very tasteful one. In genuine Welsh flannels, Messrs. W. Lloyd and Co., of Newtown, Montgomeryshire, exhibit specimens of a very excellent class; and though these specimens do not possess the attractive

character to the eye of many of the articles around, yet, in an industrial and commercial point of view, it is of vast importance. There are also two other exhibitions from Lancashire, besides Messrs. Kelsall and Bartlemore. These are Messrs. J. Smith and Son, of Saddleworth, and Mr. J. Bamford, of Rochdale. The latter exhibits some beautiful examples of fine gauze flannel, and the former fine and superfine specimens, with silk warp, together with scarfs and shawls, for printing.

WELSH WOOLLENS

In connexion with the Welsh flannels above quoted, it may be well to notice a series of examples of the primitive manufactures of the rural districts of Wales. These are contributed by Mrs. Elizabeth Mills, of Dolgelly, and others; but, though interesting specimens of a very valuable class of goods, and creditable to the industry of the workers and the enterprise of those who employ them, as examples of manufacture, it would be very unfair to compare them with the highly finished goods around. But, for integrity of make, they are equal, often superior, to their more showy-looking neighbours.

IRISH WOOLLENS.

Kindred to the last-named goods are the Irish friezes, the manufacture of which has been so largely revived of late years; and, without seeking to give undue prominence to the products of Irish industry in this department, it is but justice to those who have been seeking to employ a degraded and down-trodden peasantry in the manufacture of a material which appears to belong, as of right, to the emerald isle, to call attention to the varied and excellent quality of the goods displayed by the several exhibitors. To Mr. Nicolls' friezes we have already alluded in connexion with his blankets, and the peculiar circumstances under which Widow Murphy's specimens are produced have been also glanced at; but it is to those which come before us as representing the commercial aspect of the Irish woollen trade we now desire to allude.

Mr. Richard Allen, of Sackville-street, Dublin, has done much for the promotion and improvement of the class of manufacture, and is an enthusiastic supporter of every legitimate effort in th s direction. He is the largest exhibitor, and certainly there are many points of excellence, even as compared with goods of more pretension. In short, they are at once excellent and considerable looking articles, as also are the sheep's grey and brown mixed friezes manufactured by Catherine Neil and Sons, of Tullaght, Dublin.

Mr. Luke Dillon, of Parliament-treet, Dublin, exhibits runswicklers, made of undyed foreign wool, and some excellent examples of the native friezes. Messrs. Willans, of Island-bridge, the present occupiers of the works once so famous as the locality whence Messrs. Henry sent forth their admirable printed calicoes, muslins, and lawns, also display specimens of the kind of industry now pursued there, and show a good assortment of super-friezes, military tartans, and woollen shawlyarns

In vestings, Mr. Macdona, of Dublin, shows a selection of excellent embroideries, the taste displayed in which is chiefly owing to the Dublin School of Design; which, in contra-distinction to the schools in other places, with the exception of Belfast, appears to have been looked to by the manufacturers as a means of improvement in the very direction it was intended for—art as applied to manufactures.

MIXED FABRICS.

Under this head it is proposed to finish our review of the department under consideration, with the exception of shawls, to which it is proposed to direct special attention in connexion with the magnificent display made by the East India Company, who are certainly entitled to the thanks of every student of design, and every manufacturer in Europe, for the lessons afforded by the wonderful specimens they have brought, at so much cost and trouble, to grace this gathering of the nations. We hope, then, to improve the opportunity thus afforded, and institute a comparison between that which our artists and manufacturers do, and that which is done by the Eastern weavers in their primitive looms; and most certainly, a longer or more interminable game at "follow my leader" has never been played than is here shown to have been the case with regard to the very highest class of textile fabrics in which the manufacturing communities of Europe have been engaged for some sixty or eighty years.

Our present purpose is chiefly with dress pieces; but, as there are two exhibitors of a distinct class of goods for furnitures, these are noticed first.

UTRECHT VELVETS.

Messrs. R. and T. Baughan, of Banbury, exhibit specimens of stamped Utrecht velvets and livery plushes of a peculiar character, as also printed mohair table-covers, and other articles in imitation of the Chinese. The colours are generally good as regards brilliancy, though not always well selected in point of artistic effect; but, as a whole, the display is a very creditable one. In the same department, but more exclusively devoted to the purposes of the upholsterer, is the exposition of Messrs. Bennett and Co., of Manchester, and Newgate-street, City. This house has long stood well as the manufacturers of Utrecht velvets for decorative purposes, carriage linings, &c., and the examples now shown sustain that reputation. The arrangement, too, of the whole is decorative and effective, except that the stamped and printed table-cover placed in the centre as a foil to the brilliant colours around is in the worst possible taste, both as regards ornamentation and colour.

DARLINGTON.

There is but one exhibitor in the department of Mixed Fabrics from this town, but the examples displayed are very excellent of their kind These are contributed by the well-known firm of Messrs H. Pease and Co., and consist of Coburg cloths—in single and double twill, excellent in make, and very even in colour and texture. They also exhibit yarns of various qualities and numbers, spun from Saxony and Australian wool. The summer coatings, too, may be instanced as of excellent make, whilst the dye of the green and blue Coburgs is noticeable for brilliancy and clearness.

MANCHESTER

In mixed fabrics there are only two exhibitors from Manchester, and one of these is altogether misplaced, the goods being arranged with the cottons.

The contribution of Messrs Kay, Richardson and Wro (186) is of a very excellent character, alike highly creditable to their taste and skill. It consists of a great variety of chiné goods, in which the adaptation of design to material has been well cared for, and the combinations skilfully made. These consist of silk, linen, cotton, and worsted, the warps being printed in a very superior manner. Indeed, there are no similar goods in the Exhibition, which at once combine so much novelty in mixture, together with a result so successful.

Messrs H. Walmesley, of Failsworth, near Manchester (51, Class 11), whose contribution, as already mentioned, has been placed with cottons near to the Carriage Court, exhibits very admirable specimens of their class in power-loom mixtures for dress goods. The watered effects are very excellent, and the figures well introduced, the economic character of the production by means of steam power being a striking feature. This exhibitor also displays a singular effort in commemoration of the Exhibition, but it is to be regretted that the means and money expended thereon had not been better employed. The subject is a table-cover, the border of which represents a procession of all nations bringing their offerings to the Great Exhibition, whilst in the centre is a perspective representation of the Building, with sky and foreground: To the student of textile design, who considers its real principles, the effect of this specimen of architectural weaving is ludicrous in the extreme; and it is, we repeat, very sincerely to be regretted that so large a sum of money, probably £2500, should have been expended in getting up such a production, when that sum, expended with due taste and judgment, would have been amply sufficient to have worked out three or four elaborate designs, which might have done honour to the spirit and energy of the manufacturer; and there can be no better proof of this than the very excellent examples to which we have already alluded, as forming the true features of his display.

GALASHIELS.

The contributions from this manufacturing district of the north consist of tartans, shawls, and tweeds. It is more especially to the latter that attention is now directed, for, as already stated, the two former classes of goods are intended to be specially considered. The tweeds consist chiefly of trouserings, and a few vestings; and the exhibitors are Messrs. R. and T. Dixon, Sanderson and Sibbald, J. and W. Cochrane, Inglis and Brown, and others, and are generally of average excellence, not calling for any special exemplification; but, as representing the manufactures of an important section of northern industry, they are deserving of consideration.

The other contributors from Scotland, of this class of goods, are Messrs. J. Crombie and Co., of Aberdeen, who exhibit Scotch tweeds in various qualities, Messrs. Byers and Son, of Langholm, and Messrs. Bowman and Son, of the same place, each of whom show examples of shepherd tweeds, railway plaids, and other articles, made from Scotch and Australian wool. The trouserings of Messrs. J. and H. Brown and Co., of Ettrick Mills, Selkirk, are, however, the most varied and novel in mixtures and styles, and present many tasteful features, not commonly found in articles of this class. The same may be said of those of Messrs Dickson and Laings, of Hawick

IRISH POPLINS—DUBLIN.

There are few contributions in the Exhibition which, as a whole, will strike the visitor more than the very admirable display of Irish taste and industry which the poplin manufacturers of Dublin have made on this great occasion; inasmuch as it is one of which they have every right to be proud, and which will do more to show that, with proper care and attention, a greater degree of development may be given to Irish manufactures than even some of the best and truest friends of that portion of the United Kingdom could have hoped for.

The increased estimation in which the class of goods here displayed has been held of late years, has given a great stimulus to the manufacture of, probably, the most elegant material for ladies' dresses which the skill and industry of modern times has produced; and the traditionary excellence of the products of those descendants of the victims of the revocation of the edict of Nantes, who were permitted to settle in Dublin, as well as at Spitalfields and Norwich, has been revived on this occasion with all its force, aided as it is by modern means and appliances in the Jacquard loom, and the various mixtures of materials which the industrial activity of the age can now supply so readily.

Messrs. Pim Brothers and Co., of Dublin, worthily sustain their reputation for the production of beautiful and appropriate designs in a material so well calculated to show, by the contrast of the parts, the skill of the artist and the weaver; and in the brocaded poplins the breadth of effect in the ornaments and the fitness of purpose are worthy of all praise. The colours, too, are selected with taste and judgment, and the brilliancy of the contrasts are enhanced by the introduction of the metallic threads in gold and silver. Nor do these remarks apply with less force to the productions of Messrs. R. Atkinson and Co., of College-green, Dublin; for though the style of pattern is generally less bold than that of Messrs. Pim, yet it is not less effective for the purpose, and the value of the brocading machine at work under the gallery, near to the display under consideration, is shown in a variety of tissues of great richness and beauty. The introduction of so many colourings in the sprigged effects and in the bouquets is a marked feature of these specimens. The elegant scarfs manufactured by Messrs. Atkinson are also worthy of notice, the borders being so well and distinctly marked, though woven in the same piece with the body of the scarf.

Mr. Reynolds, of Grafton-street, Dublin, shows some very elegant examples in imperial blue and gold tissues, as also in white and gold. There is, perhaps, less splendour about this display than in those just noticed, but the result is not less satisfactory; and, in addition to the dress goods, we have some excellent specimens of figured furniture, brocaded tabarets of very excellent quality and generally good design. The plain cord, checked, and tartan poplins are also worthy of special notice.

Those manufactured by Mr. Edward Jones, of St. Andrew-street, Dublin, and exhibited by Mr. Richard Allen, are also of excellent make, though of less pretension in appearance. "The last," but by no means "the least" of this very satisfactory exposition of Irish skill is the display of Messrs. W. Fry and Co., of Dublin, in silk furniture damasks of a superior class, together with poplins, plaid tartans, and conch laces. The silk furnitures are bold and effective in pattern, and generally well selected in design, as specimens of weaving and colour they are above the average. The brocaded poplins, too, are elegant examples of their class. In conch lace this house stands high, and the productions here displayed prove that it deserves to do so.

In front of Messrs. Fry's stands the celebrated brocading machine, at which a weaver is constantly at work upon a tissue of more than ordinary richness of effect; and, as the loom is a very handsome one—the framework being of polished mahogany, and the mountings to match—it is generally surrounded by a crowd of visitors, anxious to see into the mysteries of its operations, though we fear they go away more puzzled than before, after looking at the maze of strings presented to view in the orderly disorder before them. Great credit is due to Messrs. Atkinson and Co. for their spirit and energy in sending this loom and its intelligent worker to represent so important a branch of Irish industry.

Having thus gone through the great group of woollen and mixed fabrics so located in the centre of the nave, and out of the avenue, in order to finish the classified arrangement it is essential we should ascend to the South-west Transept Gallery, where the Norwich and London goods of this class are displayed, the whole being shown together in one large glass case in a series of compartments. Many of the articles displayed in this arrangement belong to the department of clothing, in the midst of which the case is placed. The noticeable articles within our present scope are those exhibited by Messrs. Jeakins, of Plastic Cloth Change (300). These consist of some excellent fabrics in good taste as regards colours. The dressing-gown fabrics exhibited by Messrs. Welsh, Margetson, and Co. (304) also claim attention. These latter are very effective in pattern and elegant in general appearance.

NORWICH.

Norwich has long been famous for its poplins, and there can be little doubt that the production of these fabrics, both in that city and in Dublin, arose out of the experience and skill brought by those Protestant emigrants whom the evil policy of Louis XIV. drove into exile. The bombasins and crapes of Norwich, too, have long held a high reputute; and, latterly, shawls and spun silk goods have been added to the number of its products.

The poplins shown by Messrs. Clabburn and Son are of a very high character. One specimen is especially admirable for its beauty and softness of texture, and the perfection of the satin face in the brocaded figure. The design, too, is free and appropriate. The chintzes are clear and distinct in pattern, the design being free of complexity, as in many by no means always achieved, even to the necessary degree of intelligibility, in this kind of fabric. The dye and finish of Messrs. Clabburn's goods are excellent.

Messrs. Edward Willett, nephew, and Co. (310) make a pleasing and satisfactory display of plain poplins, brocades, and chinés; and Messrs C. and F. Bolingbroke (311) exhibit plain and watered examples of an excellent character. One specimen, a brilliant blue, is particularly noticeable for its richness and brilliancy of tone. The specimens of black paramattas, a fabric for which Norwich is now noted, exhibited by Messrs. Middleton and Ainsworth (312), are capital examples of their class. These paramattas consist of a mixture of silk and worsted, the warp being of the former, and the weft of the latter, and the fabric is a very favourite one. The large pattern brocaded poplins, exhibited by this house are not so satisfactory as the effort deserved to be. The effect is marred by the introduction of too many colours, and the contrasts of form and colour are not good. More simplicity of treatment would have succeeded better

Messrs. E. and P. Hinde's (312) display of poplins is not in good taste The bouquets are too heavy in form; but the beauty of the figured silk barèges compensates in some measure for this, inasmuch as we have rarely seen a more delicate or elegant tissue—one, indeed, which would be suited to Titania herself, the effect is so transparent and fairy-like. As this is comparatively a new production, we may anticipate great improvements therein. Messrs. Fowler, Campion, and Co. (309) exhibit paramattas, stripes, and challis, which are elegant in effect, though very simple in design. The display of this house is chiefly in shawls, and arranged in another department.

Our notice of the British productions in woollens and mixed fabrics has extended to such length from the very excellent character of the exposition when examined in detail; and it is quite impossible to understand this excellence except by careful and systematic examination, when we have no hesitation in saying that the position of the important trades represented is immediately elevated ten-fold: and it is no boast to say, that such a collection of excellent productions as that displayed in the British side of the Transept of the Crystal Palace was never brought together before.

There is one group, however, to which we have still to refer, and have reserved until the last, as a suitable finish to our review.

THE PRINCE'S CACHMERES.

This contribution of his Royal Highness Prince Albert has been an object of great interest to all interested in the woollen and worsted manufactures of this country, and not the less so because it indicates the eminent practicality of the mind of the Royal contributor whose interest in the progress of industry never flags. The specimens of manufacture we are about to notice are arranged in a tasteful glass case, appropriately placed in the Central Avenue, in front of the department to which they belong, as a trophy of that class of articles. They consist of two shawls, two dress pieces, and a specimen of coarse woollen cloth manufactured from the wool of the Cachmere goats kept by his Royal Highness Prince Albert in Windsor Park; and the experiment has been made at his suggestion, and for him, by Messrs. T. Gregory Brothers, of Sheif, near Halifax, and Messrs. John Haley and Son, of Bromley, near Leeds.

In the raw state, the Cachmere goat's wool is very peculiar in its character, consisting, as it does, of two distinct materials. These are known as wool and kemp. The wool is soft, beautifully rich, superior even to the finest Continental lamb's wool, and is divisible into distinct qualities. The kemp is a coarse, rough-looking hair, and is constantly avoided by the manufacturer, as the smallest admixture of it with the wool gives the fabric an appearance of coarseness, through its harshness. Intermingled as these two wools are with each other when shorn from the goat, it becomes a matter of great difficulty to separate the one from the other, and, as there is no mechanical invention for doing this, it has to be effected by hand, and thus is done fibre by fibre, a difficult and tedious process. To have done this in the ordinary course of trade would have entailed an expense of no ordinary character; but it was no sooner known in the woollen districts of Yorkshire, that the Prince desired that an experiment in the manufacture of the wool from his goats should be made, than there were hundreds of volunteers to do the preliminary work of separating the fine from the coarse hairs; and from the highest to the lowest in station, all set about their work earnestly, under the direction of Messrs. Haley and Messrs. Gregory; and the only remuneration given, or required, was an elegantly engraved certificate, with a view of the Crystal Palace as an ornament, stating that the holder had been employed in forwarding the benevolent wish of the Prince in the manufacture of Cachmere wool; and it is a singular fact, that for some months upwards of 1000 persons of all grades were so employed, according as their leisure enabled them to devote attention to this "labour of love."

In the manufacture of the shawls considerable difficulty arose, from the impossibility of again dividing the small quantity of wool produced in order to make warp and weft yarns, so that the fabric is not so fine as might be expected, or indeed as appears in the dress goods where the warp is composed of silk. The white shawl, however, has a very delicate appearance in colour, and the extreme fineness of material is easily seen on examination. The dress goods will attract most attention from the lady visitors; but then it must be remembered that they are only partly composed of the Cachmere wool, the warp being of silk. The white dress is very elegant in its appearance, the pattern being of the wild strawberry, prettily put together to form a "trail." The larger pattern of the coloured dress is not so good, though the effect is broad, for it appears to have been elongated in the weaving. The dresses are the production of Messrs Gregory, and the shawls are manufactured by Messrs. Haley, who have also wrought up the "kemp" into the specimen of coarse woollen cloth placed in the centre of the display; and as this latter is produced from a material hitherto considered worthless, and by that means making use of the whole produce of the goat, these gentlemen are deserving of all praise for the manner in which they have seconded the efforts of the Prince in this matter, through the medium of Mr. Pollock, of Leeds, who interested himself largely in the experiment

How far the manufacture of Cachmere wool may prove of value in an economic point of view, remains to be seen; but the present experiment is not the less interesting because the ultra-utilitarian may consider it will not "pay." Under any circumstances, the greatest credit is due to the Prince for promoting the present attempt; and had it done nothing more than prove the earnest feelings entertained towards him by those engaged in the preliminary labour of assorting the wool, it would have been a source of gratification to every loyal subject.

EXHIBITION NOTES.—No. 1.

AMONG the more important considerations connected with the Exhibition are the disposal of the Crystal Palace itself—its retention in Hyde Park, or its transfer to another site—its possible modifications—its temporary character—or its establishment as a permanent Institution for various national and universal purposes.

Why should we not have a permanent home for the reception and display of the industrial products, the mechanical inventions, the new discoveries and improvements, and, in short, of all that could mark the advance of the country in civilisation, and the progress of mankind? At stated periods, say every fifth year, the whole world should again be invited to repeat the festival of 1851, and renew the pacific Jubilee. How marvellously instructive such periods of comparison would be, it is needless to anticipate: and young generations, as they sprang up, would have opportunities similar to those of their forefathers, for the acquisition of knowledge in the most delightful school, which held a concentration of the materials and sources of intelligence, otherwise scattered abroad over the whole face of the earth. To our minds every renewal of this scene would be attended with a great increase of usefulness and benefit. One swallow does not make a summer, nor a peaceful congress sufficient to harmonise and consolidate the good-will, generous sympathies, and liberal intercourse of nations. It is but the beginning of the end; and so auspiciously and gloriously commenced, it is our duty to employ every means to perpetuate the beginning and render the end worthy of the beginning

But, besides this one mighty object, we would turn our Crystal Palace to other and most valuable purposes.

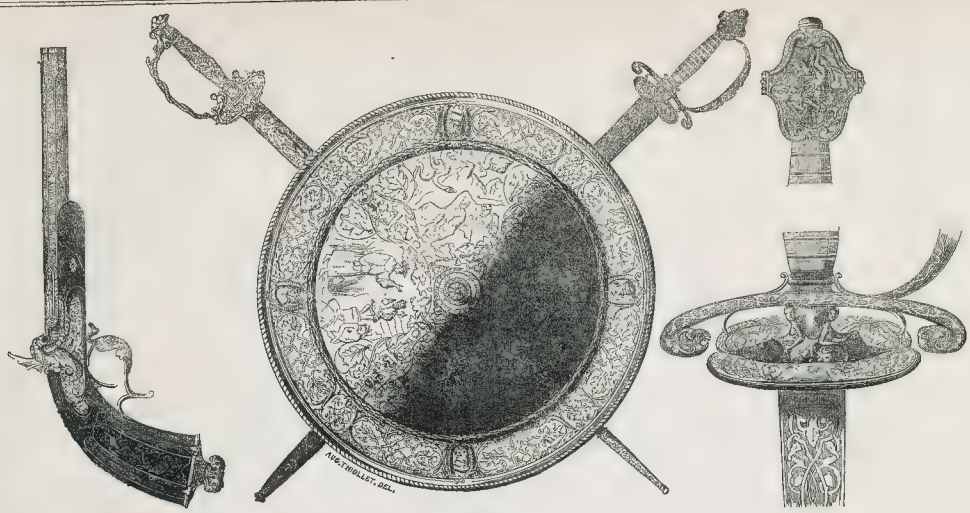
There should be a winter garden for the culture and exhibition of flowers and shrubs—not of the very delicate exotics so difficult to tend and rear, but of species sufficiently acclimatised to withstand our variable seasons. This branch would support itself, and furnish at the same time re-creation to the inhabitants of London, and supplies of a beautiful flora to the country.

A healthful promenade, sheltered during all weathers, and made fashionable by Royal and aristocratic patronage, would be another feature of welcome luxury and benefit Galleries should be constructed in suitable style for the exhibition of sculpture, paintings, and other works of art; and halls for multitudinous meetings of all kinds, including festivities, balls, &c. London has grown to above two millions of population, and requires to be accommodated on a far larger scale than heretofore.

Compartments, as in the present Crystal Palace, should be maintained for collections of machinery, and manufactures and products, such as are seen there, some of course being omitted, and yet amply compensated by the additions which we have advised, and which, under one roof, would be conspicuous, and admirably adapted to promote the enjoyment and welfare of our vast capital, the prosperity of England, and the happiness of the world. Every epoch would be a register or record of advancement, and a starting-point whence to proceed in the race of friendly competition for the glorious prize, who should do most to better the condition of their fellow-creatures throughout the habitable globe.

Gigantic as such a scheme would be, let it not be assumed, even in relation to commercial expenditure and return, that it would in price be an experiment too costly to warrant its being tried. The Crystal Palace will not only pay its expenses, but leave a very considerable fund to be applied to any congenial object. And these are not merely speculative and unsupported opinions; but the opinions of many who have devoted much attention to the subject; and as such, we trust we shall not be deemed unauthorized in repeating them for the serious consideration of "all whom it may concern" and who are possessed of influence in deciding so truly important a question.

Turning our attention to minor matters, we cannot omit to notice that there has been a departure from the rules laid down by the Commissioners, which, in a multitude of cases, vitiates the integrity of the Exhibition. These rules it might, perhaps, be impossible to have borne out; but we believe they might be better guarded, and the result would have been that we should not have witnessed so many false claims to inventions by parties who never invented anything; and so many pretensions to manufactures which have been executed by other people, and not by those whose names are attached to them. The Catalogue is crowded with such fallacies, alike injurious to real ingenuity and desert, and contributing to deck a wilderness of daws in peacock plumes. The amount of this evil is too copious for analysis; and the patience of Job and the wisdom of Solomon would not suffice to apply the test of the stocked



SHIELD AND ARMS.—BY M. LEPAGE.

Palace of Truth to the vast treasures heaped together in the Crystal Palace.

The combination of analogous objects is one of the chief puzzles and difficulties in the Exhibition. Take any one class for example—say jewellery, hair, artificial flowers, feathers, botanical produce, textile fabrics, or works in metals, and you find them dispersed through miles of space, and in compartments belonging to every division and country. You are thus confined, in a great degree, to localities, and unable, without much toil and travel, to arrive at generalities, and close comparison or contrast. In such a future institution as we have shadowed forth, there might be many novel arrangements by which articles of a similar kind from every part of the world could be disposed in juxta-position, and afford great facilities for the proper understanding of their relative and various merits; which, if united with a criterion of price, would be of infinite consequence to their due appreciation and choice. In a first essay, such a classification could not be effected, and it is only surprising how much has been done.

Two remarkable things, as regards the past origin and future utility of the Exhibition, demand grave consideration: first, the bringing together a collection of this prodigious mass of valuable properties; and, secondly, what effect their "exposition" is likely to produce in the world.

Upon the *first*, it may be stated that no nation or capital are in a condition to undertake such a design except England and London. The vast amount of value here entrusted to our safe keeping is the highest acknowledgment ever paid to the genius of national order and stability. Millions of money's worth are almost carelessly scattered throughout the interminable windings of a huge glass house, and no one fears a loss. From the Mountain of Light, which to most people, whose imaginations had been inspired by description, appears little more than a mole-hill of rock crystal, to the three calf-skins of Hanover, or yet smaller deer, there is no want of confidence in a country, be it remembered, without passports, alien acts, or secret government police. Where else, we would ask, could this reliance be reposed? We have great reason to be proud of the distinction: it is gratifying now, and bodes auspiciously for the future.

With regard to the effects likely to result from this congress, it branches into several speculative opinions of immense interest, to which justice could not be done in a passing newspaper essay. To what improvements in manufactures and mechanical works will it lead? How soon, or how late, or where will they be developed? How far will it spread better understood principles of taste? In what realms will it sow new seed of active rivalry and successful competition? Whom will it benefit, whom injure, and in what ways? At present the London shopocracy are idle, and without demand for their goods, especially of a refined and luxurious kind. What is to compensate them for a lost season, in which none but victuallers and retailers of the smaller order of necessities reap a harvest? Will the creation of foreign demand on the commerce of England arise to re-invigorate the system; or will English demand, on the contrary, be diverted from home to foreign produce? These are very serious questions—questions which only time can solve. Meanwhile, it seems to be demonstrable that the Exhibition of thousands of the richest and most beautiful articles which human ingenuity and lavish cost could form, must have a striking influence from the very top to the bottom of the classes of production to which they severally belong. We may look at a tissue which nobody could wear; at a carriage in which nobody would ride; at a fireplace which no servant could clean if it were ever guilty of a fire; at a chair in which nobody could sit; at a musical instrument not fit for one in fifty thousand to play; at endless inventions incapable of the duties imputed to them; but yet every one of these may be suggestive of useful improvement. The humblest of artisans (and there are multitudes of them gifted with extraordinary natural talent as well as practical experience) will be stimulated to more skilful exercise of their duties and craft; and it may be next year, or three, five, or more years hence, but we may depend upon it we shall witness the fruits of this causation ripen in a thousand different ways, and in many a quarter of the globe; let us hope, not the least in the empire and colonies of Great Britain!

MARTINUS SCRIBLERUS.

SWORD HANDLE.—BY DELACOUR.

SWORD HANDLE. DELACOUR.

The sword handle, richly ornamented bronze and or moulu, by M. Delacour, is a handsome specimen of decorative workmanship.

SHIELD AND ARMS.

M Monitier Lepage exhibits some remarkably fine armour and arms, ornamented in the richest manner with reliefs, done by the process of punching, known as *repoussé* workmanship, as well as by embossing, chasing, and engraving, of which we have engraved a few specimens.

GROUP OF GLASS. BY GREEN.

The samples of glass exhibited by Mr. Green display a good deal of variety and of improved taste, in the shapes and ornamentation of the vessels for the table. Many of them are beautifully engraved.

GLASS.—BY MR. GREEN, OF ST. JAMES'-STREET.

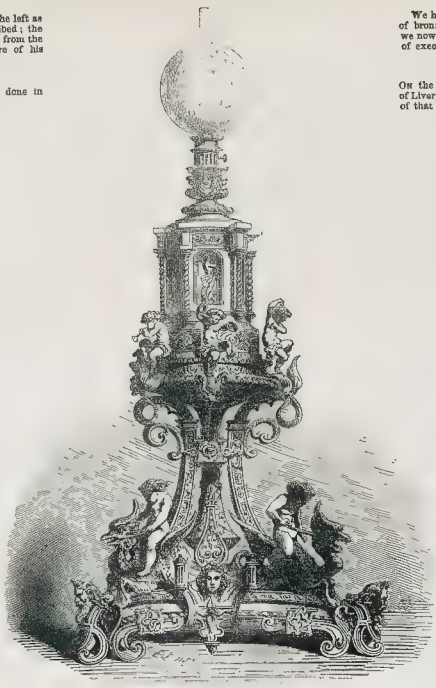
"THE WANDERER." BY J. H. FOLEY.

This pretty little subject stands in the Sculpture Room, on the left as you enter. The story, or rather the situation, is well described; the "Wanderer," wrapping his cloak about him to protect himself from the pitiless blast, turns an upward look to heaven, expressive of his miserable and forlorn position. It is nicely executed.

"EVE." BY J. BELL.

One of Mr. Bell's favourite productions, which has been done in electro-bronze by Elkington.

"THE WANDERER."—BY J. H. FOLEY.



LAMP IN GOLD AND SILVER. BY M. VITTOZ.

LAMP. VITTOZ.

We have already made honourable mention of the magnificent display of bronzes produced by M. Vittoz. The lamp in gold and silver, which we now engrave, is a composition of considerable beauty; and the finish of execution is perfect.

THE GREAT LIVERPOOL MODEL.

On the 3rd ultimo we gave the reasons for constructing the great Model of Liverpool, executed under the direction of Mr. Grantham, civil engineer, of that town. We may now add a few interesting particulars with regard

"EVE" (JOHN BELL), IN ELECTRO BRONZE. BY MESSRS. ELKINGTON.

to the objects represented in the model. Only about one-third of the houses and one-third of the river Mersey are included; and a large extent of the property under the Dock Trustees, lying to the north of the district represented, is not yet formed. The sea-wall is in progress, and the whole, with the unfinished part, as shewn in the model, will be prepared for new docks when required.

Preparations are now being made for the formation of two docks in the middle of the whole range, which, when completed, will effect a thorough communication from one end of the docks to the other.

It will astonish our readers to know, that when the works now in progress shall be completed, the large sum of *eleven millions* sterling will have been expended in carrying out the finest and most complete docks in the world: nearly half of this enormous amount has been paid out of profits, the remainder being a charge on the estate.

It is much to be regretted that the numerous figures of men and women, which were prepared to have been dotted about in the various streets, and which would have given a life-like appearance to the model, have been omitted. This was owing to the unfinished state of that part of the roof of the Crystal Palace immediately above the site marked out for the model, which could not be fixed in its appointed place in time to get the whole completed as designed, ready for the opening of the Exhibition on the 1st of May.

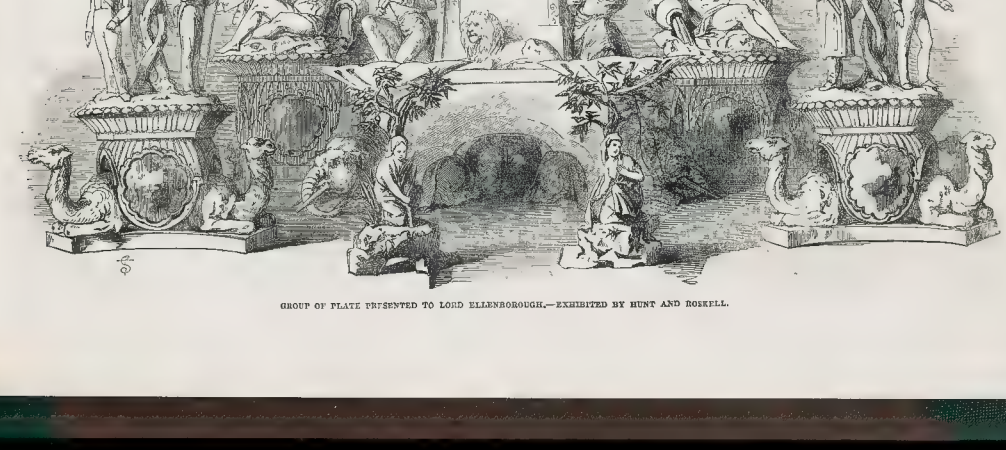
THE ELLENBOROUGH PLATE. HUNT AND ROSKELL.

Amongst the magnificent works in silver exhibited by the house of Hunt and Roskell, the service of plate (or portions of one) presented to the Earl of Ellenborough, by his Lordship's friends in India, occupies a prominent position, and will command attention, on account not only of the beauty of the compositions themselves, but the historical events which they commemorate. The principal object is an ornament for the centre of the table, of massive monumental character, surmounted by two figures, typifying Asia crowning Britannia. The *bas-reliefs* present four subjects—the ratification of the treaty of Nankin, and views of Calcutta, Cabul, and Canton. On the base are figures of Affghan and Chinese captives, and of a British sepoy. The architecture is of Indian character, embellished with palms, and supported by recumbent elephants.

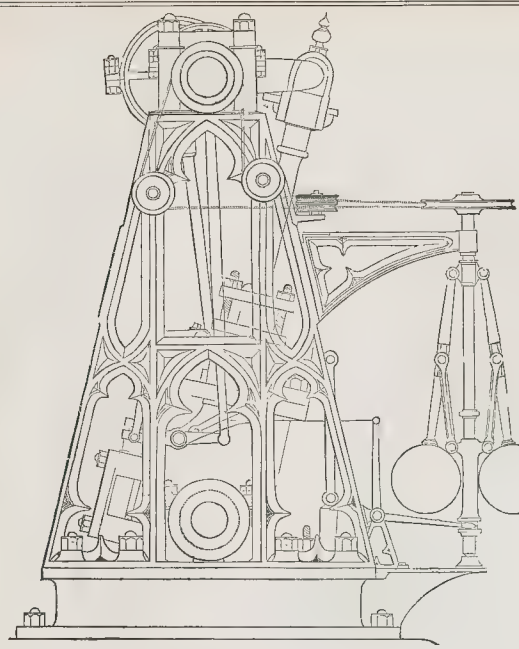
DODDS' PORTABLE FOUR-HORSE ENGINE.

THE great object of all manufacturers of steam-engines of the present day is to reduce the parts to as small a number as possible, to make those parts as simple as possible, and so to place them that they may be readily got at for repairs when necessary. Messrs. Dodds and Son, of Rotherham, have, we think, accomplished such object in the "Four-horse Portable Engine," which they exhibit in Class 6 of the Great Exhibition

The boiler, which is of a cylindrical form, extends from end to end o the engine, and the strengthening stays which are required in the cas



GROUP OF PLATE PRESENTED TO LORD ELLENBOROUGH.—EXHIBITED BY HUNT AND ROSKELL.



POPE'S OSCILLATING ENGINE.

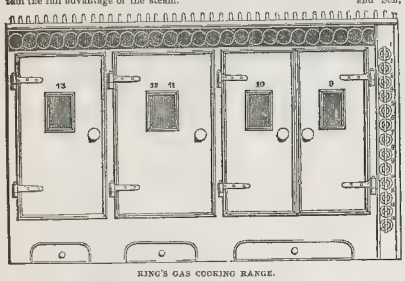
of the square fire-box are dispensed with, notwithstanding which an additional area of 16 superficial feet is obtained.

This engine works expansively and is direct in its action; the valve-rod is worked by a return crank; and all the steam-pipes being enclosed within the boiler, surface condensation is prevented, except as regards the cylinder and boiler, both of which, however, may be clothed to obtain the full advantage of the steam.

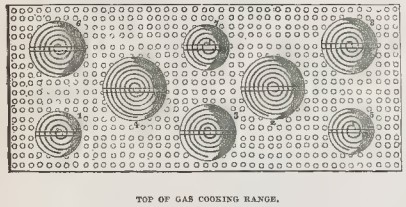
POPE'S OSCILLATING ENGINE.

Oscillating engines are visible in all parts of the "Machinery in Motion" division of the Great Exhibition, the power of each being fully tested by a certain amount of daily work required to be done for other exhibitors.

One of the lightest and most elegant is that by Messrs. Pope and Son, which is situate very near to Appold's pump, and Crawhall's vertical rope-making machine—two very conspicuous objects. While many of the steam-engines at work in the same division are attended with a ceaseless noise, that under consideration is entirely noiseless. The whole machine stands on an iron footplate 27½ inches long by 25½ inches wide, embedded into a pedestal of stone 9 inches thick. The diameter of the cylinder is 6½ inches, and the length of stroke 14 inches, the fly-wheel being 78 inches in diameter. The engine makes 70 revolutions per minute. The several parts, including the feed-pump, throttle-valve, and governor, are all contained within a neat Gothic frame; and the power of the engine is calculated at four horses.



KING'S GAS COOKING RANGE.



TOP OF GAS COOKING RANGE.

KING'S GAS COOKING RANGE

Mr. Strode exhibits a gas cooking range, in the side aisle south of the western part of the Nave, which is constructed on a plan peculiar to the town of Liverpool. It was designed by Mr King, chief engineer of the gas-works of that town. It is divided into three compartments of different sizes for roasting and baking, being furnished with a damper to regulate the flow of air through them. The burner is arranged inside the oven, at bottom, around the sides, back, and front, with a dripping-pan occupying the centre. The meat is hooked on to a sliding frame or carriage, which, when pushed in, allows it to be suspended surrounded by the gas. On the top of the range are eight spiral burners, in round well-holes, for boiling, stewing, frying, &c., any of which operations can be done with the same facility as on a hot plate or over a charcoal fire. The meat roasted by this range, owing to the regularity and certainty of the operation, is of a more nutritive character than that cooked by the ordinary process, as more of the juices of the meat are retained, which is ascertained by the comparatively small loss of weight after cooking. By the operation of broiling, twelve chops can be cooked at once, at a cost of not more than *twopence* per hour for gas, which gives at the rate of sixty chops at an outlay of only twopence for gas. Comfort and cleanliness to the cook, and economy to the consumer, are among the qualifications of this useful invention. The gas is lighted with a gas-torch, or portable jet of iron pipe, attached to a flexible pipe.

LETTERS FROM LONDON
ON
THE GREAT EXHIBITION AND OTHER MATTERS,
BY PELEG E. WHEELER,
WITH AN INTRODUCTION—BY BAYLE BERNARD.

LETTER III.—TO MR. ENOCH PEABODY, SAW-MILLS, PENOBSCOT.

ENGLAND—THE PARTING AND THE VOYAGE.—THE OLD WORLD AND THE NEW. THE MAJOR'S SPECULATIONS ON NATURE AND HUMANITY.

DEAR UNCLE ENOCH,—

HURRAH for the old country! Here I'm on it, sure as snakes, safe and sound on the old shore—a sorter babe, to speak poetical, that's crawl'd back to the maternal bosom—or not crawl'd exactly, jump'd—fifteen days, from land to land. Well, aint that brig of ourn a beauty! Put a screw into her keel, and wouldn't she worry out a hurrykin. So I warn't so very wrong, you see, in not coming by Cunard. There'd been a saving of four days, and jess a loss of forty dollars. However, here I am, Uncle; and, what's more, I'm here in Plymouth—the old haven of the Pilgrims—the harbour they set sail from 'bove two hundred year ago. Well, aint Time a sorter conjuror! Two centries since and better a handful of suffering English are driven out by their Christian brethren to find a home in the wild woods—to turn the beasts out of their tenements, and pacify the savages; and now their sons are coming back to show their gratitude to England, by helping to pacify the savages she may happen to have at home! Now, aint that behaving prettily? I want to know if that aint suthin' to make the good old krittur proud on us. Aint it the Pilgrim touch repeated—a new edition of the work, adapted to modern notions, with no cend of Yankee notes, and a hull freight of illustrations?

Well, and how about my voyage? S'pose you heerd all about my starting? What a dust it riz about us, and what a jam it gin the Focus; notwithstandin' that all the winter, folks had come crowding round our doors like buffaloes at a salt-lick. The human mind, they say, has got an aggregating tendency, and I guess here was a proof on it. But my last day was the dandy. Then come the show of cattle: such a drove for size and sersyness, you'd find it hard to cap, I tell you. Such an eternal raft of fellers as come pelting to my bar, if it warn't a sight—no matter! And yet that warn't the wonder nuther; the peck was ful, but it got a topping. They didn't only come, they stuck there; every one on 'em held on as though they'd run to a breaking bank, or to git clear of a whirlwind! I was to sail, you see, at daybreak, and as they considered me their deligit, the man that was to represent them at the Congress of all Nations, they thought it a pint of dooty to stick to me all night, and see my brains were clear at starting; to lay my instructions in afresh, so that they'd keep well through the voyage. Now you see this was a notion that necessitated juleps. These were thinking chaps, the hull on 'em; for any kind of brain-work, fitted up with good machinery. So it warn't likely their ideas would turn out of the same pattern; if their textars were all one, that they'd be alike in shape and colour. And yet, differ as they might, as they got to pack away together, to squeeze and fit into a system, how the dogs was it to be managed? Well, of course, there was but one way, and that was by screw preshur; and screw preshur, you know, Uncle, is the first force of mechanics. There's the water screw, for instance, if you're going to pack a cotton ship; and there's the rum-and-water screw, if you're going to jam up men's opinions, and I guess the last is jist as strong, and about a hundred times as pleasant.

But there was a couple all this time there was no screwing—try your darndest. There was Kezy and Abiram. You know Kezy never voted for this voyage of mine to England: allers sot her head agin it, as fierce as a heifer at red flannel; but seeing 'twarn't no use, and I could be as ugly as herself, the poor soul took to sulking, and as the sailing time came on, she rarly began to look as if she was waiting for the sheriff. And the boy was jist as bad. He dittoed her in full. You never seed sich a pair of spectacles since the hour you were raised. They were as dark as Dr. Cox's, and jist as powerful magnifiers. Well, they wouldn't go to bed, nor e'en lie down on the sofy; but Kezy clapp'd herself into the old chair in the back parlor, with her teeth clench'd, and her eyes fix'd, and her face as white and holler as a large-sized chiny basin, and begun rocking away ful split at the rate of tweuty mile an hour—rocking away, poor soul, as if her wits had bolted, and she was riding after 'em. If she didn't look for all the world like a corpse that was taking exercise. Whilst Abiram sot right agin her, with his elbows on his knees, and his cheeks tuck'd into his fists, and every now and then, was he getting up and going out to have a boohoo in the shed. Well, I aint the moistest man, Uncle my clay is rather tropical—considerable baked; but I guess this was a sight to take the stiffning out of granit. The moment that I seed 'em, I felt about as streak'd as if I'd read a lot of epitaphs, or some of my first love-letters when I shinn'd up to Mirr.am Gookin. All power's got a limit, and I felt I'd got to mine, and if this sorter game went on, it was gone goose with my departure. I should boohoo out myself, and give up the undertakin'. So you see the case was kritical. There was my dooty on one hand, all the great interests of society, my credit, and, what's more, the reputation of Penobscot; and there was Kezy on tother, and that little imp Abiram yelling out among the nine pins as if he'd split his cheeks. There was a plank across my heart, and patriot and husband were see-sawing at its ends, up and down alternately; so I seed I must do suthin' to restore my self-possession—some strong act of decision to invigorate my will, and in this kritical conjuncture, I'll jess tell you what I did.

I went up to our bed-room, and pulling out from a top drawer, Kezy's bran noo summer muslins—four of the slickest little notions you ever clapped your eyes on—one a blue spot, one a yaller, and all as big as sarsers, and I made no more to do, but shoved the candle right among 'em, and when they were well alight I begun to sing out "Fire!" Well, that's a word with us that's gin rally electrical. A woman will hear that, when she'll want her lover to speak louder; and I guess Kezy's ears jist then were as open as her optics. She made but one clip up the stairs, taking ten on 'em at once, and when she seed what I had done, though I swore 'twas all an axydent, I want to know if 'twarn't the plug out? if it didn't open the kennel door, and say "Here's suthin' that's larnt barkin?' She'd been restin' her tongue all night, and now didn't it git exercise: she pitch'd at me the dixshunary in first-rate style, I tell you; she called me all the nasty ugly worrits she could think on, all the hateful plagues and torments that ever cuss'd a woman, wished I was gone with all her heart, and wouldn't cry her eyes to jelly if she never seed me back again. So, seeing that pint settled, I went down into the shed, and takin up the cow-skin, I jist called to my Abiram, and told him I wanted to give him a last mark of my affection, and I guess my second sattler was as sartin as the first. So I was able arter all, you see, to go abroad with perfect comfort, and should have been conveyed to the wharf by the entire buling of my friends, but that the discussion had overpowered 'em, and I left them stretched about the bar for Kezy to revive at breakfast time, which she could allers do first-rate, for such a style as her'n at a bucket—I guess you never witnessed!

And now, how about the voyage, my first across the ocean—and whoever that may happen to, I hold that that's an ery. I dont keer as to the weather, it may be grandest in a gale, to be runnin over mountains and see sky and water mix, as though the globe was becoming bankrupt, churning up into a new chaos, in order to form a new creation. But s'pose its just as quiet that you aint climbing over summits, but only sliding over medders, or, what's nearer the notion, prairies, in their bare and lifeless solitoods; when for weeks, perhaps for months, you see nothing stretching round you but the solemn waste of ocean, flowing off to the heaven's rim, as though 'twas the edge of a great cataract, over which it sheeted down upon some broken world below. Or look up and see above you those fixed and constant heavens, which never move, whatever fury may be going on beneath, till at last you begin to think it is the calm face of eternity looking down on that of time; and what on airth will you find to match it? I want to know if it aint a new world to you, that no dreaming was e'er a door to? Talk about sea voyages as sich good things for the health, it ruther strikes me, in addition, they aint the worst things for the mind!

It's a sight, and that's a fact; but for all that it's got a use—'taint only made for wonder. The rockiest hill will breed a bird, and so the ocean must have a porpus, tho' our thoughts are a sorter flying fish that will neither stop in nor out on it. And yet what is it it says to us? Why what we've allers said ourselves, Uncle, when we've sot pondering and exploring that old map of the world of yourn, that fits in so nicely betwixt the window and the book-case in the parlor at the saw-mills; with its two hemyspheres criss-cross'd with lines of latitude and longitude, that look for all the world like a couple of big sieves, which the airth had got chuck'd into, but was too solid to sift thro' (and it's a sample altogether, with its ships scuddin' along, starn uppermost, like hens in a high wind, and its boys riding upon dolphins, big as the state of Massychussetts, to say nuthin' of its emblems of the four quarters of the globe, and Britanny and her trident, and the old lion, looking as usual as if he'd swallow'd all her enemies); I say it does say suthin', uncle, and that's this: "Here rolls a mystery!" And how often have we dittoed it, and wondered how it was, seeing that the world was made for man, and man lives upon the airth, that the airth should nevertheless consist of three parts of water. That's been our hitch, the knot there was no fixin'. All that heap of water—what the stars can it be wanted for? We can't kiver it with ships, and we can't turn ships into cities. We can't build on it, and live on it, as some of the Chinese do. We can't drain it, and we can't drink it, and we can't distill it at a profit. We git our salt cheaper from mines, and no send to the abundance; and we can't say it was intended to supply the world with food, that man was meant to live on fish, and not on grain or animals; for we know that all his sustenance came into Noah's Ark—and of course there was no fish there, they were all outside! All we can see it sarves for is, to keep the world apart, or give 'em reasons for not meeting, to breed hurrykins and quicksands, and bury men and treasures in. Aint it a mystery altogether, as deep as its own ocean?

And yet, I reckon 'taint the only one. Mysteries are a family there's no numbering or sizing. There's geology, for instance, turns 'em up as quick as pebbles, works as well, and knows as much as a pickaxe at a pyramid. Take its fire and water systems, and jess tell me what is their total? One making the globe a copper, and the airth a blazing furnace, with only a tiny crust of matter twixt its fire and the sea, (which of course is jess to say that the biler will go on heating till it turns the world into a stoo, unless we can put the fire out—turn the ocean in upon it, and I s'pose down Mount Vesouvus, as that's the copper funnel); whilst tuther, the water system, makes the globe a sort of mash tub with all creation in a soak, and land and animals coming out on it like turtles on the Bahamas, and as man's among the animals, of course he comes from water too; so I s'pose he was once a mermaid, and if you ask

about his legs, perhaps, as the kritters crawl'd ashore, they split their tails upon the rocks, and so in course of time the two halves took to walking! Now aint that an exalting theory? aint that clearing away a mystery? aint that throwing up a winder, and blowing it off like smoke.

Now facts are another matter—facts are a sutkin' positive—a sorter domestic animals, that we can turn to use and profit. However strange and shy at startin, we're sure to harness 'em at last. Now here's one that can't hold me on as we were coming over. I know you'll scarse believe it. You'll vow it's outside of natur; and as to folks in Europe, they'll just swear it's our invention, one of our old pedlar notions—about as genooin as horn gun-flints, or a string of red flannel sassages. And yet facts aint exactly nine-pins, to be bowled over at a round wurds. Facts have got good ankles, and here's one that stands as fast as a bull agin a gateway, or a lightus on a rock. You know it's a law of natur that every thing's in motion, and consequently that everything is allers changing places. Well, the best proof on it is the sea. The sea is changing place, Uncle, shifting sutkin' every day, as tho' it had got tired of its old bed, and wanted it shook up agin. The cap'n knows it for a fact, that coasts have rix in one place and gone out of sight in tother; how shores have shrunk to islands, and islands grown to shores; and of course the cap'n knows—a whaler and a Cheap-man, who knows the face of natur as well as his own mother's, and thinks about as little of going round the globe as a fly in our school-room. But I've got to cap the story yet. I aint shook out half the reef on't. What do you think he says to boot: that the coast that's rising now, actooly rising at this moment on the bottom of the deep, is that of our own country, yes, actooly Amerikey. The last survey of Newfoundland shew'd the seaboard was getting up from Cape Ray to Bony Visty; and the cap'n swears it's the fact all the way down to the Gulf, and round Cape Horn, and home again. So you cynykur out that fact, jess sum it up for a moment. What's its total. Aint it this, that our country is risin' generally, in land as well as people, in mind not more than matter, that mentally and physically she exhibits at this moment a most trumphant instance of harmony and progress.

And much for the theory; and now, how about the land? What do I think of the old country? that's what you want to ask me. What's the size of my first impressions since the day or two I've been here? Well, it aint so hard to tell you, for I guess its nuthin' noo. What is it we've allurs heerd both from folks and from travellers. Why, that England's just a garden, and I reckon that's the fact; that word's a bit of essence—there's the whole truth in a drop. It's a garden—which allers means a sutkin' small, well kept, and beautiful. One of our Eastern fellers told me t'other day like Natur with her hair comb'd: and the fact exactly: it's Natur lovely and well dress'd; Natur tidy as well as beautiful, with nothin' wild and loose about her, but all in order and right trim like one of our Eastern gals in her go-to-meet'n bonnet; You've no notion of its look, Uncle—its bright fields, its bushy woods, and white crystal streaks of water—but more especially its greenth, such as you never clapp'd your eyes on, and I really wish you could, for 'twould strengthen 'em much more than those green spectacles you wear. Aunt Huldah is always making you a herb ointment for the eyes, and here you have it natrally—and, what's more, the hull year round. But there's two sides to a pictur—good and evil's allers balanced, and effects must have a cause; and the cause of this, Uncle, is the climate, which is about the wettest in creation. It rains here all the year, more or less, as I've been told, and it don't come down in our style—in good, straight-forard torrents, an honest thoughtful sort of raining, that having seen the fitness, resolves to go the entire tub; but a poor hesitating drizzle, a weak unsartain sort of drip, as tho' the climate was hysterical, hadn't strength to go in for a good thunk. That's its scurce of beauty, the sky is allers crying, and that keeps its cheeks in bloom; but still for all this moistur, it don't seem at all unhealthy. People live as long as we do; and, what's more, they seem as strong. So its of no use for English system to what they call a good shaking, for it don't agree with the climate, as with us, the west is the agricultural quarter, and the north is the manufacturing; and a thunderin' deal it needs it, you is a different sort of kritter in the old world and the new. Here he's not a tenant, jist a servant of the landlord, who hires him to do his tillage, and pays him with the surplus that happens to run over the rent. He has to heap his master's pock, and live upon the overflow. Now, with us it's the title of the land to be in his keepin, and to support the man that cultivates, and can turn into his own bin, heap and overflow and all; and I guess that makes a difference both in his pocket and his looks. And that don't fence the whole. Here in England he's a sort of patriarch. He's got to keep a whole neighbourhood only not all the hull of the sogers and the sailors, and the fellers who've got places, and the hull possy of the poor. And that don't top it nuther: whilst with us it's thought enough if a man tackles his own debts, here that's only half; he must square up for other people's—he must pay the cost of wars that were made a hundred years ago, 'bout which he was never ask'd, and from which he gits no benefit; all the good on 'em being squeezed out by the folks that sot 'em going, and all the evil shoved off upon the shoulders of posterity. Now, aint that rather cruel—aint it, more than than that, unlawful? Aint it agin' the British constitution, taxin' without representin'? Aint it wicked, that, in addition to rent and food and clothing, a man should be charged for glory, such a luxury as that —when, perhaps, he's in want of bread, to make him pay for others pine-apples?

So, standing among the farmers, you won't wonder, I 'spose, at my first impressions of the old country—that it's altogether slow and backard—has a used-up sort of look, a break-down kind of hankster, like an overcasked horse, or an overstrain'd free-liver's, that don't think of going forards, but ruther seems considering whether he'll be able to keep his legs—whether, if he makes a move at all, he won't go whop down altogether. Well, but I guess, you'll say, aint there plenty of force to ease him of his worrit, and give him a spell of rest, and strengthen him—and so, arter a time, get him to jine the ginral progress? Aint their British manyfactors which yearly increase the revenue, and, whilst sharing the ginral burthens, contribute to reduce them? Aint there the Exhibition, which is the post proud to the country not only a congress of all nations, but an influx of all monies, which is to put in circulation a double kind of spesby—human and metallic? What do the farmers say to that? Don't they see no help in that quarter? In sich time 'twill open, for it's now the dull season, and the gate will be up, and the stream will be flowing in; and don't they mean to say it will turn out a proper fertilizer—as good an inundation as ever was heerd on of the Nile? What's their feeling, I want to know; and that of the people ginrally? Well, as I've got to my paper's end, I'll tell you that by the next ship.—Your dootiful and affectionate

PELEG E. WHEELER.

CHAUCER AND THE EXHIBITION.—Chaucer, it would seem, possessed a prophetic faculty in his prefiguration of this Palace of Glass. The passages we quote occur in the "House of Fame," in the introduction of which he describes in a dream the edifice that emanates upon the causes of dreams, affirming his inability to decide whether

Spirits have the might
To make folks dream o' night;
Or if the soul of proper kind
Be so perfect as men find.
That is wote what is to come.

* * * * *

"As I slept," he goes on to say—

I dreamt I was
Within a *temple made of glass*,
In which there were more images
Of *gold* standing in sundry stages,
In more rich tabernacles
And with *jewels* more pinnacles,
And more curious *portraitures*,
And quaint manner of figures
Of gold work than I saw ever.

* * * * *

Then saw I stand on either side
Straight down to the doors wide
Fewer or *dale* than a pilgrim
Of metal that shone out full clear."

* * * * *

Then gan I look about and see
That there came entering in the hall
A right great company withal,
And that of sundry regnons
Of all kinds of conditions
That dwell in earth beneath the moon,
Poor and rich.

* * * * *

Such a great congregation
Of folks as I saw rouna about,
Some within and some without,
Was never seen nor shall be no more!

So palpable a coincidence is, to say the least of it, very curious.—*Liverpool Mercury.*

TO CORRESPONDENTS.

PIERCE PIPE PUBLMAIN ROSE.—Mr. Pierce has sent to us a very long communication upon the principles of which we have much pleasure in giving an abstract. As our remarks were upon the whole principle, we hardly feel disposed to open the question for discussion by one manufacturer. As far as he particularly complains of the prohibitory duties, it is entitled to high consideration, and we distinctly stated that it might in many cases be most usefully employed, moreover, there is no question as to the value of this class of stove in one of the best form which can be used. We think it right to repeat, and strongly enforce, that it is our decided opinion that there is no more unhealthy mode of warming rooms in a climate comparable to the ordinary forms of open fire-grates; but we stated that the preference of the Americans have a different opinion, and therefore every person must take a decision of his own medical attendant as to their relative sanatory importance. Mr. Pierce evidently does not quite understand the principle of ventilation, which requires the qualities of the air from its being heated. He states that he loses no moisture in his stove, but that he simply raises its temperature to 75 or 85 degrees. Now, when scientific and medical men treat of the process of the air, they speak of the difference between the temperatures and dew points; and that a saturated atmosphere at one temperature becomes a very drying air at a higher degree of heat. For this reason gardeners always add water to the air whenever they raise the temperature, and the difference between it and the dew point becomes much increased. In the same way, whenever a current of warm air is let into a sitting apartment, its hygrometric condition should also be a subject of attention. The matter, however, is very difficult of satisfactory regulation, and for this reason we do not like any form of stove of this principle for ordinary rooms. In some cases those observations do not apply, as for a large lecture theatre in which the air is not, and in such cases our readers may safely employ Pierce's Pyro-Pneumatic stove. It is the general principle to which we called attention, and we think these observations we must close the subject

INQUIRER.—The Deputy-Lieutenants are chosen from the principal landholders of each county, and their list differs little from that of the Commissioners of Income-tax.

A SUBSCRIBER.—A magistrate for a county, whether of the quorum or not, must (with some exceptions, as long as he acts as such, be possessed of a freehold estate of the clear yearly value of £100, or to one in immediate succession of the clear yearly value of £300 (5 Anne, c. 18; 9 Geo. 2, c. 26). Corporate corporate Act, s. 101, the property qualification for [illegible] from Jacob's Diets, p. 1. I am not aware the bearer of a [illegible] at the same.

SUCKERSHAW JOHNSON.—Your letter is perfect and [illegible] are the same as the collectors of the other assessments. We do not advise that it is absolute have more than one collector for each township.

A SUBSCRIBER.—A residence of fifteen days (prior to the granting of the license) in the parish or chapelry where the marriage by ordinary license is to take place is incumbent on one, but not on both the parties marrying. Any surrogate residing may be asked to license the marriage.

H. E.—The marriage must take place within three months after the full publication of banns, and it must be celebrated in one of the churches where the banns were published.

F. W.—Sir, a reckoning is only incumbent on the master of the party who is giving, not on both. The marriage takes place in the parish or locality where the residence is

P. J. Where family of Johnson?

X. Q.—We can find no arms to the name of Cupp

PUBLICS.—An illegitimate child cannot be a member, unless by grant from the Earl Marshal

PRUDENS QUÆRENS.—The expense of a grant of arms from the Heralds' College is about £75. Napoleon I., the Duke de Richemont, died Count Survilliers, in 1826, in the Palace de Schönbrunn, attended by his mother, who came from Parma to visit him. The representative in blood of the Royal House of Stuart is the Crown Prince of Sardinia.

E. F. R.—There is no Scotch Baronet Monteith. The present Sir James Stuart Menteath, Bart., of Closeburn, Dumfriesshire is a Baronet of the United Kingdom. His father, the late Sir Charles, was created a Baronet in 1838

R. W.—Miss Catherine Hayes is not compelled as either of the Italian Opera Houses this season, as she departs for America the first week of August

T. S. A.—There are many accounts of Irish and Irish airs, which may be found at any of the great publishing houses in London

VIATOR.—By Review, our correspondent no doubt means the "Treasurer of a County Court." Such Treasurer need not be a lawyer: he is appointed by the Commissioners of the Peace.

ANXIOUS INQUIRER.—1. Navetay, Coo dadle, Moore an sune. 2. Arg. means *argent*, or silver; *gu.*, *gules*, or red; *sa.* sable, or black; *az.*, azure, or blue; *vt.*, vert, or green; or *gold*. The rest, named by the French colours, from cimar the top or apex, is the heraldic device borne on the helmet: the arms are the emblems carried on the shield. The arms of Rome are "An eagle displayed on a fasces." Gu. a mantle az. lined erm, in front thereof a sword, all ppr.

SUBSCRIBER FROM THE COMMENCEMENT.—The Duke of Wellington is Colonel of the Grenadier Guards, and Colonel-in-Chief of the Rifle Brigade. The Duke of Richmond was formerly in the army, and served in Portugal, Spain, and the Netherlands, as aide-de-camp to the Duke of Wellington

ELLA.—We cannot find no arms or crest registered to the name of Deeming. A daughter, having no paternal coat of arms, is not allowed to use those of her maternal grandmother

BATH.—Lord Gonbermere resides at 46, Berkeley-square. All at Hare's Gazette, Whitehall

ARMORIAL.—The usage [of any heraldic device or plate would render the party liable to the tax.

VATA. The usage of the crest in the way mentioned is clearly taxable

A. F. W.—The arms of Woodcock, of New Timber, county Sussex:—"Az. a fesse erm between three leopards' faces passant or. *Crest*: Out of a ducal coronet ppr. a demi-bear-cock disp. and arg."

Zenyna.—A son is entitled to quarter with his paternal arms those of his mother, if that she be dead, and was an heiress or co-heiress, not otherwise. The husband of a lady who was a widow inquires her maiden arms with his own

H. G. F. B. F. is entitled to one crest only out of his paternal ancestors. His mother having been a co-heiress, he has a right to quarter the Evans arms. Miss Kempster, who married Francis Evans, was not an heiress. Her brother Thomas Kempster was heir to Miss Plumptre, Esq. M. P for Nottingham, grandfather of the present member for East Kent, left, besides Mrs Evans, two sons, who have both died unmarried.

J. D. Liverpool.—The eldest son of an Earl is styled Lord by *courtesy*. Lord Stanley, eldest son of the Earl of Derby, has been summoned to the Parliament as Baron Stanley, of Bickerstaffe, and is, consequently, a Peer in his own right

X. Y. Z.—he lacy takes no precedence

M. P. S. Crest of Wainwright: "A lion rampt. arg., holding an ancient battle-axe, handle or, on the head."

P. J.—he Duc de Bourbon, who succeeded Philip Duke of Orleans in the Regency of France, was representative of the House of Condé, founded by Louis, Prince of Condé, brother of Henry IV., King of France. He was ancestor of the ill-fated Duc d'Enghien. The family is extinct.

CONSTANT READER.—Apply by letter to the Provost of Trinity College, Dublin

J. O. J. Lessington, is desirous of ascertaining particulars of an Edward Flintsephens, formerly in the 33rd Regiment, and now, it is supposed, in India

HONEY.—We can trace no arms to the name

N. W. L.—The additional surname may be properly and legally assumed by the mere adoption

N. B.—Henry Rose Drummond, Esq., of Stanmore, county of Perth, M. P., married, in 1813, Christian, daughter of Charles Moray Stirling, Esq., of Cambusbarron, in the county of Stirling, and has two sons, George and Charles, and one daughter, Anne, Duchess of Athol

E. L. L.—The faces of the holy Virgin and child, in the arms of the see of Salisbury and Lincoln, are "or." The face of Our Saviour in the arms of Canterbury is "arg." At Oxford the ladies' faces are "arg."

DELTA.—The second insertion of the Bernard arms was the correct one. We do not know the motto

ETA.—Simply "Lady Gomm"

SUBSCRIBER.—Mrs Mivehouse, 50, Upper Seymour-street

J. P. Apply at the Prerogative Office, Doctors' Commons

ARTHUR.—Advertising in the daily papers is a dangerous mode, and we fear that few places would be successful

T. B.—Arms of Hulse: "Quarterly 1st and 4th arg. on a chief gu., three griffins' heads erased or. 2d and 3d az., a crescent for difference between the arms of Hulse and the crew's head arg. *Motto*: Virtute acquiritur honos."

LAVINIA.—The Earl of Stamford, Enville Hall, near Stourbridge, and at Dunham Massey, near Warrington. Brudgate still belongs to his Lordship

ALBERT A. Gelera, of Edinburgh, bears on "Crest: An arg. in a fesse gu. between three square padlocks az. annules or. *Crest*: An anchor in pale ppr. *Motto*: Candida et cauta."

STAINED AND PAINTED GLASS.

ALTHOUGH the art of staining glass is lost amid the shades of antiquity, its adaptation to pictorial purposes is comparatively recent. Doubtless the mosaics of the Egyptians and Romans originally suggested the idea of transparent glass pictures; for, indeed, the earliest attempts were entirely composed of small pieces of glass of various colours, united by thin strips of lead, as may still be seen in old churches and cathedrals. The first records of pictorial glass work extant date from about the year 800, in the days of Pope Leo III., when so many magnificent ecclesiastical edifices were commenced throughout Europe.

Venice was chiefly famous for the manufacture of stained glass, the use of which was brought to high perfection with the pointed style of architecture in England. Fine specimens of the art may be seen in York Minster, the collegiate halls and chapels, and especially in the chapel of King's College, Cambridge. It is evident that the art of painting on glass may be divided into two perfectly distinct operations; firstly, the artistic design with reference to the capacities of the materials; secondly, the mechanical or rather chemical preparation and application of the materials themselves. Of these the former alone belongs to painting, in which vegetable as well as mineral colours are freely used, glass requires the exclusive use of mineral colours. The oxides of metals, such as gold, silver, cobalt, &c., are chiefly employed. These colours are, as it were, burnt into the glass, the process of staining the whole substance, and are quite transparent; others mix with a substance called flux, and *vitrify* on the surface. These last are more or less opaque or semi-opaque, according to the manner in which they are applied.

Now, the ancients being more moderate in their demands in such a means, were more primitive and, perhaps, more successful in their effects, whilst the moderns have certainly progressed in an artistic point of view, but at the expense of the transparency, which is the great charm of their ancestors. As a general rule, the modern paintings on glass are too much paintings in the strict sense of the word, too opaque in their shadows, and, in fact, too much shaded altogether. Whereas, painting on glass, to be really effective, should be almost entirely outline and colour, and as free from non-transparent, that is, *black*, shading as possible; for it must be remembered that all non-transparent colour becomes neutral tint when opposed to light in a window, and that the depth of the tint is mainly regulated by its transparency, rendering a somewhat muddy character of the majority of modern paintings on glass. Where, however, the nature of the material is sacrificed to real excellence in the design, we are inclined to think it deserves praise; but, unfortunately, either most manufacturers of stained glass grudge the expense of employing competent artists to draw for them, or artists of merit consider it beneath their dignity, or, lastly, the patrons of the art themselves regard it in too mean a light, and do not offer an adequate remuneration for the production of such painting on glass in their churches, &c. as we should desire to see, and, seeing, to admire.

Yet there are plenty of young artists who would be glad to make coloured designs for glass windows for a very moderate remuneration, and who are perfectly capable of good composition, correct drawing, and judgment in the arrangement and distribution of the colours. Upon those more especially, who, from the spur given to the art by the present Exhibition, may speedily be called on to fulfil the above requirements, we would impress the following suggestions, which we venture, with all humility, to advance for the guidance of adventurers into a new domain of pictorial creation. In the first place, it must be borne in mind that a stained glass window is not a mere painting, but a means of admitting light, modified and tempered, it is true, but still light, into the building to which it pertains. Hence an additional reason for the all-importance of transparency in glass window-pictures. Secondly, it must be remembered that these pictures are generally seen at a considerable distance; therefore, the boldness, breadth, and, above all, the harmony of the effect, is far more vital to its success than any minuteness of detail. Thirdly, it must be invariably present to the mind of the artist, that he is not producing a work for isolated exhibition, but is labouring in combination with the architect of the edifice which his design is to adorn, and with which it is expected to fill in and harmonise—not to jar and contrast by painful and violent uses of light and shadow, such as, we are sorry to say, the present collection very plentifully offers. Actual white and black (that is, opaque shadow) ought to be almost entirely excluded from works of this kind. In a word, the window ought never to lose for an instant its character as a window, that is, an admitter of light, which is its absolute and æsthetic relation to the walls, columns, and domes of the building it illuminates.

It is certain that the practical art of *staining* glass, which flourished in such perfection during the thirteenth century, has been in a great measure lost, and, notwithstanding all the efforts of modern chemistry to equal and surpass it in purity and brilliance of colour, it remains unrivalled. On the other hand, painting on glass, when carried out by artists such as form the exceptions to the strictures above made, is decidedly much further than in former times, as far as mere pictorial excellence is concerned. Whether it has advanced in its legitimate mission, that of producing harmonious adjunct to architectural effect, we doubt. A new era has, however, commenced in the art, and we must take it as we find it, merely considering its merits with reference to the object intended to be attained, and not criticising it according to any abstract causes of glass window-painting, which, right or wrong, may form a part of our artistic conscience.

As a general fact, candour compels us to admit, that the English exhibitors do not take the first rank in this branch of national competition. On taking a first and cursory view of the long range of stained glass windows and medallions in the northern galleries of the Exhibition, our attention was forcibly arrested by the striking works of MM. Mercheir and Guyton, of Metz, which, in almost every quality of excellity, far excel all the productions of their competitors. In artistic composition, harmony of colour, and mechanical execution, the prize is unquestionably theirs. In the "Portrait of a Bourgemestre" the richness of the dark crimson tale drapery is very remarkable. Perhaps the head is a little too bright a contrast to the deep background and dress. But in the large painting at its side no such defect is visible. "St. Charles borromeo giving the Sacrament to the Victims of the Plague," is a masterpiece of medieval life and sentiment. The drawing of the figures, the devotional sincerity of the expression and the attitudes, the local historical truth in the peculiar cast of feature, all the elements, in fact, of art and skill, sentiment and erudition, are combined in this *chef d'œuvre* of stained glass to render it a fair specimen of the degree of perfection attainable by the present school. The blue sky in the background admirably relieves the warm group of earnest figures in front, and the colouring is of a beauty which reminds one of the early Italian painters in some of their happiest efforts. Nor is it in pictorial effect and drawing only that Marechal of Metz excels. His medallions of the thirteenth century style is an exquisite specimen of colour and design. It harmonises well with the rest of his paintings, and, though simple in its outlines and its colours, it is rich both in chromatic harmony and general effect. There is nothing like it on the walls of the Munich Gallery. Marechal is, in fact, the one great glass painter and stainer of the present day in Europe. His works have long been known and appreciated in France as the first in that line of art. His paintings in the windows of the church of St. Paul, at Paris, which were destroyed a few years ago, raised for an once above all his competitors in France, both as a glass stainer and an artist. Without dwelling on the minute gradations of merit in other exhibitors and painters, we now pass on to a general examination of the works most worthy of attention in the Exhibition.

Messrs. Chance Brothers, of Birmingham, exhibit a variety of paintings, amongst which we noticed a Virgin in a green robe, well contrasted with some rich crimson drapery. There is much harmony and purity about this figure. We also observed a landscape, which would be very well, but for the excess of green in the arrangement of its colour. And here we may pause to mention a very curious fact as to the glass painting exhibited, viz. that each manufacturing district seems to have a peculiar love for one particular colour, in the production of which he succeeds better than in others. Thus, Messrs. Chance's greens are remarkable for their purity and transparency; whilst, as we shall presently have occasion to remark, other glass stainers excel in other colours, and affect them more exclusively.

Mr. Edward Baillie exhibits a painting of "Queen Elizabeth listening to the choristers of Shakspeare," which is very creditable, and the excellent contrast of its lights and shadows, and in the impenetrable opacity of the latter. We cannot say much for the faces or drawing in this group. However, the Queen's white satin robe is very brilliant; and the largest light is very well executed, that we could have wished the remainder of the picture up to the same level.

Mr. W. Wailes is enterprising in design, and displays considerable brilliance of colour and transparency, but there is a rudeness and harshness about the paintings which is not pleasing.

The St. Helen's Crown, Sheet, and Plate-glass Company send a large painting of "St. Michael and Satan," in which the tail of the archenemy is prolonged to an indefinite degree. There is some spirit in the drawing, but the execution is lamentable in every respect.

Some lions and unicorns by Tobin, the former yellow, and the latter white, are not very wonderful productions, nor in any respect likely to putshine the ordinary lions and unicorns of every-day life.

Messrs. Hetley and Co., of Soho-square, have sent a very fine painting of the "Ascension." The rich colour in the foreground contrasts well with the lightly managed atmosphere, against which the figure of the Saviour is seen in a glory very spiritually conceived and executed.

M. P. Lafaye is doubly unfortunate in being placed by the side of Marechal, to whose works his specimens serve as a foil. They are muddy in colour, and very inferior in design.

Henri Fougue, has sent some curious specimens of mezzotinto transparencies, produced by glass or obins, carved or modelled so as to produce the different gradations of light, shade, and tone, in a manner remarkable for its softness and purity of effect.

M. Thibaut Dallet has a very brown monk, effectively drawn, but deficient in transparency. His "Judith and Holofernes" is a fierce piece, of strong expression, and somewhat crude but rich effect. Red is evidently the predominating and favourite colour with the artist. The "Lord's Supper," which is unfortunately broken, is more transparent, but with little merit either in design or colour.

Herr Geyling, of Vienna, has a female figure leaning on a window-sill, which resembles an oil-painting in effect. The flesh of the face and hands, and the white chemise, as well as the dress, are very well executed; but we object to the opaque background. As a work of art it resembles one, on the whole, of Julien's coloured lithographs. We consider this a strong example of success in a line which ought never to be attempted by a glass-stainer.

M. Thevenot is chiefly noticeable for a blue turn of mind in his colouring. He has, however, some very tolerable saints on pedestals, which are edged with gold, most effectively rendered by transparent yellow glazing. His "Radegonda" is a severe figure, with much depth and richness in the colouring, which is yet too opaque for real brilliancy of effect.

We have thus glanced at a few of the most meritorious, or, rather, to speak conscientiously, of the least sinning, amongst the exhibitors in the Stained-glass Gallery. But, in passing out, we will pause for an instant, to regard the painted window representing Dante and some of his ideas, by G. Bertini, of Milan. This work is placed in the Main Avenue, and is one of the most attractive objects formed by drapery of dark cloth, guarded at the entrance and sides by four statuettes from the Nibelungenlied, by Ferneoni, cast in iron, remarkable for their Gothic vigour of martial attitude and force. These stern emblems of physical strength and valour are no inapposite guardians of the chapel in which Dante, the hero poet, is enthroned in all the majesty of the spiritual triumph of genius. He is represented seated in his famous attitude of tremendous meditation; his legs crossed, his eyes fixed upon the Infinite. Around him are the allegorical representations of his sublime fancies, which to the students of the post will be interesting puzzles, but which neither our space nor our subject permit us at present to enlarge upon. As a painting on glass, we cannot rank this work with those of Marechal. Its undue opacity may, however, be excused as in accordance with the sombre character of the poet of the "Inferno."

Before taking leave of this subject, we would draw this general conclu-

sion from the examples before us that there are few fields in art or industry that offer more extensive opportunities for improvement and enterprise than the staining and painting of glass for windows of churches or other edifices. And once more we would express upon the improver and the enterprising that eminently transparent, and moderation in light and shade are the three great requisites after harmony of colour in this beautiful art, which we hope to see far extended as the use of glass itself, which already excites imagination by the vastness of its actual application and possible future aggrandizement.

The subject of our Illustration is a small Gothic window, by M Martin, of Troyes. We select it for its quaint imitation of the old style of glass pictures, as regards artistic treatment and brilliancy of colour. It is one of the most curious specimens in the Exhibition to lovers of the ancient glass stainers and their peculiar characteristics.

STAINED GLASS.—BY M. MARTIN DE TROYES.

intended to stand some 25 feet high, though the model is only 4 feet 8 inches high, and is of that size. In form it is [illegible] and at the corners are figures of the [illegible] with appropriate texts [illegible] equal [illegible] inscribed, leaving [illegible] Mr Baker will we hope find [illegible] have a taste for this sort of [illegible] we confess we think that art has been [illegible] these matters, whilst nature, with a few simple everlastings and flowers, would afford a tribute from the living to the dead much more pleasing in effect, and much more congenial in sentiment. In a sanitary point of view [illegible] would not be unimportant, it being now well ascertained that the planting of trees and flowers in burying-grounds is of positive service to the health of the neighbourhood.

DESIGN FOR A MONUMENT.

Mr Baker, a young artist of Southampton, exhibits a new design for a monument, intended [illegible] ordinary run of tombstones and mural tablets so much in vogue. It is a Gothic composition,

MONUMENT.—BY BAKER.

LECTERN FOR HEREFORD CATHEDRAL. BY COTTERELL.

This is an extremely fine work of its class—a brass lectern, or reading-desk, in strict accordance with the earlier style of church furniture. It stands in the Western Nave.

LECTERN.—BY COTTERELL.

THE ILLUSTRATED LONDON NEWS.

No. 495.—VOL. XVIII.] SATURDAY, JUNE 21, 1851. [TWO NUMBERS, 1s.

REFORM OF THE CUSTOM-HOUSE.

THE recent legal proceedings instituted by the Board of Customs against one of the most respectable public companies in the city of London—proceedings in which the Board was proved to have conducted its business, not only in a most careless, but in a most vexatious manner, has directed no ordinary amount of attention to the constitution and powers of this department. A Select Committee of the House of Commons has simultaneously been collecting evidence upon the subject, from which some painfully interesting particulars may be gleaned, of the manner in which the irresponsible autocracy, called the Board of Customs, affects the vast trade of this empire.

Although the general public may not experience it, every traveller and every merchant in the kingdom feels to his cost that the English Custom-House is a gigantic nuisance. When the Englishman goes abroad, he is sometimes subjected to delay, inconvenience, and incivility at the *douanes* and custom-houses of the Continent; and if it be his first visit to "foreign parts," he is apt to indulge in feelings the very reverse of amiable towards all such establishments and their officials. But no sooner does he return to his own country, and learn the inexpressible misery of landing with his luggage at Dover, Southampton, or, most horrible of all, at London, than he acknowledges the injustice he has done to our Continental neighbours, and considers a French or any other foreign custom-house a perfect Elysium of ease and happiness, compared with the Pandemonium of torture into which he is plunged on his arrival in his native land. The English law supposes every man honest till he is found to be the reverse; but the English Custom-House acts on no such charitable maxim with regard to travellers. In Thames-street, it supposes every man and woman to be a cheat and a smuggler, and thinks it no wrong to treat them accordingly. If any thing could diminish or put an end to the proverbial love of Englishmen for foreign travel, it would be the annoyance inflicted upon them at their return by the officials of her Majesty's Customs. The only means by which a man can land in comfort upon the English soil, is to travel without other luggage than a razor and a tooth-brush, and to buy his shirts as he goes, and leave them behind him, as some have actually done. With his whole wardrobe upon his back, he may perchance feel like a free man when he puts his foot on British ground; but if he have so much as a carpet-bag, and persists in coming to London, he will, in all probability, be treated like a slave and a felon. At Dover or Folkestone he may receive more respectful treatment; but at the head-quarters, in Thames-street, there is no trial of patience or temper to which he is not ruthlessly and needlessly subjected.

But such tyranny and hardship do not form the greatest of the nuisances that are laid to the blame of the Customs department. It is the manner in which the Board affects the magnificent and daily extending trade of the country, that is the most insupportable evil. According to the evidence given by the chairman of the Board before the Parliamentary Committee, an importer who would pass goods through the Custom-house for home consumption, must comply with no less than nineteen different forms. When goods not subject to duty are entered outwards, the forms with which the exporter must comply are nine in number, of which it may safely be said that eight are useless, and that the ninth—a matter of pure statistical information for the benefit of the Government—ought not to be a burden upon the time or the capital of the merchant. For an export entry of goods which may be subject to an *ad valorem* or other duty, the cumbrousness of the machinery of the Custom-house may be imagined, when it is stated that the forms to be gone through by the unhappy merchant are twenty-one in number, and that a want of compliance, intentional or unintentional, with any one of them, subjects him to the detention, or to the damage or loss of his property. If the goods, whatever they may be, are not described in the way that suits the capricious judgment of an inspector who may happen to know nothing whatever of their real quality or value, they may be seized, and detained till the merchant loses his chances of a market for them. If it be clearly proved, on his remonstrance, that the ignorant or malevolent official was in the wrong, he has no redress; he has to put up with the injury, and thank his fortune that he did not lose his goods as well as his chance of disposing of them.

So vexatious are the proceedings of the numerous officials of the Board, in the various ports and outports of the kingdom, that, upon an average, no less than 15,000 complaints are annually lodged against them by the mercantile community, or nearly 300 a week, or 50 every working day. The manner in which these complaints are received and adjudicated upon by the Board is among the most serious of the grievances alleged against it. When the Board receives a complaint, it refers the matter to the person whose conduct or judgment is impugned, or to the superior officers of his department; upon whose report, without hearing the evidence of the complaining party, it passes—or, more properly speaking, refuses—judgment. Should the aggrieved trader be dissatisfied, he may appeal to the Lords of the Treasury. Their Lordships, however, know nothing of the matter until they apply to the Board of Customs for information; and, as that information is invariably in support of their own foregone decision, the complainant walks in one endless circle of wrong, from which he can only escape by the desperate and disagreeable process, known in common parlance as pocketing his injury, and saying nothing about it.

The charges alleged against the system pursued by the Board of Customs and its officials, and of which these 15,000 annual complaints

HER MAJESTY'S COSTUME BALL.—(SEE PAGE 585.)—COSTUMES WORN BY

THE COUNTESS OF GRANVILLE. HIS ROYAL HIGHNESS PRINCE ALBERT. HER MAJESTY THE QUEEN. THE DUKE OF WELLINGTON. THE DUCHE OF ROXBURGHE.

are in themselves tolerably strong evidence, have been classified under six different heads —

1. The uncertainty of all commercial transactions involving the assessment of duties, from the capricious conduct of the officers of that resistance by the Treasury of all claims for the redress of wrongs inflicted and acknowledged by themselves.

2. The total want of system in the books of the department, as illustrated by their claims against warehousekeepers and merchants for duties on obsolete transactions.

3. The substitution of complicated and absurd forms for simplicity and efficiency of management.

4. The perplexity of merchants in transacting Customs business, from the inconsistent and contradictory nature of the interpretations given by the different offices to the same past instructions.

5. The obstacles thrown in the way of legitimate trade, and the deprivation of the just privileges of the merchant, by the commercial regulations of the Board relative to warehouse securities, and the arbitrary infliction of fines for non-compliance with unnecessary regulations.

6. The oppressive encroachments of the liberty of the subject, and the unconstitutional exercise of the powers of the law officers of the Crown.

There is not a merchant, either in a large or in a small way of business, within the limits of Great Britain, whose daily experience would not qualify him to give inculpatory evidence against the Board of Customs under every one of these heads, and who has not, in one year or another, figured among the 15,000 hopeless complainants. If the Parliamentary Committee had not published the valuable evidence taken before it, and still pending, the report of the trial instituted against the London Dock Company would have been sufficient for the condemnation of the system; and if any one proof had been required in addition, it would have been afforded by the too notorious case of the 3300 chests of Fokien Bohea, upon which the Custom-House authorities attempted to levy the sum of upwards of £8000 more than the revenue was entitled to, and in which, after an inquiry extending into two years, the importers proved themselves to be in the right, though at an expense of nearly £2400, and the loss of their profit upon the transaction. The Board of Customs lost nothing—not even its time or its temper; it did not even lose the public confidence, for neither boards nor private individuals can lose what they never possessed.

It would be unjust, however, to blame the members of the present Board for all these evils. The bad system is of long standing; it is propped up, not by them, but by the inert officialism, including thousands of wives, which lives upon it. Reforms, as every one knows, are proverbially difficult: they must come from without, and not from within, in the case of such a body as this. It is of no use to look forward to the happy time when trade shall be wholly free, and when all nations shall be allowed to send the produce of their soil and the productions of their industry to our shores, without the impediment of Customs duties. We must, therefore, endeavour to make the irremovable but not irremediable evil as little felt as possible. There is a reason for the existence of a Custom-House, but there is no reason why merchants, exporting or importing, and administering so largely to the power, grandeur, and wealth of this country, should be subjected to vexatious impediments in their business; harassed with cumbrous, costly, and utterly useless forms; exposed to the petty tyranny and caprice of irresponsible functionaries; mulcted for unintentional errors in valueless and unmeaning documents, and treated as public enemies. There must indeed be a vitality in British commerce, when it has existed and flourished under this system, with no other outward signs of its suffering than the 15,000 annual groans to which we have alluded. Where only needs a strong report from the Select Committee of the Lower House to ensure the much-needed reform of this important department: and from the whole tenor of the evidence as elicited by the inquiries of the several members of the committee, there is every reason to believe that the report will be such as the mercantile community will approve, and the public applaud.

CHURCH, UNIVERSITIES, &c.

OXFORD.

In a convocation held on Tuesday last, the several alterations proposed in the Stat. Tit. IV., on the Public Professorships, were submitted to the vote of the house. The proposition to increase the stipends of some of the professors of the new School of Natural History was carried. The propositions to augment the stipends of the Readers in Mineralogy and Geology, and that of the Professor of Chemistry, were lost. It was decided to augment the stipend of the Reader in Experimental Philosophy by £170 per annum, and that of Dr. White, Professor of Moral Philosophy, by £150. The proposed augmentations of the Camden Professor of History's stipend was lost on a division. It was resolved to transfer the funds from the press account to the general account of the University, and to pay the augmentations of the professorships out of the profits of the sale at Ten per Cent. Consols Reduced. The proposition to transfer the sum of £30,000 from the press account towards a fund for defraying the expenses of erecting a new University museum, and additional lecture and examination rooms, was lost. The convocation was attended by nearly the whole of the heads of the houses, several professors and doctors, and by a large number of the resident Masters of Art. Dr. Pusey, in a Latin speech of some length, opposed the statute.

PREFERMENTS AND APPOINTMENTS.—The following appointments and preferments have recently been made:—*Archdeaconry:* The Rev. William Hayward Cox to Salop. *Rectories:* The Rev. Richard Rigg to St. Michael's Coslany, Norwich; the Rev. Henry Wright, to Cotton, Norfolk; the Rev. Richard Brown Mathews to Widworthy, Devon; the Rev. John Smith to Brisley, with Gateley, Norfolk; the Rev. Charles Wright to the chaplaincy of the European part of the St. John del Rey Gold Mining Company's Establishment; the Rev. J. Pinder Wright to be secretary of the Church of England Young Men's Society for aiding Missions at Home and Abroad.

TESTIMONIALS.—The following gentlemen have lately received testimonials of esteem and affection:—The Rev. W. Cape, head master of Peterborough Cathedral Grammar School, from the senior pupils resident in his establishment; the Rev. George Gregory Perring, from the inhabitants and the Bath Friendly Society; the Rev. J. Henderson, from the congregation of the church of Colne, Lancashire; the Rev. David Dale Stewart, perpetual curate of St. Bride, Liverpool, from the younger members of his congregation; the Rev. F. Woolley, on his leaving his late curacy at Great Hazeley, from the parishioners; the Rev. S. W. Newbald, on his leaving the incumbency of Rawcliffe, near Snaith, from his late parish oners.

CONSECRATION.—On Tuesday, the Bishop of Salisbury consecrated a new church at Beaminster, in Dorset. The building has been erected by subscription, assisted by grants from the Diocesan and Church-building Societies, and has an endowment of £50 per annum. The style is strict Early English, and consists of a nave and chancel and two side aisles. There is accommodation for 400 persons in open seats, all free. The members of a choir occupy seats on each side of the chancel.

HOME CIRCUIT.—The judges have appointed the following days for holding the ensuing Summer Circuit:—Hertford, July 19; Chelmsford, July 21; Maidstone, July 28; Lewes, August 4; and Croydon, August 7.

INAUGURATION OF THE STATUE OF POUSSIN.—The inauguration of the statue erected by his native town, Andelys, near Rouen, in Normandy, in memory of the celebrated painter, Nicolas Poussin, was celebrated on Sunday with great pomp.

The Royal Agricultural Society of England have issued a programme of their proceedings at the forthcoming meeting, in Windsor Home Park. By command, as we learn, that on Friday the 11th, and Saturday the 12th of July, cattle will be received in the Home Park, on Thursday, and the examination of the stock in the afternoon, of Tuesday, the 15th, the judges have delivered in all their awards, members of council and governors of the society will be admitted into the show-yard on the payment of 2s. 6d. each, and the public will be admitted into the show-yard on Wednesday, and Thursday, the show-yard to be open to the public; the great dinner of the society will take place on Wednesday, in the pavilion. The show yard and pavilion will be in the Home Park, immediately below the slopes and terraces of the north front of Windsor Castle.

At a Protectionist meeting at Doncaster on Saturday, it was announced that Mr. Denison, one of the members for Yorkshire, had declared it to be his intention not to present himself at the next election for their suffrages. It was therefore urged, that a Protectionist should be invited to come forward, and every means used to effect his return for the county.

Sir James Graham, Mr. W. Beckett, Lord Henry Bentinck, Sir John Hanmer, and Mr. Ellis, are appointed a committee of the House of Commons, to whom the Metropolitan Water Bill, and all the other bills connected with the supply of water to the metropolis, are referred, including the Wandle Water and Sewerage Company, the Lea River trust, the New River Company, and the East London Waterworks.

FOREIGN AND COLONIAL NEWS.

FRANCE.

The Revision of the Constitution still stands the foremost and almost the sole political topic of the day. The petitions in favour of it multiply amazingly; but the labours of the committee to which the question has been referred, in order to its being reported upon, progress slowly, the difficulty of drawing up a report to which the committee will agree being chiefly owing to the great variety and differences of opinion entertained by its members on the question.

In the Legislative Assembly, M. Bonhier de l'Eclusa has given notice of the following motion on the subject —

On the second Sunday in May, 1852, all the electors of France assembled in their respective electoral colleges shall be convoked to proceed to the revision of the constitutional articles, such as are laid down before the law of May 31, in the manner and according to the mode then followed

1. To the nomination, in executive and according to the terms of Article 45 of the Constitution, of a provisional President of the Republic

2. To the nomination of a new Constituent Assembly, invested with the special mandate of the people, and with full powers to proceed to the total revision of the Constitution of 1848, and to declare the government of France.

A number of reviews are about to take place in the presence of the President of the Republic. The first is held to-day (Saturday). These intended military spectacles *give offence* to Louis Napoleon's enemies, because they affect to believe that he is desirous of promoting public demonstrations in his favour, by which he may forward some secret and personal ambition.

On Wednesday, in the Legislative Assembly, upon the motion for establishing a Prefect of Police at Lyons, M. Pelletier denounced it as subversive of liberty, and as solely intended to serve the ambition of Louis Napoleon. He then enumerated several measures passed by the Legislative Assembly in support of the Bonaparte interest, and declared that if they did not alter their course, they would justify any attempt that might in future be directed against them. This expression of opinion was received with great applause by the Left, and with loud murmurs by the Right. M. Pelletier concluded by stating that the army, in refusing to fire on the people in 1830 and 1848, had behaved like worthy and noble citizens—a sentiment which elicited cheers from the Left, and cries of disapprobation from the Right.

M. Léon Faucher characterised the speech of M. Pelletier as "abominable," which epithet aroused all the violent feelings of the Left, who rushed to the tribune as if to inflict personal injury upon the Minister; but the calm defiance with which he viewed their menaces softened their desperation, and they quickly returned to their seats. M. Faucher said, in spite of factious threats, he would continue to perform his duty, and not recede one step. He then proceeded at some length to justify the measure, based as, he said, it was upon the system adopted in England, where municipal institutions were well understood.

The proposition was then put to the vote, and carried by a great majority.

A charge has been made against M. Lemallier, one of the members of the Assembly, of having procured a Government situation for a friend, upon the mutual understanding that he was to receive half the salary. The accusation is to undergo a thorough judicial inquiry, the proceedings of which commenced on Wednesday. M. Lemallier has resigned his seat, that nothing shall embarrass the inquiry.

The Prefect of the Allier has ordered the disarming of the National Guard of Chantelle.

A duel took place at Toulon, a few days back, between M. Thomas, editor of a Democratic paper, and M. Bernadou, secretary to the Legitimist committee. The combat, which was with swords, lasted nearly half an hour, in the course of which the latter received three wounds, and his opponent one. This was the third duel which M. Thomas had fought, occasioned by the violence of his political writings.

ITALY.

Accounts to the 10th instant, from Leghorn, mention the arrest, on a charge of political conspiracy, of the three sons of the late English nobleman, the Earl of Aldborough, at their villa near that city. The Tuscan authorities had received notice that these young men, who have been born and bred in Italy, and whose sympathies are naturally Italian, had entered into connexion with a secret political society, and that their house was a deposit for political papers and a printing-press, besides other revolutionary implements, the readers of the society having printed upon their counterfeit assignats a good place for their meeting, less liable to suspicion than the dwelling of an Italian. Some Austrian soldiers and Tuscan police surrounded the house; and as they offered a passive resistance by shutting the doors and windows, the soldiers had to force an entry, when they found political papers of importance, a voluminous correspondence in English, a complete set of printing materials, several clandestine publications, including a newspaper called the *Agnatolo*, printed on the premises, and a quantity of arms. Two persons were arrested in the act of burning a mass of papers; and several others who have been compromised by the discovery of the papers have also been arrested. A person who attempted to escape over the garden wall, at the moment the villa was forced, was arrested, and was at once identified as a native of Lucca, who had formerly served in the police corps. The three Englishmen have been placed in the custody of Her Britannic Majesty's Consul-general, and had several interviews with Count Crenneville, the Austrian general, acting as governor of the town, but as yet nothing has transpired with regard to the steps about to be taken in this matter by the authorities.

UNITED STATES.

The advices from New York this week are to the 4th inst., but they contain scarcely any news of interest, the whole reference to Gallegher having been already from which is to the 1st of May. The steamer of that date took gold dust to the amount of 2,000,000 dols. to Panama.

After a session of four months the Legislature adjourned on the 30th of April, having passed an act to protect the homestead from legal process under certain conditions, and a usury law, fixing the rate of interest at 10 per cent. and allowing 18 per cent. by special agreement.

The intelligence from the mining districts is of a most encouraging character. New diggings are daily discovered on the Shasta Valley, which promise the most abundant returns. Their depth is from one to four feet, and they have yielded an average of 80 dollars a day up one to five men, who have been engaged there ever since the first discovery.

Our dates from Santa Fé are to May 1. Fifteen companies of U. S. troops were to leave New Mexico on the 10th of May, upon a campaign against the Navago Indians. The force was considered sufficient to overawe the tribe, if no nothing else, on account of the impulse it would give to the soldiers, whose health has been seriously injured by the recent inactivity of their life. The census of the territory of New Mexico has been taken by direction of Gov Calhoun, showing a population of 56 984, beside the Indians. A public meeting was held at Santa Fé on the 29th of April, to nominate candidates for the legislature. Governor Calhoun issued his proclamation on the 23rd April, for the election of members of the Legislative Assembly on the 19th of May. The session of the legislature is to commence at Santa Fé on June 2.

A second arrival this week from New York brings dates to the 7th instant, but the advices add scarcely any news to the above. It is stated that the French government are about to make a claim of 3,000 000 dollars against that of the United States, for goods confiscated at Rio Janeiro for non-compliance with the revenue laws.

A terrible tornado visited the city of Louisville, Kentucky, on the 17th ult. A number of buildings were levelled, and other damage done to property.

Cambridge, Massachusetts, has been visited by a fire which destroyed a great amount of property.

The *Madrazo Republican* says, that at no period since 1840 has the emigration to Illinois, Iowa, Minnesota and Missouri been so great as this spring. Large accessions are daily made to the many population from other States of the Union, and sections of the country which are heretofore have been passed by are now rapidly filling up with population. In addition to the tide from other States, greatly increased numbers of foreign emigrants are arriving. Nearly every boat from the south, and frequently boats from the Ohio, come crowded to excess with these emigrants.

The cholera is increasing in mortality in the western rivers. Forty-five deaths had occurred in one week on board the Mississippi steamers *Grand Turk* and *Pride of the West;* and there were fourteen deaths by cholera the same week in New Orleans.

Six barges, laden with dressed lumber, were despatched from Montreal recently, for the United States, two of which proceeded direct to New York, without re-shipment. They are believed to be the first attempt made for a direct communication inland with New York.

WEST INDIES.

According to intelligence of the 23rd from Jamaica, the House of Assembly was prorogued by the Governor on the 23rd. The Governor made a long speech on the occasion, reviewing the acts of the Assembly, some of which he condemned with severity. The planters still lingered in the island. It had appeared in several localities which had been hitherto exempt. At Mountain Valley the people have refused to bury the dead. The wife of Sir William Colebrooke, Governor of the Virgin Islands, was dangerously ill.

The latest news, dated May 18, from St. Domingo, represents Soulouque as remonstrating, in a friendly and pacific tone with the Dominican republic; so that French intervention will probably not be required.

INDIA

The accounts in anticipation of the Overland Mail, a telegraphic notice of which, *vid* Trieste, appeared last week, have been received.

The latest date is Bombay, May 14.

The intelligence thus conveyed is of little importance, its chief feature being a notice of the speedy assembling of troops, which on the summer heats has caused all the great officers, including the Governor-General and the Commander-in-Chief, to make to Simlah, or other cool retreats in the mountains. The western frontier of the Punjab is still occupied by the hill tribes of the Indus, and there seems to be no intermission of the robberies and murders committed by these very troublesome neighbours.

Government have resolved to take all their remaining cases against Jolee Persaud, who is understood to be nevertheless pressing forward his suit against them in the Supreme Court of Calcutta.

At Bombay the trial for the robbery of the Bank of Bombay notes committed at the Orental Bank on the 8th of February last, has been discovered. The principal culprit is a young Parsee of very good family, named Dorabjee Hormasjee.

There have been storms of rain and hail throughout the north-west provinces, in Bengal and at Madras. Near Calcutta the hailstones were the size of hen's eggs, and did much damage.

From China we learn that the disturbances in the provinces adjoining Canton continue; they seem beyond the power of the Chinese authorities to quell. They have a most injurious effect upon trade.

SOCIETY FOR THE PROPAGATION OF THE GOSPEL IN FOREIGN PARTS.—JUBILEE.

On Monday the opening of the third jubilee of this society was celebrated in Westminster Abbey. Many of the highest dignitaries of the Church (including the Archbishop of Canterbury, the Bishop of Oxford, and the Bishop of St. Asaph) were present in full canonicals; and a sermon was preached by the Bishop of London, who selected his text from the 8th chapter of St. John, the 12th verse. "I am the light of the world." The service performed was of the ordinary character, but nevertheless the congregation was extremely numerous—an invitation to attend having been previously addressed to all who feel an interest in the missionary operations of the Church of England.

Tuesday, the second day of the jubilee, was celebrated by a public meeting at St. Martin's Hall, Long-acre. His Royal Highness Prince Albert presided; and this fact, added to the interest attaching to the occasion itself, drew a vast concourse of persons to the meeting. Long before one o'clock, the hour at which the doors were opened, a great number of persons assembled in Long-acre, and certainly nothing could exceed the determination and perseverance evinced by the ladies to be "first in the throng."

At two o'clock his Royal Highness arrived, attended by the Archbishop of Canterbury, Lord J. Russell, Earl Grey, and the Bishop of London.

Among the distinguished company present were, his Royal Highness Prince Albert, in the chair; the Archbishop of Canterbury, the Archbishop of Dublin, the Bishop of London, the Bishop of Winchester, the Bishop of Oxford, the Bishop of St. Asaph, the Bishop of York, the Bishops of Bombay and Jamaica, the Bishop of Argyll and Ross, Bishop Otey of Tennessee, the Duke of Newcastle, the Duke of Argyll, the Marquis of Abercorn, the Earl of Harrowby, the Earl of Chichester, Earl Nelson, Earl Grey, Lord Redesdale, Lord Saye and Sele, Lord John Russell, M.P., the Right Hon. Sidney Herbert, M.P., the Rev. Sir H. R. Dukenfield, the Rev Canon Blomfield, the Rev. Dr. Hook, the Right Hon. H. Goulburn, M.P., Sir John Hamilton, the Dean of St. Paul's, Bangor, and Norwich, the Master of the Temple, the Principal of King's College, the Chancellor of Cashel, Archdeacon Sinclair, Mr. J. E. Denison, M.P., the Rev. C. B. Dalton, the Rev. J. Dowsal.

Among the ladies on the platform were the Duchess of Argyll, Lady — Howard, the Marchioness of Blantyre, Miss Burdett Coutts, &c.

The Bishop of London having opened the proceedings with prayer,

His Royal Highness Prince Albert rose amidst loud cheers to address the meeting, and spoke in the following terms:—"My Lords, ladies and gentlemen, we are assembled here to-day in order to celebrate the third jubilee of the foundation of the Society for the Propagation of the Gospel in Foreign Parts, incorporated by Royal charter, and one of the chief sources of the spiritual aid which the Established Church affords to our extensive colonial dependencies. We are not commemorating, however, an isolated fact, which may have been glorious or useful to the country, but we are thankfully acknowledging the Divine favour which has attended exertions which have been unremitting during the lapse of 150 years. We are met at the same time to invoke the further continuance of that favour, pledging ourselves not to relax in our efforts to extend to those of our brethren who are settled in distant lands, building up communities and states where man's footsteps had first to be imprinted on the soil, and wild nature yet to be conquered to its use, those blessings of Christianity which form the foundation of our community and of our state. (Cheers.) This society was first instituted by that great man, William III. (Cheers), the greatest Sovereign this country has to boast of (loud cheers), by whose sagacity and energy was closed that bloody struggle for civil and religious liberty which had so long been convulsing this country, and were secured to us the inestimable advantages of our constitution and of our Protestant faith. (Loud cheers.) Having thus placed the country upon a safe basis at home, he could boldly meet the enemies abroad, and contribute to the foundation of that colonial empire which forms so important a part of our present greatness; and honour be to him for his endeavour to place this foundation upon the rock of the Church. (Lesser) cheers.) The first jubilee of the society fell in times when the religious apathy had succeeded to the over-excitement of the preceding age. Lax in their principles, they were indifferent to the means they employed to attain their (Hear, hear.) Lukewarm and indifferent to the end they had in view, they neglected the most sacred objects. Still this society persevered in its labours with unremitting zeal, turning its chief attention to the North American continent, where a young and vigorous society was rapidly growing into a people. The second jubilee found this country in a most critical position. She had obtained by the peace of Amiens a moment's respite from the tremendous contest in which she had been engaged with her continental rival, and which she was then about to renew in order to maintain her own existence, and to secure a permanent peace to Europe. Since the last jubilee, the American colonies, which had originally been peopled chiefly by British subjects who had left their homes to escape the persecution of religious intolerance and oppression, had thrown off their allegiance to the mother country in defence of civil rights, the attachment to which they had carried with them from the British soil (Cheers). Yet this society was not dismayed, but in a truly Christian spirit continued its labours in the neighbouring North American and West Indian settlements. Then the third jubilee falls in a happier epoch, when peace is established in Europe, and religious fervour is rekindled, and at an auspicious moment, when we are celebrating a festival of the civilisation of mankind, to which all quarters of the globe have contributed their productions—(Loud cheers) -and are sending their people—for the first time recognising their advancement as a common good—their interests as identical—their mission on earth the same. (Loud cheering.) And this jubilee, which rests on Christianity —could only be raised on Christianity—can only be maintained by Christianity (Cheers) the blessings of which are now carried by this society to two vast territories of India and Australasia, the inhabitants of both to be peopled by the Anglo Saxon race. (Hear, hear.) Whilst we have thus to congratulate ourselves upon our state of temporal prosperity -harmony at home, and peace abroad, we cannot keep deploring that the Church, whose exertions for the progress of Christianity and civilisation we are to-day acknowledging, should be afflicted by internal dissensions—(Hear)—and attacks from without. I have no fear, however, for her safety and ultimate welfare, for as she has in fact to what our ancestors gained for us at the Reformation—the Gospel, and the unrestricted right of its use. (Cheers.) The dissensions and difficulties which we witness in the Church, as in other church, arise from the natural and necessary conflict of the two antagonistic principles which move human society, in Church as well as State—I mean the principles of individual liberty and of allegiance and submission to the will of the community, exacted by it for its own preservation. These conflicting principles cannot be disregarded—they must be reconciled. (Hear, hear.) To this country, to Europe the honour of having succeeded in the mighty task as far as the State is concerned, while other nations are still wrestling with it. And I feel persuaded that the same earnest zeal and practical wisdom which has made her political constitution an object of admiration to other nations, will, under God's blessing, make her Church likewise a mode, to the word. (Hear, hear.) Let us look upon this assembly as a token of future hope, and may the harmony which reigns among us at this moment, and which we owe to having met in furtherance of a common holy object, be, by the Almighty, permanently bestowed upon the Church." (Loud cheering.)

The following resolutions were agreed to —

That the members and friends of the Society for the Propagation of the Gospel, assembled on the occasion of its third jubilee, an occasion which demands their thankful acknowledgments to Almighty God for his blessings upon their past labours, desire to express their devout hope, that the same providential guidance and support may be graciously continued, so as to enable the society to discharge more adequately than it has been able to do hitherto the duty in which it has been so long engaged on behalf of the Church of England, towards the members and the heathen inhabitants of the British Colonies.

That, while the population of the United Kingdom is ever adding itself over vast portions of the earth, and thus laying the foundations of future empires, it is incumbent on the Church of the mother country, so long as her help is needed, to provide for the spiritual wants of her enlightened children these ministrations and ordinances of religion which are the privilege of her poorest members at home.

That, notwithstanding the success which has attended the labours of the society's missionaries in the British Colonies, the increasing claims upon the resources of the society to a knowledge of Christ must always depend, under Divine Providence, upon the efforts of a native ministry.

The third day of the jubilee, or 150th anniversary, was celebrated in St. Paul's Cathedral. At three o'clock, the clergy, in their surplices, assembled in the nave of the cathedral, where they were received by the Archbishop of Canterbury, the president of the society, and a procession was formed, which included in its ranks the Bishops of London, St. Asaph, and Winchester, Dean Milman, Archdeacon Hale, the Rev. Canon Dale, the Master of the Temple, Dr. Jeaffreson, the Lord Mayor and Sheriffs, and several aldermen. The choirs of her Majesty's Chapel Royal, St. Paul's, Westminster Abbey, and St. George's Chapel, Windsor, assisted. The sermon was preached by the Bishop of St. Asaph, who took his text from the 2nd chapter of Daniel, 35th verse:—

Then was the iron, the clay, the brass, the silver, and the gold broken to pieces together, and became like the chaff of the summer threshing floors; and the wind carried them away, that no place was found for them, and the stone that smote the image became a great mountain, and filled the whole earth.

At the close of the ceremony, which was attended by a very large congregation, the Archbishop of Canterbury and the other church dignitaries left the cathedral in procession, and a collection was made at the doors.

In the evening, the Lord Mayor and the Lady Mayoress gave a splendid entertainment to the members of the society. There were upwards of 170 persons present. Amongst the company were the Archbishop of Canterbury, the Bishop of London and Mrs. Blomfield, the Bishop of Winchester, &c.

LOSS OF THE ROYAL MAIL STEAMER "FALCON."—On the arrival at Portsmouth, on Saturday, of her Majesty's steamer *Falcon*, on May 27, from St. John's, Newfoundland, Captain Adams, her commander, communicated the sad news of the total loss of the steam-ship *Falcon*, on her passage to Halifax, during the night of the 4th inst. The *Falcon* left for Halifax at nine P.M., on Wednesday, May 7, and when five hours out from St. John's, she struck with tremendous violence on some rocks outside of Isle de Bois. The engine was immediately reversed, and she backed off and struck another rock astern. After repeated collisions, she managed to back out clear to sea. By this time she was 3½ feet by the head, the bows having been stove in. The engineer let off the steam to prevent the boilers collapsing, and the cry was, "To the boats." Fortunately, the water was smooth, and all hands made good their escape to the shore. Captain Corbin remained by the vessel till the last moment, and succeeded in saving the mails and almost all the moveable property. The night was densely foggy. The *Falcon* was built in the Clyde about three years ago, and was employed in carrying the mails between Bermuda, St. John's, Newfoundland, and Halifax, Nova Scotia.

IMPERIAL PARLIAMENT.

HOUSE OF LORDS.—MONDAY.

Their Lordships re-assembled after the Whitsun recess.

Lord BROUGHAM called attention to the absolute necessity of improving the administration of justice in the Court of Chancery. The noble and learned Lord said that the details of the measure introduced by Lord John Russell, so far as he had had time to study of attending to them, met with his entire approbation; but he was not prepared to say that they went far enough.

The Highways (South Wales) Bill passed through committee.

The Public-houses (Scotland) Bill was read the third time, and passed.—Adjourned.

HOUSE OF COMMONS.—MONDAY.

UNIVERSITY COMMISSION.

Mr. J. STUART inquired whether it was the intention of the Government to suspend the proceedings of the University Commission until a decision should be pronounced by the proper tribunal on the petition presented to her Majesty in council by the University of Oxford, complaining of the illegality of the commission.

Lord J. RUSSELL stated that the Government had no such intention.

Mr. DISRAELI referred to the claim of Mr. Ward on the Venezuelan Government, and inquired of the Secretary for Foreign Affairs if he was prepared to support the claim.

Viscount PALMERSTON regretted to say that this was one of many cases in which British subjects had to complain of oppressive treatment by the South American Republics, whose code of right and wrong seemed to be differently constituted from that of European nations. Mr. Ward's claim was under consideration, and whatever amount might be decided upon as justly due to him the Venezuelan Government would be formally called upon to pay.

THE GOVERNMENT FINANCIAL POLICY.

On the motion that the Customs Bill be read a second time,

Mr. DISRAELI intimated that he should propose an amendment to the motion for going into committee on this bill. The House having limited the Income-tax to one year only, it was obvious that the country was placed in a different position as regarded its financial policy from that in which it stood when the Chancellor of the Exchequer brought forward his Budget. He thought it right, therefore, that the House should consider whether, with so large a portion of the revenue granted only provisionally, it would be advisable to abandon other sources of revenue. If the committee were fixed for Monday, he would communicate the terms of his amendment on an intervening day.

Lord J. RUSSELL apprehended that Monday might be inconvenient, as interfering with the progress of the Ecclesiastical Titles Assumption Bill.

After a short conversation the bill was read a second time, and ordered to be committed on Monday—the day for the discussion of the amendment to be fixed in the interim.

The Inhabited House Duty Bill was read a second time.

The House then went into Committee of Supply.

On the vote of £23,230 for public buildings in Ireland being proposed,

Mr. SPOONER moved, as an amendment, to reduce the amount by the sum of £130 181., being for the repairs of the Mayno and Lunatic Asylums.

After some discussion, the committee divided, when there appeared—For the amendment, 119; against it, 121: majority against, 2.

The vote was accordingly agreed to in the original state.

The House then resumed.

The third reading of the Acts of Parliament Abbreviation Bill was moved and discussed for some time.

The division showed—For the third reading, 12; against it, 60: majority, 54.

The bill was consequently lost.

Adjourned at a quarter to two o'clock.

HOUSE OF LORDS.—TUESDAY.

THE NAVIGATION LAWS.

Lord STANLEY having presented a petition from the Shipowners' Association o' Liverpool complaining of the injurious effects that had followed the repeal o the Navigation Laws, proceeded to advocate in a long speech the opinions expressed by the petitioners. The noble Lord detailed a variety of incidents, and traced the course of commercial intercourse in various quarters of the world, to prove that our merchants were subjected to unequal competition, our ports to restrictions being next almost everywhere by hostile tariffs, and our vessels in no no places prohibited from engaging in the most profitable branches in trade. He remarked that the remedy lay ready-made in the hands of the Privy Council, who were empowered under the act to reimpose duties on vessels belonging to states that had refused reciprocity, and that protection he considered it was now time to adopt.

Earl GRANVILLE questioned the accuracy of the statements on both sides set forth in the petition. The shipowners were undoubtedly not prospering through the Navigation Laws, and were not injured by their removal. Authentic returns showed that the business was extending, the tonnage of vessels employed in our commerce having increased, and proofs were given that the effect was not to the satisfaction complained of was, at all events, exceptional. He observed that Lord Stanley himself had abstained from following up his speech by any substantive motion, and had declined to enter into any proposal for the alteration or repeal of the Navigation Laws could ever be reviewed.

Lord HARDWICKE maintained that the proof of prosperity deduced from the increase in our shipping was illusory, since that of other countries had increased in larger proportion. He contended at much length on the justice and necessity of obtaining reciprocity from other countries, or enacting it on our own parts.

Earl ELLENBOROUGH believed that the shipowners were sufficiently good men of business not to persevere in a losing trade, and therefore saw, in the increase of shipbuilding and employment, an irrefragable proof that the trade was not in so bad a way as the petition inferred. We had already obtained reciprocity from several foreign countries, and, among others, from the United States, though he admitted that the position and feelings of that country rendered it unlikely that natural self-interest would act on its certain directions. As regarded France and Spain, which still retained their differential duties, he was convinced that any attempt to retaliate would be met by a tariff of prohibitory duties.

After some brief remarks from Lord COLCHESTER, the petition was ordered to lie on the table.

Their Lordships adjourned at half-past eight o'clock.

HOUSE OF COMMONS.—TUESDAY.

The House had an early sitting, the Speaker taking the chair at twelve o'clock

PRIVILEGE.

The report from the Select Committee upon the petitions of Messrs Bradford and Strutt, relative to the late Ayrshire election petition, was brought up for consideration. The report stated that the name of Thomas Hughes Bradford had been improperly affixed to that petition by two individuals named Strutt and Cunningham, who had thereby been guilty of a breach of privilege.

The ATTORNEY-GENERAL moved that the report be adopted, and the parties in question taken into custody by the Sergeant-at-Arms.

During the course of the morning sitting the Sergeant-at-Arms reported that he had presented with the Speaker's order, and had Messrs. Cunningham and Strutt then in his keeping.

On the motion of the ATTORNEY-GENERAL, the two individuals were brought up to the Bar, when they received a reprimand from the Speaker, and were then ordered to be discharged on the payment of the customary fees.

The St. Albans Bribery Commission Bill, and the Prevention of Offences Bill went through committee.

The House then adjourned for a short time.

On resuming at five o'clock,

ST. ALBANS ELECTION.

Mr. SPOONER moved that Henry Edwards, who had been n'ne weeks in custody for offences against the privileges of the House, in connexion with the St. Albans election, should be this day brought up to the Bar of the House.

Mr. HUME and the ATTORNEY-GENERAL briefly contended that the motion was premature.

The House divided. For the motion, 4; against, 133: majority against, 129.

THE MALT TAX.

Mr. BASS then moved a resolution to the effect that half the malt tax should be repealed on the 10th day of October, 1852, with a view to re lave the producer of barley and the consumer of beer, without material and ultimate loss to the revenue. The increased consumption of malt would repay the amount of taxation reduced, while the public would obtain a genuine article at a cheap rate.

Mr. CAMPBELL opposed the motion.

Mr. ALCOCK thought the defence of the tax on principle had been altogether given up, and that it was now only regarded as a matter of revenue. As an equivalent for the reduction of the duty on malt, they might place a duty on Peruvian guano, which could injure no one, except the government of the country which produced it, and kept it in its own hands as a close monopoly.

Sir W. JOLLIFFE advocated the reduction of the malt tax altogether.

Mr. M. HEYWORTH supported the motion.

Mr. FERRIFIELD said that no boon would be conferred on the agriculturists by the reduction of the malt tax, unless they could be assured that the substituted duties would prove less injurious in operation.

Mr. SADDAS opposed the motion

The CHANCELLOR of the EXCHEQUER said the reasons given on the debate for the total repeal of the malt tax would apply with equal force to the proposed motion. He also reminded the House of the impossibility of getting rid of the income-tax while they were suggesting the propriety of getting rid of a greater amount of revenue in another direction.

Mr. NEWDEGATE said not support the motion, although he had supported the motion for the total repeal of the tax, for the entire repeal would justify the House in making equivalent for the revenue in some other way.

Mr. BROTHERTON was opposed to the reduction of every tax which tended to check the consumption of intoxicating drinks.

After some observations from Mr. H. DRUMMOND, Mr. HUME, and Colonel SIBTHORP,

The House divided, and the numbers were—For the motion, 31; against it, 76: majority, 45.

INTERNATIONAL ARBITRATION AND DISARMAMENT.

Mr. COBDEN moved that an address be presented to the Queen, praying her Majesty to direct the Foreign Secretary to communicate with the French Government, and endeavour to prevent in future the rivalry of warlike preparations, and obtain, if possible, a mutual reduction of the armaments. Limiting his suggested reductions to the naval force and fortifications, and admitting that the armies were necessarily kept up for police purposes, the hon. member insisted that our existing navy was far larger than was required for the protection of commerce. The presumed necessity for maintaining so large a force was self-created, and grew out of the irritated policy we pursued towards France, retorted again by France upon ourselves. Each country alternately alarmed its neighbour by the extension of its armaments and military works, and thus both were frightened into enormous preparations and expenses. It was a neck-and-neck race of extravagant folly. History already afforded us a pattern for this suggested remedy. In 1817 a convention was entered into between England and America, limiting, and practically removing altogether, the armed force severally maintained on the frontier lakes of CANADA. This example might be followed with regard to France and other neighbours. Every invention of science, every improvement in communication and extension of commerce, tended to proclaim and secure peace; and he enjoined the Government to act up to the spirit of the age.

Mr HUME seconded the motion.

Mr. URQUHART, while thinking that the present motion was the natural result of the intermeddling policy of Lord Palmerston, yet deprecated as unexpedient adopting resolutions calling on the Crown to originate negotiations on abstract questions.

Mr. MACKINNON, thinking that the policy of Lord Palmerston had been of a very pacific tendency, was of opinion that there was nothing in the state of our relations with France to call upon them to adopt such a resolution.

Lord PALMERSTON entirely adopted the sound views and just principles which Mr. Cobden had advocated, and fully shared in that hon. member's aspirations for peace. He nevertheless differed in his appreciation of the best means of securing that happy result. Much as civilisation had progressed, we were yet far from the point when nations could safely depend upon their neighbour's wisdom and forbearance. He objected to the resolution, that it recommended England to disarm before we were sure that other states would follow the example. Intercourse had increased, prejudices born shaken, and the old prepossessions of enmity and rivalry given way to juster feelings; nevertheless he still considered that the best way of assuring ourselves of peace was to continue to be prepared for war. Instancing the vast sums spent upon the fortification of Paris as a test of public opinion in that country in favour of defensive preparations, the noble Lord doubted whether any negotiations, prompted by a vote of that House, could avail towards changing the popular spirit of Frenchmen, or induce them to diminish their military establishments. In the present point of view, the present motion might, however, be considered as a tender of friendship towards France, and he hoped it would be so felt, and not forced in a different sense upon us by either party in that country in much danger of a misinterpretation. Rejoicing in the pacific tokens and tendency at present manifesting themselves, among which he assigned a high place to the Industrial Exhibition, the noble Lord pronounced for himself and colleagues an emphatic declaration that they were and would be actively interested in suppressing the outbreak of war, not only between this country, but between every country and the world.

Mr. ROEBUCK drew a wide distinction between the readiness to fight, if attacked, and a perpetual existence in military harness. The resolution now proposed would place us in the first-mentioned position, and with a fervent appeal to all the principles and sentiments of social progress, he called on the House to adopt it.

Mr. MILNER GIBSON propounded the maxim that every warlike armament was not merely an utter waste, but an unmitigated moral evil. Experience showed that France and England had entered upon a rivalry of increase in their respective establishments, and why should not they continue to be rivals in reduction, if the example were set on our side?

Sir H. VERNEY, Mr. BROTHERTON, Mr. HUME, Sir R. H. Inglis, Mr. Gaeth, and Mr. LOWDEN, having spoken,

Mr. CORDEN consented to withdraw his resolution, trusting that the discussion it had elicited might produce a good effect, and that the Foreign Secretary would carry out in practice the sentiments he had expressed in his speech.

Lord PALMERSTON guarded against future misconception by repeating the terms in which he had given his partial concurrence in the proposition of the hon. member.

The motion was then withdrawn by consent.

BIBLE MONOPOLY.

Mr. HUME moved an address to the Queen, to cancel the patent now granted to the Queen's printers, conferring a monopoly of printing Bibles and Prayer-books in England and Ireland.

The motion was seconded by Mr. COWAN and opposed by Sir G GREY, who observed that the patents in question could not be revoked, except by an act of Parliament.

Sir R. INGLIS also opposed the motion.

The resolution was negatived without a division.

The Locging-houses Bill was postponed to Friday.

The survey of Gowaers, the Inclosure Bill was read a third time.

The Court of Chancery (Ireland) Regulation Act Amendment Bill was read a third time.

Adjourned at a quarter to one o'clock.

HOUSE OF COMMONS.—WEDNESDAY.

The House sat from noon to six o'clock.

NEW WRIT.

Sir ROBERT INGLIS, in moving that a new writ be issued for Bath, took occasion to express his high sense of the parliamentary services and private virtues of Lord Ashley.

Mr. MACKINNON and Sir GEORGE GREY expressed their concurrence in the sentiments enunciated.

SUNDAY TRADING

The debate upon the motion for going into committee on this bill was resumed by Mr. WILLIAMS, who complained that Mr. Anstey and other members, unacquainted with the metropolis, had interposed a mass of amendments to subvert and delay a bill which was already in the most mature measure, and much desired by the inhabitants of London.

Mr. ROEBUCK contended that the bill affirmed a principle of general application, and proceeded at some length to censure the injurious and anomalous principles contained in the distinctions drawn in the bill between articles allowed and those prohibited to be sold on the Sunday.

Mr. SPOONER condemned many of the provisions in the measure (very ardent), and argued that it would be hazardous to withdraw it.

Mr. ANSTEY was convinced that legislation on the subject was impossible. There were many anomalies in the bill, and it left untouched the most flagrant violations of the Sabbath. But these anomalies were inherent in the nature of the result sought to be attained. By amendments he could hope to see the measure passed into session, and he could not concede in the wish that it should be re-introduced in the next.

After a long discussion, the House divided, when the motion to go into committee was negatived by 77 to 42, showing a majority of 35 against proceeding further with the bill.

The Landlord and Tenant Bill was considered in committee.

The Fee Farm Rents (Ireland) Bill was read a third time and passed.

Adjourned.

HOUSE OF LORDS.—THURSDAY.

VETERINARY SURGEONS.

Lord BEAUMONT presented a petition from veterinary surgeons, praying to be exempted from serving on juries. The noble Lord then moved the second reading of the Bill which he had introduced to exempt them, which was agreed to.

The Registration of Voters Bill and the Arrest of Absconding Debtors Bill passed through committee.—Adjourned.

HOUSE OF COMMONS.—THURSDAY.

The House had an early sitting at 11 o'clock.

SMITHFIELD MARKET REMOVAL BILL.

On the motion of the House resolving itself into committee on this bill,

Sir J. DUKE said, he was surprised to find by the schedule attached to the bill that the tolls were to be increased 100 per cent., which he thought was a most oppressive charge.

Sir G. GREY said, when they came to the schedules he would be prepared to discuss them, but he should oppose them being settled by a committee up stairs, because a committee of the whole House was the place for them to be considered in.

Sir J. DUKE said in that case he would move as an amendment, that the bill be committed that day six months. The City plan would, he contended, serve every purpose they had in view, and he hoped the Government would again consider the subject before pressing forward this bill. It was, he believed, the first instance in which the Government had ever itself called upon to advance public money for the erection of a market. Up to the present time, the Government did not know, and if they knew they had not stated, what site they had fixed upon for the new market.

Mr HUME thought that the additional rates proposed to be charged were nothing less than taking the property of individuals. He thought the schedules ought to be sent back to the select committee, to which those new rates had not been submitted. He also thought the Government ought candidly to state if they had a site in contemplation for the new market.

Sir G. GREY said, if there should be any serious objection to the new schedules, which were very much in amount the same as the old, the Government would not press them. He begged to repeat what he had said upon the second reading of the bill, that the Government had not felt itself at liberty to decide upon a site until Parliament should have decided upon the measure before it. They had not even an idea of the site which might be intimately selected.

The House then divided, and the numbers were—

For the amendment	..	..	..	..	..	28
Against it	..	..	..	..	..	64
Majority	..	..	..	..	..	36

The House then went into committee.

Sir J. DUKE hoped the right hon. Baronet would say who were to be the commissioners to carry out the bill.

Sir G. GREY said, the Government had not fixed upon any commissioners, and he hoped it would never be necessary for them to do so, for he hoped the City of London would undertake to carry out the bill

The discussion of the clauses, which were agreed to after several divisions, occupied the committee until four o'clock, when an adjournment took place until six o'clock.

ACCIDENTS ON RAILWAYS.

Lord NAAS asked the President of the Board of Trade the following question:—That, as several of the late accidents to travellers and workmen have been manifestly caused by neglect and carelessness, whether it is the intention of the Government to propose any measure during the present session for the more efficient protection of persons traveling by steam-vessels or railroads, or of those employed in working steam machinery.

Mr. LABOUCHERE said the law with regard to steam-vessels was in a very bad state, and he had introduced a Bill on the subject, which had already been read a second time, and he trusted it would receive the sanction of the House this session. In regard to steam machinery and railroads, he did not intend to bring in a Bill this session to give the Government greater powers of supervision than they possessed at present, and he did not think it would be possible to prepare a measure of general application for the better prevention of accidents, without taking away some portion of the responsibility at present resting on the directors.

UNIVERSITY TESTS.

Mr. HEYWOOD moved that the House resolve itself into committee of the whole House, to consider the religious tests at present required by either by the authority of the Crown or by act of Parliament, as a qualification for any civil corporate privilege in the universities and colleges of Oxford, Cambridge, and Dublin.

Mr. EWART seconded the motion.

Lord J. RUSSELL was in favour of removing restrictions which prevented Dissenters obtaining the honours to which scholars were entitled; but he thought this motion went further, and would admit them to the government of Universities. To that he was opposed, and he could not, therefore, agree to the motion in its present shape.

Mr. MILNER GIBSON rose, but the House was "counted out," there not being forty members present.

LOCK HOSPITAL AND ASYLUM.—A general meeting of the governors and patrons of this charitable institution was held on Thursday, at the hospital, Harrow-road, for the purpose of taking into consideration the expediency of having out-patient departments in connection with their establishment in the central part of the metropolis; the Hon. Arthur Kinnaird in the chair. It appeared from the report that the financial prospects of this charity were now assuming a more favourable aspect, as at the end of 1849 they had a debt amounting to £1085, which was now reduced to £630. The number of patients treated during the year were 909; of these, 193 were female and 203 male in-patients, making an aggregate of 396, being about the number admitted to the hospital in 1747. After some discussion, resolutions were passed for carrying out the objects of the charity; and after a vote of thanks to the chairman, the meeting separated.

LOAN FUND BOARD OF IRELAND.—The thirteenth annual report of the Commissioners of the Loan Fund Board of Ireland, drawn up pursuant to the Act 6 and 7 Victoria. cap. 91, has been presented to both Houses of Parliament by command of her Majesty. It appears that the number of societies is 122. The amount circulated during the year 1850 was £669,794, and the number of loans was 188,238. The gross profit amounted to £18,760; interest on capital, expenses of management, bad debts, &c., £16,880; net profit, £1738; net profit, £2,605. The circulation was more last year than in the year preceding by £12,860, while the capital of 1850 was less by £6986 than that of 1849. The report states that the depressing influences of the times had affected those institutions less than in any year since 1845. It was believed that the system worked better now that managers had given more supervision; that less opportunities of fraud had existed; greater circumspection in making loans had been observed; and, lastly, it is said that the people manifested a strong desire to meet their engagements, and some had even voluntarily done so who had embarrassed by American failures in 1847, and having subsequently returned home with some means, had discharged loan fund debts of a long standing. The number of societies was less in 1850 than in 1849 by 28, yet the number of loans exceeded those of 1849 by 1,502. The amount of fines had increased since the year previous by £789. The amounts appropriated to charitable purposes fell short of the grants of 1849 by £386, while the amount in the treasurer's hands in 1849 exceeded that of 1850 by £2900.

LANDS CLAUSES CONSOLIDATION (IRELAND) BILL.—This bill, which has been brought in by the House of Commons by Mr. Labouchere, Sir W. Somerville, and Lord Attorney-General for Ireland, and which is proposed to call "The Railways Act, Ireland, 1851," recites, that on account of the great number of small occupiers, and of other circumstances connected with the tenure of Ireland, the provisions of the Lands Clauses Consolidation Act, 1845, are found to be unsuited to the existing condition of that country; and it enacts, that the Commissioners of Railways should have power to appoint an arbitrator between the company and the persons interested in the land, who should finally adjudicate upon the value of the lands required for the purposes of the railway, the expenses of the arbitration to be borne by the company.

NEW ELECTRIC TELEGRAPH COMPANY.—At the Exhibition, the Electric Telegraph Company put up a board daily, showing the state of the wind and weather in every chief town in the kingdom; and it is said he added the results of the barometer and thermometer each. Recently, however, the company has prepared a far more practically important use of the telegraph—to make a ball fall at the same instant at Greenwich as at other spots in every part in the kingdom; so that ships at Liverpool, Hull, Bristol, Southampton, Newcastle, Shields, Glasgow, Aberdeen, &c., may set their chronometers at the same instant. Liverpool is the first where an observatory is kept up at a cost of from £1200 to £1500 a year, for little else than to enable ships to set their chronometers; and as other ports considerable delay and confusion arises from the difficulty of obtaining chronometers. A statement of the expense of this port notice to all ships of the line will shortly be laid before the Admiralty. The Telegraph Company would not make any charge for the use of the wire to discover the longitude, simply for the first expenses of setting up the needful apparatus, and which would not be great, though, in a national point of view, the service would be most important.

A MEMORIAL TO THE HEROES OF THE CRIMEA at Greenwich has been erected in the parish church of All Saints, Maidstone, to the memory of Lieut.-Colonel Hutchins, of the 11th Light Dragoons, and some of his comrades, consisting of a tablet and figure, in pure white marble, on a pedestal of the same material. It is of white marble, raised, it we may so term it, on an arch of dark slate, resting upon a base of the same material. To the right is a full-length figure, in the uniform of the regiment, of Captain Darby Griffith, having principally in the right hand the standard of the regiment, and in the left a sword, and the cap of the latter thrown off. The arms of Hutchins appear in the centre of the arch, and the following inscription is in the hand pointing to the inscription, as it were, to attract attention to the deeds of the heroes whose names are recorded. On the left is a palm tree, with the leaves drooping over the tablet, on which rest sabres, a carbine, belt, and cartouch-box. At the foot of the palm tree is the regimental shako. The monument is executed by Westmacott.

LAUNCH OF THE SCREW STEAMER "CITY OF MANCHESTER."—This fine steamer, built by the firm of Tod and M'Gregor, Glasgow, was launched on Saturday, from their building-yard at the mouth of the Kelvin. She is the largest vessel ever built on the Clyde, and is the property of the Liverpool and Philadelphia Steam-ship Company. She is intended as a consort to the *City of Glasgow*, in the Liverpool and Philadelphia trade, and in consequence with the new American screw steam-ships, *City of Pittsburgh* and *City of Philadelphia*, between Liverpool and Philadelphia. She has been built with a view to speed, extra accommodation, and comfort to passengers, her internal fittings having been finished in a style equal to any of those princely vessels that now cross the Atlantic. She is fitted up to carry 160 passengers in the first and second cabins, for whose comfort and accommodation no expense has been spared. The following are her dimensions:—Length of deck, 274 feet; breadth of beam, 37 feet 2 inches; length from spar-deck to bottom of keel, 320 feet; burthen, 2125 tons. She is to be propelled by a three-bladed screw, which will be driven by two beam-engines of 400 horse power. She has four masts, which will enable her to show a large surface of canvas, and her sailer management in stormy weather. She is expected to be ready for sea in three weeks, her engines, boilers, &c. being all ready for fitting, and is advertised to leave Liverpool on or about the 25th of next month.

THE WAR IN KAFFIRLAND.

WE have been favoured with the following intelligence, and the accompanying Sketch, by an officer serving in Kaffirland

"Camp, Fort White, April 20th, 1851.

"As I have an opportunity of writing, which may not soon occur again, and as you have shown a wish to know how we are getting on, I shall endeavour to give you a brief summary of the events of the last few weeks. The Commander-in-Chief having been joined by the newly-raised Regiment lately, determined no longer to stand upon the defensive, but to set to work in downright earnest to spoil the Phillistines, and for this purpose a general muster of all arms was ordered on the 18th of March. On the 19th the Division marched upwards, and were ever after a burning sun and continually on the move, and engaged with the enemy until the 30th, our loss was but trifling. The action of the 19th was a regular stand-up fight, the Kaffirs and Hottentots standing and pluck for pluck with our men; and, although they outnumbered us as 4 to 1, and were well armed, we drove them into the fastnesses of the Amatola with great loss. They were about 6000 or 6000 strong, and in some cases actually rode close upon our columns; but the well-directed fire which received them, given with right good-will and effect, both by Borgher, regular, and our Fingoe allies, has, I hope, taught them a lesson which they will not soon forget. We got around with his, but the Chief soon polished the object of our advance, viz. the destruction of the kraals and crops, and the capture of several head of cattle and a few horses.

"On the 30th we marched out with a considerable force, consisting of the 6th and 73d regiments, a party of the Burgher levies, a few of the Cape Mounted Rifles, and part of Armstrong's horse, started at 2 A.M., on the 16th inst., to secure Sandile's cattle, in the vicinity of the Keiskamma and Iqqibga. After a fatiguing march of four hours we came in sight of the kraals, right in our front, when a party of Armstrong's horse, under Captain Robertson, was sent forward to destroy them and capture the cattle. This duty was gallantly and rapidly performed; and though the Kaffirs fought like devils, and tried to recover them, the captured cattle were brought in and made over to Captain Davies of the Burgher levies, notwithstanding the enormous difficulties which the nature of the ground presented. After a short halt at the junction of the Iqqibga and Keiskamma, to refresh both men and horses, all of whom were well blown, we moved down the valley to join Colonel Mackinnon's camp on the Iqqibga, at the missionary station, and we were sharply attacked, *en route*, on our flanks and rear, the ground being much broken and favourable to the

THE WAR IN KAFFIRLAND.—DESTRUCTION OF STOCK'S KRAAL, ON THE KRISKAMMA RIVER.

enemy. Colonel Eyre, who commanded, frequently halted the column, and we dispersed the Kaffirs at the *pas de charge*. They made a vigorous defence at the kraals, but we burned them under their very noses, and captured about 250 head of cattle. Our loss, I regret to say, includes three killed, and eleven horses missing. Poor Fletcher, adjutant of the 73d, in his ardour, was led to follow a retreating body, when he was pounced upon in a kloof by an overwhelming force, and fell pierced by twenty assagais. Captain Morris, of the Lavies, was severely wounded, and Robertson and the rest of the party had a narrow escape; the inclosed sketch will give you a very good idea of the scene of the conflict. The Lavies behaved gallantly, and, indeed, but for them we could not occupy our positions in this country. We want at least four more regiments here; if we had our old friends the Rifle Brigade and some cavalry armed with double-barrelled rifles, we should then stand some chance of terminating the campaign soon; but since Kreli has thrown off the mask, and has joined his forces with those of the common enemy, thus putting 7000 or 8000 additional combatants into the field, it is clear we can do but little beyond standing upon the defensive until the arrival of the 74th and the other troops that were sent out from England. We also want a rocket troop—they would clear the bush in a short time. My own opinion is, the campaign will be a severe one: the Tambookies, and the other tribes, are driving their cattle to the fastnesses of the Amatola, and if we follow them, there will be, I fear, a few vacant places in some of our messes.

ST. ANDREW'S, LAUNCESTON, TASMANIA.

THIS neat edifice has been erected as a Presbyterian place of worship, in Launceston, Van Diemen's Land. Above seventeen years ago, the local government granted a piece of land to the Presbyterians of the above town, on which a substantial brick building was raised, capable of seating above 280 persons; this was done with a view to the structure being appropriated to school purposes at some future period. The first minister was the Rev. J. Anderson, from the Synod of Australia, and who had been brought out under the auspices of the Rev. Dr. Lang. Amidst many local difficulties and opposition from other quarters, the church continued to prosper for several years, until, by an accident, Mr. Anderson was deprived of his sight. His consequent incapability for the usual duties, and the agitation of the "Free Church" question, reduced the number of the congregation, and at last seemed to threaten its existence. At this juncture, the Rev. R. K. Ewing, a very young man, a native of Glasgow, and educated there, was received into the Presbytery of Van Diemen's Land in May, 1848; and, by the united call of the remaining congregation, inducted to the charge at Launceston in July of the same year. An immediate reaction took place. His popularity as a preacher gathered him hearers from all denominations; until, the old building being insufficient, the foundation-stone of a new one was laid by Sir W. J. Denison, Lieut.-Governor, on the 16th October, 1849. The site was granted by the Government, and had been formerly used as a "watch-house," thus forming a practical comment on the words of the Apostle, that "Where sin did abound, grace should much more abound." On the 8th December, 1850, it was opened in a state of completion for divine service. The Rev. Dr. Lillie, from Hobart Town, conducted the first service, preaching from Psalm cxxii. 1, the Rev. R. K. Ewing, Moderator of Presbytery for the year, the afternoon and evening service, preaching both times from 1 Kings, viii. 12, 13. £50 were collected at the several services. The building has cost above £4000, which sum has been raised entirely by voluntary contributions.

NEW CHURCH AT LAUNCESTON, VAN DIEMEN'S LAND.

The architect of the new Church is Mr. Clayton, a native youth. The building consists entirely of colonial materials. The interior is fitted up in a style of elegance and comfort equalled by few, and surpassed by none of the churches in Scotland. The Presbyterian Church in Launceston is now in a vigorous and compact state. The above building was finished in fourteen months. The sum was raised without any great effort. It is attended by about 500 persons, being nearly two-thirds of the entire Presbyterian population of the district; and in other places of worship of the same denomination throughout the island the average attendance, in relation to the census, is larger considerably than is to be found even in Scotland. Strangers generally are struck at once, when they arrive, at the absence of drunkenness in the streets, and the marked quietness and decency with which the Sabbath is observed.

"CLEOPATRA'S NEEDLE."

THIS famed relic of the antique world has an interest which bids fair to be as lasting as that of the Pyramids themselves. About once in ten years public attention is called to the point—of the Needle, by some inquiry as to its future destination. Sometimes this curiosity exhibits itself in the form of a letter from a newspaper correspondent, or a question from a Peer in Parliament. Thus, a few evenings since, in the House of Lords, the Marquis of Westmeath inquired what steps had been taken for obtaining possession of, or for removing, the obelisk called "Cleopatra's Needle," in consequence of the gift made to George IV. by the late Pasha of Egypt, in 1820? The noble Marquis adverted to the proposal made for its removal to this country at the end of the campaign of 1801. The opinion of the late Sir R. Peel expressed to himself was, that it was a monument which ought to be brought to London and erected as a memorial of Sir Ralph Abercrombie and others who had fought and died in Egypt. The late Sir G. Murray also stated that he joined with all his military and naval friends, who desired that the obelisk should be brought to this country. Some obloquy had been thrown on the condition of this monument, under the impression that it was not of adequate value to compensate for the trouble and expense of removal. Perhaps its intrinsic value might not be much; but, as a monument, and as a trophy, it had a value peculiarly its own. The sculptures, he understood, were in comparatively good preservation. He had called attention to the subject solely at the request of several military and naval officers.

The Earl of Carlisle acknowledged the importance which attached to the obelisk, not merely as a memorial of the ancient art of Egypt, but also as a monument of British heroism. He had consulted with his noble friend the First Lord of the Treasury, and inquiries had been made on the subject. There were, he apprehended, some mechanical difficulties; and all he could say was, that the matter was still under consideration.

Pending the Treasury deliberation, it may be interesting to represent to our readers the present position of the obelisk, which we are enabled to do by aid of the sketch-book of an obliging Correspondent. He remarks:—"Scarcely a trace of the former greatness of the ancient city of Alexandria remains—the seat of empire, the emporium of the East, the centre of learning. Among the few objects of antiquity are Cleopatra's Needles, about one mile distant from the city; one of which remains standing, the other is partly imbedded in the sand. Each is one vast block of granite, measuring in length about 70 feet, covered with hieroglyphics. These obelisks are said to have formed the entrance to a palace of the Egypto-Macedonian Kings, and are situated in the midst of the wretched hovels of the Arab poor, in a dreary waste of sand."

Champollion, who has deciphered the hieroglyphics with which the obelisks are inscribed, assigns them to the age of Moris, one of the most celebrated of the Pharaohs, who flourished 1725 years before the Christian era. They were, probably, originally erected at Thebes, and brought down the Nile by the Romans.

The "Needle" has been occasionally the source of much pungency and pleasantry. Thus, we find Mr. Thackeray describing the relic, in his tour "from Cornhill to Cairo:"

"We went to see the famous obelisk presented to the British Government by Mehemet Ali, who have not shown particular alacrity to accept the ponderous present. The huge shaft lies on the ground prostrate and desecrated by all sorts of abomnations. Children are sprawling about, attracted by the dirt there. Arabs, negroes, and donkey boys, quite indifferent, were passing by the fallen monster of stone, as indifferent as the British Government, who don't care for recording their glorious campaign of Egypt. If our country takes the matter so coolly, surely it were wrong on our parts to be enthusiastic."

The reviewer of Mr. Thackeray's work, in *Fraser's Magazine*, adds this lively comment: "England appears, from her apparent bewilderment about the matter, to be in the position of the elderly lady who won an elephant in a lottery. Ten years ago there was spread a rumour that some wealthy tourist, Lord Prudhoe or Colonel Vyse, had ordered its shipment at his private expense, with a view to its erection at the bottom of Regent-street. The shareholders of Waterloo Bridge were on the alert, and a meeting was called by advertisement to petition Lord Melbourne that it might be placed on the centre arch of that hitherto unprofitable structure, with a view to attract passengers. The report went the rounds, not only of the provincial but of Continental journals. At that period we happened to be in communication with the poet Beranger, who took occasion to display, on the part of the French, no mean jealousy of our luck, but rather a generous sympathy with our acquisition."

We have only to add that, in every-day life, when a gift is made, and the acceptor neglects to take away the present, the general inference is that it is not worth having; and in a less intellectual age than ours, this would have been the interpretation of England's insensibility to "Cleopatra's Needle."

CLEOPATRA'S NEEDLE, FROM A RECENT SKETCH.

GRAND MUSICAL FESTIVAL AND FANCY FAIR IN THE GARDENS OF CHELSEA COLLEGE, IN AID OF THE CONSUMPTION HOSPITAL, AT BROMPTON.

GRAND MILITARY MUSICAL FESTIVAL.

The gathering together of full military bands is of rare occurrence. From time to time, two or more bands may be heard at *fêtes*; but the practice adopted in Germany and France, of collecting into one orchestra all the military bands, has not yet been established here. Those persons who have heard in Prussia the divers military bands executing music under one directing *bâton*, have a vivid recollection of the magnificent effect produced by such masses. When the King of Prussia welcomed the Queen of England at Brühl, near Bonn, nearly 900 executants performed the National Anthem and Mendelssohn's "Wedding March." Never can the sensations which the *ensemble* created be forgotten by the thousands, who from Bonn and Cologne crowded the entrance of the palace to witness the reception of our Queen. On Tuesday, at the Royal Hospital, Chelsea, for the first time, the fine bands of the Household troops, comprising the 1st and 2d Life Guards, Royal Horse Guards (Blue), Grenadier Guards, Coldstream Guards, and Scots Fusilier Guards, as well as the Royal Artillery, were formed into one formidable phalanx exceeding 300 executants, on a vast *estrade* that had been erected before the *façade* of the edifice, under the direction of Messrs. Waddell, G. Cooke, Boose, Godfrey, Tatton, Collins, and Schott, the respective masters of the above-mentioned bands. Marches, overtures, waltzes, quadrilles, and fantasias of the most celebrated composers were executed with great precision. The splendid march from the "Prophète," one of the most inspiring works of its class, opened the scheme; the march from "Norma," Wallace's "Maritana" (overture), Meyerbeer's "Camp of Silesia" (overture), Weber's "Euryanthe," Labitzky's "Quadrille of All Nations," were included in the programme. For Wednesday's scheme there were Mendelssohn's "Wedding March," the "Masaniello" overture, selections from "Robert le Diable" and the "Prophète," and Mendelssohn's "Antigone," Weber's "Oberon" (overture), Rossini's "Gazza Ladra" (overture), Beethoven's "Egmont" (overture), besides Jullien's "Exhibition Quadrille," in which our English drummers were quite equal to the French batch of *tambours*. We do not entertain the slightest doubt, that our military bands, if more frequently brought together, under one spirited conductor—the change of conductors is always bad—would quite rival the Prussian execution. It is a curious fact in acoustics, that the stringed instruments in the open air are totally ineffective, and it is only the brass and wind instruments, with those of percussion, which will tell under the blue canopy of heaven as the sounding-board. Our military players are excellent in point of executive facility, but a little more attention to intonation would be expedient.

EXHIBITION AND SALE AT THE WESLEYAN CENTENARY HALL, BISHOPSGATE-STREET WITHIN; FOR THE WESLEYAN MISSIONARY SOCIETY—(SEE NEXT PAGE.)

The grand military and musical performance we have just described, was given in aid of the funds for completing the building of the Hospital for Consumption, at Brompton, under the patronage of her Majesty and Prince Albert; and we are happy to add, that the *fête* on Tuesday and Thursday was remarkably well attended: the intervening Wednesday, however, being wet, the company was not so numerous.

The Illustration is a correct picture of the arrangements for the festival, which was principally held in the courtyard of Chelsea Hospital. Immediately in front of the great central position is the monster orchestra already described. Between the mass of company and the band, the red and blue and gold of whose uniforms lends a very gay effect, seats were reserved for the holders of tickets for the concert, whilst the general assembly promenaded in the grounds. Thus far the musical performance.

The "Fancy Fair" was held in Mr. Benjamin Edgington's huge tent, leftward in the picture; and around were smaller seats, in which refreshments were served. In the large encampment we observed the stalls of the Duchess of Sutherland, the Marchioness of Stafford, the Marchioness of Aldegrove, Viscountess Combermere and her daughter, the Hon. Miss Combermere, the Countess of Harrington, the Countess of Antrim, Lady Charlotte Egerton, Lady Southampton, Lady Louisa Pole, Lady West, Lady Foley, Mrs. Kingsley, Lady Leigh, Lady Shelley, the Hon. Mrs. Charles Ashburnham, Mrs. Philip Rose, and Mrs. Robert Montgomery. The purchasers of elegances at the stalls were very numerous.

Notwithstanding the unpropitious weather on Wednesday, the grounds were well filled: but part of the musical programme was of necessity omitted, owing to the continued rain.

On Thursday the grounds were re-opened at a reduced rate, and the company was exceedingly numerous.

We trust that the proceeds of this festival will materially add to the fund for completing the Brompton Hospital buildings: with the sum of £1760, the product of a concert generously devoted by Mdlle. Jenny Lind to this charity, we have an excellent prospect of this consummation.

FEEJEE THANK-OFFERINGS AT THE WESLEYAN CENTENARY HALL.

At the Wesleyan Centenary Hall, Bishopsgate-street Within, an interesting collection of articles from the Friendly and Feejee Islands of the South Seas was exhibited on Thursday and yesterday for sale. They are *thankofferings* from the natives of the Friendly and Feejee Islands to the Wesleyan Missionary Society, and have been recently brought over by the Rev. Walter Lawry on board the *John Wesley*. Many of these articles are of a singularly curious character. One of them, for instance, is the model of a "Mburi," or *Feejee Temple*, manufactured of cocoanut fibre, of which material, also, the immense rope mat, contributed by the King at the missionary meeting at Lakemba. His Majesty brought in the roll of mats and cloth upon his back, in procession, followed by singers and a hymn, "We'll follow the Lamb." The subscription is generally made up of clubs, mats, spears, clubs, shells, and bowls; pieces of sandal-wood, ladies' dresses, musquito curtains, bales of sinnet, fish-hooks, native flutes, &c. Among the assemblage, there is a sort of pandean pipe with five tubes. Much of the cloth has been beaten out from the bark of trees, and is fine as the finest cotton. The idols are rather symbols than images, such as elephants' and whales' teeth, which represent, indeed, the chief divinity. Fourteen small pieces of peacock's feathers, for instance, stand for Fakatemmuli, daughter of Tuibatakaiana and Halaigalanafi. The collection has been gracefully arranged by the ladies who presided at the sale. We cannot help singling out for their beauty some vases of a classical shape, and some exceedingly pretty drinking cups. Many cases and large trays for human flesh may likewise be mentioned as contrasts. But the cannibal propensities of the natives are now in process of extinction, under the influence of Christianity. Wooden pillows, made of bamboo, with well-ventilated wicker for sleeping in, attract as curiosities; as do also wooden knives and forks.

The printing-blocks made of bark for impressing cloth, with the ink used in the process, are also interesting objects. Some beautiful specimens of coral and shells would also doubtlessly find ready sale. Mats, particularly as the prices put on the most superb examples were very moderate. Fauga, a boy's game, was represented by a set of small quoits; and the class of female ornaments, by a necklace of shells. Youth, beauty, and religion were associated in the contemplation of such items; and we left the Bazaar with feelings of pleasure not unmixed with pious aspiration and hope.

CALENDAR FOR THE WEEK.

SUNDAY, June 22.—First Sunday after Trinity.
MONDAY, 23.—Ledbury born, 1545. Alexander died, 1776.
TUESDAY, 24.—Midsummer Day. John Hampden died, 1643.
WEDNESDAY, 25.—Battle of Bannockburn, 1324.
THURSDAY, 26.—Length of day 16h. 34m. George IV. died, 1830.
FRIDAY, 27.—Allan Cunningham died, 1840.
SATURDAY, 28. Queen Victoria crowned, 1838.

TIMES OF HIGH WATER AT LONDON BRIDGE,

In addition to these Supplements, SEVERAL GRATUITOUS HALF-SHEETS and the LARGE VIEW of the INTERIOR (to complete the series of Views) will be published.

On SATURDAY next, JUNE 28th, will be given with the ILLUSTRATED LONDON NEWS, price SIXPENCE, an extra HALF-SHEET, GRATIS!

Announcements will be made from time to time of the Publication of the Double Numbers.

THE ILLUSTRATED LONDON NEWS.

LONDON, SATURDAY, JUNE 21, 1851.

MR. COBDEN has brought forward his annual peace motion, and the Duke of Wellington has given his annual dinner to the officers who shared with him the "heat and burden of the day" of Waterloo. These two events occurred within four and twenty hours of each other, and both have passed over, without leaving any other traces behind them than certain columns in the newspapers, and pleasant recollections in the minds of those who, in one case, listened to the oratory of Mr. Cobden and Lord Palmerston; and who, in the other, partook of the hospitality of the gallant and illustrious Duke, and listened to the short matter-of-course speeches delivered after the removal of the table-cloth. Nothing, in fact, could be more satisfactory than either. Mr. Cobden moved an address, praying that her Majesty would direct Lord Palmerston "to enter into communications with the Government of the French Republic, and enter into a treaty to prevent a reality of warlike preparations in time of peace, and to promote a mutual reduction of armaments;" and Lord Palmerston showed very clearly that there was no necessity for any such proceeding, that Great Britain and France were excellent friends, that the armaments of France were matters of domestic police and not of foreign aggression, and that we had, in reality, nothing to fear from the present highly improved state of the armaments of Mr. Cobden—thought the period well chosen for expressing them—and, although he could not indulge the pleasing belief that the day had yet arrived when human passions would cease to influence the conduct of nations in their intercourse with each other, he was pleased to see the British House of Commons holding out in this way the right hand of fellowship to the world, and expressing to France more particularly the cordial sentiments, which are fortunately as general in England as they are well reciprocated in France. Mr. Cobden, on his part, was just as highly satisfied with Lord Palmerston as Lord Palmerston was with him; the motion was withdrawn, the affair was left entirely to Lord Palmerston's discretion, and the matter dropped, to the edification and satisfaction of all parties. Thus ended the first peace demonstration of the week.

The second peace demonstration was entirely a private affair, not intended for the public at all, though made known to them by

the caterers for the newspapers. But while the world at large has no right either to approve or condemn the greatest soldier of the age for dining once a year with his brave companions in arms, on an occasion peculiarly interesting to them, the English public, although they know it is no business of theirs, feel sincere satisfaction in reading the account of that annual celebration. They like to hear of it not by any means because they gloat over the idea of Waterloo, but because they rejoice to know that the men who gave peace to Europe and the world thirty-six years ago, is still hale and hearty, and in the full possession of his faculties, and to indulge the hope that he and his companions may yet be spared for many years to share in similar festivities—talking harmlessly of old battles, and not being required to take part in any new ones.

And now what moral should be drawn from these two celebrations? In the one case we have a man who talks of peace as an abstract proposition; and in the other we have a man who put an end to the most desolating and cruel war recorded in history, and thereby gave this country and Europe the leisure to work and thrive. The true philanthropist and the true soldier are both men of peace, and pursue the same object by different roads. Society cannot spare either at present. When the happy day arrives, that the members of the Society of Friends shall not find it necessary to rely upon those domestic soldiers, the police, for the protection of their property and persons—when individuals and nations shall not make brute force the ultimate arbiter of all disputes that admit of no other adjudication—when reason shall sway the minds of all men, as well as all communities—and when universal justice shall reign in the world—we shall be able to spare such men as the Duke of Wellington. In the meantime we wish all success and wide-spread prevalence to Mr. Cobden's admirable principles, and sincerely trust that the day will never dawn when Great Britain shall have no other or surer defence against the aggression or insult of a rapacious, unscrupulous, and ambitious neighbour, than the abstract justice of her cause. Offensive war is a crime and an abomination, but defensive war is a sacred duty; and holding these opinions, we earnestly pray, that, while the race of Cobdens may not fail, we may never be reduced to a scarcity of Wellingtons.

THE summary of the returns of the population obtained under the Census Act has been published, and will be found in another part of our Journal. To that official and valuable document we must for the present refer our readers, for the part culars of the movement of the population during the last ten years. We shall enter more at length into the subject in a future Number of this Journal, and shall from time to time, as further official details are published, direct the attention of our readers to the remarkable facts which they are certain to disclose. In the meantime we shall merely state, that, if the return be at first sight not so satisfactory as might have been expected, a brief examination of the circumstances of the period enables us to explain the diminished rate of increase, and justifies us in stating that the hopes of continued prosperity, and a continued increase of the means of comfortable subsistence f.r an increasing number of people are as great in 1851 as in 1841. For the population not to have room to grow, carries with it many disasters for the population to decline in numbers is replete with social misery. It is synonymous with starvation and death. We can say, with unmixed satisfaction, therefore, that our brief examination of the circumstances of the period justifies the conclusion that the population may, in the next ten years, increase faster than in the last, and be in the enjoyment of continually increasing supplies of food, of comfort, and luxuries, while knowledge and skill will be sure to increase in an equal, if not greater, proportion.

COURT AND HAUT TON.

THE COURT AT BUCKINGHAM PALACE.

Her Majesty the Queen and his Royal Highness Prince Albert, with the Royal children, continue in the enjoyment of perfect health. Her Majesty and the Prince have made almost daily visits to the Great Exhibition during the past week, generally arriving early at the Building, and retiring when the crowd became so dense to promenade with facility.

The departure of the illustrious guests who have enjoyed the Royal hospitality during the past month, has given the public another opportunity for the exercise of a private hospitality, which this week has been freely exercised. Her Royal Highness the Duchess of Kent, and his Serene Highness the Prince of Leiningen, have been frequent guests at the Royal table.

The Queen and the Prince, frequently accompanied by the Royal children, have taken daily drives in the parks, and her Majesty has honoured the Opera with her presence twice during the week.

On Monday Lord John Russell had an audience of her Majesty, at Buckingham Palace. On the same afternoon the Queen and Prince Albert left Buckingham Palace in an open carriage and four, for Claremont, to visit the French Royal family. The Countess of Charlemont, General Wemyss, and Colonel Bouverie attended in another open carriage and four. Her Majesty and Prince Albert and suite returned to Buckingham Palace at ten minutes to eight o'clock.

On Wednesday the King of the Belgians arrived at Buckingham Palace, on a visit to the Queen. His Majesty landed at Woolwich at two o'clock in the afternoon, from the *Vivid* steam-packet, commanded by Commander Smithett, from Ostend. The King was accompanied by the Duke de Brabant, the Comte de Flandre, and the Princess Charlotte. His Majesty looked remarkably well, and apparently more healthful than when he last landed at Woolwich. On landing he was received by a Royal salute from the field battery of Royal Artillery, the guard of honour of the Royal Marines presenting arms, and the band playing the National Anthem. Three of the Queen's equipages in waiting conveyed the King and family, and the Royal suite, to Buckingham Palace, where they arrived at five minutes past three o'clock. The Queen, with Prince Albert, received her august uncle, and the Duke de Brabant, the Count de Flandre, and the Princess Charlotte, on alighting from their carriage. Soon after the King's arrival, her Royal Highness the Duchess of Kent arrived at Buckingham Palace, accompanied by his Serene Highness the Prince of Leiningen to welcome her Royal relative.

The Viscountess Canning has relieved the Countess of Charlemont in her duties as Lady in Waiting to the Queen.

FASHIONABLE ENTERTAINMENTS.

The Marquis of Londonderry gave his grand annual military banquet on Tuesday evening, at Holderness House, to the officers of his regiment, the 1st Life Guards. The entertainment was upon the same princely scale of magnificence marking similar celebrations on preceding anniversaries. The Marchioness of Londonderry had a ball the same evening, which was attended by 1200 leading members of the fashionable world. The noble Marquis entertained the Lord Mayor and Corporation of Dublin at a grand dinner on Thursday. Lord Stanley and a large number of leading Irish peers and commoners were present.

Viscountess Palmerston had an assembly on Saturday last, at the family mansion in Carlton-gardens. The *réunion* was attended by a brilliant circle of the fashionable world. His Royal Highness the Prince of Wales was among the early arrivals. The Prince came in company with the Marchioness of Douglas (*née* Princess Mary of Baden).

Lady Ashburton gave a magnificent *bal costumé* on Wednesday night, at Bath House. The *réunion* was honoured with the presence of a very brilliant circle of the aristocracy, nearly a thousand members of the *haut ton* responding to her Ladyship's invitation. The ball commenced shortly after eleven o'clock, and nothing could possibly exceed the animation with which the whole affair went off. The noble hostess and her distinguished guests appeared to be equally delighted.

Miss Coutts gave a *bal costumé* on Monday night at her mansion, in Stratton-street. The company began to re- down at ten o'clock, and from that hour until after midnight there was a continual succession of arrivals. The saloons at length became so crowded that dancing was quite out of the question, and the brilliant assemblage were for some time reduced to the necessity of promenading—a matter itself of some difficulty. A large proportion of the costumes were the same as those worn at her Majesty's ball on Friday last. Miss Coutts was herself attired in a magnificent costume, studded with diamonds and precious sto e.

Lord Brougham has been suffering from illness since his return from the Continent.

The members of the Fox Club held their fifth meeting at Brookes's, on Saturday. Amongst those were present Hon. Mr. Mostyn, M.P., Lord Anson, M.P., Sir M. Cholmeley, M.P., Earl of Scarborough, Earl of Leicester, Lord Saye and Sele, Hon. Mr H. Duncan, Mr. A. Stephenson, Lord Sudeley, Mr. Alston, Lord J. Stuart, M.P., Mr. Stephenson, Sir G. Phillips, Sir R. Adair, Lord Foley, Lord Cremorne, Mr. Fitzpatrick, M.P., Lord Charlemont, &c.

THE ILLUSTRATED LONDON NEWS.

METROPOLITAN NEWS.

WATERLOO BANQUET.—The Duke of Wellington gave his customary grand banquet on Wednesday evening, in celebration of the anniversary of the battle of Waterloo, to the officers of the army who served under him on that occasion. The muster of veterans who assembled at the banquet was little short of that last year, there being about seventy present. Amongst the guests were Prince Albert, the Marquis of Anglesea, Viscount Hardinge, the Earl of Cathcart, &c.

THE DUKE OF WELLINGTON'S ANNUAL VISIT TO THE TRINITY HALL.—On Monday last (Trinity Monday), the Duke of Wellington, as Master of the corporation of the Trinity House, made his annual visit to the hall of that ancient corporate body at Deptford. After observing the ceremonies usual on these occasions, the Duke attended Divine service at St Nicholas Church, and in the evening presided at the annual dinner at Trinity House.

ROYAL MILITARY ACADEMY.—A board of officers of the Royal Artillery and Royal Engineers assembled at the hall in the Royal Arsenal, Woolwich, at ten o'clock A.M. on Tuesday, for the purpose of examining the gentlemen cadets of the Practical Class, previous to the summer vacation. The examination lasted about three hours, and it is considered, several gentlemen cadets were passed as qualified for commissions in the Royal Artillery or Royal Engineers.

STATUE OF THE LATE SIR ROBERT PEEL IN THE CITY.—On Tuesday, at the City Court of Sewers, Sir Peter Laurie, attended with Mr. B. S. Phillips and Mr. Richard Williams, as a deputation from the committee with reference to the Peel statue, appeared in court for the purpose of explaining to the Commissioners that the committee had named two places as eligible for the bronze statue of the late illustrious senator Sir Robert Peel—one site was the western end of Cheapside, and the other the eastern end of the Royal Exchange. The deputation wished to know whether there would be any objection to their placing the statue upon the first-named site, as that appeared to be the most eligible to the members of the committee. Further information as to the size of the statue at the base and other technical details being required, the matter was dropped until the necessary information can be supplied to the Commissioners.

CLERICAL CONVERSAZIONE.—On Monday evening, a *conversazione* was held at Willis's Rooms, King-street, St. James's, in order "to afford foreign pastors and other religious foreigners opportunity to become acquainted with the clergy and such lay members of the Church of England as take special interest in its affairs." The attendance of English clergymen was numerous, while that of their foreign brethren was somewhat more scanty than was anticipated.

The annual meeting of the Church of England Schoolmasters' and Schoolmistresses' Mutual Assurance Society took place on Wednesday evening, at Bridge-street, Westminster. By the financial statement, it appeared that, over and above the year's expenditure, there were locked in bank £203. Their Graces the Archbishop of York and Canterbury were re-elected patrons for the ensuing year, and the Lord Bishop of London president. The Committee-of-Management for the ensuing year, and the Lord Bishop of Winchester, Archdeacon Hale, Archdeacon Sinclair, Lord Ashley, Lord Robert Grosvenor, Lord Ebrington

HER MAJESTY'S COSTUME BALL.

COSTUMES WORN BY

MR. PEMBERTON LEIGH. LADY AUGUSTA HARE. OFFICERS OF THE 4TH DRAGOONS. LADY MIDDLETON. THE MARCHIONESS OF STAFFORD

COSTUMES WORN BY

COUNTESS OF STRALHEIM. LADY ADELIZA FITZALAN HOWARD. MRS. DANIELL. BARON BRUNNOW. BARONESS BRUNNOW.

HER MAJESTY'S COSTUME BALL AT BUCKINGHAM PALACE.

THE QUEEN'S COSTUME BALL.

THE State Ball, so graciously designed by her Majesty the Queen to give an impetus to the trade of the metropolis, took place on Friday last, the 13th inst., at Buckingham Palace.

The company began to set down at twenty minutes before nine o'clock—and continued to arrive in one uninterrupted stream for more than two hours.

Among the earlier arrivals was Miss Burdett Coutts, who displayed some magnificent jewels. Miss Coutts had, on, among other ornaments, a broad band of emeralds and diamonds, worn in the same manner as a gentleman's baldrick, over the right shoulder to the left hip, where it terminated in a very large clasp of diamonds, used to fasten back the dress, which was open in front, and displayed the petticoat. Mrs. John Townley wore a very elegant costume of cloth of gold, trimmed with bows of purple ribbon and pearls.

The Marchioness of Londonderry's costume was exceedingly splendid. A girdle of diamonds, and a diamond border or berthe, on the top of the corsage, were among the profuse display of jewels on this magnificent dress, which was of exquisitely beautiful embroidered cloth of gold. The headdress was also remarkably elegant, and a perfect blaze of precious stones.

The national costumes of the Turkish Minister, his *attaché* the Prince A. de Vogoride, and that of M. de Lodorizki (a very beautiful Greek dress), produced a great effect from their singularity in such an assemblage. Among the dresses, not of our own Court, though of the same period, were those of Lord Ernest Brace, who wore an extremely *recherché* dress of a Venetian nobleman; Lord Holland, who wore a dress apparently Venetian, a long mantle completely enveloping the figure, of a material resembling Utrecht or uncut velvet, on cloth of gold, and a square velvet cap edged with fur.

Lord Campbell, the Chief Justice of England, appeared in the costume of Chief Justice Hale, and Baron Parke wore the dress of a judge of the time.

The American Minister appeared in the costume of John Winthorp, Governor of one of the New England colonies from 1657 to 1676.

Count T. Bigelow Lawrence represented Cecil, second Lord Baltimore, governor and proprietor of his Majesty's colony of Maryland. In America, and wore a doublet and trunks of crimson velvet, heavily embroidered in gold, trimmings of blue and white satin.

The suite of State-rooms thrown open for this Ball were the Green Drawing-room and its ante-room, the Throne-room, the Picture Gallery, Ball-room Saloon, Yellow Drawing-room, the Music Library, and the Garter-room. These beautiful apartments were illuminated and decorated in a manner to display their magnificence and their artistic treasures with the most consummate effect. A throne was erected for her Majesty and his Royal Highness Prince Albert, in the middle of the west side of the Throne-room. Seated on this throne, her Majesty and his Royal Highness Prince Albert received their numerous and distinguished guests at the commencement of the Ball.

The Throne-Room and the Ball-Room were appropriated to dancing, temporary orchestras being erected in each room for the quadrille bands. The Garter-room and Green Drawing-room were set apart for refreshments during the evening, and supper was served in the State Dining-room.

Her Majesty and his Royal Highness Prince Albert, attended by the Ladies and Gentlemen in Waiting, were conducted by the Lord Chamberlain and the Vice-Chamberlain to the Throne-room.

The guests then walked in procession up the whole length of the room, making an obeisance before the Throne, and passing into the Picture Gallery, from the entrance in the west side of the apartment. This being concluded, a Herald of Arms, the Hon. Leopold Ellis, in the full costume of his office at this period, followed by four pages of four national quadrilles—Lord Vaughan, Hon. Seymour Egerton, Lord Richard Grosvenor, and Mr. Fraser, each in the characteristic dress of the nation represented—entered the Throne-room, and approaching her Majesty, made a profound reverence. The Herald and Pages retired, and joined the national quadrilles assembled in the adjoining apartments.

The orchestra now commenced playing a march, and the Spanish quadrille entered the Throne-room, preceded by their page.

This was followed by the French quadrille, preceded by their page, Lord Richard Grosvenor).

This was followed by the Scotch and the English quadrilles, respectively headed by the Marchioness of Stafford and the Marchioness of Allesbury.

Each quadrille advanced to the Throne and tendered its homage to the Queen When all the quadrilles had performed her Majesty, the Polonaise opened by the English and Scotch quadrilles dancing together. The next dance was that of the French and Spanish quadrilles. The four national quadrilles having danced, lines were formed by ladies of the English and Scotch quadrilles, and by those of the French and Spanish quadrilles, who advanced to the Throne and made their reverence.

Her Majesty and Prince Albert were now conducted to the Ball-room, where the magnificent music of Wilton's quadrille was danced.

The intricate country dances having been performed, the general company prepared for the usual dances.

Her Majesty danced the Polonaise with Prince Albert, the Duke of Cambridge, and Prince Edward of Saxe-Weimar. His Royal Highness Prince Albert danced with her Grace the Duchess of Norfolk.

The splendour and brilliant effect of the costumes of the gentlemen was remarked on all sides. The waving feather, the gay colours, the flowing curls, and the splendid embroidery, the studied elegance and ruffle, the flitting streamers of ribbon, and the highly-picturesque baldrics, gave a colour and variety to the scene, strongly in contrast with the usual sombre effect produced by the universal black dress usually worn by gentlemen at balls.

At a quarter past twelve o'clock, the Queen and Prince Albert were conducted by the Marquis of Westminster (Lord Steward) to the supper-room, and, on returning to the Ball-room, her Majesty danced with the Prince of Leiningen.

Before the conclusion of the ball, a Highland reel was danced by a number of Scottish ladies and gentlemen; her Majesty and all the company playing the Scotch tunes. After which, at ten minutes before two o'clock, her Majesty and his Royal Highness Prince Albert left the State apartments. The Duke of Cambridge, the Prince of Leiningen, and the Queen's other guests in waiting soon afterwards left the Palace. Dancing ceased, and this most magnificent Royal *fête* was brought to a close. About three o'clock the whole of the company had departed.

Our Artists have engraved the Ball-room, and the following costumes:—

HER MAJESTY THE QUEEN.

Her Majesty wore a correct Adelaide dress of the Court of Louis XIV., imported from France by Charles II. The skirt of the dress was of rich grey watered silk, trimmed with gold and silver lace, and ornamented with bows of rose-coloured ribbon, tastefully disposed of diamonds. The front of the dress was open, and displayed another dress of cloth of gold, embroidered in a shell pattern in silver, scalloped and trimmed with silver fringe. The gloves and shoes were embroidered admirably with roses and *fleurs de lis* in gold. Her Majesty wore on the front of the body of her dress four large pear-shaped emeralds, of an immense value. Her Majesty's headdress was composed of a small gold crown placed on the top of the head, and a large emerald set in diamonds, with pearl drops on the side of the head, the hair behind was gathered with pearls.

HIS ROYAL HIGHNESS PRINCE ALBERT

The Prince Consort wore a coat of rich orange satin brocaded with gold, and with a green sprig, the leaves being of green velvet, embroidered in gold and silver, with pink satin roses; he wore upon the shoulder, A baldric of gold lace, embroidered with silver, and edged with a fringe of pink silk and silver bullion, part of the sword. The breeches were of crimson velvet, with pink satin gold lace. Stockings of lavender silk, each of white silk and gold fringe. The waistcoat of the dress was composed of materials of British manufacture. The beautiful silk for the coat, the beauty of which could not be surpassed in any country, was manufactured in the town of Spitalfields, in the county of Middlesex. The lace on the sleeves, which is larger than the arm has four gold Spanish lace turning up round it. The cuffs are square, flap on the shoulders, and trimmed with lace very much like the lace. There are in front a number of large, trimmed down the side and round with broad bands of dead gold, striped down at intervals of about five inches, all the way round the skirt, with gold lace. At each a yard to the hem are rosettes of velvet ribbon, edged with gold lace. The waistcoat is of gold cloth, trimmed about half way up with gold fringe; over an elaborate and antique satin, is formed by gold lace, from which hung a deep fringe of grey silk, with black and gold tassels of different lengths. The robe was lined with fur-coloured satin, grey, and a half length, embroidered at the back with black and gold trimmings, with a deep gold fringe, and bows of rose-de-Chine ribbon.

DUCHESS OF ROXBURGHE.

Robe and train of brown velvet, lined with pink satin looped back with pearls; corsage of old point lace, with a deep point of white satin, trimmed with blonde lace, with a fretwork of silver and silver fringe, having on it a design of leaves and tracery in gold, with pearl flowers.

MARCHIONESS OF BREADALBANE.

A dress of the fashion of the Court of Louis XIV. Robe and train of blue Gobbi moire, trimmed down the skirt with gold lace and ground waved, and bows of crimson satin ribbon; the body and sleeves were striped with gold, and trimmed with fine guipure lace, stomacher of diamonds, ornamented with a petticoat of Indian cloth of gold, trimmed with crimson and gold lace, apron of fine old guipure, over crimson satin, trimmed with gold fringe. Headdress, diadem, and other ornaments of diamonds and pearls, and a veil spotted with gold

LORD FEVERSHAM.

A suit of crimson velvet and satin.

LADY ASHBURTON.

(As Madame de Pompadour)

Green taffetas petticoat, embroidered all over with gold and precious stones—amethysts, emeralds, and rubies—in the most elegant manner, and bordered with gold fringe, gold lace, and burred with cherry satin looped up in each side with superb sprays of rubies, sapphires, emeralds, and pearls. The body covered with bouquets of emeralds, diamonds, and pearls. The ballad is designed, with cherry satin bands, trimmed with diamonds and sprays of diamonds, rubies, and pearls at the back of the hair.

THE PRINCE OF LEININGEN.

His Serene Highness wore a coat of black velvet, the cuffs of gold brocade edged with gold lace, the skirt of the coat and the cuff ornamented with gold buttons; the waistcoat of gold brocade; the breeches of black velvet, which also came down the shoes, the stockings of red silk, and the gloves ornamented with gold fringe. A gold baldric was worn diagonally round the body, trimmed with gold lace and enriched by white and red feathers placed alternately; bows of orange ribbon were placed on the shoulder, and also tied the brooches at the knees and the shoes. The Prince wore the star of the Order of the Garter

MADAME VAN DE WEYER.

Robe and train of gold-coloured satin, lined and faced with black velvet, en revers with rows of pearls, and caught up with pearl brooches, corsage of the same, trimmed with black velvet and pearls to correspond, and bouquets of diamonds; petticoat of white satin, trimmed with a very handsome guipure lace, looped down with bouquets of pearls.

MR. PEMBERTON LEIGH.

An elegant suit of purple velvet

LADY AUGUSTA HARE.

A costume composed of a satin robe de Chêne coloured, trimmed with two rows of guipure and pearls; the manches of white moiré antique, trimmed all round with silver—in front of the manches a bouquet of rose de Chêne, bows of satin ribbon, and pearls; body trimmed with a berthe of pearls.

LADY MIDDLETON.

(As the Countess of Carlisle, temp. Charles II.)

A costume composed of grey satin and silver, ornamented with three bordures of white jet lace and cherry silk; in front of the skirt a rich chevaline of amethysts, pearls, and diamonds; the manches of black velvet, lined with cherry satin, embroidered down the seam with white jet lace, the body covered with rows of amethysts, pearls, and diamonds. Black velvet head-dress, with cherry feathers, pearls, and diamonds

THE MARCHIONESS OF STAFFORD,

As the leader of the Scotch quadrille, wore a costume of Pomona green silk glace, barred with silver lace, the design of which was in a rich and descending scale, the flounce half the breadth, just above the silver, giving scope for a bouffe of the fine lawn full and elastic, heavy which were tied with white and gold ribbons; the corsage being unbuttoned from the throat, displayed a deep French waistcoat of cherry satin, richly trimmed with silver, and having broad flat gold buttons, very large; the skirt, full as that of a riding habit, was pink satin, and richly ornamented with silver fringe and gold lace, the sleeves being loose, broad-brimmed hat, with the pink and white feathers resting softly round it, the gay flutter of the bow of ribbons streaming from each shoulder, and the graceful riding whip thrown in the hand, gave the costume a very piquant character.

THE COUNTESS OF STRATHMORE,

As the English quadrille, wore a robe as it were, with rose coloured and gold ornaments.

LADY ADELAIDA FITZALAN HOWARD,

In the French quadrille, wore white satin dress, with bows of light blue ribbon; the under skirt of cloth of gold, trimmed with silver fringe.

MRS. DANIEL.

Costume of rich Jonquil satin, tastefully arranged with pearls; the facings of rich satin; body and sleeves of magnificent lace.

BARON BRUNNOW.

His Excellency the Russian Minister wore a remarkable costume, being the dress of a Russian Ambassador of the year 1600. It was composed of a rich cloth of green velvet, with bows of gold lace, and gold buttons in front; and an under kaftan of silver cloth having in front a double row of flowers, separated with bars of velvet colour, with a fine border of gold. Sword in united by gold and green velvet, and suspended from a sash of crimson and gold. The cap of green velvet, with sable fur, fastened in front with a large diamond ornament, having a very handsome ruby in the centre, the boots of yellow Russian leather. His Excellency wore both the Jewel and the star of a Russian order of knighthood, and his brilliants

BARONESS BRUNNOW.

The Baroness wore a costume of great and peculiar magnificence, of the Louis Quatorze style. The train was of dark red velvet, trimmed with gold lace, at top and with satin, and the skirt in front of white satin bows of the same, the lace going round in the middle of the bouffes was of gold tissue, and shone in or contrast with diamonds, rubies, sapphires, and also with large sprays of the same gems; the petticoat was of white satin, richly trimmed in front resembling from her top to the bottom and covered with the same precious stones as the skirt, and a deep row of lace going round the bottom of the petticoat, on one side a rose of the same colour, as the train, and on the other side an ornament of diamonds and other gems.

THE GREAT EXHIBITION.

THE flood of visitors seems now to have set in in good earnest, and the pressure daily augments and over-crowding is said, and for Whitsun week being over, every one seems bent upon making up the deficiency by adding to the crowd. On Monday, the number of visitors reached to 7999, and on Tuesday, upwards of 70,000; and when these two days' receipts of the preceding shilling days. In fact, the £vh b thus keeps up its mysterious character, and baffles calculations of an ordinary kind. The class of visitors this week has been essentially different from that of the previous one, the great mass being of the artizan instead of employed. But, from all we can learn, there is every probability that each day will have its own due admixture of both. Manufacturers are making arrangements for closing their works at a stated period, thus allowing the workpeople to come up in a body. Many of these gentlemen have availed themselves of the Whitsun-week to visit town, to arrange for the better accomodation of their hands' wishes, and have been edified by the crowds of those very hands passing leisurely defrayed by the manufacturers, in aid of the funds arising out of the entire formed, where large bodies of workpeople are employed, for the purpose of making a provision to suit the big great of the year. Such would be the means of inducing provident habits in the worker, and suggested liberality to the employer, which may have a lasting influence in the future relations wherein they will stand to each other.

The "gem" mania continues. The Duke of Devonshire's hawk, a model of a bird beautifully executed with precious stones of various colours, and of a value approaching £30,000, has been added to Indian collection. The great diamond has been the subject of an experiment by which it was expected its beauties would be more developed than in days of old. The whole of the fittings were boxed up in deal planks and crimson cloth. A gas light was introduced to illuminate "the mountain" but, after all the trouble, it could not be got to display itself in a satisfactory manner. The mysterious-looking arrangements attracted greater crowds than the diamond had formerly done, to the crystal cage stands as before.

The magnificent present of the Nawab Nazim of Bengal has arrived, but how to arrange it to advantage is a question of some moment. "Wanted, an Elephant," was an advertisement which appeared in the *Times* of Monday last, and in the columns of a newspaper; for how to show a howdah without a suitable form to fix it upon, was a point which puzzled those who had got over so many difficulties. A basket-carriage, with the howdah on the top, would make a sticker "dummy," to carry, probably, one of the most interesting objects of the whole Exhibition. Gold and precious stones, silk, native calico furniture, silver poles, and golden umbrellas, are among the items of the magnificent gift to our beloved Queen.

The Maharajah of Travancore has followed the Nawab Nazim's example, and sent his present to her Majesty. This consists of a magnificent ivory throne and footstool, wonderfully carved, and studded with diamonds and rubies. Thus the riches and interest of the Exhibition are almost hourly on the increase. Additional examples of sculpture, too, have been placed in the Nave; the trees have been duly washed and watered, a most important point, if the beauty they add to the effect of the Crystal Palace is to be preserved, and promised to contribute now works, but have failed to do so; but Mr. Frank Mori, Mr. Edward Flower, and Mr. Stegall have successfully entered the field. The performance of Gounod's "Sanctus" (twice), the "Hallelujah Chorus" (twice), and a Motett and "Libera me," by the gifted composer of "Sappho," would alone have stamped Mr. Hullah's undertaking as entitled to the highest eulogium.

MUSICAL EVENTS.

The Choral Fund, established in 1827, under her Majesty's patronage, gave their annual concert in aid of Affected and Distressed Musicians, and their Widows and Orphans, at the Hanover square Rooms, last Monday evening. Handel's "Messiah," Mozart's "Ave Verum," Dr. Bishop's "With Mirth," Haigrove's principal violin, and Mr. Turle as organist, was performed. The principal vocalists were Miss Louisa Pyne, Miss Kearns, Miss Dolby, Mr. Donald King, Mr. F. Bodda, and Mr. H. Phillips.

M. Bil ot's second classical concert of pianoforte and vocal music took place at the Hanover Rooms, on Monday morning, assisted by Madame Thilion and M. Sainton-Dolby, Mr. Blagrove, and Signor Piatti. The concert began by Sonata in A, Haydn's piquant Caprice in C, Dussek's fine sonata in C minor, and masterly studies by W. S. Bennett, Hunsell, Chopin, Moscheles, and Thalberg. Madame Thilion's singing of Vivier's touching "Le Retour du Marin," was exquisite.

Mr. Cooper, the accomplished violinist, had a classical chamber concert on Monday, at the Mortimer street Rooms, with the assistance of Sainton, Hill, Oppenheim, and Sturdaee Bennett. Mr. Cooper played Mozart's sonata in B flat, No. 4

The Royal Music-Hall, Lowther Arcade, under the title of Grand National Concert, on agreeable programme was provided last Monday: in which the talents of the Collins family, the Lockwood family, Misses Mossett, Eyles, Jolly, and Messrs. Collins and Le Brun were included.

At the fourth extra *matinée* of the Musical Union, last Tuesday, Ernst, Halle, Deloffre, Hill, and Piatti were the able executants. The scheme comprised Beethoven's Quartet in D, No. 3, and Mozart's in E minor, Op. 89, with the pianoforte and violin sonata in F of the latter; and pianoforte solos by Chopin, Weber, and Mendelssohn. The Directors' *matinée*, next Tuesday, will include the rare celebrities of Joachim.

The third concert of the Whittington Lyric Club took place last Monday, under Mr. Shonbridge's direction, with Mr. J. M. Wingrave as pianist. The selections included Beethoven's and mathias's by Spofforth, Elliott, O. Gibbons, Horsley, Webbe, Bishop, T. Cooke, Dr. Clarke, and Beale

Guido Regondi and M. Kuhlmark, the pianist, presented a very attractive morning concert last Saturday, at Beethoven Rooms, at which a numerous and fashionable company were present. Regondi, as a guitarist and concertinist, is a first-rate player; the popularity of the concertina is mainly owing to his exquisite refined style of execution. The vocal pieces included the admirable singing of Sivori, Piatti, and Botticini, three of the lions of the season, on their respective instruments; Miss Catherine Hayes, who sang charmingly an aria, composed for her by Balfe, "Come pur ameno," and a song, "The Dew," by Chaminade; the Misses Pyne, Signor Marras, and Bottoni, Mr. Whitworth, and Herr Mengis. Miss Louisa Pyne's "Cease your framing" was quite equal in brilliant execution to any of the florid displays of the foreign artists of the day. Mr. Frost was the accompanyist.

A *matinée littéraire et musicale* was given on Wednesday, at Staff wi-house, by M. Stanislas David, with the special and kind permission of her Grace the Duchess of Sutherland, and under the patronage of her Majesty, his royal highness Prince Albert, the Duchess of Gloucester, the Duchesses of Norfolk, Sutherland, and Argyll, the Marchionesses of Douro, Staff rd, and Kildare, and the Countess of Jersey. M. David declaimed several pieces of poetry, including that by Victor Hugo, "L'Ange et l'Enfant." We shall publish in our next Number an Engraving of the Gallery of Paintings, in which the *matinée* took place. Owing to the non-appearance of Madame Viardot at the Royal Italian Opera, she was prohibited by her engagement from singing anywhere at pub lic concerts until after her *début*, and Miss Catharine Hayes was therefore her substitute, Mdlle. Rachel reciting a scene from "Athalie." M Lovasor singing two of his comic scenes, and Mdlle. Meara performing some of Chopin's pieces on the pianoforte

Mr. Benson, of the Temple, a tenor singer of classic taste, gave an evening concert, on Wednesday, at the Duchess of Gloucester, the Duchesses of Norfolk, Sutherland, and Argyll, the Marchionesses of Douro, Staff rd, and Kildare, and the Countess of Jersey. M. David declaimed several pieces of poetry, including that by Victor Hugo, "L'Ange et l'Enfant." We shall publish in our next Number an Engraving of the Gallery of Paintings, in which the *matinée* took place. Owing to the non-appearance of Madame Viardot at the Royal Italian Opera, she was prohibited by her engagement from singing anywhere at pub lic concerts until after her *début*, and Miss Catharine Hayes was therefore her substitute, Mdlle. Rachel reciting a scene from "Athalie." M Lovasor singing two of his comic scenes, and Mdlle. Meara performing some of Chopin's pieces on the pianoforte

Mr. Benson, of the Temple, a tenor singer of classic taste, gave an evening concert, on Wednesday, at the Queen's Concert Rooms, assisted by Messrs Birch, Dolby, and Phillips, Signor Marchesi and Mr. Phillips Mr. W. S. Bennett (piano), Mr. Willy (violin), Mr. Lucas (violoncello), Mr Richardson (flute), with Mr. Lindsay Sloper as conductor

The popular and accomplished contralto, Miss Dolby, and the able pianist, Mr.

Lindsay Sloper, gave their annual morning concert on Tuesday, at the Hanover Rooms, in the presence of a numerous and fashionable assemblage. The two *Benefactaires* afforded highly gratifying examples of their ability. Ernst and Blumenthal, Mr. Willy, Mr. Lucas, Mr. Schumann, Misses Birch, Millis's Grammatti, Herr Sitzelli, Herr Reichart, and Herr Stockhausen, were included in the programme.

Messrs. H. and R. Blagrove had their second quartet concert, at the Mortimer-street Rooms, on Friday evening, assisted by Miss Thornton, Herr Pauer, Clementi, and Lucas.

The Sacred Harmonic Society performed last night, at Exeter-hall, Haydn's "Creation," under Costa's direction, with Miss Catherine Hayes, Miss Birch, Mr. Sims Reeves, and Herr Formes, as principal singers, for the second time.

A concert of concertinaists was held yesterday morning at Willis's Rooms, at Mr. Pye Case's concert, who secured the co-operation of Miss Louisa Pyne, Miss Pyne, Mrs. A. Stone, Miss Case, Mr. R. Blagrove, Miss Hall, Mr. Lake, Master Wade, Mr. J. Case, Mr. Buckland, &c.

Next Monday will be the eighth and last Philharmonic Concert, the first of Mr. Brinley Richard's *matinées*, Mr. Milne's Scottish *soirée*, and Mr. John Parry's entertainment.—On Tuesday will be Miss Dolby's morning concert, the second concert, the meeting of the Madrigal Union, and Herr Kauffmann's concert.—On Wednesday will be the first evening concert of the young and gifted *pianiste*, Miss Goddard.—On Thursday will be Mr. Seekely's second pianoforte *soirée*, Miss Chandler's concert, and Mr. W. Sinclair's Jacobite Minstrels of Scotland, at the Music Hall; and the Sacred Harmonic Society, in Exeter Hall.—On Saturday will be the second matinée of Miss Ellen Day and Mr. John Day.

Mrs. Anderson's annual morning concert took place yesterday at the Royal Italian Opera, Covent Garden, a notice of which will appear in our next publication.

FOREIGN MUSICAL NEWS.

After ten performances of *Zerline*, or the Bride of the Abruzzi, and *Orangers*," Mdlle. Alboni re-appeared at the Parisian Grand Opera as *Fides*, in Meyerbeer's "Prophète," in which a new tenor, M. Chapuis, made his *début*, as *Jean of Leyden*. He has a very fine voice, but is an indifferent actor, and the music is too high for him.

Auber's "Enfant Prodigue" continues its successful career.

Rosenti, at the end of his London engagement, will make his first appearance at the Grand Opera in Paris.

MR THACKERAY'S FOURTH LECTURE.

The subjects of this discourse were Gay and Pope. The former was treated more in connection with the latter than independently. The sketch given by Gay of the lovers in the storm was much admired by Pope, who was the most refined and polished of writers. He, however, borrowed from all available sources, even audacious in other poets. He practised his versification early and, by private reading, supplied the defects of his education. His childhood studies are like a fairy dream. When seventeen years old he addressed love-letters to a Lady M——. They were written in a style of considerable purity

"IL PRODIGO," AT HER MAJESTY'S THEATRE.—SCENE THE LAST.—(SEE PRECEDING PAGE.)

SCENE FROM THE NEW PLAY OF "INGOMAR," AT DRURY-LANE THEATRE.

THE author of the very effective drama of "INGOMAR," now so elegantly translated by Mrs. Lovell for this theatre, is the celebrated M. Halm, whose tragedy of "Griselda" is one of the most pathetic of German poems. We this week give an illustration of the scene in the first act, which, as we have already stated, is repeated in the last act, thus, as it were, completing a circle of dramatic interest. It presents the ancient city of Massilia (now Marseilles), and is both curious and picturesque in its archæological details. Between this scene and its re-appearance in the last act, the real business of the play is transacted—the triumph of female beauty and innocence over the ruggedness of the savage nature. The theme of the play is the prettiest. It is also (the other extreme of the bipolarity) the sublimest; the mid-point and synthesis representing the beautiful. The combination of these three elements makes the attraction of this drama; and if it has not an extraordinary run, it will be owing entirely to the circumstances of the management, and not to the want of the proper stage qualities in the acting play. We have witnessed it a second time, and, notwithstanding faults of Mr. Anderson's own acting, which are egregious, we were in a state of delightful sympathy with the persons and actions of the play during the whole performance. The performance of Miss Vandenhoff is exquisite; and a renewed inspection of Mr. Ray's *Polydor* has served to confirm our conviction that the actor in question is an artist of consummate ability. He must be drawn forth from his obscurity.

TESTIMONIAL TO MDLLE. JENNY LIND.

OUR readers have received so many commemorations of the active benevolence of Mdlle. Jenny Lind, that they will not be surprised to hear of [illegible]-tion to the United States, where this highly-gifted lady is now singing.

On the evening of Mdlle. Lind's arrival in New York, by the steamship *Atlantic*, she was waited upon by the firemen of the city, who not only most cordially cheered her, but received her with the music of the excellent bands of the Fire Department. It will be recollected that the receipts of Mdlle. Lind's first concert were given to the several charitable institutions of the city; and the "Widow and Orphan's Fund" of the Fire Department received by far the largest share, viz. 3000 dollars, or about one-fourth of the whole. The Firemen, therefore, to evince their gratitude, held a public meeting; and in a gold box, purchased by subscription for the purpose, resolved to convey to Mdlle. Lind the resolutions passed at the meeting; and also a rosewood book-case containing Audubon's "Birds and Quadrupeds of America." These testimonials of gratitude were presented to Mdlle. Jenny Lind by W. Mills, president of the Fire Department Fund, on the 16th ult., and most graciously received. We have engraved one of these tributes, stated to be the largest gold box ever made in America, and a splendid specimen of workmanship. The dimensions are—length, 7 inches; width, 3 inches; depth, 1 inch. In the centre of the lid is a scroll, bearing the following inscription:

The Firemen of New York
to
MISS JENNY LIND.
Sept. 13th, 1850.

GOLD BOX PRESENTED TO MDLLE. JENNY LIND, BY THE FIREMEN OF NEW YORK.

Supporting the scroll, and on either side of it, are branches of laurel and of oak—the one emblematic of friendship, the other of fortitude—beautifully worked in green enamel.

In the two upper corners of the box are engraved the initiation and discharge certificates of the Fire Department—the one surmounted by the flags of Sweden and America, with a lyre between; the other by the same flags, and the appropriate emblems of the firemen, the hook and ladder, &c. A rich chasing surrounds the rim; and the whole is at once massive and elegant, harmonious, chaste, and tasteful. The box weighs twelve ounces, and has been manufactured by J. W. Faulkner.

Our New York correspondent adds:—"By an announcement made by Mr. Barnum in this morning's *Tribune* (June 3), we learn that the engagement between him and Miss Lind will terminate at the one hundredth night; and ninety-one concerts having been given, but nine remain, one of which will be given in this city, and the remaining eight in Philadelphia and Boston.

SCENE FROM THE NEW PLAY OF "INGOMAR," AT DRURY-LANE THEATRE.

CURIOUS PRESENT.—Among the presents offered to the King of Hanover, on his eightieth birthday, a week or two ago, was one of a modest, but, nevertheless, interesting kind. It consisted of nothing more than a white cotton pocket-handkerchief, on which was printed, in red colours, a family portrait of George III. and Queen Charlotte, with nine of their Royal children, with the names and ages of each. The King of Hanover is represented as a boy of four years old, playing at the feet of his Royal mother, who holds Prince Adolphus, the late lamented Duke of Cambridge, a baby, in her arms. This curious old relic, printed 76 years past, had been preserved in the family of the anonymous donor from that period to the present day. The handkerchief was post addressed to the Princess Royal, who presented it to the King, by whom it was received with thankful emotion.

By the death of Mr. Barnard, a vacancy is caused in the representation of the borough of Greenwich. The late member sat for the borough nearly twenty years, having been elected in 1832. A supporter of the Government will be immediately brought forward.

EXHIBITION OF THE NEW SOCIETY OF PAINTERS IN WATER-COLOURS.—"HOPPERS."—PAINTED BY WILLIAM LEE.

"HOPPERS." PAINTED BY W. LEE.

THIS is Mr. Lee's picturesque contribution to the Exhibition of the New Society of Painters in Water-Colours, in Pall-Mall. It is a scene of charming nature, very nicely represented. The artist could scarcely have chosen a happier phase of truly English rustic life: the occupation is so winning, as to afford amusement to children, who love to gambol amid the luxuriance of the hop-ground. The business of the picking is, however, not forgotten here by the painter; the wood-framed bins and the pickers at the sides, with the placing of the poles, are correctly given; and the whole scene reminds how superior is the picturesqueness of the English hop-garden to the boasted vineyards of the Continent.

THE GREAT EXHIBITION.

THE Messrs. Garratt, of Saxmundham, Suffolk, the well-known agricultural implement manufacturers, lately gave to the persons in their employment—nearly 300 in number—a treat they will not easily forget, in an opportunity of seeing the wonders of the Crystal Palace. Messrs. Garratt fitted up and victualled, entirely at their own cost, two schooners, the *Margaret* and the *Jane*, of Aldborough, and had them towed by the steamship *Joseph Soames* to London, where they remained a week; the workmen living on board during their stay. The vessels were moored off the Horseferry-wharf, Millbank, as being the point most convenient to the Great Exhibition Building. The charge of the people was entrusted to Mr. Woolnough, the principal foreman of Messrs. Garratt's works, to whom great credit is due for the satisfactory manner in which the whole trip was carried out.

The Messrs. Garratt deserve great praise for the liberality and kindness thus shown to their workmen, and we have no doubt it will be fully appreciated by them.

INTERESTING DISCOVERY AT THE DEANERY-HOUSE OF WATERFORD.

WE have been favoured with the following communication (with a Sketch) from the Very Reverend the Dean of Waterford:—

It was always known that a large vault existed beneath the Deanery-House at Waterford; but it was never explored, nor was it known how far it extended. On coming to reside here, I found this an object of interest to the antiquary, and proceeded to explore and re-open the crypt.

At the commencement of the work, we found the end of the crypt filled with rubbish, so that no more than two-thirds of its entire extent was visible by lamp-light, and all was darkness, no ray of light being admitted into it. On removing some of the rubbish, there was discovered at the extreme end (the south) a pointed arch doorway; and on proceeding with the work, this was found to lead to a spiral stair. Proceeding up the stairs, we found ourselves in an apartment adjoining the coach-house, the entire staircase having been filled up with rubbish, and part of the offices built over it. The present Deanery was erected about 150 years since. Having removed the building, the staircase was made to open into the garden. This was evidently the stair of a round tower, leading to the upper story of the ancient buildings.

It still remained to find the original entrance to the lower part of the buildings, which might be presumed to exist. Perceiving at about the centre of the east side of the crypt three steps and an archway over them, as of a porch, I opened the passage, removing a wall built at a period subsequent to the rest of the building, and which, as I had expected, proved to have been built to stop up the original entrance. After removing the rubbish and earth, and ascending five steps, I came to the threshold of the ancient gate of entrance; still proceeding upwards, and ascending in like manner five other steps, I came to a broad landing of flags, which must have been the original level of the exterior (and which is at the present level of the gardens adjoining the Deanery). I was still five feet below the level of the present surface, and found the intermediate soil to be chiefly composed of lime rubbish and the *débris* of old buildings.

To reach the level of the floor of the crypt and the bases of the pillars, it was necessary to remove two feet and upwards of rubbish from the centre.

The whole length of this crypt is 60 feet—the breadth, which is uniform, 19 feet. The arch of the vault, which reaches from east to west, is a semicircle, and the whole is supported, and divided into two equal aisles, by 'massive arches, broad and round,' springing from

Ponderous columns short and low;

In Saxon strength the abbey frowned.

evincing the character of the original building, when, like that of Lindisfarne,

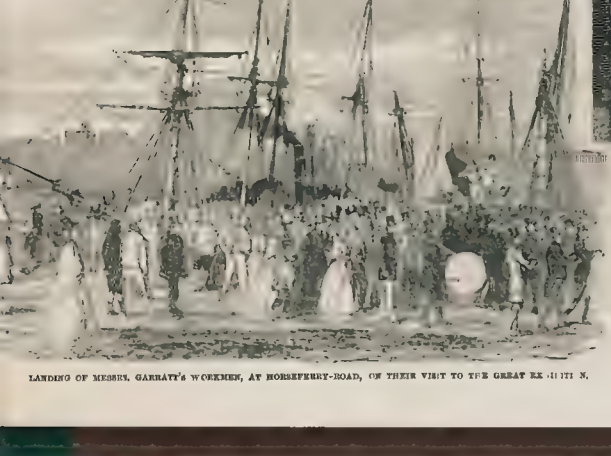
The counter arches are semicircular, springing from pillars square, but *chamfered* at the corners. Of these pillars there are five distinct, and two pilasters, forming six arches, running from north to south. The height of the crown of the arch is 11 feet, that of the pillars 6 feet 2 [illegible] the distance between the pillars 8 feet and a half. The entrance at the east side is 5 feet and a half wide. From floor to threshold of this entrance are five steps of 9-inch risers; and from thence to the original level are five steps more.

CRYPT RECENTLY DISCOVERED UNDER THE DEANERY-HOUSE, WATERFORD.

The spiral stair at the south end is 8 feet and a half in diameter, and consists of 21 winding steps of 6-inch risers. The pointed door-arch at foot of stairs is 7 feet to the point of arch. The window of stairs is 3 feet below the present exterior level.

In the rubbish on the floor, two feet below the surface, was found a coin, having on one side a ship, and on the reverse three *fleurs de lis* in a lozenge, with the following word inscribed three times on each side, which I do not understand, 'Orborum.' There is no date on the coin. It is believed that this is a piece of the *black* or *mail* money, decried *temp.* Edward IV., but in circulation till Charles II., called 'Nuremburgs.'

There were also found several pipes and bowls of pipes of a peculiar form and small bowl. These, it is conjectured, may have been left there by some of Cromwell's soldiers. A very few human bones were also found, at two feet deep. The greater part of the pillars and the entire of the pointed door-arch are built of a white soft stone, which I believe to be Caen stone; the rest is of native limestone. There are four open-



LANDING OF MESSRS. GARRATT'S WORKMEN, AT HORSEFERRY-ROAD, ON THEIR VISIT TO THE GREAT EXHIBITION.

ings, originally windows, but now beneath the outer surface, at the west side, and one at the end of the east side. It is probable that the crypt extended further, but was cut off to erect the Deanery at one end, and the Town-hall at the other.

"A second vault, hitherto used as a coal-cellar, extends from the northern end of the crypt above described which is curious, as containing in the roof large quantities of the *hurdle*, used for the centreing of the arch in the original building of the edifice. In a brick partition dividing off a wine-cellar in this vault, I found built up and plastered over as part of the partition, a finely-carved piece of oak, apparently part of an altar-screen, measuring seven feet by twenty inches—in good preservation. The buildings appear to be of the twelfth century, when King John built a palace in Waterford, adjoining the cathedral, and the present site of the Deanery.

"Within twenty yards of the Deanery are the ruins of a Franciscan Abbey, containing some fine lancet-windows and pointed arches, and several curious tombs of the 15th, 16th, and 17th centuries, and a fine mural monument. On several of these tombs are the four letters, I. M. R. A. The meaning of these letters I have not been able to learn. On one of the tombs, representing the crucifixion, &c., is the *sword* used by Peter, and the *right ear* of the servant which he cut off

"There is a fine altar tomb in the Cathedral close, one half of which had long lain buried under the pavement, until I restored it a few days since. It represents a Mayor of Waterford, of the name of Rice, who flourished in the middle of the 16th century, and represents his figure as a corpse, as it was found *twelve months after interment*. Worms, toads, and reptiles are represented crawling out of the body, and about the head and stomach. Around the sides of this tomb are finely executed bas reliefs, representing the twelve apostles (six at each side), and at the head three Bishops, one in the centre sitting in his chair, and holding a crucifix between his knees; as feet are the Virgin and Child, St. Catherine with her wheel, and a third saint."

OBITUARY OF EMINENT PERSONS RECENTLY DECEASED.

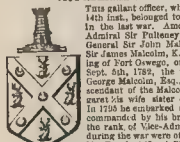
VISCOUNT MELVILLE.

ROBERT DUNDAS, second Viscount Melville, of Melville, in the county of Edinburgh, and Baron Dunsa, in the county of Perth, Lord Privy Seal in Scotland, and Chancellor of the University of St Andrew's, was the only son of Henry Dundas, the first Viscount, and was born on the 14th March, 1771. He was educated at Emmanuel College Cambridge. In his early and middle life, Robert, second Viscount Melville, occupied a somewhat prominent place in the political world, having been President of the Board of Trade in the Administration of Mr. Perceval, from 1809 to 1814. In the subsequent Government of Lord Liverpool, he was appointed First Lord of the Admiralty, which office he held from 1812 to 1827; and, after the short interval of the Canning and Goderich Administrations, he resumed it in 1828, and finally retired in 1830. Latterly, his Lordship has chiefly resided in the county of Edinburgh, in the affairs of which he evinced great interest, taking a leading part in all that related to the management of the public roads, as well as in other local matters falling within the scope of his jurisdiction as a commissioner of supply and justice of the peace. Lord Melville, who succeeded to the peerage on the demise of his father, the first Viscount, the 29th May, 1811, had married, in August, 1796, Anne, daughter and co-heir of Richard Hack Saunders, Esq., M.D. and grandniece and co-heir of Admiral Sir Charles Saunders, K.B., by whom (who died the 10th September, 1841) he leaves, with other issue, an eldest son, the Hon. Henry Dundas, K.C.B., and lieutenant-colonel 60th K. Rifle Corps, now Lord Viscount Melville. The death of the second Viscount occurred on the 16th inst., at his family seat, Melville Castle, near Edinburgh, where he expired in his 81st year, surrounded by his sons and daughters. The deceased peer's father, Henry Dundas, the first Viscount, was the well-known Lord Melville, who was impeached in 1805, and acquitted, and to whose memory there stands a magnificent statue in St. Andrew's-square, Edinburgh.

SIR JOHN MURRAY MACGREGOR, BART.

SIR JOHN ATHOLL BANNATYNE MURRAY MACGREGOR, Bart., of Macgregor, in the county of Perth, was the eldest son of Major-General Sir Evan John Macgregor, the second Baronet, Governor-General of the British Windward and Leeward Islands, and was born the 20th January, 1810. He succeeded to the Baronetcy on the demise of his father, the 14th June, 1841, and early in the present year he was appointed President of the Virgin Islands, and assumed his government at Tortola, on the 24th of last March, but, to the inexpressible grief of all who knew him, he has not held it two months. He died of fever, on the 11th ult., in his 42d year, and was interred in the island His remains were there deposited in a leaden coffin, with the intention of their being removed on some future day to the vault of his ancestors. Her Majesty's brig *Helena*, being in port at the time of his funeral, fired minute guns; and the officers and crew, as well as the chief population of the island, attended the burial of the lamented President. Sir John, who was chief of his clan—the Macgregors of historic and romantic fame, married, the 14th November, 1833, Mary Charlotte, youngest daughter and co-heir of Rear-Admiral Sir Thomas Masterman Hardy, Bart., G.C.B., Governor of Greenwich Hospital, and leaves, with two other sons and a daughter, an eldest son, Malcolm, the present Baronet, a youth of seventeen.

VICE-ADMIRAL SIR CHARLES MALCOLM, K.C.B.



THIS gallant officer, whose death occurred at Brighton on the 14th inst., belonged to a family pre-eminently distinguished in the last war. Among his brothers we may name the late Admiral Sir Pulteney Malcolm, G.C.B., who died in 1839; General Sir John Malcolm, G.C.B., who died in 1833; and Sir James Malcolm, K.C.B., Colonel of Marines at the storming of Fort George, on Lake Ontario. Sir Charles was born Sept. 5th, 1782, the tenth and youngest son of the late George Malcolm, Esq., of Harnfoot, county Dumfries (a descendant of the Malcolms of Lauders and Lunaris), by Margaret his wife sister of Admiral Sir Thomas Pasley, Bart. In 1795 he embarked as midshipman on board the *Fox*, 32, commanded by his brother Pulteney, and in 1797 joined the rank of Vice-Admiral of the Blue. His public services during the war were of importance, and are fully described in Mr. Byrnes "Naval Biography," wherein the memoir of Sir Charles occupies three closely printed columns. Sufficient for our purpose to state that the gallant officer was actively employed in the East and West Indies, and the Channel. When in the *Narcissus* (32), in the Mediterranean, he captured with four boats on a convoy of 30 sail, lying in Conquet Road, near Brest, under the protection of several heavy batteries, but was eventually obliged to retire; and in the same year it was his fortune to be the chief in command destroying the property of the British at Oporto from falling into the hands of the French From 1828 to 1838, Sir Charles held the appointment of Commander-in-Chief, Indian Navy. He married, first, June 4th, 1808, his cousin Magdalene, daughter of Charles Pasley, Esq.; and, secondly, April 11th, 1829, Elmira Riddell, youngest daughter of Major-General Shaw. By the former, he leaves one daughter; and by the latter, three sons.

LORD DUNDRENNAN.

THOMAS MAITLAND, Esq., of Dundrennan, in the stewartry of Kirkcudbright, a distinguished Scotch Advocate, and a Member of the College of Justice, with the title of Lord Dundrennan, was born the 9th October, 1792. He was a scion of the ancient and noble family of Maitland, to which belong the Earls of Lauderdale; his own branch springing from William Maitland, an eminent Scottish statistic during the latter part of the seventeenth century. Mr. Thomas Maitland was called to the Scotch bar in 1813, where he obtained a large practice and was particularly successful in jury cases. He represented Kirkcudbright in Parliament; he held the office of Solicitor-General of Scotland, under the Administration of Lord Melbourne, in 1840 and 1841, and again, also, until very recently, when he was appointed a Judge, upon which occasion he took the titular designation of Lord Dundrennan. His Lordship married, the 31 July, 1815 Isabella Ann, daughter of the late James Macdowall, Esq., and sister of the late William Macdowall, Esq., of Garthland, M.P. for the county of Renfrew, by whom he leaves four sons and three daughters. The learned judge had but just returned from the Northern circuit, where, during the Judicial at Lord Monzieff, he presided alone, when, after a short illness, he died on the 10th inst., at the residence of his brother, in Moiville-street, Edinburgh.

THOMAS MOULE, ESQ.

THIS gentleman, who was an antiquarian, topographical, and heraldic writer of no ordinary ability, died on the 14th inst., at his residence, Stable Yard, St James' Palace, aged 66. Mr. Moule was the author of the following works: "Antiquities of Westminster Abbey," "Bibliotheca Heraldica," "English Counties Illustrated," "Essay on the Roman Villas," "Heraldry of Fish." All these productions displayed infinite care, research, and taste, and were written in a graceful and agreeable style. That quaint book with a quaint title, the "Heraldry of Fish," was very and deservedly popular. Were merit an knowledge now the qualifications for the admission into the College of Arms Mr. Moule was just the person to have eminently filled the office of the Garter King, or some other heraldic Monarch.

THE CENSUS OF 1851.

THE following interesting and instructive summary of the returns gathered under the Census Act, on March 31st, of the number of the people in Great Britain, was published by authority in the early part of the week:—

	Inhabited Houses			31st March 1851 Population			Uninhabited Houses			30th June 1851 Population		
	Inhab.	Uninhab	Building	Persons.	Males.	Females.	Inhab.	Uninhab	Building.	Persons.	Males.	Females.
Great Britain, and Islands in the British Seas ..	3,675,451	165,903	29,109	20,919,531	10,184,587	10,734,844	3,465,981	198,129	30,334	18,535,981	9,074 642	9,581,339

NOTE—The army in Great Britain, and the navy, merchant seamen, and other persons on board vessels in the ports, are included in the Return for 1851; the navy, merchant seamen, and persons on board vessels, were not included in 1841

The apparent decrease of houses in Scotland between 1841 and 1851 is attributable to the fact that, in 1841, flats or stories were reckoned in many places as "houses," in the present Census the more correct definition has been employed.

Census Office, Craig's Court, 14th June, 1851. GEORGE GRAHAM, Registrar-General.

DESTRUCTION OF MRS GRAHAM'S BALLOON, IN ARLINGTON-STREET, PICCADILLY.

SERIOUS BALLOON ACCIDENT.

On Monday evening, at six o'clock, according to previous public announcement, the Victoria and Albert balloon ascended from Batty's Hippodrome, in the Kensington-road. Favoured by its proximity to the Exhibition, the ascent was attended by an immense crowd.

At the appointed time, Mrs. Graham, accompanied by her husband, stepped into the car, and the balloon was immediately detached from its fastenings. It rose slowly from the earth, but had not ascended above 50 or 60 feet when it again sank, and in doing so the main envelope came into contact with a pole or flag-staff, sustaining a considerable rent, by which the gas began to escape. This receding motion was due to the insufficiency of the supply of gas The balloon again ascended, and by a succession of alternate risings and sinkings at length got clear of the inclosure, and floated away in the direction of the Crystal Palace. When over the building the aeronauts discharged their ballast, which they had been compelled to carry, greatly to their own disadvantage, while moving over the heads of the crowd. After clearing the building with some difficulty, and damaging a flag-staff, the balloon drifted towards the Green-park, and skimmed the surface of the reservoir, whence it again suddenly rose to the altitude of the houses in Piccadilly. A breeze at this time carried the balloon towards the roof of Colonel North's house in Arlington street, which looks into the park. In its passage over that dwelling the car became fixed between the sloping roof and a stack of chimneys rising from it. A gust of wind now gave an impetus to the machine, which worked heavily, and carried away the chimney stack, the balloon alighting on a roof in Park-place. Its remaining force seemed to have been exhausted by this effort. A body of police immediately provided the means of arriving at the top of the house, when a frightful spectacle presented itself. The car of the balloon was jammed in its position so firmly, that all means of releasing it appeared for a long time hopeless. Mr. and Mrs. Graham had been thrown from their seats, and were lying on the roof of the house. Medical aid was quickly rendered by Mr. Moore, a surgeon, in Arlington-street. On examination they were both found to be severely contused and lacerated, especially about the head and forehead; Mr Graham had also his collar-bone and breast-bone broken wounds of a dangerous nature at his advanced age, 66 Mrs. Graham is nearly twenty years younger. After having their wounds dressed, they were placed in a cab, and removed under the care of a police officer to their residence, No. 8, Liverpool-street, Walworth.

After considerable difficulty, the tattered remnants of the balloon were removed to the Vine-street station.

COURT OF VICE CHANCERY.

METAIRIE *v.* WISEMAN.

This remarkable case, which, it may be remembered, arose out of certain large bequests made by a Frenchman on his death-bed, for the benefit of certain Roman Catholic charity-schools in Somers-town and the northern part of the metropolis, which bequests were disputed by the relatives of the deceased, has been brought to a conclusion somewhat more speedily than is usual in Chancery suits generally

On Tuesday, before Lord Cranworth, Mr. Bethell made the following application:—If your Lordship pleases, I am instructed to move, on behalf of the plaintiff, that all the proceedings in this cause and in the information be stayed, and that the records of the bill and several answers and information, and the affidavits on both sides, be removed from the files of this court, an arrangement having been made with the parties on the subject of the costs, which is satisfactory to the plaintiff and the persons interested with the plaintiff in the cause.

Lord Cranworth.—I suppose the object is, that there are imputations which the parties wish to be removed

Mr Bethell.—Yes, my Lord.

Mr Stuart.—My Lord, it is stipulated expressly, that all offensive imputations be withdrawn by the plaintiff, and, with the consent of the parties, the bill and answer are to be taken off the file. We have the consent of the Attorney-General on behalf of the charity to the arrangement that is made

Mr. Bethell.—He is quite satisfied with what has been done

The reader has remarked a case, which occupied the attention of the Court during nine days. We append the terms of the compromise as contained in the minutes:—

"METAIRIE *v.* WISEMAN.—ATTORNEY-GENERAL *v.* COOKE

"We, the undersigned, solicitors of the parties in the above mentioned suits, hereby agree that all litigation in the suits shall be sealed on the following terms; that is to say—

"First—Four thousand pounds stock (part of the £7000 stock in the pleadings mentioned) to be transferred to the next of kin of Mathias Carre in the pleadings mentioned, in the shares in which they would be entitled thereto in case of intestacy, and the rest of the £7000 stock to remain vested in the trustees of the charity in the pleadings mentioned.

"Secondly The trustees of the charity to pay the sum of £404 10s. 5d. to the same next of kin in the same proportions as mentioned in No 1 Mr. Bethell will be so good as to suggest such protection for Mr. Cooke in accounting to these persons as he may think necessary, Mr. Cooke being willing to leave this matter in the hands of Mr. Bethell.

"Third—Each party, except the Attorney-General, to bear their own costs of each of the suits, and to be plaintiff and next to his share in one half of the costs of the Attorney-General and the defendant; the trustees to bear the other half of such costs.

"Fourth—All offensive imputations to be withdrawn by the plaintiff, and, with the consent of all parties, the bill and affidavits in the suit of Metairie *v.* Wiseman to be taken off the file

"The above arrangement to be carried into effect by the consent of all parties, including the Attorney-General,

"GREGORY, FAULKENER, and Co.
NORRIS and SONS.

"April 25, 1851

"And her Majesty's Attorney-General this day appearing by his counsel, and consenting and certifying his opinion that it is fit and proper for the benefit of the charity that the said arrangement should be carried into effect, but the said agreement to be confirmed and carried into effect accordingly; and let all further proceedings in the aforesaid cause and information respectively be stayed, and let the records of the bill filed in the said cause and the several affidavits filed in the said cause on behalf of the plaintiff and defendants respectively be taken off the file"

A public meeting was held in the Town Hall, Manchester, on Monday morning, to petition Parliament in favour of Mr. Cobden's motion in the House of Commons, for an address to her Majesty in favour of international arbitrations and a general disarmament. The meeting was called by the Mayor of Manchester, upon a requisition signed by upwards of 200 influential men. His worship presided. A public meeting for the same object also took place at Leeds on Monday.

EPITOME OF NEWS—FOREIGN AND DOMESTIC.

According to a Parliamentary paper just published, as many as 360 317 persons emigrated from the United Kingdom in the years 1849 and 1850. The number that went from Great Britain, including 328,000 from Liverpool was 459,017, and 121,830 from Ireland.

The Count and Countess de Morella have contributed, as their third donation to the amount of £30 to the Leicester-square Soup Kitchen.

The officers who have served and are now serving in the 7th (or Queen's Own) Hussars met together on Monday at Grillon's Hotel, Albemarle-street, to celebrate at their annual festival the services of that gallant regiment on the field of Waterloo. Among the gallant and distinguished officers present, we remarked General Sir Edward Kerrison, Lieut.-General Sir William de Lisle, Major-General Hodgson, the Marquis of Worcester, the Marquis of Donegal, Lord Vivian, Sir Arthur Chichester, &c. The gallant Field-Marshal, the Marquis of Anglesea, who commanded this gallant regiment for nearly half a century, was unfortunately prevented from presiding on account of indisposition. The Duke of Beaufort was also absent from a similar cause.

Recent advices from Yucatan (Central America) state that the Indians were then fast drawing to a close. The Indians had sustained a bloody defeat at Bacalar.

We are sorry to have to record the occurrence of a destructive fire at the Lea Mills, near Manchester, belonging to the firm of Messrs. Johnson, Ireland and Co., manufacturers of woollen cloths, linsey, &c. The damage done we have heard estimated at £10,000.

When the last steamer left California (May 1), a rumour was abroad that a very extensive scheme was on foot for separating from the Mexican Republic the rich state of Sonora. Five hundred well armed men had left California expressly for the purpose. It was considered to declare the State independent of Mexico, organise a provisional Government and finally get it annexed to the United States. It lies on the Gulf of California, between 27° and 33° north latitude, is about half as large as Texas, and is exceedingly rich in minerals, especially silver. Another expedition to take possession of Lower California, and situate on the port of Mazatlan, was also much talked of.

Recent accounts from Syria state that Father Basili, a Capuchin, was found strangled at the foot of the altar at Aleppo. The French consul has taken energetic steps for inquiring into his crime.

Last week at Penrhyn, a pile of new buildings came down with a tremendous crash, at a moment when thirteen persons were at work. Several were very seriously hurt, but no lives were lost.

A letter from Bombay, April 11, says:—"Lord Dalhousie has had a very narrow escape from a broken neck. On the 26th ult. his Lordship went to pay a visit to a strong fortress on the frontier, called North Kangra. Whilst traversing the hills on a steat country pony, he came suddenly upon a nearly landed tunnel in turning a sharp angle of the mountain. The Governor-General was nearly thrown over the precipice, but fortunately escaped with a few bruises. A fatal accident of the same description occurred a few months since, only few days prev ously, to Lieut. Sale (the young est son of the General), who fell down a precipice, and was killed on the spot.

During the month of May, 477 vessels arrived in New York from foreign ports, with an aggregate of 88,346 immigrants. Of these vessels, 79 were under the British flag.

A fearful earthquake took place at Valparaiso, Chili, South America, on the 5th of April. There were several shocks, but the second was the most severe, and caused some loss of life, the falling of many buildings, and the destruction of much property. Occasional shocks were felt for the succeeding three days, doing more or less damage.

From the Sandwich Islands we learn that the prospect of collision with the French had passed away. A compromise had been effected, in which the King had agreed to refer the Legislature the question of equality between the Catholics and Protestants, and of the tariff of duties on French spirits. Documents from French subjects were to be received in the French language, and the treaty was to be adopted in French and Hawaiian.

Up to the present time there are among the articles found in the Exhibition, and deposited with the police, 75 parasols and 175 silk handkerchiefs, which have not been claimed. A silver watch and one or two purses, with money enclose. therein, are also included in the unclaimed list.

An American professor of music, Mr. S. P. Tuckerman, of Boston, U. S., has received an engagement from the Jenny Lind Committee.

The accounts received from the Australian colonies by the Overland Mail state that the anti-transportation movement was rapidly increasing, and the voice of the people was loudly raised against the system. The gold escort returns, of whom 34 gave £105 each, nine of £59 10s., one of £50, five of £2 5s., twenty-three £35, one £15, two £11 10s., three £10, five £5 5s., and 49 £5.

Mr. Alderman Salomons is a candidate to supply the vacancy caused in the representation of Greenwich by the death of Mr. Barnard. Alderman Wire is also most zealous in the Protectionist cause. He declares he is trying their chances, but the name of their candidate has not yet transpired. Mr. Alderman Salomons polled 1236 votes at the election for the borough in 1847.

The increase of population in Cornwall does not exceed 12,000, whilst in each of the three previous periods of ten years the excess had uniformly been 40,000. The increase, from 1841 to 1851 is now ascertained to be only 47 500. Emigration is suggested as the cause of the reduced proportion of increase

From a return obtained at the instance of Lord Naas, it appears that the number of licensed distillers in Ireland was, in 1838, 87, against 94 in 1840, 49 in 1847, 53 in 1848, 50 in 1849, and 53 in 1850.

We are sorry to learn that the Earl of Eldon is still suffering from severe indisposition.

This day (Saturday) a splendid banquet is given by the officers of both services who have served in the Peninsula to the Grace the Duke of Richmond, and a piece of plate, worth the sum of £1500 will be presented to the gallant Duke on the occasion, in token of the value set by the army and navy upon his untiring exertions to obtain from the Government the long delayed medals. The most distinguished officers in the service are to be present.

The reward offered for the discovery of the persons who committed the gigantic robbery on the South-Western Railway, a few weeks since, has been increased from £250 to £500.

The First Lord of the Admiralty has conferred the good-service pension of £100 per annum, which was held by the late Colonel M'Cleun, on Colonel Samuel Burdon Ellis, C.B. Colonel Ellis served in the *Agincourt*, in Calder's action, and at Trafalgar; and was commander of the Marines in the Chinese war.

Accounts from Africa, dated March 4, mention the defeat of the Dahoman army (part Amazon) before the walls of Abbeokuta, a town about 60 miles inland from Lagos, in the Bight of Benin. The invasion, it is said, was wholly unprovoked, and their discomfiture is likely to have an important bearing on the decline of the slave trade.

On Saturday the following news was received at Lloyd's, that on Thursday evening, the 15th inst., the Plymouth packet, while on her voyage from Falmouth to Liverpool, struck on a sunken rock rounding the Scilly, and almost instantly foundered, carrying with her, unfortunately, the whole of her crew of eight men, she had about eighteen emigrants proceeding to Liverpool to go out to America. Their names are not at present known.

Sir Edward North Buxton, Bart., addresses published in the Essex papers, states his intention of seeking the support of the electors when a dissolution shall take place. He avows himself an advocate of Free Trade, though feeling a deep sympathy for the agricultural interest in their depression.

At a Privy Council held on Saturday, at Dublin Castle, a proclamation was issued, making Belfast an assize town instead of Carrickfergus.

A lamentable accident occurred on Sunday night, on the Great Western Railway, near the Maidenhead station, to one of the guards employed on the line. The cattle train having arrived at the goods station, the guard, before the train had quite stopped, jumped off the down line without noticing the mail train, which was approaching at a rapid rate. In an instant he was knocked down, and some of the wheels crushed his head, almost cutting it from his body. Of course his death was instantaneous.

The Earl of Rosse, as President of the Royal Society, gave his fourth and last *conversazione* on Saturday night, at his Lordship's residence in Connaught-place. His Royal Highness Prince Albert honoured the noble host with his company, and a large number of distinguished scientific and literary characters, as well as many eminent foreign *savans*, were present on the occasion.

From South Wales mention has been made frequently of late of the cultivation of the vine having steadily increased since 1843, the number of acres in 1849 being 1127, producing 101,063 gallons of wine and 1761 gallons of brandy. It now appears that the Caledonians have commenced the first consignment of 255 dozen having recently arrived in London by the ship *Waterloo*. The qualities are described as "Australian white wine" and "Australian red heroism."

The time honoured toast of St. Patrick, vacant by the death of the Earl of Meath, has been bestowed upon Viscount Masserene and Ferrard.

At the Liverpool Police Court, on Saturday, two men, named John Smith and W. J. Chew, were committed for trial, the magistrate refusing to accept bail, for swindling. By a system of mock auctions the prisoners have reaped a large harvest; and a charge of defrauding Mr. Peter Wilson of the respective sums of £7 10s. and £7 5s., for two alleged gold watches, being clearly established, the witnesses are bound over to prosecute.

The Admiralty have directed, that, in future, all bulky documents, such as periodical returns, reports of survey, accounts for the principal officers at Somerset House, including store and victualling accounts, be made up and sent as *parcels*, and not sent in the mail-bags as *letters*.

COURT NEWS.

THE GREAT EXHIBITION.—VISIT OF THE [illegible] COMMISSIONERS AND FOREIGN VISITORS TO BIRMINGHAM.

On Thursday morning the Royal Commissioners and a number of foreigners, to all about 250 ladies and gentlemen, left Euston station by special train, in order to visit Birmingham, in answer to an invitation received from the Mayor and Corporation. Upon their arrival at Birmingham, the visitors, after a short inspection of the town, and partaking of refreshment at the Queen's Hotel, proceeded to view the various processes adopted in the manufactories of Messrs. Bacchus and Son, and R. Harris, flint and coloured glass works, G. & Collis and Co., manufacturing goldsmiths, &c.; W. Elkington and Son, button manufacturers; Elkington, Mason, and Co., electro-platers; Fox, Henderson, and Co., engineers; Gillott, and Hinks, Wells, and Co., steel pen manufacturers, Jennens and Bettridge, and J. Lane, *papier mache* works; F. C. Osler show-rooms of glass chandeliers &c.; Winfield, manufacturer of metallic bedsteads and brass founder; and the Government proving house, for proving guns, barrels, &c., were thrown open for the purpose. The only four, however, which Lord Granville and the main body of the visitors could attend, were Messrs. Elliot's, Gillott's, Jennens and Bettridge's, and Wingfield's. At the latter manufactory the chairman read an address to Lord Granville, and presented an address to Lord Granville, expressing their gratification at the manner in which the Exhibition had been carried out, to which his Lordship made an appropriate reply.

At three o'clock the party assembled in the Botanic Garden, where a very elegant *dejeûner* was laid out, the Mayor presiding, supported by the principal visitors and members of the corporation. At the conclusion of the *dejeûner*, the Mayor proposed the healths of her Majesty and his Royal Highness Prince Albert, and the rest of the Royal family, and expressed the gratification when he was sure all must feel in acknowledging the claims which his Royal Highness had upon them for the suggestion of, and the assistance he had given in, making such a splendid feature, as the Exhibition.

The Mayor next gave "Earl Granville and the Royal Commissioners," whom in the name of the corporation and inhabitants of the town he welcomed to Birmingham.

Lord Granville returned thanks, and expressed himself extremely gratified with the events of the day.

The healths of the Foreign Commissioners and of the Jurors were next drunk, and respectively acknowledged by M. Visbahn and the Baron Dupin, both of whom expressed themselves highly pleased with the events of the day, and also that they had visited the manufacturing districts of England.

The health of the Mayor and other toasts having been drunk, the company broke up shortly before six o'clock.

In the evening there was a *soirée* at the Town-hall, and a selection of music played upon the magnificent organ; and shortly before nine the party left Birmingham by special train on their return to town, where they arrived about twelve o'clock.

ASSIZE APPOINTMENTS OF THE NORFOLK CIRCUIT.—The Lord Chief Baron and Mr. Justice Cresswell have fixed the following days for the ensuing assizes within the Norfolk circuit; viz.—In Kingsbridge (Saturday, July 12), at Aylesbury; Bedfordshire (July 16), at Bedford; Huntingdonshire (Thursday, July 17), at Huntingdon; Cambridgeshire (Saturday, July 19), at the County Court of Cambridge; Norfolk (Thursday, July 24), at the Castle at Norwich; City of Norfolk (the same day), at the Guildhall; Suffolk (Wednesday, July 30), at Ipswich. The assizes for the city of Bristol, in the Western circuit, are fixed for Wednesday, August 13

ATTACK UPON THE EMIGRANTS' HOME IN LIVERPOOL.—In addition to the institution for emigrants, established by Mr. Rathbell, in Mount-field (Liverpool), another, under the direction of Mr. Marshall, has been recently established, under the patronage of the local authorities, in Vulcan-street, Canning Dock, in the same town. The latter has given much annoyance to those who have hitherto victimised the unfortunate emigrat ts arriving in Liverpool, that a prohibition has existed for the purpose of putting down by any means the Emigrants' Homes, which have put a stop to their nefarious traffic. In one instance of the formidable array of these manœuvrers, who surround vehicles carrying emigrants to the Home, and take them away to other places, the assistance of the police to protect the respectable keepers was required by a magistrate on Monday afternoon. a regular attack was made upon Mr Robert Williams, while conveying to the Home a party of 100 emigrants about to embark for Nova Scotia. For some time Mr. Williams bore the rough usage to which he was subjected by the police the fisters w re dispersed, some of them being appr hended and conveyed before the magistrates Mr. Aspinall, the barrister, attended for the prosecution; and in the mean the magistrates gave di cretion to Mr. Jones, the gaoler, the chief superintendent of police, to afford every protection to the establishments of both Mr. Sabel and Mr. Marshall.

CULTIVATION OF FLAX.—The cultivation of flax is no longer a matter of theory in the Fens; for upwards of sixty acres are now growing in the North Fen, and Mr. Aitken is erecting extensive premises at Pinchbeck for preparing the flax for market

An admirable code of by-laws and regulations have just been issued by the Dublin Corpora tion for the improvement and health of that city. They relate to the regulation and regulation of the houses of call for fish, and general markets, and of slaughter-houses and knackers' yards, and appear to be most carefully framed to accomplish the objects in view.

INQUEST ON THE RAILWAY ACCIDENT.—On Wednesday morning the inquest was resumed, at the Town-hall, Brighton, when the coroner having summed up, the jury delivered the following verdict: The jurors find that Samuel Jackson died on the 10th instant, from injuries received on the train passing over the line near the archway leading to Newmarket Hill, on the Lewes and Brighton Railway, caused by a wood n sleeper having been wilfully, feloniously, and maliciously placed across the rail on the northern side of the down line, by some person or persons unknown. The jury cannot separate without calling on the directors to discontinue the practice as far as possible of running the tender before the engine, as the view is obstructed by a cloud of smoke from fire. The guards might have removed the obstruction, and in doing have prevented the accident. The jurors also hope that the company will adopt some plan for strengthening the guard irons, as they are insufficient to prevent the convoy as well as light substances, and likewise for fixing guard irons to the tender

MONETARY TRANSACTIONS FOR THE WEEK.

(From our City Correspondent.)

Since Monday the tendency of the English Market has been downwards, and still continues depressed. The only assignable cause is that money stock has been plentiful, which is evidence of sales on behalf of the public, and such circumstance usually acts as a check to any extensive operations. Consols, on Monday, quoted 97¾ 98 for money, and 98 for account, but declined ¼ on Tuesday in July. On Tuesday a decline of ¼ occurred, and on Wednesday prices were 96¾ to ¾, closing at the latter rate for account. The Market on Thursday was unusually inactive, prices being precisely the same as in the previous days. Exchequer Bills are firm, without any variation, and India Bonds maintain last week's quotations. Railway shares, however, is both has been extremely limited. New Three-and-a-Quarters and Reduced have maintained their prices, the public buying small sums in the only stocks open at the close of the week The Market closed on Saturday, following yesterday's notice, at 97¼ New Three-and-a-Quarter per Cent. Annuities, 98¾; Long Annuities, to expire Jan., 1860, 7 5-16; India Bonds, under £1000, 55 pm.; Console for Account, 96¾; Exchequer Bills, £1000, 45 pm.; ditto, £500, 45 pm.; ditto, Small, 42 pm.

The Foreign Market has been dull and inanimate, transaction having been few and for small amounts. Peruvian continues firm, at the late advanced prices; and Mexican and Deferred are also supported. Spanish Passive is about ¼ per cent. on Wednesday, upon the understanding that the dividend due the 1st of July next will be paid. At the meeting of Mexican bondholders, on Thursday, a series of resolutions were passed, authorising the committee to make terms of arrangement with Messrs. Manning and M'Intosh for the adjustment of the balances due from them; and also for the negotiations of the 2,500,000 dollars indemnity which is to be settled by the Mexican government for losses in the late civil war, and to be transferred. The opinion of the bondholders was unanimous on these points, and also respecting the remuneration paid to Mr W. Parish Robertson, who was entitled by the Mexican government to a certain per cent. on the sum

NEW BOOKS, &c.

1073, 1074, 1075, 1076, 1077, 1078, 1079, 1080, 1081, 1082, 1083, 1084, 1085, 1086, 1087, 1088, 1089, 1090, 1091, 1092, 1093, 1094, 1095, 1096, 1097, 1098, 1099, 1100, 1101, 1102, 1103, 1104, 1105, 1106, 1107, 1108, 1109, 1110, 1111, 1112, 1113, 1114, 1115, 1116, 1117, 1118, 1119, 1120, 1121, 1122, 1123, 1124, 1125, 1126, 1127, 1128, 1129, 1130, 1131, 1132, 1133, 1134, 1135, 1136, 1137, 1138, 1139, 1140, 1141, 1142, 1143, 1144, 1145, 1146, 1147, 1148, 1149, 1150, 1151, 1152, 1153, 1154, 1155, 1156, 1157, 1158, 1159, 1160, 1161, 1162, 1163, 1164, 1165, 1166, 1167, 1168, 1169, 1170, 1171, 1172, 1173, 1174, 1175, 1176, 1177, 1178, 1179, 1180, 1181, 1182, 1183, 1184, 1185, 1186, 1187, 1188, 1189, 1190, 1191, 1192, 1193, 1194, 1195, 1196, 1197, 1198, 1199, 1200, 1201, 1202, 1203, 1204, 1205, 1206, 1207, 1208, 1209, 1210, 1211, 1212, 1213, 1214, 1215, 1216, 1217, 1218, 1219, 1220, 1221, 1222, 1223, 1224, 1225, 1226, 1227, 1228, 1229, 1230, 1231, 1232, 1233, 1234, 1235, 1236, 1237, 1238, 1239, 1240, 1241, 1242, 1243, 1244, 1245, 1246, 1247, 1248, 1249, 1250, 1251, 1252, 1253, 1254, 1255, 1256, 1257, 1258, 1259, 1260, 1261, 1262, 1263, 1264, 1265, 1266, 1267, 1268, 1269, 1270, 1271, 1272, 1273, 1274, 1275, 1276, 1277, 1278, 1279, 1280, 1281, 1282, 1283, 1284, 1285, 1286, 1287, 1288, 1289, 1290, 1291, 1292, 1293, 1294, 1295, 1296, 1297, 1298, 1299, 1300, 1301, 1302, 1303, 1304, 1305, 1306, 1307, 1308, 1309, 1310, 1311, 1312, 1313, 1314, 1315, 1316, 1317, 1318, 1319, 1320, 1321, 1322, 1323, 1324, 1325, 1326, 1327, 1328, 1329, 1330, 1331, 1332, 1333, 1334, 1335, 1336, 1337, 1338, 1339, 1340, 1341, 1342, 1343, 1344, 1345, 1346, 1347, 1348, 1349, 1350, 1351, 1352, 1353, 1354, 1355, 1356, 1357, 1358, 1359, 1360, 1361, 1362, 1363, 1364, 1365, 1366, 1367, 1368, 1369, 1370, 1371, 1372, 1373, 1374, 1375, 1376, 1377, 1378, 1379, 1380, 1381, 1382, 1383, 1384, 1385, 1386, 1387, 1388, 1389, 1390, 1391, 1392, 1393, 1394, 1395, 1396, 1397, 1398, 1399, 1400, 1401, 1402, 1403, 1404, 1405, 1406, 1407, 1408, 1409, 1410, 1411, 1412, 1413, 1414, 1415, 1416, 1417, 1418, 1419, 1420, 1421, 1422, 1423, 1424, 1425, 1426, 1427, 1428, 1429, 1430, 1431, 1432, 1433, 1434, 1435, 1436, 1437, 1438, 1439, 1440, 1441, 1442, 1443, 1444, 1445, 1446, 1447, 1448, 1449, 1450, 1451, 1452, 1453, 1454, 1455, 1456, 1457, 1458, 1459, 1460, 1461, 1462, 1463, 1464, 1465, 1466, 1467, 1468, 1469, 1470, 1471, 1472, 1473, 1474, 1475, 1476, 1477, 1478, 1479, 1480, 1481, 1482, 1483, 1484, 1485, 1486, 1487, 1488, 1489, 1490, 1491, 1492, 1493, 1494, 1495, 1496, 1497, 1498, 1499, 1500, 1501, 1502, 1503, 1504, 1505, 1506, 1507, 1508, 1509, 1510, 1511, 1512, 1513, 1514, 1515, 1516, 1517, 1518, 1519, 1520, 1521, 1522, 1

EXHIBITION SUPPLEMENT TO THE ILLUSTRATED LONDON NEWS

No. 496.—VOL. XVIII.] SATURDAY, JUNE 21, 1851. [TWO NUMBERS, 1s.

THE GREAT EXHIBITION.

SCULPTURE.

OUR present sheet contains several Engravings of works in sculpture displayed in the present Exhibition, some of which may serve for illustration of the remarks which we have from time to time made upon the principles upon which this art should depend for legitimate success. We by no means approve of all these works; they are weak or vicious in many respects, but, as they have arrested, and still continue to engage, the attention of the public, we think it right to include them amongst our pictorial memorials of this great and national exposition. Amongst the foremost of this class are Kiss's "Amazon," and Simonis' two little juvenile subjects illustrative of joy and grief. These works, although of very dissimilar character, are all samples of a prevailing propensity with sculptors of the present day to extend the range of their art into a walk which, in our humble opinion, does not properly belong to it, at least, does not tend to exalt it. The same observation may be made of the little groups of a Girl and her Dog, by Benzoni, of Rome, given in a previous Number, from which it would appear that the practice we deprecate is not confined to the artists of any particular country, but is general, not to say universal. We may conclude, therefore, that it is popular; certainly it is art popularised.

What we object to in this new school is, that it endeavours to substitute incident for character; and converts the marble or bronze, as the case may be, into a medium for pictorial, not to say dramatic, effects. It involves combinations, also, which are incompatible with that unity of purpose and interest which are the legitimate attributes of high excellence in the plastic art. No doubt, it is easier to tell a story of violent passion, or of startling casualty, or of pretty childish fun, than to embody the appropriate attributes of a Juno, a Diana, a Jove, or an Apollo, a dancing nymph, or a dying gladiator; no doubt there are thousands who will understand and enjoy the former class of works, for one who could be able to appreciate even the intention of the latter. Let us not, therefore, attempt to deprive the multitude of art after their own taste, but neither let us, in awarding the praise due to such works, according to their class, be misunderstood to admit them to an equal rank in the temple of Fame with those which evidence the highest success with purer subjects.

For the Amazon, it is a figure of tremendous energy: the manner in which she is represented, as having thrown herself back out of her ordinary seat, in order to get out of the reach of the tiger, whose claws are already deep dug in the neck and flanks of the horse, whilst she takes deliberate aim for a single and critical blow at the head of the savage monster, is admirably conceived and carried out; the face, with its mixed expression of terror and determination, is of itself a study sufficient for an entire work in sculpture. The horse and the tiger are both masterpieces in their way, but unfortunately more than divide the interest with the human subject. It was a dogma of some modern writer on art, we think a Frenchman, that a piece of sculpture ought to have eight distinct points of view. We don't know whether this group may present so many but certainly it might be looked at from three or four different parts of the room, presenting almost a new picture on each occasion. This work is a copy from the original in bronze, erected before the Museum at Berlin.

KISS'S AMAZON.

As for M. Simonis' little urchins, they may almost speak for themselves. No. 1. The "happy dog" is gazing with delight upon a wooden Punchinello, which he evidently considers the perfection of art. And does not the very truth of this little episode come in illustration, and almost in confirmation, of our introductory observations about the tests of excellence, and the legitimate aims of sculpture? This little gentleman thinks his Punchinello a finer work than the finest in M. Simonis' *atelier*; he would rather have it than any of them; and the ignorant multitude, who, of course, can only truly admire what they understand, would like this little marble urchin better than the Apollo Belvidere. The other piece represents a boy crying over a little drum, which he has broken by over beating. The face is ludicrously true to nature and the occasion. As the introduction of baser animals, the dogs, for instance, in Benzoni's little groups, and the horse and tiger in M. Kiss's "Amazon," as actors, not to say *premiers sujets*, is a declension from the higher provinces of sculpture, the drum and the Punchinello in M. Simonis' groups are still more objectionable, as involving a degradation of art.

M. Le Seigneur's colossal group, in plaster, of St. Michael overthrowing the Dragon, which stands in the East Nave, is a specimen of the more exaggerated school which prevails sometimes amongst our French neighbours. It is vicious in composition, and disturbs the eye with innumerable angular projections; it has all the vice of ill-studied and incomplete action, whilst there is nothing in the character or expression of the principal figure to redeem the more glaring defects of the composition

RIDING GEAR AND TRAPPINGS.

SADDLERY is one of the industrial pursuits, in respect to which, as in respect to hardware and cotton manufacture, England will be generally allowed to head the world. To some extent, the strong national passion for sport and the turf has undoubtedly led to this result. The trade of the coachman and the groom—of everybody, in fact, engaged about horses, was and is one which gentlemen and amateurs of all ranks delight to have a hand in. There is in the process of driving, and generally in that of managing horses, a something that we take to with a kindness and a gusto genuinely national. To some small extent, we have inoculated the French with the feeling, but the turf is an exotic there. The Jockey Club of Paris is thoroughly exotic. "Four-in-hand" does not flourish kindly in the soil. The steeple-chase leads but a lingering life, and the *morale* of such a population as annually resort to Melton Mowbray would not be understood by a Frenchman, if you lectured him from now to Christmas on the subject. It is, then, no doubt, in a great degree, to our national love for horses and sports, and those occupations in which horses are engaged, that we owe the perfection to which saddlery has been carried amongst us. The horse tailor has been well superintended and guided and counselled by tastes more cultivated, and knowledge more extended than his own. The formation of the horse and the working of his muscles have been carefully studied, so as to adapt to him the most suitable form of trapping, while an exaggerated love for neatness and a certain easy elegance in the adjustments of the animal—a feeling generally rendered by slang phrases, such as those which commend "a natty turn-out," "a slap-up drag," and so forth—has eventuated a system of harness manufacture, in which great lightness is combined with great strength, and the easy elegance in question is attained without anything like gaudiness or a meretricious display of ornament

The show of English Saddlery and Harness, appropriately placed in the vicinity of the beautiful array of vehicles of all kinds contributed by our Long Acres, metropolitan and provincial, is a very interesting display of the firmest and strongest, yet the neatest and lightest looking work in leather. We have several models of horses, like *Macbeth*, "with harness on their backs." The spectator will contrast the small quantity of glittering metal used for ornament in these "suits," compared with the Canadian and American harness, as well as some of the work sent from Belgium and France. He will note, however, the superior polish of the leather, and the taste with which the thickness and heaviness of the straps have been diminished to the furthest point consistent with due strength and solidity; while he will admire the extreme neat-handedness of the work—the sewing, for example, which seems as delicately managed as if a lady's fingers had conducted the operation upon silk, not leather No new forms of harness, however, are, so far as we observed, exhibited In this respect we were certainly disappointed. The old collar, and the old shoulder-straps and bearing-reins, still bear sway, though great attempts have evidently been made to improve the collar—to make it fit as easily as possible upon the horse, and to keep it from ruffling or pinching the shoulder; and a number of collars laying claim to various merits of this kind are exhibited. But with all these improvements the collar appears to us to be a clumsy way of harnessing a horse. The article, though infinitely lighter than it used to be, is still unnecessarily heavy, and few horses escape an occasional frayed neck and shoulders from its action. Two or three years ago the warmest hope lay in a reform in this respect had commenced The collar was in many instances given up, and a broad and handsome belt, crossing the chest of the horse above his forelegs, was substituted for it So far as appearances went the change was a great improvement; but the belt seems rather to have lost than gained ground. We very seldom observe it now. It has been said that the pressure of the leather upon the horse's chest prevented the free play of the lungs, when dragging a vehicle up hill; but it strikes us that the belt might have been so arranged as to lie principally on the shoulder and neck, in which position it would have all the advantages of the collar without its clumsiness or weight. At the same time as the introduction of the belt in question, a fancy came up for doubling the ornamental portion of the harness worn by gig and carriage horses as actually useless. Many of the omnibuses at once gave in their adhesion to this new school, preserving, out of all the paraphernalia commonly used, the simple traces, collars, and reins. The effect to the eye was odd, and has been described by the gentleman, whoever he was, who said that it seemed quite improper to put naked horses into a public vehicle, and drive it through the streets. Since then, however, we observe that the old fashion is reviving. The horses have been restored to the full enjoyment of their ancient wardrobe, no doubt to the great delight of the harness-makers, who must have looked upon the new lights, as to horse trappings, with a peculiarly evil eye. As might be expected, then, the craft in question has refrained from giving in its adhesion in any respect to the scanty harnessing doctrine by presenting specimens of the style. On the contrary, a strap has been omitted which could be inserted, and the horses will be in no respect obliged to the Exhibition for any diminution in the weight of the leather they are destined to carry over and above their stipulated burden.

Talking of harnessing matters, the abolition of blinkers is a reform which has been long agitated, and in which the weight and reason appears to us entirely to lie on the side of the anti-blinkerites. In fact, the whole blinker system, as regards man as well as horses, and moral decisions as well as visual perceptions, is a mischief and a delusion. Let us see—men and horses—all that there is to be seen; and if what we do see be wrong, let us correct it, so that we may gain future pleasure by the spectacle. What is the use of shutting our eyes, or causing our weaker brethren whether on two or four legs—to shut their eyes, wholly or in part, to objects around them? The chance is, that the result will be the very catastrophe which we seek to avoid. A roadside object half seen—through the uncertain glimmer permitted by the blinker philosophy, becomes a bugbear; and away we go awfully frightened, and kicking up our heels, and perhaps upsetting the coach in our panic at a supremely innocent donkey, quietly making his dinner by the hedge, but which, by reason of these stupid blinkers, we mistook for a griffin, or a dragon, or a roaring lion, or something more dreadful and astounding still.

As to the practical part of the argument touching horses—the blinkerite party will have it, that unless a horse be three parts blinded he will be sure to take fright and run away. "Take off the blinkers," they say, "and see how startled he is." Of course, until he has got accustomed to the new state of things. Fix blinders over the eyes of a horse who had always been allowed to use his optics as nature intended, and the creature would be in a greater panic still. The simple fact, that saddle-horses are not blinded, settles the whole question; or, if the blinkerites try to get out of the loophole that they do not start because they are not drawing vehicles behind them, we reply with the climber that dray and cart-horses do not start, they being generally free from blinkers, and that on the Continent, both in France and Germany, we have travelled hundreds of miles behind teams of horses who never had a blinker on their eyes. But the blinkerites—moral and physical—never understand logic. We would only hint to the sticklers for the old system, that they might keep it up and welcome, if they only introduced a change in the material of the implement, and made their blinkers—of glass.

In our saddles we see that the tendency of the manufacture is to make the article as small, light, and easy-sitting to the horse as possible. Many of the saddles exhibited in the English department are triumphs of neatness Those sent to us by foreign nations are invariably clumsier and heavier, and not a few fell under our inspection in which the seat of the saddle was full of wrinkles and folds which would have tried the endurance of the most hardened horseman. In ladies' saddles, three horns are now generally used, instead of the two old-fashioned ones; and several are so constructed as to shift from side to side, at the pleasure of the fair equestrian. The Canadian sledge harnesses are constructed upon the general model of our carriage trappings, but seem slighter and weaker, while the workmanship is provincial and unfinished. Possibly so much strength is not required, as the draught of a sledge is slight. These harnesses are all fitted with bells, of the same form as the *grelots*. It is only from the few ancient waggons which still contine to crawl on the less-frequented highways of England, that we now hear, in our own county, the once-universal jangle of the moving team Our stage-coaches have long disused the metallic music as something puerile and absurd; and yet that low, incessant, tiny, tinkling peal had its beauty and its soothing effect. Often, often, has it lulled us, leaning lazily back in the dusty depths of the diligence *banquette*, as the mountain-like vehicle went thundering and lumbering along its path—the sweet, clear music of the bells forming a running treble melody, backed by the monotonous ground bass of the wheels.

Turning from Europe, we may glance a moment at the horse-trappings and furniture of the East. The saddles, both for barbs and camels, displayed by Turkey, Egypt, and Tunis, are principally state affairs, intended only for use by the grandees on high-days and holidays, and blazing with as much and as brilliant decoration as if they had formed part of the caparisons of an Astley's pageant. Only a few ordinary work-a-day saddles are shown at the Tunisian department, and the construction of both, however, is identical. They are somewhat like our own old demi-pique saddles; the rider sitting low, and fortified in his seat by the huge upright pummels, or pillons, before and behind him. From these saddles a fall would be almost an impossibility. The gala articles are very splendid: a vast quantity of cloth, generally red, and so stiffly and thickly embroidered with gold as to be almost like armour, descends from the saddle, and completely covers the flank of the horse. The garniture is never complete without bolsters for pistols, and altogether the caparisons of an Eastern steed must often be as valuable as the animal which they adorn. A few saddles are made like mere pads, covering a large space of the horse's back, and apparently intended for ladies. These, like the riders, are all gaily adorned with gold or, if not with gold, with tinsel, which looks just as well and makes as brave a show. The bridles and head accoutrements are generally formed of narrow but very thick straps clumsily wrought, and ornamented here and there with roughly fashioned ornaments of metal. The bit is the most remarkable part of this portion of the riding gear. It is terribly severe, and would, we should think, conquer and reduce the very hardest mouths. All the Oriental bits are much upon the same principle, with a circular or oblong metallic ring, which lies upon and presses the horse's tongue: while the curb being very long, the leverage is proportionally great. There are few, even of the most determined bolters, we should think, who would run far against the will of their riders or drivers with a Turkish bit in their mouths. The stirrups commonly used serve for spurs as well as for the legitimate purpose; and huge clumsy lumps of metals, particulary the Moorish and Arabic examples, they are, being in fact, a sort of semi-slippers of iron, which cover all the instep of the foot, ending with sharp projecting points and angles, a dig from which would punish a horse more severely than the operation of the most long-rowelled spurs. The camel saddles commonly used, and the best specimens of which are exhibited in the Tunisian department, are mere bundles of course cloth, straw, and wood-work, heaped round a central pillon, to which the rider clings with hands and legs if necessary, as the beast progresses in his uneasy shambling trot. In the Indian collection there is a curious specimen of a camel's or dromedary's saddle, fitted with a brass swivel gun, which can be swung round so as to fire either sideways or over the animal's head One or two handsomely embroidered camel's saddles and accoutrements are also exhibited in Turkey and Egypt; but the animal being principally used as a mere beast of burden, his ordinary trappings seem to have been accounted too common and coarse affairs to have been brought over. A ride upon the back of either camel or dromedary is generally described as something to which the sensation of sitting a high-trotting horse is like lying in a well-stuffed easy chair. Albert Smith, in his recent book of Eastern travel, recommends any one who wishes to obtain a notion of the paces of the "ship of the Desert," to perch himself upon the top of a music-stool screwed up to its full height, to place the stool in a rough cart without springs, and then to drive the cart at a good trot along over a ploughed field. In the same book, however, and on the same subject, the author, in falling foul of some alleged shams, says that the camel is a great obtainer of pity under false pretences, and he backs the assertion by citing the fact, that the animal will moan and cry if you only make believe to load him, and place not more than a few ounces on his back Now, with submission, however, we take this very statement as entirely proving the fact of the general overloading of the poor beast He always connects the operation of loading with cruelty and overburdening, and moans and sighs in consequence. The very fact, that when the pretence of loading excites symptoms of distress, proves what the reality of loading must be.

IRON ORES, IRON AND STEEL.

Of all substances in nature that are available for the purposes of man, and have assisted in advancing him to that high position in which he is enabled to command and guide mechanical force to an extent almost unlimited, there is not one that can be regarded as more important than iron Without this metal the stores of mineral fuel must have remained unemployed, or at least must have been of comparatively little value; without it, the other metals, however valuable and useful, could hardly have been obtained for use; and without it, we should hardly be enabled to build, at least in cold and temperate climates, those abundant returns of food which support millions of human beings in health and comfort; and without it there could have been no such systems of communication between distant lands connected only by the ocean, as are now found to be true sources of commercial wealth, and of the advantages of which we Englishmen have the best knowledge of any people in the world. Gold and silver without iron are mere toys for children and savages; precious stones without iron remain encrusted with the matrix, which prevents their beauty from being displayed; coals, earths and metals now of enormous value would be unknown and unattainable without the iron implements by which they are produced; and steam, that source of all power, that giant by whose services the most impossible things are effected, would sleep at rest, or, if employed, would be occupied in the merest trifles, if it were not that its forces are concentrated, and its powers directed by the iron prison in which it is confined, and the arms by which it works. Look where we will, in the vast forest of human constructions, within the walls of the Crystal Palace, we shall everywhere see contrivances in which iron holds a prominent part, from the pillars and girders that support the Building itself, to the nail and the pin that connect the different parts of the smallest object exhibited within it. Well than may we rejoice in the stores of unsightly but invaluable nodules with which many parts of England, Wales, and Scotland abound, and of which there are large collections in the Building; well may we be proud of the contrivances shown in numerous models, by which the metal is obtained from these unpromising ores, and but little excuse can be needed for a long and detailed account of such treasures by any one who looks for information as well as amusement, while traversing the avenues of our Palace of Industry, and while endeavouring to realise to himself the origin of those accumulated riches, and that display of the results of human labour and ingenuity spread on all sides, and inviting attention. We propose, therefore, to consider to-day the various sources from which iron is obtained, the mode of obtaining the metal, the methods adopted for preparing it for uses of various kinds, and the applications commonly made.

Perhaps it may be well, however, first of all to mention the chief properties that give a value to this metal. The first of these is its hardness, which is always considerable, but may be varied by different modes of treatment, and in one state (that of steel) may become so great as to cut all but the very hardest substances in nature Owing to its hardness, iron is well adapted for making all kinds of tools and implements, and the use of it now is so extensive in this respect that hardly any limit can be put to its employment. Next to hardness, iron is remarkable for its tenacity, in which, when pure, no metal surpasses it. A wire, 1-12th of an inch in diameter, will support a weight of a quarter of a ton without breaking. It is needless to enlarge on the advantages of such a property, and the application of iron wire in the manufacture of ropes and chains are examples of this power of tensacity, which will occur to every one.

The next remarkable property of iron is its malleability, which is greatest at a high temperature, and in consequence of which it may be hammered into almost any shape, and rendered available for innumerable important uses. Every one is aware of the facility with which the blacksmith at his forge will mould a piece of red-hot iron into the required form; and those who have visited any large manufactory in which iron is worked will know of yet further operations of a far more astonishing kind. The visitor to the Exhibition may see innumerable examples of the malleability of iron in every part to which he turns his attention, but especially amongst the machinery

In the further application of heat, iron exhibits other properties equally remarkable and useful. It can be fused when nearly pure, but requires for that purpose the very highest degree of heat producible by a strong blast. Although thus difficult of fusion, however, there is no difficulty in uniting two pieces at a far lower temperature, for this metal is capable of "welding," a name given to the union of two surfaces by a kind of cementation, obtained when both surfaces are at a high heat and very clean, and are then hammered together. Few metals, and no other substances known, exhibit this property, but its value is too manifest to need further remark.

Although iron in its pure state is tough, almost infusible, malleable, and admirably adapted for various purposes in which great strength and tenacity is needed, there are yet other uses in which a more fluid condition is desirable, and others again where a far greater degree of hardness is wanted. Both these are obtainable, however, by a very slight admixture of a substance so common as charcoal (carbon), which in different proportions renders the iron either so easily fused as to be readily cast into moulds, or so intensely hard as to form steel. In the ordinary method of reducing the metal from the ore, a number of impurities remain, the proportion of iron not exceeding from 91 to 93 per cent., although of the remainder not more than from three to four per cent. are carbon, except in very unusual cases. This small percentage suffices, however, to alter the character of the product so far as to give a peculiar granular texture, sometimes almost crystalline. The metal is also then more brittle, lighter, and more fusible than malleable iron. At a red heat, when the iron is made with charcoal, cast iron is so soft that it may be cut with a saw, and in this state by admixture with a small quantity of other substances it may be rendered far more fusible

When iron, cast into pigs with the impurities already alluded to, is subsequently melted and exposed for some time, in a fluid state, to the air, it parts with the greater portion of such foreign substances, becoming at length less fluid and much more pure. When in this state, if it is removed from the furnace, exposed first to the violent blows of a heavy hammer, and afterwards passed through heavy rollers, it is brought into the state of wrought or bar iron. The purest kinds of wrought iron still contain a certain portion of carbon (not exceeding five parts in a thousand, and often not exceeding two), but in this state the metal is tough, solid, best adapted than cast iron where durability and strength are needed, and having a very distinct texture. Soft bar iron is more free from carbon than hard, but no additional hardness is produced by rapid cooling after exposure to a high heat, as is the case both with cast iron and steel.

When pig iron, containing little besides carbon, and perhaps manganese, is first refined by exposure to the blast under charcoal, and then [illegible] bars, and these bars cut into lengths and welded together into bundles, they become what is called *steer steel*. This, again, when exposed for a period of from five to eight days, at a red heat, in pots filled with charcoal powder, becomes altered by the absorption of carbon, which penetrates the iron, and when it meets with any oxidised portions produces blisters, forming thus *blistered steel*. This fused under pounded glass, with or without carbon, and then cast into ingots, becomes *cast steel*. In the last state, it is fit for use in the arts, and is somewhat whiter than iron, and has a distinct texture; when made red hot and slowly cooled, it becomes soft, but when re-heated and suddenly cooled, it may be brought to almost any degree of hardness, being then also very elastic, more or less brittle according to circumstances, and capable of use for a variety of important purposes. The nature of the resulting steel is almost entirely affected by the temperature to which it is raised before cooling, and by the mode of cooling; and as the temperature is marked by the colour which the metal assumes while re-heating, this is commonly referred to as an indication of the temper. The order of colours is, straw-yellow, deep yellow, purple, violet, dark blue, and light blue

The sources from which iron is obtained vary much in different countries, but the common ores are oxide and carbonates, of which there are several varieties. The richest is the magnetic iron ore, containing upwards of 71½ per cent. iron, and either itself magnetic or readily attracted by the magnet. It is of iron grey colour, brittle, and often crystalline. Little of this ore is found in England, but large quantities occur in Scandinavia, Russia, and India, which are all celebrated for the quality of the steel extensively to mix with and bring to a convenient average some of the poorer ores The ores of this kind are reduced generally with charcoal, and on rather a small scale, and are easily brought into the state of pig, having few earthy impurities mixed with them. All finest steel is made from magnetic ores; and the samples of the ores themselves, and the pig and bar iron manufactured from them, are exhibited in the Russian and Scandinavian divisions. From India, also, besides a large series of ores, there will be found a case containing the various products of the iron smelted in that land in various states known as *wootz steel*, and exhibited by the Indian Iron and Steel Company. The large and highly-important series of Sheffield goods on British side must also be mentioned here as presenting the best and most valuable illustration of the products obtained from the magnetic ores. Amongst the Sheffield goods are also to be found one or two models—one in particular, of large size and in great detail, illustrating the whole of the processes adopted in converting iron into steel, and bringing this very remarkable compound of iron and carbon into a state available for the manufacturer. We refer to the model of the Cyclops Works in Class 29, No. 109 A, which is accompanied by a series of articles in steel of great interest. No one can examine the articles exhibited in the Sheffield court without being perfectly satisfied of the high state of perfection which the manufacture of steel has attained in this country, and the importance of having the best material for such admirable workmanship. There is generally understood to be a greater amount of elasticity, and a susceptibility of finer temper in the steel made from Indian iron than that from Sweden; and it has been supposed by very eminent chemists that this is owing to the presence of a small quantity of aluminium; but it must as yet be considered doubtful whether this is essential or accidental

Before concluding the notice of the magnetic ores, we should direct attention to those obtained in British North America, where are some fine specimens indicating a source of wealth which will not, we are sure, be neglected

Next to the magnetic ores, the richest material from which iron can be obtained consists of the peroxide known to mineralogists as the specular iron ore, micaceous iron ore, red hæmatite, and oligist respectively. This ore is also sometimes called iron glance. It exists in two forms—the one earthy, and the other crystalline and metallic; but both are equally rich, and yield, when pure, about 69½ per cent. of metallic iron. These ores, like the former, are not those generally found and used in our own country, although they exist there in considerable abundance, and are even used extensively to mix with and bring to a convenient average some of the poorer ores The more brilliant and metal-like specimens chiefly abound in Elba, and are often called Elba ores; but these and other less glittering forms also occur in almost every district where iron is found in mineral veins. They are worked in small furnaces almost as easily as the magnetic kinds, but are nowhere so valuable for the manufacture of steel, although, like the former, they are smelted with charcoal only. The Belgian ores, those from Spain, may be quoted as examples of these, and the admirable quality of the iron exhibited, and of the goods manufactured of such iron, shows clearly that if it cannot vie with that made in England in the matter of cost, it may yet take a very high place for excellence of durability. It is chiefly the earthy varieties (hematites) that are used in England, and of these many specimens, very remarkable for size and beauty, will be found in Class I., both from Cornwall and Lancashire, exhibited by various persons, and amongst the rest by Mr. Thomas Ainsworth, of Cleator near Whitehaven, No 493, and Messrs. Harrison, Ainslie, and Co. (408), of Newland Furnace, Ulverston. In both these cases the ores contain from 60 to 65 per cent. of iron, and are found immediately adjacent to the poorer ores common in England, and also to the coal, so that they are brought into immediate use. The quantity that can be supplied is very large; but there are at present, we believe, only three furnaces in blast. The iron is considered to be of very good quality

In some parts of the world large quantities of hydrous oxide of iron are obtained in a state very well adapted for the manufacture of iron. Such, for example, are the bog-iron ores, of which there are magnificent specimens from Canada (160 to 163), said to produce excellent metal In its pure state, this hydrous oxide would not yield more than 56 per cent of iron, and from 12 to 18 per cent. water; but it is rarely found in large

quantities having anything like this value. The technical name for the ore in question, as a group, is *brown hematite*, and they may be regarded as averaging 20 to 40 per cent of iron. Large quantities occur in the northernmost counties of England, in distinct and regular beds, associated with the lead veins of that district. Fine specimens will be found in Mr. Blackwell's collection of iron ores (427), bearing the numbers 420 to 421 inclusive.

But the chief of all importance to England, and those supplying by far the largest proportion of all the iron manufactured in the world, are neither the richest in quality, nor those deposited in the thickest masses, but the smaller series, far less likely, at the first glance, to attract attention, and requiring methods to reduce them of a more complicated kind than the simple forges hitherto needed. We allude to the *clay iron-stones*, as they are called, which are widely distributed with the coal, and near the limestone, in South Wales, North Wales, Shropshire, Staffordshire, Yorkshire, Derbyshire, and Northumberland, and the valley of the Clyde. These are the true materials of England's greatness, and these, accordingly, have long been anxiously sought after, and most carefully worked. From these sources upwards of two millions and a quarter of tons of iron are annually produced; of which South Wales furnishes 700,000 tons, South Staffordshire (including part of Worcestershire) 600,000, and Scotland 500,000 tons. Of the rest from these several districts, there is one large and most valuable series of about 300 specimens, very carefully selected, and exhibited by Mr. S Blackwell, of Dudley—a gentleman who deserves the utmost credit for having, at great expense of time and labour, brought together these materials, and arranged them as a noble illustration of what nature has done for the British Islands in reference to iron.

All the clay iron-stones partake of a general character, although they differ a little in appearance, and much in relative value. They are nodules, consisting of an impure carbonate and oxide of iron, mixed with clay, and apparently separated from a more generally diffused ferruginous solution, in a large series of deposited rocks, including much clay and much vegetable matter. They occur in bands generally of no great thickness (often only a few inches), and not far from thicker bands of coal, with which they are worked. The quality of the iron made from them coal, with which they are worked. The quality of the iron made from them is a good deal—partly, it may be, from the condition of the ores, but chiefly from the fuel with which the ores are smelted and refined. We cannot too often or too distinctly recommend the reader to study this collection by Mr. Blackwell, in connexion with the list of details contained in the larger or Illustrated Catalogue

The manufacture of iron from these poor ores is conducted on a very large scale in furnaces constructed on principles generally diffused throughout, for a long time. Retained in their simplest form, these furnaces consist of a receptacle at the bottom for the fused iron to collect in, and from which it can be drawn off from time to time; a chamber to receive and fuse the mixture of ore-flux and fuel put in from the top, and a blast to produce intense heat. The chamber is generally high and partly chimney-shaped; the blast is conducted by pipes from a machine where it is produced, and there are means of drawing off not only the metal, but the slag or scum that forms on the top of the fusing mass The furnace being already heated, a due mixture of material, consisting of the ore (consisting of carbonate and oxide of iron, with alumina and silica), limestone, and coal or coke, are thrown in from the top; the alumina and silica of the ore then combine with the lime, forming a kind of glass under the influence of the burning fuel, acted on by a powerful blast, sometimes of hot air, and the iron is set free and sinks in a fluid state to the bottom. The floating slag may be drawn off from time to time, and the charge of ore-flux and fuel repeated till a sufficient quantity of fused metal is collected. The charge is added, and the metal drawn off generally at regular intervals, and thus we get the commercial iron of generally at regular intervals, and thus we get the commercial iron of pig-iron. The further processes have been already alluded to.

Very fine specimens of pig and bar-iron are exhibited both in Class 1 and Class 22. Among the latter, the Low-moor Works, near Bradford, Yorkshire (Messrs. Hind, Rhodes, Foster, and Hardy), exhibit a series extremely remarkable for their variety and great excellence, some specimens of rivet-iron, knotted cold with two or three knots, and bent at one end, showing very strikingly the tenacity of iron in a wrought state Russia is shown still further by a piece of chain-iron, originally 4 feet 8 inches long and 1¼ inch diameter, strained and broken by a weight of 24 tons, but which, before being broken, was drawn out as much as 16½ inches, and was reduced to a diameter of 1-3rd inch. A piece of wood, which show iron as cast, adapted to various purposes, are exhibited by the Ebbw Vale Company, South Wales (Class 1, No. 412), and by Messrs Bird and Co. (No. 411), who show admirable specimens of Staffordshire iron. The producers of the Scotch iron and coal-fields are presented by the Monkland Iron and Steel Company (No. 426); and, before leaving this part of the subject, we ought to direct attention to Mr. Stirling's patented method of mixing together malleable and cast iron, and also of mixing wrought metals (chiefly zinc) with iron to produce greater strength in the compound. Ireland, also, is not unrepresented, and we would especially refer to the specimens exhibited from Arigna by Dr. Moore (No. 403), which show iron charcoal pig. The quality is very good, and from what the economy of the operation is still doubtful. The ores are rich, yielding as much as 40 per cent. of iron. Coal exists in the neighbourhood, but it is not of excellent kind, and the cost of it must be considered, but it is not of excellent kind, and the cost of it must be considered, but it is not likely to be reckoned as not much under £4, a price too high to promise much success at present.

Other ores of iron are occasionally used, and are also deserving of notice. Thus, the pure crystalline carbonate of iron, or spar iron ore, is found and imported from the parts of Germany, especially the Rhine provinces of Prussia, Nassau, and Styria, and from each of these districts there will be found specimens both of the raw material and the manufactured iron. The Austrian iron is particularly worthy of mention, as providing a large quantity of metal of admirable quality, and yielding by the first process of smelting an iron which contains less than the usual proportion of carbon occurring in the pig, and scarcely any impurities, so that it is once a kind of steel. Being made with charcoal, and not in very large quantities at a time, this iron is tough and hard, and has been found valuable in the manufacture of scythes, of which vast numbers are annually distributed over Europe, from the various works situated near Gritz. The iron thus made is rather costly; but where there is a heavy duty on foreign imports, and a yet higher expense on account of land carriage over difficult roads, it can find a market, and meets with a very native demand. The spathic iron is remarkable for its resemblance to common limestone in appearance. It is, however, heavier, and turns brown on exposure. It is generally combined with manganese and lime, and when pure contains as much as 50 per cent. of metallic iron. Before use it is broken up and exposed in large heaps to the air for a considerable time, and is then roasted and treated like the earthy carbonates

In France and Switzerland various ores of iron are worked, that differ much in general appearance from those found in England. Thus in the former country large quantities of a pisolitic ore (an ore occurring in small rounded or pea-shaped masses) occur in the tertiary and alluvial beds of the departments of the Jura, the Upper Rhine, and the Côte d'Or, and supply one-third of the iron of France. A silicate of iron occurs in Switzerland, and is worked there to some extent, both for iron and steel; and in the United States of America, a mineral elsewhere rare, and consisting of a peroxide of iron combined with a considerable percentage of manganate of zinc (Franklinite), appears to be present in sufficient quantities to be worth working, and is exhibited in connexion with the iron made from it.

The manufacture of iron on a large scale has been already partly described in speaking of the management of the abundant British ores. The outside of the furnace is generally conical, the inside being more nearly pear-shaped. The whole height of the furnace varies; but, as a convenient standard we may take about 60 feet. The lower part (the hearth, which may be described as the stalk of a pear) would then be about 6 feet high and 2 feet square at the base, enlarging gradually towards the upper part. Above this is a funnel-shaped portion, about 8 feet high and 12 feet diameter at its top or widest part, and called the boshes. The rest of the interior gradually diminishes from the top of the boshes, and is called the cone. At the upper end it is about 4½ feet diameter, and receives the charge of ore, flux, and fuel. At this period chimney rises above the top of the cone, and may be from 8 to 12 feet high. The whole of the inside is lined, the lower part with a coarse gritstone, and the upper with fire-brick. The bottom or base consists of a solid mass of sand, which rests on the ground.

Before using a furnace for iron-making, it must be heated or put in blast, an operation which requires a fortnight or three weeks to perform. When this is done, the coke, the ore, and the flux are put in at intervals, in regular order, keeping the furnace always full to the top of the cone. A moderate-sized furnace will take, in 24 hours, about 15 tons of coke, 16 of roasted ore, and 7 tons of limestone, which will yield 7 tons of iron are obtained, which is run off every twelve hours from the front of the hearth. The melted iron is received into moulds made in soft and pure sand, and the pigs thus made weigh about 2½ cwt each.

The pig-iron is blast-furnace iron is taken to the finery furnace, where it is re-melted, and run out at a loss of from 12 to 15 per cent. or more; the pig parting with a large portion of its impurities of becoming what is called fine metal. This is usually cooled by pouring water on it, and is thus rendered very brittle; and for the finer purposes of iron manufacture, especially where toughness is required, charcoal is used in this process.

The fine iron broken into fragments is again exposed to intense heat in a peculiar reverberatory furnace—the puddling furnace; and after a certain amount of exposure in this way it parts with the greater part of its carbon, becomes much more infusible, and at last—the soldiers into a its carbon, becomes much more infusible, and at last—the soldiers into a tough mass, being worked by a rake into rounded balls (blooms) of about 60 or 70 pounds weight. These, after again heating and hammering, are in a condition to be presented to the rolling machine, and then become bar or sheet iron.

There are many differences of detail in the methods employed on the Continent, and even in particular districts in our own country, but this general account will enable the reader to understand something of the labour and difficulty, as well as cost, required to produce a material which is, however, as we all know, supplied at a price which brings it within the daily use of every person for the very commonest purposes. It may give an idea of the magnitude of the work to mention that there are now 185 blast furnaces for the manufacture of iron in South Wales, 148 of them being actually at work, producing, on an average, 100 tons of iron per week; that in Shropshire, and its neighbourhoods, there are 28; in Staffordshire, 108; and in the more northern counties, 46—such furnaces making in all 132 in blast, in addition to the 142 in Wales. Scotland adds its share to the list, and the general result is, as we have said before, that the enormous quantity of 2,250,000 tons of iron are now annually manufactured in the British Islands, being at the rate of 3 cwt. a year for every man woman, and child of the whole population. As not less than 3 tons of coal are required to produce each ton of iron, this manufacture alone makes a consumption of 7,500,000 tons of fuel, without including that employed in the further operations of iron-making, and the industrial coal used in various ways.

LIGHTHOUSES, AND LIGHTHOUSE OPTICAL APPARATUS.

IN considering the important and interesting subject of Lighthouses there are few people in England who will not immediately call to mind those hardy sons of the ocean, who are the chief objects of its structure. Everybody remembers the old song which compares their life with that of the well-housed gentry on *terra firma*:

> Ye gentlemen of England,
> Who live at home at ease,
> How little do you think upon
> The dangers of the seas

But the old song is by no means so applicable to our own day as to former times, when it was so much sung. As to living at home "at ease" in these days, when men work harder than ever, as the Great Exhibition of India stry fully attests, we will say nothing; but, with respect to the want of thought among those ashore for the men who brave the perils of the ocean, "where the stormy winds do blow," we think that nothing could more strikingly attest our consideration, our anxiety, and our practical care, than the existence of the numerous lighthouses that stud and stand out on our coasts. Wonderful structures they are, and as useful as wonderful. Considering the great dangers of St George's Channel, and, indeed, of the whole coast of the United Kingdom we may fairly say that the existence of a regular system of lighthouses, and other light beacons, is absolutely necess ary to our present state of navigation, and the enormous increase of foreign as well as domestic shipping, and the coast trade generally.

In the Main Avenue west of the Great Exhibition may be seen two specimens of lighthouse apparatus (Class 8a). The larger one being on the cata-dioptric system of the first class of lights (near the astronomical telescope); the other, a dioptric apparatus of the fourth class of lights. Several excellent models of lighthouses will also be found in the central North Gallery (No. 52), in which the apparatus of each of these classes may be more narrowly inspected: and a variety of models, both of towers and lanterns, in the North Gallery.

No mistake, however, can be had of the extraordinary difficulties and dangers attending the erection of lighthouses, concerning which our readers will, we trust, find the following account both interesting and worthy of an attentive perusal.

Some rude kind of lighthouses appear to have been used by the ancients, but the principal lighthouse of modern times, and certainly one of the most magnificent edifices of the kind ever built or ever designed, is the Tour de Cordan, at the mouth of the river Garonne. It was commenced in the year 1584, and occupied twenty-six years in building. We scarcely need say that difficulties, in most cases, occur in the erection of lighthouses, to which no other structures are liable. The building of the Eddystone Lighthouse is a remarkable instance of this. The number of dreadful vicissitudes it encountered are as painful to contemplate, as the courage and perseverance that finally overcame them are worthy of admiration. It was originally first built of massive beams of timber, and a light was first exhibited in 1698. The architect and engineer by whom it was designed was Mr. Winstanley. But the sea frequently rose so high around it as to dash over the lighter, in fact, it was said, at times, that the lantern was buried under water. Mr. Winstanley thereupon raised the tower from 60 feet to 120. The space of rock for the foundation being but small, and the situation most frightfully exposed, this was, of course, a work of stupendous difficulty By some it was thought that he had now constructed it too high for safety They were, unfortunately, very right in their apprehensions. Not long after its completion, considerable repairs were necessary, and Mr. Winstanley went there in person, accompanied by his workmen. The repairs occupied some time; and one night a terrific storm arose, tore down the lantern and the upper part of the tower, and finally carried the whole edifice away, with poor Winstanley and all his workmen, every one of whom perished: indeed, we believe their remains were never found, nor a single wreck of the once proud structure.

Rudyerd's lighthouse for the wrecking of the *Winchester* merchantman was wrecked on the Eddystone rocks, and her crew were saved. It was now seen that a new lighthouse must, by some means or other, be erected here. another tower of timber was designed by Mr. John Rudyerd, of London; it was finished in 1708. Its height was 92 feet. The entrance was similarly for the strength of the wood). It was not long before, however, it proved to be wholly inadequate to the work of the fierce waves. It remained standing during forty-seven years. But another and more unlooked-for misfortune awaited it. Everything had been devised to protect it from the fury of the waters; nobody had ever dreamt of danger from fire in such a situation, so surrounded by the natural antagonist of this element. By some accident, however, it took fire, and, being entirely of wood, it burned down to the very water's edge. This was in 17

English perseverance was again called into requisition, a lighthouse must be erected on this spot: this was determined: and in 1756 Smeaton first landed on the rock, and commenced operations by cutting the surface into regular horizontal trenches, and into them a foundation of stone was carefully fitted. It was now resolved (they had had enough of wood) to build the whole edifice of stone. The first 12 feet of the tower, as we learn from Mr. Alan Stevenson, form a solid mass of masonry; and the stones of which it is composed are united by means of strong cement. The stones are

STAINED GLASS WINDOW. J. A GIBBS.

The stained glass window by Mr. Gibbs, of Newcastle, which we engrave, contains subjects illustrative of various passages in the life of St. Peter. It is in the Norman style, and consists of six geometrical forms upon a richly ornamented ruby background, embodying the principal events from the life of St. Peter. The centre medallion is Christ's charge to Peter; the others respectively contain the Angel delivering Peter from prison, Peter denying Christ, Christ calling Peter from the ship, Peter's want of faith, and in a small quatrefoil is the martyrdom of St. Peter, the whole surrounded by an elaborately worked and richly coloured border. The colours of the glass are rich and full-toned, and are judiciously combined in the work before us. It may be subject for regret, however, that, in reviving this ancient art, as a medium, it should be considered necessary to imitate the barbarous style of drawing of the Gothic ages.

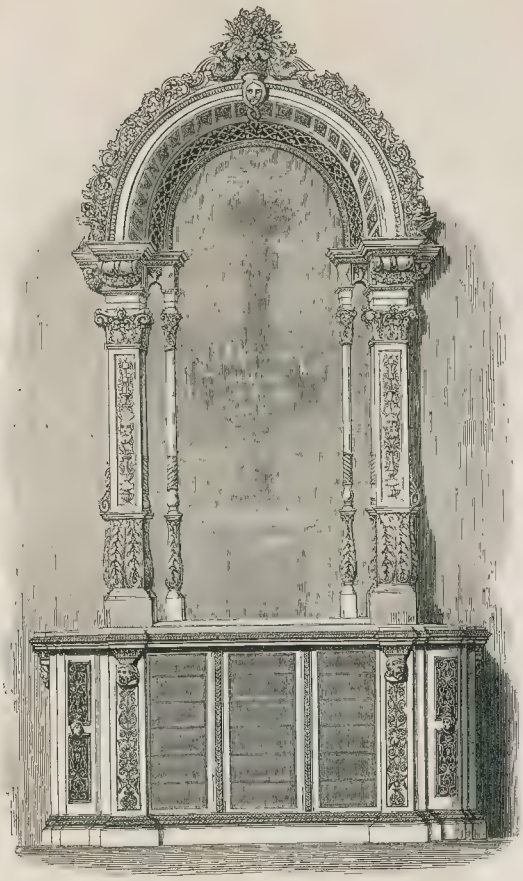
ST. MICHAEL OVERTHROWING THE DRAGON.—BY M. LE SEIGNEUR.—(SEE FIRST PAGE.)

STAINED GLASS WINDOW.—BY J. A. GIBBS.

PLATE. BY HANCOCK.

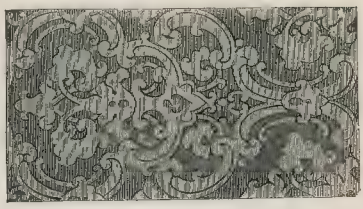
The group of plate by Hancock, which we engrave below, comprises a great variety of subjects, treated after the fashion of various periods, but all remarkable for excellence of execution. We notice a tea service in the Florentine style, a flower vase, another vase (Etruscan style), a bottle wagon, and a very handsome centre-piece.

SILVER. BY HANCOCK.



SECRETAIRE.—BY SNELL.

GLASS.—BY MESSRS. HERRING AND SON.



DAMASK.—BY HOADLEY AND PRIDIE.

SECRETAIRE. BY SNELL.

The *secrétaire* exhibited by Snell is a very handsome work of art. The form is well proportioned, and all the decorations in good taste. The chief material is walnut-wood, the inner pillars being gilt, and the basement of green stamped leather. In the door is a handsome mirror.

CHEVAL GLASS. MESSRS. HERRING AND SON.

This is a very elegant glass; the design, in the style of Louis XIV., is good, and the workmanship of the very highest character. The characteristics of the style are well-marked, and, altogether, the glass is one-from its appearance, fitted for a palace.

DAMASK. HOADLEY AND PRIDIE.

We engrave one of many beautiful specimens of furniture damask, exhibited by Messrs. Hoadley and Pridie, of Halifax.

DRINKING UTENSILS.

It is a curious fact, that by no other article or series of articles in the Great Exhibition are the extremes of time—the extremes of civilisation dawning in the East and culminating in the West—so forcibly or so aptly represented as by the specimens there collected of—to casual observers—a very commonplace and insignificant article, that of drinking-cups, glasses, or vessels, and the larger jars, vases, amphoræ, or decanters in which the potable is kept, and from which it is poured into the lesser recipients. Not that we would be understood as implying that the grandeur of modern civilisation is represented by the prettynesses of cut glass or painted crockery. We have more august pleaders for our skill in the steam-engines and printing-machines, the electric telegraphs and the models of great engineering works. But, in the case of the drinking vessels in question we see both ends of the chain. Our most important works of science and invention rose, as it were, at different stages of the world's existence, from a small and slowly opening form. We trace back steam, for example, until we discern its rude and unappreciated infancy in the times which saw the "Century of Inventions." Before that period, the power, as now applied, had no existence. So of all those great achievements which most fitly represent the triumphs of mind over matter. But in the case of that small and insignificant article, the drinking-cup, we find a work of industry in some degree, of art—which has existed from almost all time The potter's wheel was, probably, one of the very first machines ever set in motion. It must have been coëval with the rude dawnings of the loom and the earliest applications of fire to produce and to labour iron. Man, particularly in the East, must be provided with some means of carrying water from place to place, and preventing, as far as possible, its absorption by the heat. Did the world's grey fathers live in a land of brooks and wells and rivers

BOY WITH PUNCHINELLO. BY SIMONIS.—(SEE FIRST PAGE.)

BOY WITH BROKEN DRUM.—BY SIMONIS.—(SEE FIRST PAGE.)

vessels for preserving and drinking water out of would not have been one of the very earliest of their requirements. They could always have stretched themselves along the brink, or made a cup out of the hollow of the hand. But their was a land of fierce sun-glare, and sandy desert, and high, parched hills, "wherein no waters be." The fluid was scarce and precious, and so the means of preserving it and husbanding it were evidently of the first importance. Now we know that the East is the land of stagnant, changeless monotony—that ideas, customs, utensils, remain in their original mould in them formed, and endowed with their original properties, during spaces of time in which, in the faster living West, the very memory of races and dynasties becomes extinct. What do we know of the pottery of our Saxon forefathers, or of all events of the art as practised, if it was practised, by the savage aborigines of the land? In Asia, on the contrary, what was, is. The Hindoo of the present day forms his household implements, his jars and his cups, in the fashion of those figured upon tombs and temples which were ancient when the Macedonian phalanx scattered the native warriors. In western Asia, the Bedouin suit straps to his own or his camel's neck the porous bottle, which may be seen represented in the *bas reliefs* of the Nineveh. In Egypt the Fellah drinks from the earthen vase, the like whereof has been emblazoned by painters who owed allegiance to the Pharaohs. As, therefore, an interesting, although not a very varied collection of Eastern drinking and fluid-holding vessels has been got together, and as they are precisely the same articles, formed in the same way, and of the same materials, as the cups and vases in use perhaps 3000 years ago, we are enabled to contrast the first appearances of the earliest developments of the human race with the cups and saucers in which we consume the last importation of bohea, and the decanters and bottles by the genial aid of which we drink "success to the Exhibition."

The three departments in which the rude pottery of the East is collected in a greater or lesser degree are those of India (a rich museum of rude vessels), of Tunis, and of Turkey. The first thing, perhaps, which strikes a visitor in the aspect of these grey, coarse jars after he has observed their primitive simplicity of form, is, that they are the very counterparts of the vessels commonly represented in Scriptural illustrations as borne upon the heads of Eastern maidens resorting to the well. Verner's wonderful Oriental pictures, filled with the very mirage of the desert, rise instinctively to the mental eye. We think of the shady group of graceful palms and dates, and the broad thorny leaves of clustering cacti. The sun is at its highest, glaring over the long horizontal lines of the white expanding desert. The distant horizon quivering and wavering in the heat like the extreme sight line of a stormy sea. But in the oasis there is shade and shelter. The desert sprung has nourished a little patch of herbage, for the steed of the Bedouin and the camel of the pilgrim. Tents have therefore been pitched hard by. You see their white or striped canvas gleaming through the graceful feathery leaves of the date palm. Beyond, perhaps, stretching their patient faces in the direction of the running water, the string of camels kneeling in the sand awaits their well-won refreshment; while by the well stand grouped a cluster of those loosely-robed and picturesque Orientals, the men turbaned and black bearded, dignified of aspect and stern of speech; the women, with their unbending carriage and stately step, their bronzed and symmetrical features, and their narrow almond eyes, bearing either upon their heads, or on their shoulders, as Rebecca did when she gave Abraham's servant to drink, or Rachel, when she met her uncle by the fountain; the pitchers of coarse, big-bellied and narrow-necked, perfectly simple and rude in construction, yet not without the instinctive feeling for beauty of form which exists in all the higher organizations of unsophisticated men—pitchers and vases exactly resembling those before us, which are preserved by some dweller of the wilderness, according to the traditions of the craft handed down from the infancy of time, have found their way to Europe to speak to us with a sweet and solemn voice of the old time of the biblical nomadic tribes of the patriarchs, with their flocks and their herds—of the ancient cities and ancient kingdom of that awful, solemn, mysterious, and changeless East

Pausing in the Turkish and Egyptian departments, let us examine closely a group of these primitive vessels. We observe that they are all capacious and narrow-necked, so that the risk of spilling may be lessened, and the drying air have as little scope as possible to operate upon the fluid. This shape also gives convenience for loosening the vases may be easily carried to and fro, slung round the neck, or to a horse's or a camel's trappings. In one set of the largest class of vases, reticently intended to be the family reservoir in the hut or the tent, there is, besides the larger aperture at the top of the neck, a second but much smaller one, spout-shaped, on the tea-pot principle. The pitcher is evidently intended to be filled by the larger opening, and its contents doled out afterwards by the tiny orifice of the spout. The mouths of some of these larger vases are supplied with covering made in the shape of, and evidently intended to represent the ordinary Oriental summit of the minaret. The workmanship of all these vases is very rude. They are seldom or never truly circular, and the clay is full of bulges and inequalities, but still the general grace and beauty of the form aimed at, if not attained, is undeniable. That form, indeed, contains the rudiments of all the ornamental vases of Greece, as we shall see. The germ of the Etrurian art was no doubt Eastern, and in the glittering displays of the Bohemian art manufactures, in the shape of the porcelains from Sevres, and the less artistic, but still promising produce of our own pottery districts, we recognise at once that principle of art and that theory of design which the East originated, and which the West developed and perfected. The Indian vases and drinking vessels, although exhibiting far more constructive skill, are generally, we think, inferior in point of beauty and design to the more western portion of Asia. You see amongst the former a great number of jugs of not the slightest pretence to shapeliness; belonging, in fact, to the same high school of art-manufacture as that which produced our own pickle-jars and blacking-bottles. In the Arabic and Syrian vessels, on the contrary, the effort at a graceful line of beauty is all but invariable The Indian collection shows many vessels of nearly the same design and shape as our common decanter, and it will be observed that the vessels in general are by no means so well adapted for locomotion as the other class which we have described. In the Indian collection, for the first time, a greater distinction in the apparent costliness and elaboration of certain of the specimens. The Arab Sheikh drinks his lukewarm draught from the same bottle of porous earth as the tent-pitcher or the camel-driver,* Not so the Rajah or the Nabob. He has his gaily ornamented pitcher of fantastic shape, the shape, we are assured, and, as it were, embroidered with gay-coloured patterns. The collection of these ornamented cups is considerable. The decorations seldom or never appeal to anything like a real sense of art or beauty. They are thoroughly barbaresque, like all Indian ornaments; mere prettiness in the disposition of the colours, and mere ingenuity in the construction of the patterns being alone attended to. In this respect, indeed, the general nature of the Indian exhibition is worthy of consideration. The same principle will be found to prevail universally in her art manufactures. They are rich gorgeously rich—and often well wrought, showing the possession of great mechanical skill, and of a splendid series of precious raw material. But the Indian artist is nothing without a glittering or a precious substance to work on. He has no notion of the abstract and highly ideal beauty which can be produced from the simplest combination of flowing lines, constructed, it may be, out of the basest or ugliest material. His ingenuity, which is great—witness his weapons—is unassociated with art. He can be dazzling and surprising; he can construct marvels of head-handed cleverness; and, his materials being generally being valuable and glittering—gold, diamonds, and precious gems, to wit—he gets a vast deal more credit from the ordinary run of people than he is entitled to. Thus, in fact, India seems to stand artistically, as it does geographically, between China—in which ingenuity without art is brought to its perfection and the belt of the world inhabited by the Arabic races, in which art, or, at all events, the germ of art, is to be found united with ingenuity; but which, introduced to the western world—being there appreciated and there finding the necessary manipulative skill to give it development and elaboration—has given birth to the most perfect specimens of artistic production in the marbles of Greece and the sculptured walls of Italian art. In these vases, in the case of the articles in question, the jugs, vases, and pitchers which we are considering, the simple grace of the original Arabic works lost in the better manufacture of the Indian articles; and presently, too, we observe another very characteristic indication. The vessels from western Asia are uniformly made of coarse clay. Those produced in India are made of different clays and burnt-ware; and at length we find the earthenware giving place to metal, to brass, or some such composition, the old clay shapes being faithfully represented in the new metallic substitutions. It may be a prejudice grounded upon no sound principle of art or reason; but the vase, at all events in its more ornamental and artistic development, has been so constantly fashioned of potter's earth, that we regard vessels of the same design made in glittering sounding metal as something essentially barbaresque and artistically incongruous. Compare, for example, the pitchers and bottles in Tunis and Egypt with the tribe of brazen cups and decanters in the Indian compartment, and answer whether the latter—although industrially and mechanically before the former—are not artistically as much behind them. This remark is not meant to apply to the hammered-out brazen pitchers, with spouts, to be seen in Tunis. These articles are exceedingly rude and exceedingly interesting, but they do not belong to the category with which we have been dealing.

From the ancient world, then, to the modern from the patriarchal vase to the "big-bellied bottle"—from the original of the amphora, which had Falernian wine, to the modern decanter or claret jug, filled with the vintages of Oporto, or the more delicate liquid of "fair Guienne."

The display of English cut glass and crystal, in the gallery abutting the west side of the Transept, is an exceedingly beautiful and creditable one. Our cut glass, we are inclined to think, bears all competition. Bohemia colours to perfection—but we cut. There are specimens of glass in the gallery in question which sparkle just as brightly, and look just as well, as the Koh-i-noor. Indeed, Mr. Apsley Pellatt exhibits a collection of imitation diamonds, which are not one whit less beautiful or transparent than their original nals, while the prisms, with their glancing colours, are more exquisite objects than the most costly and most radiant gems ever dug from the mine. It is with glass, however, in its fluid-holding shapes that we have now to do. Let us examine with care one of these beautiful and fragile trophies of piled-up sparkling crystal, and see what advances we seem to be making in the most glittering and most artistic garniture of our tables

And first the decanters. The general tide of improvement seems to be setting strongly in the way of making these more and more richly and elaborately adorned, and massive. Many of the specimens before us are beautifully symmetrical masses of carven and glistening glass, the substance rising in crystal lumps and projections of vast massiveness to the hand. In the formation of these—principally intended for port and sherry, the favourite shape has been considerably broken in upon, the decanters being many-sided, and the square and rigid lines of the cut embellishments harmonising with the geometrical-like figure and fabric of the whole. There is little of the pure sense of beauty in these vessels. They convey the idea not so much of grace as a handsome massiveness, and a rich and bold solidity; but they are certainly immense improvements upon the old-fashioned decanters which still linger in houses long ago furnished, and in retired districts of the country decanters formed of a mere thinly-blown bell of glass, conveying an idea of intense fragility, and without the slightest pretensions to any thing but the most commonplace prettiness of form, the single ornament of the bell of late affair usually consisting of a range of narrow-bladed leaves or imitation grass growing up from the bottom of the vessel. In the decanters principally intended for claret and the lighter wines, we observe two prevailing forms, the jug shape and the bottle shape. The former is the more vase-like, and perhaps the more graceful; the latter is frequently the more elaborately ornamented without and sparkling glass, and in its general shape bears no slight resemblance to our old friends the green bottle of the beer

In the vase-shaped claret jug there are two features which greatly take off from the symmetry of the article—a handle upon one side of the neck only, and a stopper in the mouth. In the pure vase, all such appendages as handles must of course always be duplicated, and the curve of the projecting lip for pouring forth the wine is no compensation for the want of the twin projection which the eye demands. The stopper is another drawback upon this principle to confine the vase shape to after-dinner uses. Crowning the pure curve of the neck and swell of the vessel with its impertinent and inconsistent protection of square cut-glass, it shows like a cocked hat upon the head of an antique statue. The other—the bottle form of the claret decanter—is a still greater element of the ruin of the line of beauty, is also free from the inconsistencies and palpable objections attaching to its rival. The eye is not caught and offended by the one-sided appearance communicated by a single handle; while the stopper, if handsomely designed, sets off the long neck, forming, in fact, the capital of the column. However much, however, we may be improving the shape of our decanters, we fear it must be owned that we are decreasing in capacious. In this respect, as all events, we are degenerate. We see no magnum holding a couple of quarts, the regular old receptable for claret. The reign of the still more capacious vessels, of the order of the "Black Beare" and the "Tappit Hens," celebrated in "Waverly," has been succeeded by the modern glass-blower would dream of constructing a vessel which would hold more than a quart, however ready he would be to fashion one which held less. Some difference in the design of bottles for light and strong strong and wines would, however, be appropriate, and have a consistency in the very nature and harmony of things. We have small liqueur glasses for the fiery or surfeiting liquid, and larger drinking machines for the less strong and pungent wines. This is only carrying out a principle, and by the size of our bottles indicate to the toper that claret is lighter than port, and that he is fairly entitled, consistently with his sobriety, to imbibe two glasses of the first for one of the last *

The wine cups or drinking glasses are generally formed after the fashion of the vase claret jug, the greater width of the neck indicating that the liquid contained is more common, and that it may be poured freely forth. The appropriate ornaments are almost always water plants, and leaves frosted in the clear glass. The article, however, is one in which there is still room for improvement and advance in grace and elegance The absence of the necessity for a stopper, and for an undue small neck, presents facilities to the artist to exercise himself to the task of improving those humble but necessary ornaments of the table and the table. One or two specimens of "Anglo-Venetian frosted glasses," made in imitation of the celebrated *moyen age* manufacture of the Venetians, may be inspected with pleasure. There is nothing very graceful about the forms of the jugs, but the effect sought to be produced is that of massive solidity and weight, while the peculiar and lumpy character of the frosted glass gives the appearance of ice to the utensils—suggesting associations of coolness, which, perhaps, to some degree re-act upon the fluids contained in them.

As decanters have been gradually becoming heavier, more squarely built, and more elaborately cut, the previously opposite taste has been gradually gaining ground as respects glasses, which are daily becoming slimmer in the stem, less ornamented at the bulge of the bell, and thinner, with a tendency to simple roundness of form, in the holding part They were, many of them, great monstrosities, the common run of glasses formerly in use Who does not remember the old-fashioned thick-stemmed, goutty, dropsical-looking affair commonly known as a tavern glass? It was the very incarnation of clumsy ugliness, but it had its good points; it was made for rough work, and it stood it. A fall or an overset was of hardly more consequence than it would have been had the material been malleable. Increased liability to breakage, we fear, is one of the penalties we must pay for improving taste and delicacy in glass The slim and elegant claret glasses now made, with a bell like a transparent bubble, and a stem like a fairy column, will and must smash almost with the filip of a finger. But all minute and graceful objects of art must of necessity be tenderly handled. There is an element of beauty in their aërial lightness, which, as it gives pleasure, demands care. Generally, then, we think that the glass manufacturers are making a step forward, as regards so small an article, the lighter and the more gracefully aërial they can make it look, the greater will be the triumph. The old-fashioned long and slender champagne glass seems to be giving way rapidly before its new-fangled rival the open saucer-like affair perched upon the top of a short straight stem and the reason of the change is a very obvious phenomenon. In highly-flavoured and effervescing wines no small part of the pleasure of consumption arises from the discharge of the perfumed gas with which the fluid is charged being inhaled and appreciated by the olfactory nerves while in the act of drinking: now, in the shallow saucer-glasses the discharge takes place with great rapidity and power, in consequence of the breadth of the surface of liquid brought in contact with the air, a phenomenon which only occurred to a very limited extent in the long narrow tube-like glass. So well was this fact known, that champagne merchants and dealers, before the general employment of the flat glass, used to have special private tasting-glasses of the form, we believe, of a tulip, of which they estimated the quality of the wine submitted to them, and fixed its money value. Some of the tasting-glasses which we have seen are furnished with a bottom of silver, so as to enable the experimenter the better to judge of the colour and clearness of the wine. The drawbacks to this species of glass are, that it is by no means so elegantly symmetrical as the old-fashioned form, and that it is not so convenient to drink out of, for reasons which will be appreciated by every man who ever sipped his tea out of a saucer.

We were gratified by observing that the tribe of coloured glasses did not show in any strength. There is no more stupid abomination in the range of fluid-holding and quaffing vessels, than those same stained glasses. They were brought into fashion from Germany, and generally employed in the consumption of German wines; but, unless they were invented by some knowing and rascally wine-merchant, who wished to conceal the bad colour of his decoctions, we cannot conceive how they could have originated at all. The hue or tinge of the glass has no pretensions to beauty or brightness. It has, therefore, no intrinsic qualities to recommend it, but simply serves as a means of destroying one of the most refined pleasures of the experienced wine-drinker—the contemplation of the depth and richness of the colour of the wine. Take a common green hock glass, and stare through it. The bowl may contain either tea or claret ditch-water or Johannisberg. We would not have the "sunset glow" of Burgundy, or the no less beautiful and delicate varieties of tinge of other precious wines, so trifled with.

In the department of drinking pottery—in other words, of tea-cups and saucers, and common jugs and mugs used by the working classes, we see little which seems to be new or remarkable. No new shapes have been introduced, the improvements visible being almost entirely confined to the department of ornamenting with gilding and colouring. Many very beautiful sets of china and porcelain tea services are shown, the paintings done with taste and neatness of hand, and the arrangement of the colours pleasing and symmetrical. A peculiarity in this part of our Exhibition is, however, a childish triviality which ought to be reconsidered and put down. The exhibitors seem to have worked their wits for the invention and production of new and anomalous shades of colour, which they christen "Queen's colours," "Sutherland colours," and so forth. Now, we have quite enough of colours already. A porcelain painter, or any other person, if he cannot produce an effect with the colours of the rainbow, may as well give up the brush, and betake himself to some other trade. Colours are only tools—only means to an end; and the artist who produces a mulberry by his tools without increasing his knowledge or his dexterity in using them, is like the man who thinks he could make better and more skilful work if he had a greater number of hands and fingers to employ upon it.

THE CONTRIBUTIONS FROM TURKEY.

In consequence of the total and unaccountable absence of any Catalogue, either general or special, of the Turkish contributions in the various publications enumerating the contents of the Crystal Palace, this department, so replete with interest, has excited much less attention than it merits. Apart altogether from its intrinsic worth, is, moreover, the interest naturally attaching to the industry and productions of an empire the condition of which must always be regarded by the Englishman as of vital importance. Turkey lastly looks to Great Britain as one of the foremost, the sincerest, and the most potent of her allies and friends; while Great Britain cannot feel indifferent to all that illustrates the internal condition of an empire that fills up so much of the vast space interveuing between our Indian dominions and the central countries of Europe—an empire which includes within her territory the mouths of the Euphrates on the shores of the Persian Gulf on the one hand, and on the other divides with Austria the kingdom of Croatia

In complete contrast to the wonderful extent and variety of the raw products of our colonies are those of Turkish industry; for in many of them we distinctly recognise a closer analogy to what the ancients have left behind us of their domestic manners than can be discovered even in modern Italy; for, while the revival in the fifteenth, sixteenth, and seventeenth centuries completely modified Italian manners, much of the ancient forms found by the Moslems in the countries which they conquered have been left with little alteration. Of this no one can doubt who looks at the collection in question, from the brass lamp with its scissors, pincers, and bodkin, to the arabesque plaster moulding and other slightly altered traditions of the world, of which the excavations of Pompeii have given no such interesting glimpses

But it is not the conquerors of the Empire of the East that entwine themselves with our modern sympathies. Gibbon, with all his rhetorical splendour, illumines, but does not vivify the Amurs, the Saladins, and the Amenaths. Ireland, in one of his most exquisite sonnets ("The Kaiser and Dichter"), contrasts the duration of the conquests of princes and bards; and all must agree with him, who visit this collection, and think less of those who trod over great monarchies than of those who depicted the manners and superstitions of the Orientals. Not one in a hundred of those who visit these interesting collections, remembers that three centuries ago all these articles were as familiar as household words in England, and that Solyman the Magnificent was an even more powerful Sovereign than Charles V: but all remember, and none ever will forget, the heroes and [illegible] Richard the Lion-hearted and his Crusade. No Ottoman pipe is more familiar to the eye and ear, and, therefore, many who pace the Crystal Palace have comparatively little new to see in the Turkish department; but these few form, after all, an insignificant portion of the hundreds of thousands who have never seen either the Black Sea or the White Sea, the desert, or the palm grove; but are, nevertheless, familiar with the sayings and doings of the guarded city of Bagdad, from the street-porter with his weary burthern, to the Caliph himself, attended by the Barber and the unpronounceable Mesrour-es-Saf. It is, therefore the latter portion of our fellow-countrymen that we invite to accompany us in a tour through the objects on the tables and in the stalls which have been contributed by all parts of the Ottoman Empire The great merit of Russell's "Aleppo" and Lane's "Modern Egyptians" is their truthfulness; still more instructive, therefore, is the presence of the objects themselves

House-hold utensils are here in great abundance, and fill up a large space in the contributions. The usual beverage in the East is coffee, presented without milk or sugar at every visit, so that it is drunk a dozen times a day, and, in order to avoid inconvenience, not only are the cups very small, but partially filled there, therefore, are a great variety of coffee-cup holders, in form resembling our egg-cup, which are [illegible] and the best [illegible] of [illegible], others [illegible] wood, some of them of the cocoa-nut, cut with great neatness. These are to be seen in glass cases; and in the parlour stalls are embroidered cloth coverings, with which the tray is brought in in good houses

Prominent in the centre of the tables is a large machine of glittering brass and of elegant form, that looks like a huge tea-urn. This is a mangal or brazier, for charcoal, with which apartments are heated in winter. People in England may abuse our climate as they choose, but they may rest assured that in many respects it is not so easy to find a better, for we are neither roasted in summer nor frozen in winter: and at Christmas time recommend us to the sun of Wall's End or Newcastle-upon-Tyne, which blazes in every snugly carpeted English parlour, to the charcoal of the most elegant mangal that ever was constructed *Punch* is right, the black diamond is certainly the real mountain of both light and heat. The mangal stands in the centre of the room, and a crowded family circle, the ladies of the harem as well as those of it in a circle, and thus warm themselves in a manner not the most healthy or improving to the complexion. Beside the mangals are the basins and ewers, such as are used for washing before and after food the servant holding the former in his left hand, while the water is poured out with his right. Here, too, are sherbet cups, the Bohemian practice of gilding stained glass having been originally borrowed from the East; and we need scarcely say that the European offspring excels by a long way the Oriental parent. In the stalls of the Exhibition are creditable to the manufactory of Ingekyol. It is climate that suggests the quality of diluents; and while the North is cunning in the distillation of strong liquors, the South is equally remarkable for the ingenuity with which cooling drinks are compounded, from the choice lemonade and orgeat to the delicious chopped ice sherbet with the orange-flower flavour. Let it not be supposed that it is only in idleness and in the arts of pleasing that the ladies of the East pass their time; here, to be sure, are ingenious cosmetic boxes, with various compartments for the different dyes used in adornment; they are equally skilled in the useful and domestic arts, and the ladies of the highest rank are acquainted with the art of preparing such drinks as that of rose-leaves, and fruits they even excel our own housewives, and a very large mother-o'pearl frame for embroidery reminds us that the most beautiful dresses of the wealthiest classes are the produce not of the professed needlewomen, but of the domestic harems.

The military character of the Turks is sufficiently recognisable in the collection, many objects showing them to be essentially a nation that mounts much on horseback, lives much under tents, and has adapted its habits to military locomotion. Every one who has lived in a Turkish camp, or has seen how easily Turkish troops are moved, is impressed with the adaptation of their habits to this phase of life. It would take too much space to enumerate the articles illustrative of this part of our subject their camp dishes fitting into each other and easily portable, their lanterns that shut up and open out like magic, and many other articles, show that with the Orientals there is not, as with the European, that broad line of distinction between the habits of residence and the habits of locomotion that exists in the West. It is not merely the aboriginal and nomade habits that account for this, there is a political reason: the constant fear of the great dignitaries of the empire requiring a formidable local influence, causes a perpetual cycle of

recalls and nominations in order to maintain in efficiency the functions of the central Government; this produces a great deal of movement from one end of the empire to the other on the part of those dignitaries. military and civil, who in the Ottoman Empire stand in the place of a hereditary aristocracy. Thus, whatever is portable, whether of a hereditary aristocracy. Thus, whatever is portable, whether diamonds, carpets, or shawls, is prized; hence, too, the expensive velvet and gold embroidery bestowed on their saddles. And instead of such pendent ornaments as the European writing-desk, the pianoforte, and the organ, there is the diminutive cocoa-nut, or brass inkstand and pen-for the hours of business, or for the hours of leisure, the richly incrusted *nay* or *tar*, the lute, or the violin, of the most primitive construction, such as one sees in the productions of the very early Italian painters.

But we are getting into the inextricable slough of philosophy, instead of proceeding with our catalogue *raisonné* of the different objects. An examination of the collection of beads will repay trouble the habit of passing beads through the fingers being as inveterate with many Turks as the perpetual wood-whittling of a Kentucky farmer; we have even known an individual who weaned himself from this practice, and yet never met another person with beads without being unable to resist the old temptation, and beg for them to pass through his fingers.

Furs, from Tunis and Egypt there are in abundance, and also plenty of stuffs for wrapping round them hanging in various parts of the collect on, from simple cotton to fine shawls; but we saw no regularly wound and made up turban, such as is worn in the East, but a not uninteresting substitute is one of stone or plaster, such as usually adorn the cemeteries of the Turcks.

The water pipes are uncommonly beautiful, we mean those in which Bagdad timback is smoked through snake-formed tubes, and which from the noise produced by the passage of the air through the water is commonly called the bubble-bubble. In those tubes as in the snakes will be found a skilful attention to effects of colour; and if we pass to other objects, such as dresses, shawls, scarfs, girdles, we may remark that the suitableness of very bright and contrasted colours to these warmer climates, springs from the semi-obscurity of apartments partially darkened so as to exclude the fast and the light of the sun. It was the Venetians that most fully understood this phase of the beautiful. Hence, in consequence of the limpid depth of his shadows, the boldest colours of Paul Veronese never shock, and in his and in the snakes will be found a skilful attention to effects of colour; and if we pass to other objects, such as dresses, shawls, scarfs, girdles, we may remark that the suitableness of very bright and contrasted colours to these warmer climates, springs from the semi-obscurity of apartments partially darkened so as to exclude the fast and the light of the sun. It was the Venetians that most fully understood this phase of the beautiful. Hence, in consequence of the limpid depth of his shadows, the boldest colours of Paul Veronese never shock, and is certainly more than can be said of Rubens with all his genius and facility; and this peculiar quality of the Venetian school could never be attained by northern painters living in climates where every effort is made to get as much of the sun as possible, or by any set of men whose eyes are not educated to the effect of brilliant colours in every variety of sombre shadow. From tracing the connexion of Venice with the manufactures of the Levant, so frequently introduced into the Venetian pictures; the observation of the analogy of the Levant to the arts of Italy cannot be considered as a *barroque* transition, and those who take an interest in the old pottery of Faenza may remark the prevalence of that Faenza-like green and yellow in the style of pottery of Tunis.

Such observations are made for the many who pay their shilling, and not for the season-ticket holders, who have lounged up and down the Levant, and may have made such remarks for themselves; but even to the *honest blank*, in relation to Oriental life, there a much to fix attention. A jar of dates is a jar of dates, but certainly a common jar of Barbary dates has not the same interest for us as one from Medina, grown under the accumulated sarcophagus of the prophet himself. One jar of curdled milk is like another; but when we know that the one before us is that of an African ostrich, it ceases to be common milk.

Would you like to give a guinea for one of those spoons?" said a friend, as we conducted him through this portion of the Exhibition.

"We should be very sorry."

"Well, then there is one that you cannot have for less than £30 sterling."

We saw that it was not of tortoise-shell nor of ivory, but something of excessively fine texture, between the two, and learned that it was a beak of the spoon-bill heron, a bird now so rare that it is doubtful if in Germany at no d stant date so extinct as the *Megatherium* or the *Ichthyosaurus*. Even the specimens of ingenuity degenerating into the *baroque* are not without interest: here is a wooden chain, each link perfect without a joining, and cut out of one piece of wood, a piece of most laborious handiwork. On seeing a shirt almost stiff with gold-lace, we are reminded of the quaint pages of boothby's "Doctor," who, on reading of some man who had a shirt of gold and a shirt of silver-lace, declared his preference for the latter, as being by far more comfortable. The leather garment of Flanders linen. And much as we have praised the Turkish aptitude for the portable, it was scarcely without a smile that we passed the odd combination of a chibouque and the cutch, which is the name of a book called the "Pipe of Repose," and felt amused on seeing the thing itself in the shape of an article capable of doing duty in both capacities

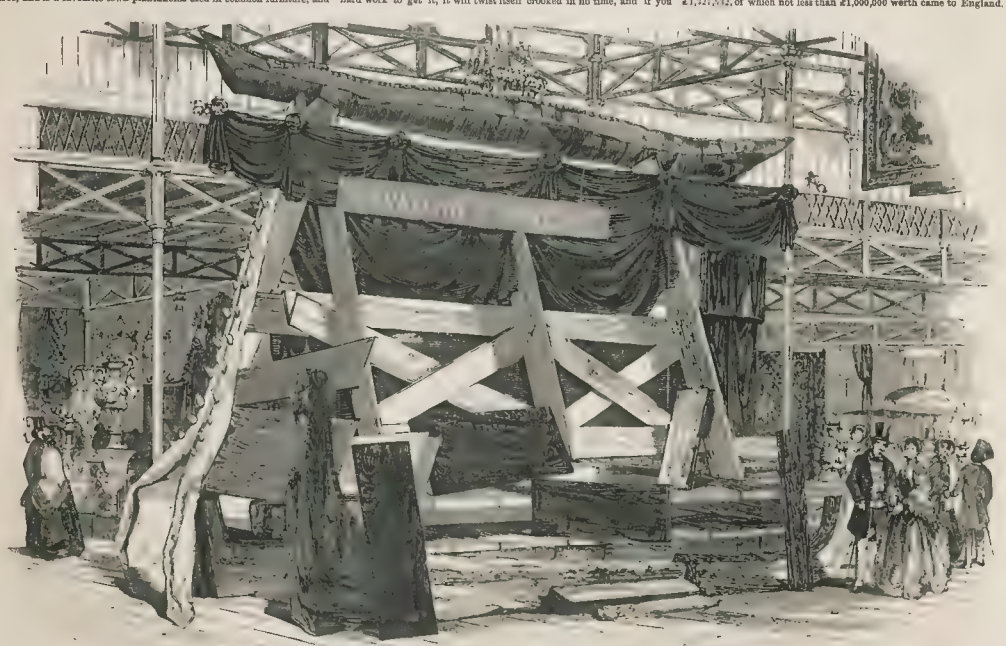
But it is not merely the gratification of a fastidious curiosity that renders a visit to the Turkish collection attractive; it is in fact the best and most interesting lesson in physical and commercial geography, in relation to so large a part of the world, that has been hitherto offered to us. The trophies Turkey has neither the scattered colonies, such as the British empire, nor has she the vast extent of territory possessed by Russia; but no state in the world is, to use a German phrase, so many sided, or presents such contrasts of productions and climates; and her vast contiguous territory is rather ruled by Turks than thickly settled by them, for they are rather the conquerors than the colonists of the wide territories stretching from the confines of her nations

RUSSIAN COURT SEE PRECEDING PAGE.—FROM A DAGUERREOTYPE BY BEARD.

long, four feet high, and four feet broad, and costing thirteen shillings English money. Each family on an average uses about six cords in a season. The soft maple is but rarely cut down, as it supplies sugar abundantly. In spring, before the snow has left the ground, when the sun begins to gain strength, and there is still a sharp morning frost, the farmer bores, about four or five feet up the trunk, a hole some two or three inches deep, and sticks a little cane spout in it. In a few hours he has in his wooden trough, below from two to three gallons of syrup; and every morning for a fortnight, as the sap rises with the sun, the tree pours its sweetness until twenty or thirty gallons are collected. In a spring without frost the supply of sugar fails, and its collection is a work of no small hardship. Its after preparation is a rude process: it is evaporated, to some extent, over a slow fire, and then poured out in pans to cool. The sugar maple grows from forty to fifty feet high, and about six feet in circumference. The other timbers in the Trophy are more generally known. The birch tree, and is a favourite town plantation used in common furniture, and the timber is largely exported to the States. Hemlock, both white and red, is exported as staves both to America and England, and so is the ash, of which Canada can furnish inexhaustible supplies. The bass-wood is new to us, but, it seems, has been proved so useful at home that it may be imported with advantage. It is a soft wood, but close-grained and durable, resembling something our willow, and has been found most excellent in parts and the panelling of railway carriages. The oak (the [illegible] new import) grows apparently from the bare rock to a height of [illegible] feet and [illegible] in diameter, a tough durable wood, and deserving trial for ship-building purposes, and the butternut, growing on the dry land, and most [illegible] favourite, both in the States and Canada, [illegible] varnishing open, as well ordinary [illegible] it is never known to warp. Last we must not [illegible] a little log on the floor, with light edges and a dark centre, marked iron-wood, of no earthly use, said our native informant: "It won't float, it's the contrariest wood in creation; if you want a straight piece, and half break your heart with hard work to get it, it will twist itself crooked in no time, and if you mark out a crooked piece, as sure as sunshine it will stretch out as straight as a line, it's as hard as iron and as heavy as lead, and as obstinate and cranky as an old mule, and never worth either letting grow or cutting down."

In conclusion, we have a word of advice, in view of this timber trophy, to give our Canadian friends: it is that they begin to build ships of their better woods. Their fir-built craft stand but four years, A. 1. on Lloyd's list. They do right well to send a cargo of timber to England to help to pay their cost, but are not profitable afloat. We have to face the world now with our ships. Canada has no longer any advantage, and can only hold her place on ship-building whether for sale or trade, by aiming to build as seaworthy and durable vessels as the Northern and United States. Cheap run up ships, are the dearest in the end; try, therefore, your walnut red oak, hemlock, and rock elm, and use the pine only where pine is best, as it is in first class vessels use it.

The total value of the export of timber from Canada in 1849 was £1,527,532, of which not less than £1,000,000 worth came to England.



CANADIAN TIMBER TROPHY.

POTTERY.—BY MESSRS MINTON.—FROM A DAGUERREOTYPE BY CLAUDET.

MAJOLICA VASES, PATENT WALL TILES, AND MOSAICS.—BY HERBERT MINTON AND CO.

THE majolica vases and flower-pots are a modern application of a very ancient style of earthenware manufacture, the peculiarity of which consists in glazing coarse material with a fine opaque glaze. For a very long period, the manufacture, which was confined to Italy, has been extinct, and, during its existence, was applied to such articles as wine coolers, dishes, vases, &c., which were painted in the highest style of art, and so well, that it is matter of dispute whether some were not from the hand of Raphael, and it is quite certain they were of his school. The manufacture took its name from the island of Majorca, where it was probably of Spanish origin; and the name travelling into other countries has gradually become corrupted to majolica, and by which is not to be understood ware for any especial purpose, but simply having an opaque glaze. The master art of old, however, employed upon the designs, gives with the name the idea of a high order of ornament, the more that the few specimens of majolica to be found are exceedingly beautiful, and fetch the highest prices of any ware in existence. The specimens of the revived ware shown on the stand in our Engraving were made by Messrs. Minton and Co., of Stoke-upon-Trent, expressly for the Exhibition, and are the finest specimens of the revival of majolica, so far as concerns the opaque coloured glazings; but in this department no attempt has been made at the old style of paintings. A wine-cooler, however, is shown in Class 25, in the gallery, which was modelled by one of their modellers, a student of the School of Design at Stoke-upon-Trent, and obtained a prize given by Mr. Smith Child, M.P. for the Northern Division of Stafford, for the best wine-cooler in the style of the majolica ware; and it was afterwards glazed with the opaque glaze, and painted in figures, as a true specimen of the old order. The pavements, of which old specimens are to be found in the tiles of the Alhambra, have the pattern stamped upon them by a plaster mould; it is then fired, and the indentations filled up in the opaque coloured glazes; it is then a second time fired, and is complete

These majolica differ from the encaustic tiles, from the indentations originally made by the plaster mould in the encaustic tiles being filled up whilst in the soft state with coloured clay in a liquid condition, after which they are scraped to give a perfectly smooth surface, and are then fired without glazing. The encaustic tiles are best adapted for floors the majolica for walls. Both these lines range in price from 18s to 30s the square yard, and the flower pots shown in the engraving, though so highly ornamental, are not by any means costly. The ware has been very generally admired. The Queen immediately on having inspected the stand, had specimens forwarded to Buckingham Palace. There is also another specimen of ware shown upon the stand in four colours, and manufactured by a patent process, which is an application of printing in colours to earthenware, the novelty being that three, four, five, or a greater number of colours are, at one application, and without the slightest admixture even at the edges of the patterns, transferred to the surface of the tile, which, by the old process of laying on the colours, must have been each separately applied by hand, and the tiles severally fired after each; a complicated process of manufacture more than doubling the expense of the patent mode.

The figure of Galatea in terra cotta, life size, was modelled at the manufactory at Stoke, by a French artist in the employ of Messrs.

...L OF PARIS, SHOWING ESPECIALLY THE SEVERAL KINDS OF SABLE.—BY SMITH AND SONS, WATLING-STREET.—FROM A DAGUERREOTYPE BY CLAUDET.—(SEE NEXT PAGE.)

Minton, and who also holds the appointment of Master of the Model Class of the Government School of Design in the town. This figure, and some other large articles in terra cotta, were fired in a kiln built expressly for the purpose, and which is requisite to carry out the manufacture of all articles too large to be enclosed separately in a *saggar* or case of clay, to protect them from the smoke and flame of the furnace. The kiln for those large articles is, therefore, so constructed, that it, in itself, forms a protective covering by being built double, so that the flame plays between the outer and inner casing; and the risk in baking such articles is very great. The time required for firing and cooling is at least three times that for articles of ordinary size; for, however exquisite the art employed, the modelling of the work might be destroyed by a single crack or flaw, the result of a little too quick heating or cooling of the kiln. The Galatea was shut up in its fire-box for ten days, and was the second first, a still more excellent one having been heated too fast, and spoiled. We have only further to mention some specimens on the stand of mosaic pavement, manufactured under Mr. Prosser of Birmingham's patent of 1840, the novelty in which consisted in the discovery that the materials of porcelain reduced to a dry powder of about the fineness of flour, and subjected to a strong pressure between steel dies, is compressed to about one-fourth its former size and becomes a compact solid substance, of such hardness that it is difficult to find a stone of sufficient hardness to give the surface a polish In fact, the stone is polished before the mosaic, which is far harder than the antique. The specimens in the compartment under notice are made of tesseræ of about a quarter inch cube, and are copies of the pavement of the church of San Bartolomeo ad Santa Maria Maggiore, at Rome The cost of these mosaics, ordinary patterns of which are from 4s. to 5s. a foot, has been so reduced by Mr. Prosser's process as to make them an article of English manufacture and considerable use.

FURS EXHIBITED BY MESSRS. GEORGE SMITH AND SON, WATLING-STREET.

THE first proposal as to the exhibition of furs was, that it should be a joint affair amongst the merchants, wholesale dealers, and retailers, a shape in which (although four of the leading houses in the trade contributed to the great case in the centre of the Western Nave, which goes by the name of the Fur Trophy) the project did not get carried out. The wholesale dealers at first hanging back, under the impression that, though furs might be shown of every class, and in every stage of finish, they scarce sufficiently formed an article of manufacture for exhibition; finally, however, nearly all dropped in, it being felt that a branch of trade occupying so large an amount of capital and employing such a number of hands should be fairly represented; and, therefore, in the wholesale trade, Messrs. George Smith and Sons, of Watling-street, Robert Clark and Sons, Cheapside; Bevingtons and Morris, King William-street; Luke and Co, King Edward-street; Myer and Co, Bow-lane, and George Ellis, Fore-street, and in the retail, Nicholay and Son, Oxford-street; R. Drake, Piccadilly; Ince and Son, Oxford-street, became exhibitors either in the common case or in spaces of their own.

The greater portion by far of our furs come through the Hudson's Bay Company; and the trade differs from every other in the world.

More than 180 years since, Charles II. granted to Prince Rupert and others a vast extent of territory in North America, stretching along the coast from Hudson's Bay to the Pacific, and how far inland is best expressed by saying that it includes all the land, with the exception of Canada, New Brunswick, Nova Scotia, and a little strip of Russian possessions from the North Pole to the boundaries of the United States. The region is, with the rare exception of the Company's station, as wild now as when King Charles's grant was made; no forests have been cleared, no roads made, no colonies planted; the whole forms a vast hunting-ground—a preserve for such vermin and wild beasts as nature has wrapped in coats of thick, soft, warmth-preserving fur.

The whole number of persons employed by the Company amounts to four or five thousand, and those on the spot are all natives of the Orkneys. The animals, however, are trapped and hunted entirely by the American Indians, who in the spring time bring in to the several stations the produce of their winter's toil and cunning, and barter the furs for arms, ammunition, blankets, knives, hatchets, and their ever-favourite tobacco. Money never passes; but until 1822, when the union of the Hudson's Bay and North-Western Companies took place, rum and brandy were always a large item in the exchanges, and served during a long period to ruin the native Indian races.

The supply of various kinds of furs, from various causes, fluctuates greatly. The marten, or real sable, skins imported from Columbia River, in 1848 exceeded 31,000; in 1849, 19,000; and in the present year, have fallen to 11,877; and from other parts, by the Company, in the same years, were, in round numbers, 54,000, 26,000, and 26,000. Sometimes a fire spreads through the forest for miles destroying multitudes of animals; sometimes an unusual severity or continuance of frost cuts millions off; or some sickness seizes whole species, or the Indian hunters are themselves the subject of some epidemic that materially thins for a season or the season for the field. It does not, however, appear that any general decay of any of the fur-giving animals has taken place.

The fur of most general consumption in England is what is called real sable, specimens of which are shown in the case before us, the greater part of which are imported by the Hudson's Bay Company, and some of a common sort are brought from Canada and the United States A very small quantity are imported from Russia, but the high price limits the demand, the best skins fetching from £5 to £10 a skin.

The three distinct sorts, which are very frequently ticketed in shop-windows Russian sable, are shown in the case side by side, for the express purpose of enabling the public to observe the distinctive character of each. The Russian is finer, darker, closer set; has a richer undercoat, and a peculiar mouse-tint in the colour, quite distinct from Hudson's Bay and Canadian. The Hudson's Bay marten or sable, which stands next in value to the Russian, and ranges from £6 to £8 a skin, according to the darkness and uniformity of colour, and are also easily distinguishable from the Canadian, which are a smaller skin, and of a redder shade, and worth from £4 to £5 a skin. Canada and the United States are consumers of the real Russian sables, the quantity used in England being very small. The ordinary articles in use, such as muffs and riding boas, take about four skins each.

The same case also contains a muff and riding boa made entirely of Hudson's Bay sable-tail, an article much esteemed by the higher classes in England; they are dark, not very expensive, and surpass all other furs in durability, &c. The other furs shown by the same firm are chinchil, Russian squirrel, Siberian squirrel, specimens of dyed squirrel, fitch, and dyed fitch. Those in fitch are from skins of pole-cats caught in Scotland, and not inferior to those of any other country.

The chinchil is from South America, an article always in esteem, but too delicate for hard usage. Of late, however, it has come largely into use in Russia. No other fur can be put in imitation of this; and the value of the skins is from 24s. to 60s. per dozen

The squirrel and dyed squirrel (imitation sable) are an article that wears well, and is of very great consumption. The skins are so cheap, that tippets sell at from 1s. to 12s. each; and some idea may be formed of the consumption from the fact that not fewer than 20,000,000 squirrels are annually killed in Russia to supply the trade.

In scarce any business are people more grievously imposed upon than in the purchase of articles of fur; and in every instance, as this case may serve to show, a very little knowledge must serve as a protecting Rabbit and ermine (except that both are white, and have black tails stuck on) are as unlike as two furs well could be: the ermine, brilliant, fine pointed, the taper hairs lying close and evenly; the rabbit, blunt and coarse; and yet we have heard of a lady giving £20 for a white rabbit cardinal, which, were it real ermine, would not have been worth more than from £12 to £13

The great enemies in a fur warehouse are moths and rats—the former kept off by constant care, the latter requiring no small expense in warehouse arrangements. Messrs. Smith and Son had to sink their floors below the rat runs, lay down three feet of concrete, and thick coatings of asphalte continued for three feet up the walls. The warehouse, though devoted exclusively to furs, is not second in extent to many of the general warehouses in London, and is the largest in this single trade

The manufacture of furs employs a considerable number of hands, and is done entirely by piecework through chamber-masters, who out out and match, and employ as many women to sew as they can keep going. A master will cut and have made up from 1500 to 3000 squirrel skins in a week, and will earn, if strong-handed, from £150 to even £400 a year, from which, however, he has to pay his sewers and finishers, and which he must work often 16 hours a day.

The entire value of the furs shown by Messrs. Smith and Son is about £400. The boa hanging under No. 10, in the case between the two chinchil muffs, is of the finest Russian sable, and worth about £50; and in the bottom of the case to the right is a muff of the same material and price. The boas hung outside the case are by Nicolay and Son.

HOROLOGICAL SECTION.

(SECOND NOTICE.)

SINCE our first general notice of the clocks and watches exhibited in the British department, we have devoted considerable time to a general examination of every horological production exhibited throughout the Building. In this excursion through all the various countries which have contributed to the World's Fair, we found the difficulties attendant on, and disadvantages of, a geographical arrangement of articles exhibited very great indeed, especially with such a useless guide as the Official Catalogue. It was only by exploring every court, passage, avenue, aisle, and gallery throughout the Building, that we were able to discover the whereabouts of the various clocks, watches, and other horological apparatus contributed by the foreign exhibitors; and even in the British division of the show of clocks and watches, though a philosophical arrangement, has been successfully carried out to a considerable extent, we discover several interspersed with the plate and jewellery which attract so much attention in the Middle Gallery South, and contiguous to the British Horological Department.

In commencing our survey, we first entered the "United States" department at the east end of the Building, and finished in "Great Britain" at the west end of the Building—travelling through Russia, at that time a barren wilderness, but now becoming civilised, Austria, the Zollverein, Greece, Turkey, Italy, Switzerland, Holland, Belgium, France, Persia, India, China, &c.

The only countries which have sent specimens of clocks and watches to the Great Exhibition are the United States, Austria, Prussia France, Holland, Belgium, the Switzerland, and the British Isles. The only real clock-producing countries are America, France, Switzerland, and the United Kingdom. The Americans make no pretensions to exquisitely finished watchwork, but have gone a-head in this as in every other branch of mechanical manufacture, with a view to utility and economy rather than to excellence of workmanship or beauty of design. It is well known that most of the American clocks keep excellent time, and the reason is obvious. As a rule, there are no complicated parts in their clock movements; moreover, the wheels and other important parts of their clocks, having been first very accurately set out and modelled, are multiplied by machinery to an enormous extent: thus, two American clocks from the same factory are far more likely to go together, as it is called, or to keep uniform time, than two of the most exquisitely finished productions of our first-rate clock-makers.

France exhibits a large collection of clocks and watches, by her first makers, in which we discover many fine specimens of clock-work, in particular, and numerous examples of astronomical clocks, &c.

Switzerland contributes an exhibition of itself, in the Middle Gallery, South, near to the Transept, consisting of every variety of Geneva watch, from the size of the top of a pencil case to that of the large and flat English watch of the present day. To the watchmakers of Switzerland we are indebted for the convenient arrangement of the works of modern watches, by which so little depth is required within the case for the accurate performance of their works. Although Geneva may be called the seat of the clock manufacture, yet the manufacturers of Chaux de Fonds have sent many of the most beautiful specimens of Swiss taste and ingenuity in the display of watches which attract all visitors to the Swiss department.

But, while we admire the go-ahead system of the American clock-makers, the elegance of design and finished workmanship of those of France, and the ingenuity and exquisite taste displayed by the Swiss, we are proud to proclaim, that, in the British division appropriated to horology, we find the choicest and most surprising collection of clocks and watches that have been ever assembled in any one room. We draw the special attention of our readers to the western division of the Middle Gallery South, and not far from Willis's Great Organ, in which they will find the results of scientific attainments and practical knowledge, on the part of makers, with a skill and taste proudly be held up to the admiring multitudes from all the nations of the earth as the veritable gems of the Great International Exhibition!

In our present notice, we intend to deal with the more than 400 the names of exhibitors, with the articles they contribute; but we have prepared, and are still preparing, detailed accounts of the best specimens of clocks and watches contributed from different parts of the world

Messrs. Benson, of Old Bond-street; Messrs. Rogers and Co., of London, exhibit upwards of fifty clocks made by Charles Jerome, of Newhaven, Connecticut, U. S.; and Messrs. Holloway, sons of London (No. 514 in the Catalogue), exhibit twenty-nine clocks, also of the true American cut. There is one clock in this department, however, known as "Crane's Patent," and exhibited by the "Year Clock Company" of New York, which differs from all the others shown in this department, in that the pendulum, instead of vibrating upon a pivot, is made to rotate, first in one direction, and then in the other, within a circle of short radius. The absence of the inventor, or some person understanding the construction of this clock, prevented us from obtaining any account of the working and advantages of this horological novelty. We omitted, in the first part of this notice, to mention that a great deal of the work in the manufacture of American clocks is executed by females, especially the painting of the dial figures

Hamburgh, No. 10. Mr. J. L. Nieberg, exhibits a constant pendulum clock, with centre seconds, the whole mounted on four columns.

Hamburgh, No. 11. Mr. Brocking, who is one of the principal clock-makers of the free city of Hamburgh, exhibits a clock escapement, in which the impulse is given without the irregularities occasioned by the movement and by the oil. It is placed on a light double bracket. He also exhibits an electro-magnetic clock (bearing date 1850), by which the impulse is given by the gravity of a lever, independent of the greater or less intensity of the magnetic fluid.

Zollverein, Seebas and Co., of Offenbach, contribute three samples of cheap time-pieces, the dials of which are painted on glass, either to form or circular mounted on pedestals, the works being enclosed behind the dial in a small metal case.

E. G. Zimmermann, of Frankfort on the Maine, exhibits two time-pieces of somewhat similar design, but each having a pendulum, and also sockets for candles. The above are exhibited as low-priced articles

Prussia (No. 75). Gustave Seemann, of Warmbrunn, exhibits in the north east recess of the Octagon Room three little clocks, less than an inch in width, the pendulum of which seem to be continually racing: these diminutive articles, however, are more for ornament than use, as they are not found to keep time accurately.

Wurtemburg (No. 1). In the same recess is a neat and well-finished pendulum clock, in mahogany frame and glass case, with centre seconds, exhibited by W. Holch

In the Octagon Room (No. 443) are two ivory watches, by Michael Dorer, under a glass case on pedestal, near to the south entrance. In the same room, A. Bacher, of Stuttgart, exhibits a small watch set in a bracelet, after the Swiss fashion, which is much admired by the fair visitors. He also shows an ivory watch; a second, more like the English make with centre seconds; and, lastly, one for scientific purposes

Saxony. A. Lange exhibits ten plain watches, as also the parts of a watch, but not nicely arranged and without labels—very different from the analytical classification of the parts of a watch as exhibited by Messrs. Rotherham, of Coventry. In the Middle Gallery South (Prussia, No. 63), Pierre Guerlin exhibits, as specimens of cheapness of production, twenty-three enamelled circular-faced time-pieces, with pendulums, valued at about £1 each; and also three very common-looking mantel clocks, one in china case, which shows the time at twenty-two different places.

Prussia, No. 72. A portable carriage clock of superior workmanship. Contiguous to the above is an attempt at turret lock works, striking hours and quarters—workmanship very inferior.

Descending from the Gallery we entered the Austrian department, on south side of the Nave, and found answering to No. 166, two mantel-piece striking clocks, exhibited by Anton Liszt, of Vienna; altogether, 12 clocks in this division, including an old pendulum clock, with glass front and sides, and three flat clocks in square gilt frames, in very common use in different parts of the continent of Europe.

Jacob Schwarz, also of Vienna, has sent several models of churches made of mother of pearl, each having a small clock with external pendulum.

Crossing to the north side of the Austrian allotments we found No. 170 appended to a compensation pendulum clock, in neat case, by August Selisko, of Prague; and Pasquale Anderwalt, of Trieste, shows two of the most curious clocks in the Exhibition Without knowing more about them, we cannot at present offer a satisfactory opinion as to their respective merits: suffice it for the present to mention, that the one worked by hydrogen gas is said to be able to perform for thirty years without being touched; and the other, in which the power is obtained by the pressure of the atmosphere on a reservoir of quicksilver, is calculated to go a hundred years or more with very little attention. The absence of an interpreter here is much felt by those who crowd around Anderwalt's extraordinary productions.

Austria, No. 169. S. Kralik exhibits a clock, and also various movements; the whole placed on a pedestal. A picture clock is suspended near to the extraordinary clocks above mentioned, in which the hours, minutes, and seconds respectively appear at their proper intervals in small openings left in the picture

In the Middle Gallery North we discovered the contributions of two exhibitors from Holland. The one, Andrew Howhu of Amsterdam, No. 86, shows a clock with the hour circle excentral, extending to 24, above it a seconds circle, while the minute hand alone is central. He also exhibits a half seconds chronometer, the property of Prince Henry of the Netherlands. The other exhibitor from Holland is A. Kalsir, of the Hague, who contributes a small pendulum clock in plain case.

The clocks and watches from France are placed together on the north side of the eastern part of the Nave: there are upwards of twenty exhibitors. We commence with A. Brocot (No. 441 in Catalogue), who contributes eleven, chiefly astronomical clocks, which are very much in vogue in France.

653. G. Moser exhibits altogether 41 clocks, some astronomical, others elegantly mounted, one in particular of globular form, which is supported by an eagle; others again are attached in an artistic fashion to the backs of sunstands. The combination of watches in particular with other articles of utility is fully illustrated in this Swiss department.

1186. Le Roy shows a handsome astronomical bracket clock, a large clock surmounted by warlike figures, and 11 watches elegantly set with brilliants, &c

1401. L. Potonne exhibits twenty-seven clocks, of various designs; one of which is ornamented with singing-birds, perched on the branches of a tree. This description of horological ornament may be seen to advantage among the French *bijouterie* on the south side of the Nave. Potonne also contributes three portable carriage clocks, and three others.

L. C. Bourgeois, of Morez de Jura, exhibits three pendulum clocks, and two carriage clocks or "Impenals."

14. Bally, Brothers, and Son, also of the same place, which would appear to be one of the principal seats of the French clock manufacture, contribute one specimen of clock-work.

415. Chavin, also of Morez, has sent to the Exhibition some old clocks, seven in number, and one skeleton, with compensation pendulum.

584. Reydor Brothers, and Colon, of Morez, three clocks, in polished wooden cases, of old construction; also one pendulum clock, and two striking clocks

168. Philibret Bally exhibits his chronoscope, by which the exact time may be ascertained without calculation at any place on the globe. The following curious notice is attached:—"This instruments will set himself according to any place, is of service to all persons, and is very useful for country residences; it marks the time with a precision who no sun-dial the best finished are able to reach, which after all gives only the quarters of an hour." The same person contributes nine clocks.

230. Pierret, of Paris. One variety-piece clock, in marble case, and twelve small pendulum skeleton clocks.

525. Gourdin, of Mayet, contributes a handsome musical clock, which strikes on five bells; the whole enclosed within four fluted columns.

211. S. Mutt and Co.—Seven modern ornaments

1425. A Redier exhibits his Horograph, for use on railways; it is partly for the same purpose as Whishaw's Centimetral Chronometer, but more complicated in its use. He also exhibits his "Controller," for registering the velocity of a train at each moment, and at each mile or kilometre, the time of stopping at each station, &c; giving, in fact, the complete results of the progress of a train from the commencement to the termination of its journey; and a number of other articles.

344. V. Pecheloche.—A thirty-five day pendulum skeleton clock

365. A Ponlet, of Lyons.—Six flat watches

1664. M. Moinet, director of the house of Breguet, exhibits chronometers giving seconds and indications for the days of the week, month, and year, respectively. M. Moinet is not quite correct in calling such indications *unusual*: any person looking through the various clock departments, will find a great display of clocks with such indications; the great clock from Exeter is, perhaps, the finest example exhibited. Also four clocks

7. A mantel-piece clock, surmounted by two bronzed figures.

9. An eight-day Sherbert and Bunn, by exhibiting his electro-magnetic clock with two faces—one on the north side of the eastern part of the Nave, and the other on the south side, and immediately opposite to the first

11. A work of the same nature but to be seen in the Middle Gallery South, and about Messrs. Shepherd's, of three faces, and which has already been described in the ILLUSTRATED LONDON NEWS. M. Wagner also exhibits on his stall, fronting the Nave, two clocks of large dimensions, with compensation pendulum, and a chronometric apparatus to verify the law of gravity: this is placed next to the Nave, and consists of a vertical cylinder, made to rotate by clockwork; the cylinder is covered with paper, on which lines are marked, and the exact time when the necessary results are obtained. On the same stall is a glass case containing five watches and two movements

735. Visière contributes three chronometers, four watches, and parts of movements. Another clock (231) is exhibited on a pedestal in front of this stall, as above

1539. On the east side of the same stall is a splendidly finished regulator, by Detouche and Houdin, on gilt case, with compensation pendulum. The minutes are indicated on a circular dial below the clock face. Contiguous to the above, under a glass case, is a handsome astronomical clock. The rising and setting of the sun are indicated, and also its elevation. Below the hour circle are two smaller circles, in which are shown the days of the week and phases of the moon respectively. The equation of time and the day of the month are indicated on segmental plates recessed below. Next is a handsomely gilt clock with compensation pendulum, and two lights supported by two nymphal figures. Three plain clocks in black enamelled cases, eight other clocks exquisitely finished, and watches under glass case; also parts of clocks and two small clocks. In the south side of the Transept we found another example of the introduction of time-keepers into other useful articles. It is a small time piece, 6 inches in diameter, placed in the back of a carved sideboard, by E. P. Durand, of Marais.

1018. In the same north of the Nave two clocks are exhibited by the Vieille Montagne Zinc Mining Company, merely as specimens of their ornamental zinc work: on the top of one is a representation of "Jean Sanspeur," and on the top of the other is represented "the Wrestlers." Several other examples of the perfection to which this company have brought their zinc manufacture are exhibited, especially that of her Majesty, in the foreign division of the Nave.

Leroy exhibits a large watch, with metallic thermometer, twenty holes in rubies, and compensation balance, by Kramer.

266. Figuet Brothers.—A gold watch with duplex escapement.

34. Frederick Courvoisier, of Chaux de Fonds. Five watches.

18. Perret, of Brenets, canton of Neufchatel, has invented and perfected a complete and elegant pocket-clock and independent repeater, which strikes the hours, the quarters, and the minutes, forty-two holes in rubies; the whole is beautifully got up.

17. A repeating watch, with perforated dial, to show part of the works, by Justin Kopp

263. Lecoulte and Golay exhibit movements with teeth of various numbers.

16. Meroz Dely.—Two flat gold watches.

Baues also exhibits two flat gold watches, on one of which is an engraved representation of Paxton's Crystal Palace.

20. Francis Moser.—A gold watch.

23. A chronograph, for taking the times of observation, by H.A. Favre. The time, by this invention, is accurately taken to the fifth part of a second.

7. Flat lever watch with compensating balance, twenty-four holes in rubies.

267. E. and A. Paillard, of St. Croix, canton of Vaud, exhibit a beautiful little watch, with a portrait of the Queen of Holland, set with diamonds.

13. F Bovet, of Bienne, contributes a 370-day flat gold watch, handsomely engraved, and also a second gold watch.

11. Henry Augustus Five, of Locle, exhibits an instrument for determining the epicycloida curve of the teeth of wheels and pinions.

28. A flat gold watch, by Cæsar Vaucher, showing equation of time, months, &c

24. A pair of open-faced watches, with centre seconds, by Charles Henry Groscluude, of Fleurier.

21. A glass case containing six flat watches by Perret and Son, of Locle.

264. Three silver watches.

16. Messrs. Mermod Brothers, of St. Croix, exhibit a chronometer, an eight-day gold watch, and four others handsomely set.

22. Louis Andersen exhibits seven watches of various kinds

74. Messrs. Baron and Uhlman, of Geneva, contribute fifteen watches, some of which are patented on account of improvements therein.

31. Henry Bock, of Locle, contributes seven silver watches.

219. Under this number are exhibited, by Duterle, a splendid lot of exquisitely finished bracelets, rings, card cases, &c., each containing "a love of a watch," to borrow the expression so often used in this part of the Exhibition by many of the thousands of fair visitors who are attracted to the horological display of the Swiss allotments.

3. F. A. Reigel, of Couvet, contributes tools used by watchmakers, especially a pivot and depthening tool.

9. F. W. Dubois, of Locle, a marine chronometer of new construction.

19. Two "Imperials," or carriage clocks, are exhibited by Henry Borel, of Chaux de Fonds.

30. Pierre Gerard, of the same place, also exhibits an "Imperial."

21. Two similar clocks are contributed by Henry Louba, of Bienne.

99. Philippe Patek and Co. exhibit a great variety of real Swiss watches altogether seventy-one in number, the smallest being not more than three-eighths of an inch in diameter. Many of these watches have exquisitely finished miniatures let into their cases; some also are set with brilliants. Among these miniatures we find one of our most gracious Queen, and another of the "Queen of song," whose charming notes have been echoed even among the Swiss mountains.

94. Lutz, of Geneva, contributes very delicate hair springs, suited to marine chronometer-

96. W. Mann, Esq., of London, exhibits six beautiful watches, by S. Mercier, of Geneva, four of which have ornamental engraved dial backs.

92. A. L. Golay, of Geneche, Geneva, shows a repeater chronometer, with metallic thermometer attached

240. Two small watches, with compass to each.

220. Here is another example of the introduction of a watch into some other article of every-day use, which, in the present instance, is a memorandum-book, and is exhibited by L. Golay, of Geneva

Henry M. Gold, also of Geneva, contributes a handsome repeating watch, with centre seconds. The hands are delicately coloured, which produces a good effect

95 is attached to a case of five watches, each watch movements and pinions, by A. Lecoultre, of Sentier, canton of Vaud

A novelty in the shape of a half chronometer, for the use of the deaf and blind, which, with a pencil-case attached to the key, is exhibited by S. Mercier, of Geneva.

78. Every one who takes an interest in the display of clocks and watches is anxious to find out the "tiny watch," which is contributed by D. H. Elfroth, of Geneva. This little timekeeper is contained in the top of a long gold pencil-case, is not more than three sixteenths of an inch in diameter, is jewelled in eight holes, and, besides showing the time of day, the days of the week and month respectively are also shown, and it is stated to go "with the same perfection as a large watch." Two flat watches and chronometers, one with a compensation balance, complete the Swiss collection; before leaving which, however, the obliging policeman in charge introduced to our notice a beautiful little mechanical singing-bird, which is made to flap its wings most naturally and to pour fourth its sweet delightful notes. It is caged within an ornamental piece of china, the top of which encloses the little gem so soon as the tune is over.

On leaving the Swiss collection of watches, we are now proceeded towards the magnificent display of the products of British horological science in the Middle Gallery West, adjoining the attractive show of plate and jewellery by Garrard and others—on casting a glance at which, we discovered under the number 87, Class 23, a collection of chronometers, &c., by Phillips, of Cockspur-street, consisting of three two-day marine chronometers, a carriage timepiece, or "Imperial," with lever escapement, two camp timepieces; a repeating library clock with duplex escapement; compound chronometer balance helix pendulum spring, jewelled in six holes, beats seconds and strikes the hours; two small "Imperial" clocks, three in eight-day cases and the fourth in a glass case, and, lastly, seven lady's and gentleman's gold watches, and one of silver.

92, in the same class, is appended to the articles exhibited by Harvey and Co., including a "minute astronomical regulator," which beats the seconds distinctly, and striking every minute or 60th second; this is certainly a novelty in watch making, and for scientific purposes very useful.

C. F. Hancock, in the same class, No. 119, contributes, first, a flat eight-day carriage clock, with fine lever movement, by Cole—famous for clocks of this description: second, a flat eight-day carriage clock and movement by the same maker, which strikes the hours, half-hours, quarters, and repeats the minutes, ordered by her Imperial highness the Grand Duchess of Leuchtenberg; the border round the dial is of fine gold richly worked; within are the arms of the Grand Duchess in their proper colours: third, another flat carriage clock by Cole, which strikes the hours, and has an almanac under the hour circle

Michael Emanuel exhibits also, in Class 23, No. 119, a handsome silver clock on pedestal, ornamented with several figures, including one of Time, and surmounted by a Roman charlot drawn by four horses

Class 23, No 27. Lister and Sons, of Newcastle-on-Tyne, exhibit a half-seconds vertical chronometer, and a handsome timepiece in glass case.

Martin and Co., of Cheltenham, contribute a timepiece in fanciful mahogany case, the peculiarity of which, invented by Burgess and Hewston, we have not been able to ascertain.

As already observed, the collection of British clocks and watches, forming part of Class 10, are worthy of a close examination by every visitor to the Crystal Palace. The arrangement of the collection has been made by a committee appointed by the exhibitors, and certainly is highly creditable to them. A peculiarity in the construction of the exhibition is, that an intelligent person has been appointed to the special charge of the collection; and being himself a practical watch and clock maker, and very obliging, is not only able, but willing, to render every assistance to the enquiring multitude attracted by this costly horological display.

Against the eastern division wall are the productions of Gowland, Parkinson and Frodsham, Aubert and Klaftenberger, and Bennett, of Cheapside.

No. 27. James Gowland's Regulator—The great novelty of Mr. Gowland's pendulum is its freedom from nearly every impediment to perfect measurement of time. It is not only rendered free from all friction in the escapement and train from the influence of oil, the jar of the crutch or other connexion with the escapement, but fully accomplishes that most desirable end, viz. the perfect equality of the axis of vibration, as long as the clock has power to lift the weights. The method adopted compose improvements in both the pendulum and the escapement. In respect to the former, the pendulum is so constructed as to have the top and all parts forming it, as also the glass cylinder for the mercury, so firmly united by clamps and screws as to prevent the possibility of any shake or tremor. The cap of the cylinder is made perfectly mercury-tight by being pressed down by a clamp nut, which, at the same time forces the rod with the regulating index-nut against the top of the frame, and fixes it in any given place for true time. The top of the pendulum is attached by two equal springs to strong solid clamps, screwed outside each plate, and against the spring bar at right angles to the plane of the pendulum's motion. Through the centre of this bar passes a rod or beam, parallel with the seat board, and exactly in the centre of the frames At the extreme end of which rod or balance beam are two adjusting screws, having hard polished conical points, to take the small hollow weights, which keep the pendulum in motion. These points are so adjusted, that they, together with the centre of motion in the pallets, as also the point of suspension of the pendulum, and the upper surface of the arms of the escapement, all range in the same straight line, and thus have a common centre of motion. The position given to the pendulum exactly in the centre of the frames, and close to the seat board, is the best possible situation for it to receive the impulse of the weights lifted by the escapement, and for securing the greatest firmness in the point of suspension. The improvement in this escapement, is, that by two long arms, extending from each side of the pallets, having open spaces or forks at their extremities, it lifts alternately through equal spaces the small weights after each is deposited by the balance beam of the pendulum, holding up each in turn until the balance beam, rising on one side, receives the upper weight, and descending on the other side deposits the opposite weight on the escapement arm. After the deposit of the weight it immediately unlocks the escapement from its dead point of rest, and the escapement sets on the inclined plane of the opposite pallet, and the weight is again lifted to its former position. The adjusting screws at the ends of the balance beam admit of the most delicate and certain adjustment of the beat of the clock, so that, at the same instant, the weights are respectively lifted from the one and deposited on the other side of the escapement. By the above means Mr. Gowland has secured all the advantages that a perfect point of suspension and structure of pendulum can effect towards the accurately equal division of time, as the pendulum is never in any manner or degree subject to or influenced by the mechanism. This certainly must be considered as a very important step in the construction of regulators

No. 25. Astronomical clock by Parkinson and Frodsham, with mercurial pendulum, in handsome mahogany case.

Next in order, Aubert and Klaftenberger, of Regent-street, have produced a great novelty in clock-making in the shape of a regulator having a seconds and a half-seconds pendulum, a glass pendulum rod, with the mercury distributed in several vertical glass cylinders arranged in circular form. The movements cannot be described without the aid of diagrams, which are, however, in course of preparation

No. 1. Mr. Bennett, of Cheapside, contributes what he terms "an economical regulator," which has a mercurial pendulum, and beats half-seconds

Leaving the eastern wall-space, we approach the first stall or counter, immediately opposite, and find several springs by J. Brookes, including a main-spring for a two day marine chronometer, exhibited under the number 23.

32. An elegant large skeleton clock, by John Moore and Sons, Clerkenwell: green and gold letters in open-work; strikes on five bells

Under the same number, T. R. and J. Moore exhibit a beautifully designed table clock, in blue, green, and gold, the hands being finished in green, white, and gold, also an elegant skeleton clock, of smaller size, finished in green and gold.

28. Tanner, of Islington, exhibits a silver watch, the peculiarity of which is, that it shows both Greenwich and Liverpool time, which he calls a "Folhorion"

39 C. Elisha.—Two silver lever watches, one with compensation bar, compounded of brass and steel.

21. H. Gibbs. Flat watch, showing double time.

8. J. Cragg exhibits a model of a lever movement: also thirty-four gold and eight silver watches.

462. Mr. C. Copland contributes some horological curiosities; first, a "warming-pan" silver watch, with gilt face, said to be the carriage clock or watch of Henry VIII.; also a pedometer and watch used in the first survey of New South Wales

52. Aubert and Klaftenberger, whose regulator we have already mentioned, show, first, a fine repecting watch, striking the hours, quarters, and half-quarters, with a compensating lever escapement, jewelled in twenty-two holes; the moon's age, and the day of the month are shown: second, a pocket chronometer, jewelled in six holes; third, a compensated duplex hunting-watch, jewelled in five holes; fourth, a compensated lever hunting-watch, with going barrel, jewelled in twelve holes; fifth, a compensated duplex watch, going barrel, jewelled in eight holes; sixth, a compensated lever watch, with ¾-plate, jewelled in ten holes; seventh, a compensated lever hunting-watch, ¾ plate, jewelled in seven holes; eighth, a compensated duplex watch, jewelled in eight holes; ninth, a compensated lever watch, going barrel, jewelled in ten holes; tenth, a duplex watch, going barrel, jewelled in eight holes, eleventh, and lastly, a two-day marine chronometer.

James Gowland, besides the regulator already mentioned, exhibits his patent concentric chronometer, a chronometer escapement, a handsome carriage clock, and one silver and four gold watches respectively

A large clock in gilt case standing on a pedestal, with figures representing night and morning, the whole surmounted by a figure of Britannia is exhibited by John Walker. The novelty of this production consists in a series of moveable tablets, appearing in a slight recess in front of the pedestal, at intervals of two minutes; these subjects are indicative of the progress of time and science in the civilisation of Great Britain. The first subject is that of the ancient Britons leading a wandering and savage life; the second subject represents a Roman governor of one of the English provinces, receiving one of the first lessons in the advantages of agriculture; third, Henry II. protecting and granting lands to the Flemish weavers; Earl Rivers presenting Caxton to Edward IV. is the subject of the fourth tablet; the eighth and last of a series, describing his improvements in the steam-engine; the opening of the Liverpool and Manchester Railway forms the subject of the sixth representation; lastly, Britannia instructed by Wisdom is represented, offering the olive branch of peace to the four quarters of the globe. Above the ordinary hour circle, the change of each month is indicated by the appearance of the corresponding sign of the Zodiac. Mr. Walker also exhibits three watches, having plain enamelled dials, the figures painted on with a black face and white figures: this has rather a singular effect

No. 19. H. Deloime exhibits seven handsome watches with various movements; two marine chronometers; also, a movement for chronometers as made in Lancashire to his own calliper, and four watch movements

Thomas Airey, of Dale-street, Liverpool, contributes two watches on a new principle, which, however, is not at present made known to the curious.

32. Messrs. Jackson, of Clerkenwell, exhibit their soli-clave watch, the advantages of which are flatness in the capacity of the works, and economy as regards cost. The key has a solid square, in length equal to the entire thickness of the watch, which ensures greater durability: ordinarily the winding square is often little more than equal to one diameter in length whereby both key and square are injured. The same firm exhibits also eight gold watches and two of silver, a small clock in a wooden case, and a chronometer

26. The "tiny watch" of the British collection is contributed by Edward Funnell, of Brighton. It is in size equal to a three-half penny piece (Maundey money), is jewelled in fifteen holes, and goes twenty-eight hours with only once winding. This, however, is much larger than its Lilliputian competitor sent from Switzerland.

30. H. A. Davis, aged only eighteen years, exhibits two escapements, made by himself without the aid of any tools. The one known as the "horizontal," the other as the "duplex." These examples of industry and talent at so early an age are certainly very creditable.

7. Mr. Hutton contributes his patent clock, having a new compensation pendulum and barometric contrivance to the same, for counteracting the changes in the density of the atmosphere. The pendulum, as that of Messrs. Aubert and Klaftenberger, is made of glass, which, being less affected by changes of temperature than metal, is next to liable to error, to be corrected by compensation. The metallic compensation is effected *without any friction* by the ascent and descent of two spring levers with three adjustable weights; the position of the levers is regulated by two long cutting fine steel wires, the lengthening of which allow the springs to raise the balls, and the shortening of the same to lower the balls The mode of compensating by this pendulum is exceedingly simple, and is effected by loosening a screw in the top of the ball, which, in case of heat, is moved towards the centre of motion of the spring lever, or in the contrary direction in case of cold. The glass rod is attached to the pendulum-spring, by means of a screw, cut on it; and at bottom, a glass regulating nut works into a glass screw, cut on the bottom of the pendulum-rod. The compensating wires being of very small size, a simultaneous action is ensured at each change of temperature. In the barometric contrivance, which is placed on one side of the interior of the case, the ivory piston rests on the mercury, thus counterpoising the air-cases, so that, when the barometer is low, it causes them to approach the plane of the pendulum's motion, and raises them, on the contrary, when the barometer is high: thus the mechanical resistance to the pendulum is increased or decreased according to the density of the atmosphere.

Mr. Hutton also exhibits his marine chronometer, with pneumatic auxiliary compensation, the object of which is to get rid of the "errors of extremes." This is effected in the present instance by placing a light cap over the balance, so as to enclose the air immediately around it only when the thermometer is at temperate; thus the balance being confined to this space is made to go slower at this temperature: when the temperature either rises or falls the cap is gradually moved away from the balance by the action of a metallic thermometer, from which motive power is obtained.

In addition to the above, Mr. Hutton's patent lever pocket chronometer is shown, with compensation stud for changes of temperature.

17. A clock in a case of Egyptian design, surmounted by sphynxes, is exhibited by Webster, of Cornhill. For the ordinary figures from 1 to 12, the signs of the zodiac are substituted

Connell, of Cheapside, contributes two chronometers complete and one without dial, &c.

Cousens and Whiteside exhibit a sporting watch in silver case, adapted to many scientific purposes. It has an independent hand beating six times in a second.

William Birch, of Gracechurch-street, shows a chronometer and a small gold watch

From the establishments of Oldenshaw and Co., of London and Coventry, we find a chronometer, a chronometer movement, 25 gold and silver watches, some of which have a Swiss finish, as also three sets of works.

Mr. E. B. Loseby exhibits six examples of his mercurial supplementary compensation balance for chronometers, the object of which is to remove the defect of the ordinary compensation, which causes the chronometer gain in the intermediate temperature on account of the balance spring losing elasticity at an accumulating rate over the effect produced by the compound lamina. This error is removed by the addition of curved tubes, in shape like the letter S, containing mercury to the ordinary compensation; each portion of the tube is less inclined to the radii of the balance as it approaches the centre, and consequently, as the mercury expands with an increasing temperature, an accumulating effect is produced on the momentum of inertia of the balance in proportion to the curve and inclination of the tube, which could therefore be adjusted to any progression which the law of alteration of elasticity of the spring might require.

Mr. Bennett of Cheapside contributes, in addition to that already mentioned, a clock in a handsome oak case, a carriage clock, two chronometers, a gold hunting watch, and a movement.

Adams and Son, of Clerkenwell, exhibit a collection of twenty-one gold and silver watches of different sizes and patterns.

10. Samuel Lowry contributes a detached escapement chronometer, a small watch movement, a gold chronometer with spiral spring, &c., a dead seconds lever watch invented by himself, a lever watch for ordinary use, and a movement.

16. Howell, James, and Co., exhibit two large clocks in gilt cases. The one surmounted by George C. Adams is surmounted by a figure of Jupiter presiding over all things; on the two sides are Apollo and Diana in their chariots drawn by horses, indicating the approach and departure of day. In front are dancing figures representing the twelve hours of the sun; "Daily," "Spring" and "Autumn" are shown strewing fruit and flowers on the earth. The dial is enclosed by a wreath, the gilding of which is very badly executed. The second ornamental clock is smaller, and altogether of less pretensions

In addition to the above as a third ornamental clock and an eight-day timepiece, designed by Cole.

40 Brockbank and Atkins exhibit a complete chronometer and a chronometer movement.

13. T. R. Holl exhibits his newly invented index watches, six altogether, in hunting and plain case.

66. A clock, in flat polished case, on the dial of which, in addition to the ordinary hands, are shown the days of the week and month respectively, is contributed by Joseph Kaiser, who has also sent a "tell tale" for the use of watchmen and others, by which their absence at any given time is clearly indicated.

91. Six articles are furnished by Messrs. Vieyres and Repington, including a two-day marine chronometer fixed on its gimbals, a gold lever hunting watch, and three gold and one silver watches in plain cases.

47. William Harvey, of Stirling, N.B. exhibits an eight-day striking clock, with only one mainspring and one train of wheels to do all the work, including the striking, which is performed on one bell placed on the top. This is certainly a step in advance.

43. An elegant gilt model of Lichfield Cathedral, with its clock in front, is contributed by Mr. C. Thorneloe of that city; also, two handsome skeleton clocks, which are exhibited by the same person for "neatness of design."

2. Thomas Yates, of Preston, shows his patent dead-beat half-seconds clock, as also a skeleton clock of neat design.

14. A handsome English chronometer, in black marble case, the pedestal of which is supported by four caryatides, is exhibited by Thomas Adams

11. Thomas Cole exhibits a horological eight-day lantern, a flat clock of new design, a *small eight-day clock*, about 24 inches high, and about 14 inches wide, and four semi-circular flat clocks. These clocks are very unique, both in construction and general appearance. The days of the month are shown to thirty-one numbers in the semicircular space next to the top margin of the clock, while the hour and minute hands are represented in a circle placed in the upper part of the dial, and the days of the week and the month in two smaller circles below. There is also a similar flat clock, forming the back of an ink-stand, the most appropriate, unique, and something similar to a like arrangement by Mr. Whishaw in his "Telegraphic Despatch-box."

34. Messrs. Barraud and Lund exhibit, as a specimen of "minute English manufacture," one of their pocket-chronometers; also a chronometer and chronometer movement, respectively.

7. A chronometer, with improved compensation balance, is exhibited by J. Pennington, of Camberwell.

24. Alexander Walkins contributes an original eight-day chronometer repeater, which he states to have been produced by the labour of eight years. It strikes the hours similarly to the old striking watches, and chimes the quarter on five bells; it also shows the day of the month. The whole consisting of 200 pieces of mechanism, including a newly invented compensation pendulum to equalise the extreme temperatures; also another, similar to the above in external appearance; and a very small *chronometer*, supposed to be the *smallest of the kind in the world*.

164. For actual utility, the different parts of a watch and the various escapements in ordinary use, as sent to the Exhibition by a few British and foreign contributors, must be considered as the most important contributions in the horological section, as affording information to the visitor which cannot be obtained by merely seeing the exterior of a watch. Such are the various escapements on a large scale as exhibited by Messrs. Robert Bryson and Sons, of Edinburgh: first, the vertical escapement, showing the action of the regulator; second, the horizontal or cylinder escapement, as in Swiss watches, third, the duplex escapement, the lever escapement; and, fifth, the chronometer or detached escapement.

(To be continued.)

IBBETSON'S CASTINGS.

IN a glass case, in an obscure passage near the entrance to the machinery in motion, are placed three specimens which are entitled to some consideration, from their novelty and beauty. There are three kinds of castings in this case, and each may be said to contribute a new power to the manufacturer. The first of these comprises castings in brass from works of nature, and in this way Capt. Ibbetson has contrived to render the leaf, with all its detail, in a manner which has not heretofore been accomplished. Chantrey some years ago had a high appreciation of casting approximate, and he devised means by which the object was encased in clay, baked, and then the powdered part driven out by means of a current of air; but he could only take one cast from a mould, whilst Captain Ibbetson states that he can make any number of copies. He exhibits, also, a casting, of brass, of a raised map of the Isle of Wight, which may be useful for educational purposes. He has not, however, as yet, as we are informed, made from his own surveys, which he has represented in the wonderful geological model in the Western Nave. Prince Albert, who, from his own geological knowledge, is so well qualified to judge of the merits of such a production, has already intimated that it ought to become the property of the island—that it could not fail to be of the highest interest to all who visit that charming spot.

The second kind of casting consists of deposits of an alloy of gold and copper by chemical agency. Now, electro-metallurgists state that these depositions are in the highest degree difficult, because the current will reduce that metal which requires least force, to the exclusion of the rest. Ibbetson says that his specimens have been analysed, and they are found to consist of an equivalent of each metal, a fact of much interest to the chemist. By this plan he has covered the fairy-like maiden's hair fern, the pitch plant, the humming-bird, and many other curious species which he has procured from the national gardens at Kew. The mode by which he obtains these results he at present keeps secret.

The third invention consists in a new mode which he has discovered of bronzing iron. He states by his plan he conquers the corroding principle, so that the iron, after the fusion, and that it dispenses with the use of varnish or any other similar substance. The specimens exhibited are very beautiful, and it has been reported that the Coalbrook Dale Company are thinking of adopting the invention, which is also, for the present, kept secret.

The importance of these specimens is not so much to be found in their own merit as in the power which they afford to the manufacturer to extend processes in directions hitherto unknown. For this reason, we attach considerable importance to them, and we recommend them to the attention of the manufacturers, to ascertain how far they may be economically and usefully adopted.

POTTERY.—BY AVISSEAU.

POTTERY.—BY AVISSEAU.

POTTERY. BY M. AVISSEAU.

The cup and dish of coarse pottery ware exhibited by Mons. Avisseau, are admirable imitations of the ware made by Bernard Palissy, in the sixteenth century. The fish, dolphins, frogs, plants, &c., which ornament these and the other specimens displayed by M. Avisseau, are modeled with great spirit, coloured with much taste; in fact, these examples are very close imitations of Palissy's renowned ware.

RIBBON PATTERN.—BY LARCHER AND CO.—(SEE NEXT PAGE.)

IVORY CASKET.—FROM DENMARK.—(SEE NEXT PAGE.)

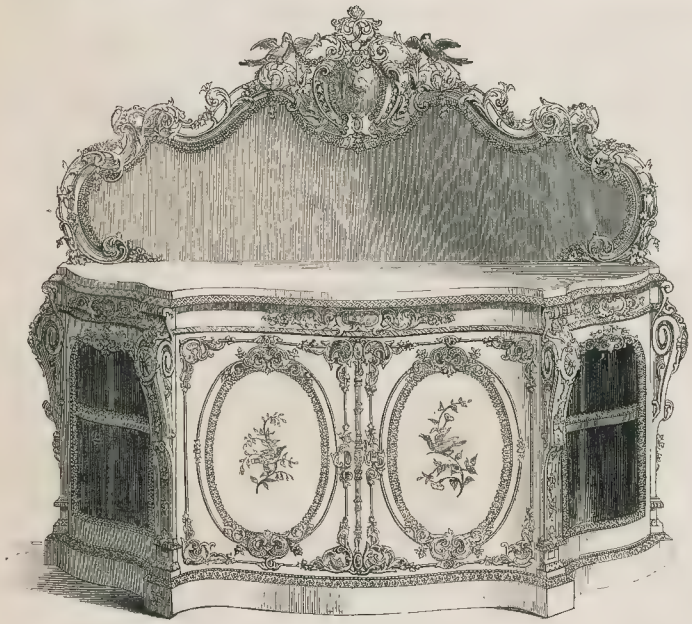
BROADWOOD'S PIANOFORTE.

Messrs. Broadwood and Co., amongst their numerous, splendid pianofortes, exhibit one very highly embellished by Mr. Morant—the design sculptured and gilt. We have engraved the head of this pianoforte as an example of what may be done in this manner.

END OF PIANOFORTE.—BY MESSRS BROADWOOD.

BLACK MARBLE VASE.

This vase and pedestal are made from the jet black marble of Derbyshire. It is one of a pair exhibited, and is noticeable from its size and good outline. The handle is somewhat weak in character, but, as a specimen of simple form, the vase itself is good.



WHITE AND GOLD CABINET.—MR. INGRAM, BIRMINGHAM.—(SEE NEXT PAGE.)

BLACK MARBLE VASE.—MR. TURNER, BUXTON.

RIBBON PATTERN. LARCHER AND CO.

The manufacture of ribbons has always been a *specialité* with the French, the Lyons fabrics being especially remarkable for variety and beauty of design. We engrave one, a specimen of many sent by Messrs. Larcher, Faure, and Co., which is remarkable for the novelty of the pattern. It is of arabesque character, and has the merit of novelty; besides being extremely effective, the interruption of the conventional ideas of curved lines is at least deserving of commendation for the originality it displays.

IVORY CASKET. KLINGSEY.

In the Denmark Court, the contents of which are very limited in quantity, there are yet some very elegant and pleasing productions in fine art. Of this character is an ivory jewel-casket, ornamented with bas-reliefs and a group after Thorwaldsen's "Ganymede." The style of execution is very perfect, and almost worthy of comparison with works of the *cinque cento* period.

INGRAM'S CABINET.

The cabinet of the Louis Quatorze period, manufactured by Ingram, of Birmingham, and exhibited in the Fine Arts Court, is certainly one of the most *recherché* articles of decorative furniture in the Exhibition. It is of white enamel and gold, the panels relieved by the introduction of bird subjects very delicately painted. The recesses at each end are glazed, and at the back is a mirror. The enamelling is upon wood, laid on cold by a new process. The ornamentation, which is rich without being redundant, is especially noticeable for its beauty of style and finish.

SILVER INKSTAND. DODD.

The silver inkstand by Messrs. Dodd exhibits a very pretty design, the two little figures being very well to the purpose. It is extremely well executed.

SILVER DISH. ANGELL.

The silver dish by Mr J. Angell is embellished with a subject designed to honour and commemorate the Great Industrial Exhibition her Majesty, as Britannia, receiving the contributions of the various nations of the earth: in the rim are a medalion containing profiles of the Queen and Prince Albert, and others allegorical of the four quarters of the globe. The design is by J. Heuning, jun.

SALT-CELLAR. MARTIN AND BURKETT.

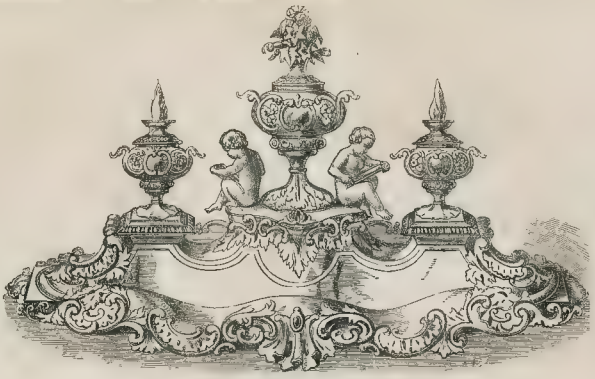
The salt-cellar by Messrs Martin and Burkett, of Cheltenham, is of plain design; the shell, supported by juvenile Tritons, is happily typical of the briny deep.

SCOTCH MULL, &c. LISTER.

The Scotch mull and silver claret jug, by Messrs. Lister, of Newcastle, are very creditable specimens of manufacture. The former, an *objet de luxe* peculiar to our northern friends, exhibits an amount of brilliant ornament in the details which we have seldom seen equalled. The snuff-box is covered with a handsome cairn gorm

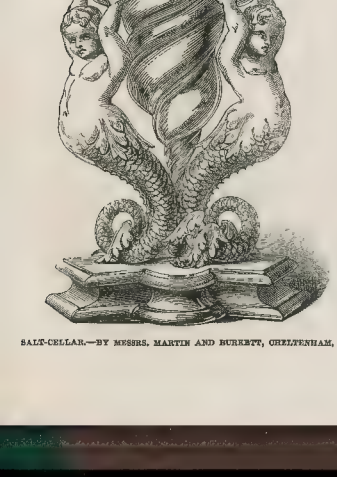
DELARUE'S ENVELOPE MACHINE.

THERE are certain points of attraction within the Great Palace of Industry which cannot fail to be discovered by the visitor who for the first time enters the Building, owing to the large number of persons congregated around such attractions from morning until evening. Thus, in the Foreign half of the Building, the Austrian sculpture, Power's "Greek Slave," the Queen of Spain's diamonds, the model of the birth-place of the illustrious president of the "World's Fair," the beautifully executed models of various animals from Prussia, the malachite doors and vases from the Ural Mountains, and the display of Swiss watches, are unmistakeable centres of attraction: while in the British division the jewels from the East in the Nave, and those contributed by British exhibitors in the Middle Gallery south; Cox's aërated water apparatus; Appold's, Bessemer's, and Gwynne's centrifugal pumps, respectively; Applegath's vertical printing machine; Crabtree's card-setting machine; and, finally, the envelope machine of Messrs. Delarue, in the Nave, and that of Messrs. Waterlow, in the Machinery in Motion department, collect together at all times the largest number of persons.

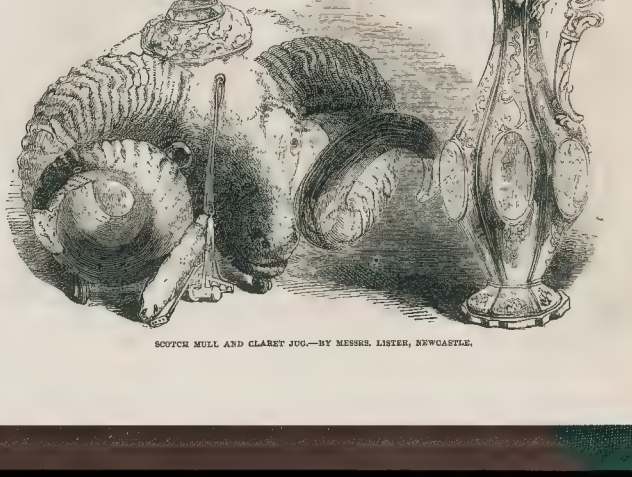


SILVER INKSTAND.—BY MESSRS. DODD, CORNHILL.

SILVER DISH.—BY ANGELL, STRAND.



SALT-CELLAR.—BY MESSRS. MARTIN AND BURKETT, CHELTENHAM.

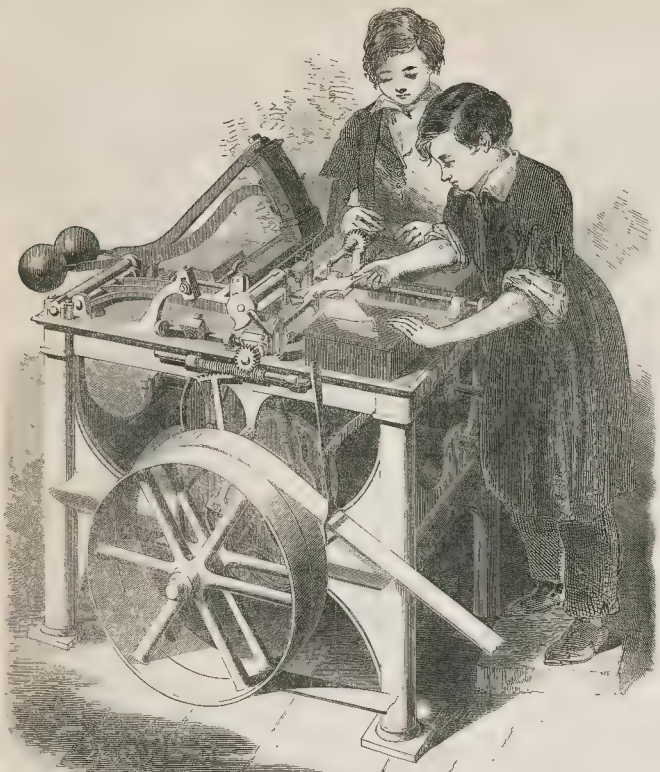


SCOTCH MULL AND CLARET JUG.—BY MESSRS. LISTER, NEWCASTLE.

In our present notice we have only to do with the extraordinary machine of Messrs Delarue, which occupies so conspicuous a place on the north side of the western or British division of the Nave. How by some unexplained mystery it got placed away from the Machinery in Motion we are unable to say; one thing is certain, every visitor *endeavours* to obtain a sight of it.

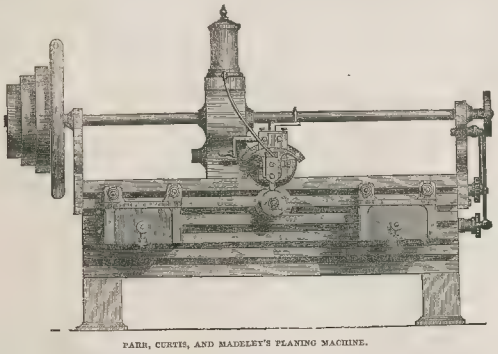
Although not so simple in its construction as that of Messrs. Waterlow, the envelope folding machinery of Messrs. Delarue presents a series of the most beautiful mechanical movements it is possible to conceive. For the various contrivances for folding, gumming, forwarding, and delivering the envelopes, which were formerly done by hand, Mr. Warren Delarue has closely followed several natural movements of the human form divine; the cams especially exhibit a thorough mechanical knowledge on the part of the designer.

In order to estimate the value of this substitute for human labour, it may be as well in the first place to call the attention of our readers to the obvious mode of making an envelope without the aid of any machinery whatever. The first thing is to mark with a pencil on paper the lozenge form required to suit the particular size of an envelope to be made; the next thing is to cut out this form either with a knife or pair of scissors; the third part of the process is accurately to fold down the four flaps; the fourth, to gum with a camel's-hair pencil the under side of the angular margin of the long flap opposite to that which is to bear the wafer, wax, or embossed stamp; the fifth, to pass the fingers of the right hand over the upper or long flap, in order to join the three flaps together; and the sixth, to gum with a camel's-hair pencil the underside of the projecting portion of the long flap, which is to be



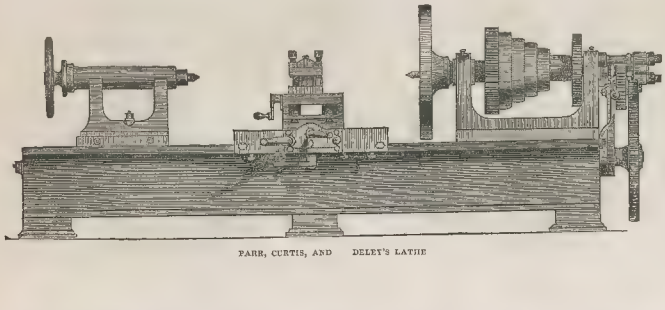
DELARUE'S PATENT ENVELOPE MACHINE.

fastened down to the other three flaps after the letter has been placed within it. It is quite clear, therefore, that, if envelopes were made in such an unworkmanlike manner as that described, the time occupied in finishing a hundred or a thousand would be such as to increase the cost to the consumer to a very considerable extent. The first and most obvious saving of time in the manufacture of envelopes on a large scale was to cut out several hundreds of pieces of paper of the required width by means of a horizontal steel cutter machine. This is the plan adopted by the Messrs. Delarue at their extensive works in Bunhill-row. These widths of paper are transferred to a powerful lever machine, into



PARR, CURTIS, AND MADELEY'S PLANING MACHINE.

which 480 thicknesses are placed at one time; a steel cutter, of the proper lozenge form, being interposed between the paper and the metallic pressure slab attached to the lever, which, being brought down upon the pile of paper by the rapid action of the machine, cuts it through in a few seconds. The cutting bed of this machine is made of lead, as wood of any description would be rapidly destroyed, and harder metal would equally destroy the cutter. The papers of lozenge form are now removed to the folding machine, and placed on an inverted ma-



PARR, CURTIS, AND DELEY'S LATHE

gany box, on one side of the boy attending the machine. Having a good supply of lozenge-shaped papers, he takes the top one, and places it on the flat bed of the machine, between four vertical register guides, so that the four angles of the intended envelope coincide with the internal angles of the four guides respectively. It is owing to this arrangement, that the envelopes, when completed, are so perfectly true in respect to shape.

In the View of the machine presented in the present Number, the iron frame of which is firmly secured with bolts to the floor, are represented two boys, the one placing the lozenge-shaped piece of paper in between the guides already mentioned, at a rate of sixty per minute, and the other waiting to carry away the envelopes as finished: it is to be observed, that the carrying attendant at Messrs Delarue's works usually serves several machines in action at the same time. In front are seen the *fast* and *loose* pulleys, with a band passing half round the working pulley, and thence passing below the floor to other pulleys in connexion with one of the steam-engines at work in the Machinery in Motion department. All the chief movements are obtained by means of cams on the principal shaft, which derives its motion from the pulley fixed on one end of it. The cams are five in number, viz. two double, two single, and a large central double cam, which works the double plunger levers seen with the counterpoise balls on the left of the view. The curved plunger in two parts attached to the levers is brought down on to the paper at regular intervals, the lower part of the plunger remaining down while the upper part is drawn upwards. The folders, which turn down the flaps in proper rotation, are worked by the two-side cams of the main shaft; and the other double cam of the main shaft gives motion to the taking-off apparatus, or "artificial hand," by which the paper is removed when folded. The two fingers of the hand are small cylinders, fitted at their lower ends with india-rubber, which is pressed on to the paper by a spiral spring within, similar to that used in Palmer's candle-lamps, the air being excluded by the closeness of the two surfaces, the paper is readily removed

The envelopes, as completed, are transferred as already mentioned, by the artificial fingers, and are deposited on an incline metallic table, each envelope as it is finished being placed in turn at bottom of the pack by means of two small springs projecting above the table. An endless basket now conveys the finished envelopes into a metallic case or mould, from which they are taken by the carrier boy; each envelope as it is delivered into the case is placed under the rest by means of small springs, as already described

We have hitherto omitted any notice of the gumming apparatus, which is equally curious and ingenious with the other parts of the machine, motion to which is given by means of a small shaft, worked by a pulley from the main shaft in connexion with a segment lever and wheel at one end of the frame. The effect produced by this contrivance is, first, to move an artificial hand on to an endless moving blanket covered with gum, and afterwards to transfer the gum to the proper flaps of the envelope

There is one other motion worthy of being noticed, which is represented in the view at top of the frame. this consists of a segment lever, the teeth of which work into the circular rack or screw, also shown. the teeth of the rack again working into a small toothed wheel, by which each of the four flaps is made to perform a half revolution, the horizontal circular rack moving first in one direction and then in the other.

Eleven machines similar to that at the Great Exhibition are constantly employed at the extensive manufactory of Messrs. Delarue, in Bunhill-row, by which the large number of 36,000 envelopes are completed in a single day. This is only one of a great variety of mechanical contrivances of great beauty by which the numerous departments of Messrs. Delarue's extensive establishment are rendered capable of producing the most highly finished articles, whether plain, enamelled, coloured, or embossed.

PARR, CURTIS, AND MADELEY'S LATHE AND PLANING MACHINE.

Messrs. Parr, Curtis, and Madeley, of whose machines we give two Illustrations, are the owners of the Phœnix Works, Chapel-street, Manchester, which occupy a very large area, and include an extensive cotton manufactory, foundry, millwrights' shops, &c. The two great branches of the business in which they are chiefly engaged are well represented in the "Palace of Industry," for in the cotton machinery department they exhibit all the various engines used by them in that important branch of manufacturing industry, while of machines for manufacturing purposes they also make a goodly show

The first Illustration is an elevation of their planing machine, by which metals are as easily planed as wood is by the carpenter's plane. On the left is seen the multiplying pulley, by which, in connection with a band or strap from a steam-engine, the motion of the machine is accelerated or retarded at pleasure, merely by shifting the strap from one step of the pulley to the other. It is self-acting, both angularly; it is simple in its several parts, and is evidently put together as regards metallic forms to be cut, either horizontally, vertically, or with an essential view to strength. The second Illustration is an elevation of one of the "slide and screw-cutting lathes," of the same firm. It will be seen that the main parts of this machine have a solid appearance, particularly the bed on which the whole is fixed. It is fitted with geared head-stocks, having a conical mandril, and case-hardened steel bearings and collar. The guide screw extends the whole length of the machine, and the compound slide rest is self-acting, both longitudinally and transversely. Motion is given to the machine by the same means as described for the planing machine, and which is shown on the right-hand side of the cut.

LETTERS FROM LONDON

ON

THE GREAT EXHIBITION AND OTHER MATTERS

BY PELEG E. WHEELER,

WITH AN INTRODUCTION BY BAYLE BERNARD.

(*Continued from page 589.*)

LETTER IV.—TO MR. ENOCH PEABODY, SAW-MILLS, PENOBSCOT.

THE EVE OF THE EXHIBITION: PUBLIC FEELING AND FOREBODINGS; FARMER AND MANUFACTURERS; RUMOURS OF AN OUTBREAK; THE MAJOR'S FLIGHT TO LONDON.

DEAR UNCLE ENOCH,—

You dont for, it where I pull'd up—where you asked me, as I s'posed what was the public feeling generally about the Exhibition, and speshally among the farmers; and now I've got to tell you, it was jist to larn as much as that that I've stopped here most a week afore I go to London. Doors don't open till the 1st, and as I'd got six days to spend, I thought I couldn't change 'em better, couldn't set with more discretion than to walk and ride about a spell. put my head into a door or two, and lay hold of any fellers I caught drifting about the country; for I reckon that's good policy. If you want to learn about fix'd interests, you must go to the fix'd classes, jist as you'd allers look for trees to know the natur of the soil. But in temporary matters the public mind is like a current, that swells or slackens, runs or eddies, as it's fed by sudden sources, and the drift upon its surface is jist the thing to shew its force. So I look'd out for a stray log or two, arter other means of measurement, and did as much as any trapper to get a notion of the stream—if I didn't it's a pity. If my appetite for knowledge warn't as great as Dr. Franklin's, didn't grow up into a Lunger that allers looked for meal-time—if it warn't my most partiklar and predominant desire to see whether this grand idea stirred the Old World like the Noo—had shook it up as thoroughly, set its heart a beatin' quicker, given it stiffnin' to its muscles, and made both deck and cabin, high and humble, rich and poor, come out as a single man upon the Exhibition ticket, I know'd it was so in London—that that was just a furnace where the fusing going forard, with none of the old forges, no cold air to the coals, but altogether the hot blast. But how about the country? says I. How is the feelin' balanced? do they go all upon my principle and keep the pressure down?

Well, for the sake of philosophy, as well as their own purses, I'm sorry to say they don't. I know you won't believe it. You never can imagine they're such an eternal heap of fools, but I vow if 'taint the fact, that half on 'em here don't think on it—don't seem to have ever heer'd on it; for when you mention it, they stare as if it 'twas one of our own airthquakes. There's a lot, that, like the farmer's, don't vally it a

mossel, don't see a grain of good in it, won't allow it will save any one except the manyfacturers; and another pile, agin, that are actooly dead agin it, that don't hesitate to tell you, it's a downright mass of mischief, and will turn out nothin' short of a great national calamity. What do you think of that, Uncle? I wish I may be shot if I hen't talk'd to people here, who vow that the "World's Fair" will bring a judgment on the country! Aint that a rise for eyebrows? can't see no sign of hope in it, no rainbow in the clouds, but jist the very storm itself! A sheet of gloom and terror, pack'd up in the shape of thunderbolts, and hidin', as it rolls up, every glimpse of the bright heavens.

Well, I've seen some sights in my time, some strange kritturs in our museums, and was often told they were the greatest curosities the world ever breathin,' so I scarseley ever thought to see their beat in human bodies—to see walking, talking men, that ought to go into glass cases; but I swear if 'tatint the truth, and it's only a proof to me, that we have some chaps, as had the Egyptians, who are jist proper for embalming. What do you think they say, Uncle? why some on 'em will tell you that this meetin' of all nations is sure to breed the plague! Yes, a downright Turkey plague, jist as genoein as thubub, that will sweep out half the capital, and, perhaps, the country in the bargain. Don't you call that weather knowledge—jist the genus for an almanac? The plague in a temperate climate, and a country where, they tell me, they get summer once a cen'ry! Still it's sartain, for all that; it's as sure to come as Monday; it will be first among the visitors; we may count on it as safe as if 'twas going to contribute—going to have a stand itself in the Great Warehouse of the World, and show specimens of its machinery, human dog-kennels, brute food, and grinding Turkey governents, by which, as well as any steam-press, it can work off its thousands bouty—the plague indeed! as if, after all, that was the only one to skeer us; as if we hadn't a hundred others that make short work with us continoolly; as if there wasn't a special grand one, the fine old mammoth plague of Europe, that, when nations come together, instead of lettin 'em shake hands, sets 'em to rebellion one another for the glory of their country. There are such places, Uncle, in the world as devils' exhibitions; and death's industrial energy may be studied there full size!

But there's another lot will tell you that this meetin' is irreligious actually profane, Uncle; that it's expressly forbid by Scriptur, and is sure to bring down vengeance on all who dared to join in it. They say a meetin' of all nations is only to take place when the world comes to an end, and to attempt the thing afore is jist one of those rebellious that has allers met with punishment. What do you think of that now? ain't your eyes a mossel wider? don't it clear 'em jist as cleverly as a pinch of Prince's mixtur'? The meetin' irreligious! Now, it's allers a rule with me, Uncle, that when people go to Scriptur' upon ordinary topics, it's because they don't know its use, and have got nothin' else to quote, and their piety and argyment might measure back to back, and I reckon here's a proof. They call the Congress another Babel: another Babel, that's its title—nothin' short of another gatherin' to creet a pagan temple, and, of course, with the same purpose, in defiance of the Creator. Now, take the sum of that; when the object ain't to build a tower, or anything, in fact, but to fill it with good furnitur; and so far from defying Heaven, is to fulfil its great injunctions, is to bring all men whatsoever into the bond of peace and amity. That's shockin' wicked, aint it? to tell men who've been raised as enemies, who've been taught to hate and slaughter, that it's their interest as well as dooty to become good friends for the futur'. That's really sinthin'-inpious, even a'most too bad to write about. The world's Congress a mere pagan idol! And yet, would you believe it, one tongue till they were punished by confusion, whilst here they is speak a hundred and only seek to jine in one—the common language of humanity. What will they tell us next, I wonder? Perhaps that the Prince is another Nebuchadnezzar, and the Exhibition a furnace; and Mr. Paxton another Adam, because he happens to be a gardener.

But the reel sinn rout out yet. There's another lot agin that have gone raving mad on politics; that look at the "World's Warehouse" as a sort of powder-house or bomb-shell, a regular infernal machine, crammed chock full of combustibles, that's all ready to explode as soon as the railways put their trains to it. Now, I vow I aint deceiving you, it's as true as our town clock, though it's noos more fit to bolt than for any man to masticate. It's actooly a fact, that there are people here who believe that the Congress of all Nations is nothing snort of a big conspiracy—a meetin' of all the enemies England has got throughout the globe, who, under pretence of beginning business, are going to put an end to her, are going to steal us a million strong without exciting any notice, and come on her some mornin' and find us all in our beds, fast awake. Who mean first to dethrone the Queen, and give the Bank up for a scramble, and then burn down London and divide England into patches: the Government and people looking on, of course, quite paralyzed, pinning their terror didn't permit 'em to boll off to the Great Seal. A rational story, aint it? Dont it read to the full as nat'ral as any passage in the primer. But you mustn't judge it yet, for it's got to git its crowning truth. It's a likeness, you may say, that's got all the striking features. Well, I'll own it's a considerable one, and only want a touch to come will do it—will make it more than speaking—as Judge Gandy used to say of Colonel Trumbal's portraits. Call 'em speaking likenesses, I vow if they don't haller;" and I gess there's a yell in this one. Who do you think are the conspirators in this treachery agin England? Now, take your time, don't hurry. Frenchmen, you'll say, of course, on account of the battle of Waterloo; Austrians, on account of Hungary; and Spaniards and Portugee, perhaps, on account of their liabilities—an easy way for a brave people to git rid of their old bonds. I thought you'd never hit it; I vow if they aint Amerikins—yes, Yankees every man on 'em, who'd do everything they could to send England under water; tho' she happens at this moment to be the nation which they're floating—tho' she's taking all their cotton, and more than half of their tobacco. She must take their iron in the bargain, in exchange for her own gold!

Now, aint this enough to rile a man—to rise the dander of a Quaker? Don't they use us scandalous, to throw dirt at us in this way? Aint we never to be forgiven, because we wouldn't stand oppression from a borough-mongering Parliament, which they kick'd over themselves only twenty years ago, and so from useless colonists grew up to be good customers? But, then, these fellers say to me, "Why, we've read it in your papers, spesbally the Noo York ones; seen the whole plan laid down in print—the whole road of it mapped out, so that you could not mistake a turning." Ah! they're knowing fellers, aint they, Uncle? They've got a wrinkle round their eye-lids, and can see all round a hill as clearly as most folks. They've found out a snake-bed, aint they? Well, I've seen a heap about our papers—who owns 'em, and who edits 'em; they can tell that to a man, tho' they don't keer to inform us; that an English-man writes for one, and an Irishman for another; and, as a cross between the two, perhaps a Scotchman for the third. I should like to ask these fellers, what's been the great cuss of our country—only to answer that; but, as they couldn't in half eternity, I'll just tell 'em that it's this, that she's been the asylum of all the scoundrels England hain't been able to manage—been a sort of doctor's basin, to catch all her stagnant blood in; that every prime rogue of her raising, the day he could cheat no longer, has run off to Ameriky; and what has he done there? Why, by way of getting credit, of course, he's call'd himself a victim, and set to work abusin' England in order to account for his desertin' her. He was an honest, industrious feller, who was crush'd by a conspiracy of the infernal aristocracy, not to say the King himself, and he thanks the stars we've got a press, in which he can pour out his indignation, or in other words a spout in which he can turn his dirty water. So he puts his hate in print, and it goes right off to England, and then its ketch'd up, and they sing out—"See the feelin' of Amerikv." But there's more to comit than that, there's the Irish in America. What's to be said of them? This last ten years has brought us over half a million of Irish exiles, and what do they tell us is the cause? misery and tyranny, famine and bad government. But do they say as much at home? Every mite, and suthin' more. Jest look into their own papers, and if you want to know what stands for Satan, you'll allers find it's the word Saxon. If you want to know how England's hated, and who are the proper fellers for a steam force of malignity, a sorter hundred cussing power, I guess you'll find it's them. Well, are they likely to get more civil arter the expence of emigration? Aint it natral they should bile up with a double head of scum? Yes, but now they're become Amerykins; and when they're ladled up in England, "Look here," cry out the noospapers—"see the nashonal antipathy!"

And so much for the feelin' generally about the Exhibition, but there's a spechal kind to menshun. What do the farmers think about? what's the fashion of their notions as to its objects and results? Well, I think I've said already, they don't rally it a mossel; don't see a grain of good in it, as far as regards themselves. But I guess that aint the tote on it; there's suthin' more than that. So far from givin' help, they rather think 'twill harm 'em. They consider it altogether as jist a move of the manyfacturers—a great dodge of the cotton spinners and the fabricators gen'rally to bring their wares into more notice, and enlarge their foreign trade, and in the measure that it's likely to benefit the spinners they think 'twill hurt themselves. That's a sound conclusion, aint it?—shows the fellers have had some eddication, are first-rate hands at cyphering out their stake in the communityS But as there's a word to say on this point, it's right to jot it down.

Now, there can't be a doubt, Uncle, that the farmers are over-loaded; that since free-trade has set in, the weight has slipp'd on their side, just as it had lodged itself afore upon the public shoulders generally. But the question comes to this: Is this the time to shift it? It's as easy to see as sunlight, that there's a pull jist now up hill. That England's got to get on higher ground to maintain her old position, and that her only chance of doing it is by means of manyfactures, which have jist been given head, and put freely to their work. They're sure to pull her up, with all the load she carries. They're the leaders born to do it. But there's a strain on the bull team; and the shaft horse staggers dreadful, is e'en arnest down-doubled. That's plaguey bad it's sartain, and you've jist a choice of evils—for the team to go ahead, and the shaft beree to stagger on, 'till they've topp'd the rise afore 'em, and got things upon a level, or pull up dead at once to give him one relief, and run the chance of the hull machine breaking down, and turning over. If the drivers know their work at all, they'll sing out "Go ahead!"

But there's another point to settle. It's a question, arter all, whether the farmer hain't brought their present weight upon themselves in doing what they did to prop up the old war system, and for no reason in the world but because it brought high prices. Whilst that system lasted, of course it made their fortuns; they'd the feedin' of the country, and of course could charge jist what they pleased for it. But when peace came and prices fell, what was the use o' their buyin' they half on 'em fell too; went down whop as quick as Bonyparte, who, arter all their swearin' at him, I guess, was their best friend—was just the crutch they leant on, the prop to their shaky houses. He was their famine upon horseback, want and scarcity in uniform. General Bonypart, I reckon, was their general excuse; so, of course, the battle of Waterloo settled them, as well as Europe, and sent those who'd saved their money to take keer on it in Amerikv; whilst it left all those who hadn't, to pay the price of the fun in England; and you would you believe it, Uncle, that there's hundreds of those fellows who would like to have the fun repeated! I vow if 'taint the fact, tho' they're groaning under the debt that all the fighting's heaped on 'em. They're sich everlastin' stoopids as to wish to make it bigger. A war, they say, is the thing that makes money circkelate, and sets trade agoing properly; and it's good for mind as well as body. A country really stagoates without a tussel now and then. It's like a feller as wants exercise, loses the use of half his muscles; no, a war—a war's the thing, that would send up wheat agin to a hundred shillins a quarter, set the farmer on his legs, and put every thing in motion: and so I guess it would; every body that had got a pound it would put in motion to Amerikv, and leave the class that had all the burden to settle with their creeditors.

Now, it is to pull the country out of the quag hole that the last war shoved it into, that the manyfacturers are working. It is to try to git a surplus by means of noo and more production, and then to adjust taxation and make the presbur even; and I want to know who but the farmers will come in for the first lift? And yet, would you believe it, Uncle, they either can't or won't allow it, they actually vow, upon the contrary, that this move will be their ruin; that they're already half gone as it is, but that this will top the bushel; that, instead of the manyfacturers being a yoke of oxen, as they will call 'em for the occasion, they're jist a set of prairie colts that will drag 'em clean over a precipice. They look at 'em, in fact, as their nat'ral born enemies, and wont allow it's possible that the two can ever thrive together. Because they're different, they think they must be really at war always 'em, and a country can only prosper when one of the two is undermost, and I 'pose I needn't tell you which of the two they mean. Now aint that a pretty doctrine? a nat'ral born cussedness, that will set the country a-twist the right and left, on left one, or the two sides of the heart, the valve that's pumping in the blood, and the valve that's pumping out, when the welfare of the system depends on them conjointly—to talk of screwing up the stomach, in order to benefit the lungs!

Now, this being the case with them, you'll see, of course, it follows that——Hallo, hold on a bit; why, marsy on us, Uncle, what do you think's the noos from London, brought by the train jist in, that's come all the way full spile, like a thunder-bolt from the skeln, or a cow down on Niagara? Why, that the talk was true enough. There's a revolution brewing—a conspiracy's been found out of Socialists and Yankees, who are going to blow up the World's Warehouse, and then burn down the capital, unless they find it easier to shove it plump into the Thames. I wish I may be shot if they don't think the Government has got wind found out all about it. How the Warehouse has been filled with gunpowder, smuggled in in tea-seats of rocking-chairs, that will go off upon percushun. Let a feller sit down on one on 'em, and whang he'll go thro' the sky-light. And in the bodies of pianys! You've only got to touch their keys, and they'll turn out infernal machines the hull on 'em. That it's s'poced that all the statitys have got a man inside of each on 'em, wholl break the plaster when its dark, and come out of his shell like a young roaster; and that the steam-ingins are head-quarters, chock full of red Republicans; and the leaders of the movement hold their sittin's in their bilers! Now, aint this really suthin' frightful, spesbally as I've sent all my contributions up to London? And if the city's to be demolished, science will suffer too; so I can't stop to say no more—can't stop even to enquire whether it's likely to be true. There's the last train going off, and I reckon I'm off with it, and, if I aint doom'd to fall a martyr in the cause of science and fraternity—if I ain't going to be shot for building a shell in one hand, and a sassage machine in 'tother, you shall hear from me by next.

Your dootiful and affectionate,

PELEG E. WHEELER.

(To be continued.)

THE HISTORY OF INDUSTRIAL EXHIBITIONS

BY W. BLANCHARD JERROLD.

(Concluded from page 532.)

CHAPTER X.

THE EXHIBITIONS OF ENGLAND *—(Concluded.)*

ON the 9th of September, 1839, a deputation from the Gateshead institution waited upon the authorities of the Newcastle Institute, to request their co-operation in promoting an exhibition of works of art, machinery, &c., for the joint advantage of the two institutions, when a sub-committee was appointed, and an exhibition was opened at Newcastle, on the 7th of April, 1840. This exhibition, which appears to have been very successful as a pecuniary speculation, comprehended generally similar articles to those already noticed at the Manchester exhibitions, and was more a show of pictures and curiosities, from which models and manufactures were not excluded, than a collection of the great industries of the locality. In 1846 another exhibition, which was a comparative failure, took place under the same auspices: 132,000 people visited the first Exhibition; whereas the second attracted only 43,000.

At Devonport, in 1844, an exhibition was held in the new Mechanics' Institution building, which deserves little notice, inasmuch as it was not, strictly speaking, an industrial exhibition, nor does it appear to have originated in any other idea than that of raising funds for the society in whose house it was held. The exhibition of 1846 another exhibition, which was to have been a strictly industrial exhibition, divided into ten distinct sections. These sections were—1. manufactures; 2. raw materials; 3. models, machines, &c.; 4. philosophical apparatus; 5. naval architecture; 6. fine arts, modern masters; 7. fine arts, old masters; 8. water-colour drawings; 9. natural history; 10. antiquities, curiosities, &c. In running through the list of exhibitors and prizeholders at this exhibition, it is pleasing to find the names of so many local celebrities. It is a good sign when such an institution is found to stimulate the energies of the ingenious and clever men within its influence. Prizes do not appear to have been awarded either at the Newcastle or at the Manchester exhibitions; but at that held in the autumn of last year at Devonport, a large sum was set apart for this purpose; and, although the institution realised only £250 by the show, their plan must be held far preferable to that of the above-mentioned societies We find ten guineas and a life membership of the institution awarded to Jebus Bickle, Hayle Foundry, for his model of an improved semi-rotary steam-engine; a bronze medal awarded to Joshua Truscott, of Devonport, for a model rotary and street sprinkler. Prizes in the form of books and instruments were also distributed on this occasion. These awards were made at a public meeting.

Leeds followed the example of Manchester as early as 1839, and copied the plan of that town as closely as possible. The exhibition was rather a bazaar than an illustration of local industries; it contained, however, some exceptional specimens of machinery and of spinning, which, at all events, indicated the willingness of local manufacturers to present their several excellences to public view within the walls of a common building. Among the objects exhibited on this occasion, we find surveying instruments, models, and philosophical apparatus, steam-engines; a machine in action for making cards for wool and cotton—its merit consisting in cutting the steel wires, to become teeth, to the proper lengths, bending them into the shape of a U, piercing the base, &c.—by Messrs. Curtis and Co., Sowerby Bridge; Walton's machine for raising the nap on woollen cloth, as a substitute for the teazle; flax machinery; and a peculiar machine, invented and constructed by Christian Schuster, who had been about to publish a cowherd.

Birmingham was behindhand in adopting the plans of Manchester, which had already been so successfully imitated by Leeds, Newcastle, Liverpool, Devonport, Derby, and other manufacturing towns. Mr. Wallis, well known as the former director of the Manchester School of Design, claims the honour of having suggested, that, in the plans for the establishment of a Birmingham School of Design, a periodical exhibition of manufacturing art should be included. Although the suggestion fell from Mr. Wallis in 1842, it was not before September, 1849, that a great Birmingham Exposition of Industry was opened. This exhibition was the most complete of any which had been yet held in this country. It filled the newly-built area of Bingley Hall. It represented minutely the great variety of manufactures carried on in the vicinity of Birmingham. All the most eminent manufacturers contributed something representative of their several industries. A complete set of specimens, illustrative of the history of the English plastic arts, was not the least remarkable part of the exhibition; and elaborate samples of electro-plating indicated the future importance of this beautiful process; and the Stafford potteries contributed some splendid wares. The completeness and high character of this exhibition may be attributed in the first place to the stimulus which the adoption of schools of design had imparted to the manufacturing arts; and, in the second place, to the influence of the juvenile Polytechnic Exhibition, as well as the enthusiasm with which the great Free-Trade Bazaar, held in Covent-Garden, in 1845, was received. These various causes had undoubtedly awakened English manufacturers to a sense of the wisdom of concentrating specimens of their manufacturing progress into a building, at regular intervals, for their mutual instruction

Of the Free-Trade Bazaar, remarkable and commendable as a commercial demonstration in favour of a political principle, no less than as a splendid picture of manufacturing England, it is not necessary to give a detailed account in a history of industrial exhibitions. It was a political bazaar, not a national exhibition

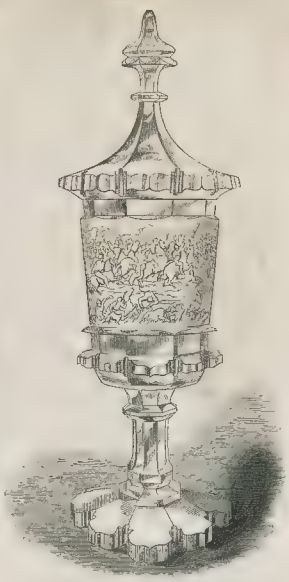
Having rapidly traced the growth of provincial exhibitions in this country, and shown that, with one or two exceptions, they have been undertaken more with the view of raising funds for local societies than with the enlightened object of testing the relative excellences of local industries, the course of this history must return for the slaughter of the Society of Arts. It would have been a difficult matter to give a fair estimate of the enlightened efforts made by this body through long series of years, had it not been for the able report of Mr. Scott Russell, had not Mr. Scott Russell compiled a statement of the society's efforts

So early as 1844, Mr. Wishaw appears to have endeavoured to stir the energies of the British manufacturing public for the foundation of a great national exhibition of industry. In the records of the Society of Arts show that these commendable endeavours ended in two limited exhibitions within their walls, held in 1844 and 1845, the former of which was visited by 150 persons, and the latter by 800. The endeavour on the part of Mr. Wishaw is not here chronicled with the view of placing him before the public as the original propounder of periodical exhibitions in this country, since it is well known that so early as 1836 Mr. S. Richards, of Birmingham, corresponded with the Society of Arts upon a subject of such a scheme; so that, in truth, the idea of a national exhibition of British industry (which, after all, is only an original recommendation to imitate the French and Belgium) is fairly due to Mr. Richards. Mr. Wishaw, Mr Wallis, Mr. Cole, another gentlemen, have been introduced to the public as deserving almost exclusively the credit of working for the establishment of such exhibitions: but, before anything was known of Mr. Wishaw, and ere the country's attention to the subject had been periodical exhibitions, and annually the Society of Arts exhibited the specimens of manufactures to the producers of which it had awarded its annual premiums

The earliest suggestion for the formation of periodical industrial exhibitions in connexion with the Society of Arts, was, according to Mr. Scott Russell, one made by his Royal Highness Prince Albert to some of the members of the Council. Here we may surely find once more the effect of the splendid French Exhibition of 1844. The suggestion fell where Princes was first taken up by Mr. Fothergill Cooke, in the same year; and, although an energetic committee was formed to carry out the project, and several members offered to advance considerable sums of money (of which the largest was £1000 offered by Mr. Stephenson), the attempt utterly failed. Mr. Scott Russell declares that "the public were indifferent, manufacturers lukewarm." The English people did not yet appreciate the advantages of such institutions; it was therefore resolved to force a sense of these advantages upon particular industries. Accordingly, premiums for works of industrial art were offered Messrs. Russell, Cooke, and others; and from these endeavours arose the offer of annual premiums, and those well-known annual exhibitions of the works of competitors. But the public was a dull pupil. In 1848 hardly any competitors came forward, and it was with difficulty the judges could find subjects worthy of reward. Before the distribution of premiums in 1846, his Royal Highness Prince Albert strongly urged on a deputation who waited on him the necessity of further exertions in this direction; observing that the manufactures of England, excelling in solidity and excellence, were deficient in beauty of design by the side of other countries. His Royal Highness indicated the subjects for which encouragement should be held out. Accordingly, a new and enlarged series of prizes was formed, premiums made for more extensive competition and exhibition in 1849. Even now the products of manufacturers were dragged from their factories; but the result was triumphant—twenty thousand persons visited the exhibition. No less than eighty thousand visitors attended the 1846 exhibition, and at that of 1849, to which the names of many members of the nobility contributed, it was clearly seen that public interest had been effectually awakened. The exhibition of 1847 was opened with the introductory remark, that "the first step to the improvement of an art or manufacture is the knowledge of what has already been done in that art or manufacture. To make improvements with advantage, we should begin at the very summit of that perfection which has been already attained." The exhibition was especially rich in artistic specimens of pottery and porcelain, glass, papier maché, and carving by machinery. Some specimens by J. Phillips were striking, and amongst the other fine specimens of the plastic arts were some beautiful manufactures by Messrs. Richardson and Son, of Stourbridge, in terra cotta. Messrs. Taylor, Williams, and Jordan exhibited some finely carved specimens. The exhibition of 1848 included fine specimens in modern marqueterie and wood-work, works in earthenware, works in coloured glass, works in stained porcelain, works in cast-iron, specimens of British bronzes, Summerly's art manufactures, works in glass, the specimens of soaps from new oils, paper-hangings The exhibition of 1849 was, in most respects, an improvement on those of 1847-8.

While these annual exhibitions were proceeding, Prince Albert, in conjunction with several members of the Society of Arts, was busily employed arranging the preliminaries of the Great Exhibition, the doors of which are now opened to the world. In the beginning of March, 1848, a site for the erection of a building, to be triennially filled with specimens of British industry, had been obtained from the Commissioners of the Woods and Forests. How this comparatively unimportant plan, under the able direction of the Prince, was extended to the magnitude in which we find his last idea of the subject, is a matter which has been published in every channel of information throughout the world. The mortifications and impediments with which the Government delayed the execution of this great scheme, even to the preservation of a few old trees, are happily also patent to the world. It should be as widely known and recognised, that the notion of opening our industrial lists to all the nations is entirely due to the liberal mind of the Prince Consort. Of the success of his scheme it is now quite superfluous to speak; suffice it, that under his guidance England, the last country in civilised Europe to recognise the wisdom of holding industrial exhibitions, has sought to redeem the past by calling upon all the nations of the earth to compete with her in her own capital.

BUNYAN'S "PILGRIM'S PROGRESS."—BY J. AND J. LEIGHTON.



ENGRAVED GLASS GOBLET,—BY BOHM.

BIBLE COVER, IN METAL.—BY MESSRS. LEIGHTON, HARP-ALLEY.

BUNYAN'S "PILGRIM'S PROGRESS." J. AND J. LEIGHTON

This characteristic binding to John Bunyan's immortal allegory was designed by Luke Limner, and most ably carried out by Messrs. J. and J. Leighton. In this binding the emblematical treatment is especially noticeable, and the workmanship is of a very high class.

BOHEMIAN GLASS

The achievements of Bohemian art in coloured glass have long been matter of history, and they have until lately been considered to be beyond competition or rivalry. We are happy to have reason to believe, however, that within these last few years—since the removal of the hateful excise upon this branch of manufacture—the glass workers of England have made courageous and successful efforts to disprove this old prejudice, and have produced articles which, as to colouring alone, might safely stand beside the best from Bohemia, whilst in the quality of the glass they undoubtedly surpass the latter. Nevertheless, the Bohemian manufacture is still a very interesting one, and the specimens exhibited very beautiful. Our Engraving represents several of these, the designs of which are varied and pleasing.

JEWEL CASKET.—BY JENNENS AND BETTRIDGE.

BIBLE-COVER. BY LEIGHTON.

Messrs. Leighton exhibit many quaint devices for bookbinding, one of which, ornamented in metal for a bible, we engrave. It is of an antique character, and is designed by Luke Limner, who has distinguished himself by several other productions of this class.

ENGRAVED GLASS GOBLET. A. BOHM.

This most exquisitely engraved goblet, though exhibited in the Hamburgh department, is the work of Augustus Bohm, of Meistordorf, in Bohemia, and owes its location to the circumstance of its talented fabricator residing at Hamburgh. The skill displayed in engraving the glass, so as to produce a perfect bas-relief, is most marvellous; and, when the numerous figures in action and horses (for the scene is a battle-field), are taken into consideration, an extreme length of time must necessarily have been spent in its realization. The glass is pure flint, and colourless.

JEWEL-CASKET. JENNENS AND BETTRIDGE.

This is in papier maché, and is from the designs of Mr. W. H Fitz-Cooke. In its general shape it is good, and the ornaments are well adapted to their respective places.

BOHEMIAN GLASS

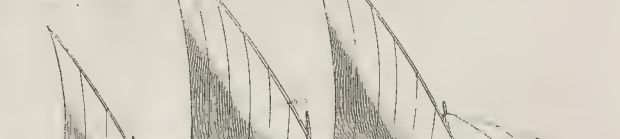
A NEW RESULT OF THE GREAT EXHIBITION.

THE Great Exhibition has passed its evil days. The voice of adverse criticism has been silenced. Those who predicted that it would lead to insurrection, if not revolution, have been disappointed—let us hope, to their satisfaction. Those who imagined, that, in default of a Red Republic, nothing less than a Black Pestilence would issue from it, have also been deceived—let us hope, in like manner, to their personal comfort. Even the gallant and eccentric Colonel, who uttered his fervent wish that the hail and storms of heaven might batter and overthrow the Building, has relaxed in his hostility, and condescended to visit the beautiful abomination. Shopkeepers, who formerly blamed it for depriving them of business; caterers for the public amusement, who foresaw their own bankruptcy in no dim or shadowy distance, but in clear and well-defined proximity, if this giant place of amusement were much longer kept open, have become consoled and appeased; and growlers of all kinds have finally admitted it as a great, and, all things considered, a rather pleasurable fact. If there be any exception at all to the general acquiescence, it is to be found chiefly among lodging-house keepers and others, over-hasty to get rich, who expected to make their fortunes in one season by inordinate charges, and who find at the last moment that they very greatly over-rated their own chances, and the capabilities of foreigners and strangers for being "fleeced." And while opponents have thus been very generally converted into friends, friends have every day discovered and proclaimed some new benefit or advantage—social or political, national or international—which has resulted, or is likely to result, from the great gathering of the nations in 1851. The Exhibition has been shown to be a great Peace movement, a great moral movement, and a great industrial movement—all of which it most undoubtedly is. Within the last few weeks, a novel and unexpected result has been witnessed, not less gratifying than any other of the more prominent and obvious ones which preceded it.

The classes who could afford to pay for their admission having had their turn, from the holders of season tickets, and the more aristocratic and exclusive visitors who love elbow-room in their amusements, down to the five shilling Saturday people, the half-crown Friday people, and the great bulk of the independent in somewhat humbler circumstances, who congregate on the shilling days; the turn of those who are too poor to pay for such an amusement has come also. Without any infringement of what we must consider the wise and judicious rule of allowing no gratuitous admissions, the doors of the Crystal Palace have been opened to many thousands of industrious, grateful, well-behaved, and admiring people, without cost to themselves. Parties of humble emigrants have come to Hyde Park, in order that they might not take their last look of England without seeing the wondrous Exhibition; and their expenses have been paid by the philanthropic individuals by whose assistance they were enabled to leave the old world for the new. Clergymen



THE GREAT EXHIBITION.—MODEL OF A SAMPAW, IN THE EAST INDIA COMPANY'S DEPARTMENT.

THE GREAT EXHIBITION.—JEWELS, &C., IN THE EAST INDIA COMPANY'S DEPARTMENT, NORTH SIDE OF NAVE.—(SEE NEXT PAGE.)

and small tradesmen in remote rural districts have organised clubs by which whole troops of agricultural labourers, with their wives and children, have been enabled to visit London once in their lives, and to see the marvels of art, skill, and industry congregated together in a building so novel in construction, and so imposing in appearance; and not among the least pleasing of the episodes in the history of the Exhibition has been the appearance of these bucolic or agrarian groups, staring with mute admiration at the splendours of so unusual a spectacle. Manufacturers in the provincial towns, and extensive employers of labour in the metropolis and its environs, have not only given their workpeople a holiday to enable them to visit the Exhibition, but have in numerous instances paid the expenses both of the trip and of their admission. Wholesale and retail traders have imitated the admirable example. Public companies and schools have done likewise; and bankers, solicitors, and others have remembered the services of their clerks and *employés*, and afforded them both time and the means to partake in the general jubilee. In the case of large companies of workpeople, from cotton or paper-mills or other factories, or of schools and rural parties, it has been easy to distinguish them among the crowds in the long avenues and galleries, or remoter courts of the Building; and their appearance has tended greatly to enhance, in the estimation of all right-minded spectators, the pleasure of the Exhibition. But a large class of visitors, not scarcely distinguishable, and whose presence is not less gratifying, must be added to the catalogue of those who within the last few weeks have established a participation in the enjoyment of the scene. These are the dusky denizens of the back yards, the female portion of whom are so numerous, and in many cases so scantily remunerated for a life of incessant toil. It has often been made a matter of serene, and we fear not altogether unmerited reproach, that the upper and middle classes of the English know but little of their domestic servants; that they do not sympathise in their joys or sorrows; that they are harsh towards them for slight faults; that they are careless of their mental and moral improvement; and that they too often hold themselves as much aloof from them, as if they were beings of another species. The Great Exhibition, if every one were any real foundation for these charges, has been the means of breaking down the barriers between the employers and the employed in this respect; or, if it be admitted that the charge is wholly unfounded, the Exhibition has not the less been the means of extending and consolidating the kindly feeling that may have previously existed between the wealthier classes and their dependants. We believe it may be said with truth, that there are very few respectable families in London, of which the domestic servants, male or female, have not received an extra holiday from their masters or mistresses to visit the "World's Fair," and the price of their admission besides; or who, if they have not yet done so, have not made arrangements for the purpose. So generally do the masters and mistresses of households enter into this matter at this time, and so thoroughly do they feel the necessity of not allowing such an opportunity to pass over without giving their humble assistants—very often their true friends—the benefit of it, that in numerous instances they have provided them with the means and the leisure, not only for one, but for several visits to the Exhibition. We rejoice to see such examples of kind feeling. They tend to obliterate the jealousies, that, to a greater or less extent, exist between the rich and the poor, and to the fusion of society into one homogeneous and contented mass of mutually related and mutually dependent people. The sympathy manifested by employers for their workpeople throughout the whole country, as well as in the metropolis, has been productive not only of the spontaneous growth of the national character. We trust that the good understanding will be of long continuance, to the mutual advantage of employer and employed, of master and servant, and that each will learn from it more thoroughly to appreciate the duties and responsibilities, and to respect the merits of the other. This was a result which, like many others working together for good, the Exhibition could scarcely have anticipated, and which leads to the hope that latent in the heart of society are yet many others of equal significance and utility which may be expected to flow from it.

THE GREAT EXHIBITION.

INDIAN COLLECTION.—ROYAL DRESS OF STATE AND JEWELS

THAT portion of the East Indian collection shown in our Engraving is in a glass case, enclosed within an iron railing, on the north side of the Nave and near the Transept. It at first sight attracts attention by the gorgeous coat of a Sikh chief placed at the top, and gains far less of minute attention than it deserves. The coat is of kinkhob (cloth of gold), with epaulets in pearls, and on each two very large valuable emerald drops, and a deep border of rich gold embroidery, beautifully overlaid with pearls, rubies, and emeralds, and was made in Delhi. In front of this dress of state are the trousers, also of cloth of gold, and the cap of an Indian chief, and on a crimson velvet saddle-cloth stands a board and set of chessmen in bloodstone and carnelian. In front of the board are two large gold with a cover of fan of bird of paradise feathers, and which not more than half-a-dozen persons are by native custom entitled to bear in the presence of the Governor-General. Below this article is placed a princely girdle of gold, containing nineteen emeralds, each less than an inch and a half square each. One or two of the emeralds are fine, but they are all cut thin, and several bear inscriptions, so that their value is very much depreciated. The girdle has, besides, a row at top and bottom of large diamonds, some of which are very fine and valuable. But all these articles are surpassed in their united worth by a pair of armlets, with three large rubies uncut, but sufficiently polished in their original shape to show their full brilliance and depth of colour. And last, in the centre front of the case, passed by unnoticed by thousands, lies, set round with ten large diamonds, the "Durr-e-Noor," or sea of light. It is cut, its set, but of great size, purity, and value. Near it is a necklace, containing 240 very large and fine Oriental pearls, and which, with a similar string on the right hand side of the case, are valued at not less than £7000. The cushion is white carnelian—the gun, wheels, and mountings most beautifully worked and put together; his barrel of fan of bird of paradise feathers; the limberer is of blood-stone, no less carefully worked. But the gems in curiosity and workmanship of this case are some vases, drinking cups, and bowls of rock crystal, clear, and worth from £40 to £60 each in this article, but which, as they bear no labels, by, we venture to say, far the majority of persons, have been looked at as specimens of Indian glass. A little jewel-box, in the shape of a swan, cut in rock crystal, seems almost as bright as diamond; and these articles are executed in a variety of shapes, in jade, a [illegible] somewhat the appearance of opal, but are very elegant in form, with most beautiful arrangement of colour, set and inlaid with flowers, emeralds, rubies, topaz, and other precious stones. One of these little boxes, in a heart shape, at the left hand side of the case, might well serve our jewellers and workers in enamel and the newly produced glass mosaic for a study, so beautifully are the colours in the setting contrasted and harmonised; and close to it lies another lesson for jewellers in a necklace of exquisitely wrought gold, set with several rows of rubies, and in which the very pattern of the gold somewhat like the setting of the precious stones, so harmonious are the colours of the gold and stones. The filigree and silver and gold wire, in the same case, are also wonderful specimens of workmanship, and especially deserving of attention. Amongst these may be mentioned a kind of [illegible] almost be called lace of solid gold, and, though, [illegible] The appearance of being punched or [illegible] from the solid. This sort of work is mostly from Azimgurh, which Delhi, and Trichinopoly from the latter, a [illegible] cases, that, to look at, seems, so perfectly is it wrought, a solid rod of silver, but is so jointed, that it bends with all the flexibility of the softest cord of silk. We must not omit to claim [illegible] for some [illegible] and saddle, placed in the case probably for the [illegible] cost, and carved from the pith of an aquatic plant, the [illegible] *sesbania aspersum*. They are most elaborately [illegible] one, representing a Hegyptorium, or entrance to an unfinished [illegible]

Streerungum, is small, but beautiful in design. Having so introduced our readers to this [illegible] royal garbs, trappings, precious stones, pearls, and elaborate art we [illegible] it is only necessary we should tell them that it contains, just to remind us that the Orientals can do everything in gold and silver, two very beautiful specimens—a pair of armlets, a spice-box in gold enamel, and the grand gold and silver embroidered and silver handled umbrellas. At either side of the case are the elephants, carried on state occasions in Royal processions.

In the upper Engraving upon the preceding page is from among the models of native vessels exhibited in the Indian Archipelago Department. It shows a first-class *Sampan*, a description of passage boat peculiar to Singapore, and remarkable for its swiftness both with sails and oars.

FOREIGN AND COLONIAL NEWS.

FRANCE.

The revision of the Constitution, and the discussions upon it in the committee of the Legislative Assembly to which the question has been referred, occupy the public mind in Paris, to the exclusion of every other topic. The advocates of revision lay great stress on the declaration in favour of the measure by the Duke de Broglie in the committee on Tuesday. The opinion of M. de Broglie is of consequence, on account of the great weight it is likely to have with the public, since of all the statesmen of France, during the last ten years, he alone has maintained his independence of character, showing himself to be actuated only by motives of pure patriotism whenever he interfered in political matters, and incapable of yielding to any sentiment of mere personal ambition or party interest, as he has always refused office, save on one or two occasions for a short time, when he deemed he might [illegible] public good.

In his speech on this occasion, M. de Broglie said, that though he has [illegible] assisted in forming the Republic nor the Constitution, yet, while [illegible] mained what she was, he would perform his duty as a good citizen. A revision of the Constitution he considered necessary to overcome the dangers of 1852, the object of which was merely to afford the country an opportunity, when it had not yet had, of pronouncing on its destiny, and of calmly [illegible] the institutions that had been created since the last Revolution. According to the 111th article of the Constitution the Assembly could do no more than declare the existence of an evil requiring a remedy, but the present would assume the consideration of the remedy. He would accordingly move simply a resolution, that "the Legislative Assembly, considering the 111th article of the Constitution, expresses its desire that the Constitution be revised in conformity with the said article." The motives for such resolution might be developed in the report. He felt assured, that whatever evils were to be found in the Republic were to be traced to the Constitution and not to men; and as it regarded the motives imputed to the President of the Republic, he would say, that though he was neither his minister, his counsellor, nor his friend, he believed that he had no intention whatever of attempting an 18th Brumaire. Whatever faults might be found in Louis Napoleon, of faults they were, must be attributed not to an [illegible] ambition, which had already satisfied with unconrolled power. Had the object been to create a President with limited power, he should have been elected in quite a different manner. Viewing the subject in all its bearings, he could come to no other conclusion than that a regular revision of the Constitution would be not desirable.

On Wednesday the discussion was resumed, and the Duke de Broglie's proposition was rejected. Another resolution was proposed and immediately withdrawn for the total revision of the Constitution, which was also opposed, but was eventually carried, though not unanimously.

M. de Iocquet is was appointed reporter.

The Budget Committee have rescinded the resolution regarding the advertisement to the Italian and Odéon theatres; and, therefore, the grant will no doubt be voted as usual.

Louis Napoleon reviewed the 3rd Division of the Paris garrison in the Champs de Mars, on Tuesday. The day was fine, but chilly, and not a numerous people assembled to witness the animating spectacle. The President was repeatedly cheered.

M. Jordan, of the *Eclisement*, and M. Paradis, the author of an article in that journal, declaring that M. Courrent, the Mayor of Poissy, had availed himself of the authority conferred by his functions to induce the persons attending the market at Poissy to sign a petition for the revision of the Constitution, were tried on Tuesday by the Court of Assizes of the Seine, charged with libel. M. Rouy, the publisher of the *Presse*, was tried for copying the libel. The defendants were found guilty, and sentenced as follows:—Jordan to a month's imprisonment, and 500f fine; Paradis to two months' imprisonment, and 500f. fine; and Rouy to fifteen days' imprisonment, and 500f fine.

Correspondence from Bordeaux states that a duel took place between M. Oliver Casenave and M. Aristide Fabre, editors of those journals, in which the latter was killed on the spot, and his adversary seriously wounded.

The *Moniteur Algérien* of Algiers contains further accounts of the successful movements of the French troops against the Kabyles. From the 9th to the 15th engagements daily took place, in not one of which were the enemy victorious, though the resistance they offered was determined. The work of struggle to be unavailing, all the tribes on the western side of Djidjelli sent in their submission. On the 15th the French troops entered upon a campaign against Beni-Slar and Beni Abbes, towards the east.

UNITED STATES.

Accounts from New York to the 12th inst. mention the nomination at Boston of Mr. Webster for President, and an accusation by the Secretary of War against General Talcott, of the Ordnance Bureau, who was to be tried by a court-martial.

The Postmaster General had made arrangements by which, after the 1st of July, letters to the West India Islands, ports in the Gulf of Mexico, and on the Atlantic coast of South America, could be sent through the Post-office on prepayment of the United States' postage to any such ports in the British possessions, and with British postage added when destined for places in the possession of other Governments.

The arrangement between Jenny Lind and Barnum terminated on the 9th. Her intention was to give several concerts in other parts of the country on her own account.

The cholera is on the increase throughout the west, and the cases are very fatal. Among the victims at Paducah, Kentucky, is Dr. Newman Edmonds, the Democratic candidate for Congress at the last election from Louisville district.

The Mississippi river still continues to rise, and accounts from St. Louis, dated June 7, state that the whole length of the levées were submerged. The merchants in that vicinity were consequently moving their goods from the ground floors. A large amount of produce on the levee had already been injured by the high state of the water; and the difficulty in shipping goods had nearly caused a suspension of business.

CANADA.

[illegible] to the 9th, inform us that a debate had taken place, on the motion of Mr. Merritt, for an address to the Queen, praying for the imposition on American products imported into England of the same rates of duty as were imposed on the like articles when imported from foreign states. The motion was lost by a majority of 9 to 7. The majority voted against the motion were all members of the Government. There is an anti-treaty feeling, however, even in Lower Canada, which appears to be increasing. The first which bears on the duties in question is the work entitled *Chansons Populaires*, by the *chiffonniers* who have good workers and crooks [illegible] extra brass; the second, which is the *Chansons des Depuis*, is for *chiffonniers* who have baskets and carts; and in the second song and the third, which is that of the *vraie prolétaires*, is for the poor workmen who have only a hot of canvas which they place their pickings. On Friday the three chambers fraternised in a general banquet. They were served with a huge *gibelotte*, for which they were made to pay [illegible] was followed on the table by [illegible] they were crowned with a coral wreath was given to [illegible] rantes for the knives and forks. After drinking several poetical toasts in wine [illegible] six sous per quart, they gave up the knives and forks, and consumed the [illegible] of each guest's brand.

A return has been printed to Parliament, from which it appears [illegible] the amount of duty received on goods imported into the United Kingdom exclusive of the port of London, in the year ending 5th January, 1851, was £10,950,935. In Europe and exclusive of [illegible] Standard, £1,95,981; and in Ireland, £[illegible]

On Monday the sheriff [illegible] given a dinner to her subjects [illegible] for the ensuing year, which [illegible] Mr Baron Parke, Mr. Justice [illegible] experiments [illegible] Cubitt, between [illegible] [illegible] [illegible]

IMPERIAL PARLIAMENT.

HOUSE OF LORDS.—MONDAY.

The Highways (South Wales) Bill was read a third time and passed.

CHANCERY REFORM.

Lord LYNDHURST referred to the Chancery Reform Bill recently introduced by the Lord Chancellor, and complained that their Lordships' privileges had been infringed by the petitions introduced on the subject by the Master of the Rolls and other equity judges. He moved that the question be referred to the Committee of Privileges.

The Lord Chancellor stated that the greatest care had been taken to avoid interference with their Lordships' just rights, and he did not believe that any interference had taken place. Still, he was quite willing that that question should be referred to the committee named.

Lord LYNDHURST said a motion was agreed to

If the Lord Chancellor's motion, that leave be given to the petitioners praying to be heard by counsel against the Capital and Counties Estates Management Bill before the select committee on the bill, was withdrawn in consequence of the opposition offered to the proposal by several noble Lords.—Adjourned.

HOUSE OF COMMONS.—MONDAY.

ECCLESIASTICAL TITLES ASSUMPTION BILL.

The committee on this bill was resumed.

Mr. WALPOLE moved the amendment in the preamble of which he had given notice, and the object of which was, he said, to make the bill effectual as a protest against the Papal aggression, as it appeared they were not allowed to make it effectual as a criminal measure.

The SOLICITOR-GENERAL opposed the amendment, contending that the preamble, as it stood, was quite consistent with the clauses which had been adopted, and that if the words proposed to be introduced would call any the Roman Catholic members to subscribe a declaration which there was no necessity to require from them.

Mr. MAULE opposed the amendment, which was warmly supported by Mr. G. BANKES.

Lord J. RUSSELL said, that, as was the committee were prepared to alter the act of 1829, which he did not contemplate doing, the amendment was perfectly effectual as a criminal measure. In his mind, one act that was requisite, and useless. He thought the preamble, as it stood, was all that was requisite, and he should therefore oppose the amendment.

After a short discussion the amendment was divided, and the numbers were—for the amendment 132, against it 141—majority 9.

Mr. WALPOLE then moved another amendment, with a view to give a clearer and more effectual construction to the clause; passing the bill than was given in the bill, which was taken exceptionally to the construction put upon it.

The amendment was negatived by the numbers were For the amendment, 117; against it, 141—majority, 24.

The committee then divided, that the preamble stand part of the bill, and the numbers were For the preamble, 200, against it, 95—majority, 105.

The House then resumed, and the report was ordered to be brought up on Friday.

JEWS' DISABILITIES BILL.

The House then went into committee on the Oath of Abjuration (Jews) Bill.

On the first clause being proposed,

Sir R. INGLIS said, he should not divide the House upon this stage of the bill, there being nothing in the details to call for remark. He was opposed to the principles, and should on a future occasion offer it the strongest opposition.

Mr. PLUNKET would not divide the committee on the bill, which had now a second time been read, but which he considered, that, with all the influences of Government in which it was connected, that, with all the influences of Government, and in a House of 400 members it was carried by a small majority of seventeen, and in a House of 400 members it was carried by a small majority of seventeen, and in a House of 400 members it was carried by a small majority of seventeen, he considered it an insult to a large body of his fellow-subjects, he considered it an insult to a large body of his fellow-subjects against the act as an insult to a large body of his fellow-subjects against the act as an insult to a large body of his fellow-subjects against the act as

TINOS.

Of all the Cyclades, Tinos is perhaps the most beautiful. Unlike its neighbour Syra, which is but a naked rock, Tinos is everywhere clothed with verdure. The centre of the island is broken into glens of picturesque wildness, and smooth quiet valleys; and the land, which stretches gently to the water's edge, is rich in vineyards and olive groves, and corn and fruits of a hundred different kinds. In no place are wild flowers more beautiful or more abundant—the island seems embalmed in their perfume. On a sunny morning in October we left Syra for Tinos in a large half-decked *caique*, with a great tapering sail. There was a pleasant wind blowing from the north, and the light boat glanced like a dolphin through the water. As we neared the island, the most striking object is the celebrated church of the Blessed Virgin. It is built of Parian marble, and is of glittering whiteness. The town lies in a long line, close to the water's edge, and on an eminence behind stands the church. With its cloisters, its courts, and its gardens, it covers a very large space, and its principal spire rises to a height of 130 feet.

Nothing can be more quaint and quiet than the little town. The houses along the shore have terraces and balconies overhanging the sea, and were possibly built in the time of the Venetians. Other parts of the town have a Moorish character. The houses are flat-roofed, and many of them have long covered galleries, with light columns and pointed arches. A broad road, paved with blocks of granite, leads up to the Church of the Blessed Virgin. After the Holy Sepulchre and Mount Athos, the Church of the Panaghea, at Tinos, is the temple most venerated by the Greeks. Crowds of Greek pilgrims come here annually from all parts of the East, and countless are the stories of miracles wrought here by the intercession of the Virgin. The principal gate, the courts, and the cloistered galleries around, are in the style of the mosques of Constantinople, which are all, of course, modelled upon St. Sophia and the churches of the Lower Empire. The church is full of costly offerings. From the centre of the painted dome hangs an immense candelabrum of massive silver; and countless lamps of the same precious metal are suspended all around. Attached to the principal candelabrum is a little silver ship, very exquisitely fashioned, and close to the keel is protruding the body of a dolphin. This was the offering of a Hydriote captain, in the time when Hydriote captains might still have freighted their ships with Spanish dollars. In the midst of a storm the Hydriote's ship had sprung a leak, and he and his crew, giving up all for lost, flung themselves in despair before the picture of the Blessed Virgin, and begged her intercession. Suddenly filled with hope, they worked the pumps again. A minute before and the ship was filling rapidly, and in less than an hour the hold was pumped dry, and a few days after the ship rode safely at anchor in the waters of the Ægean. She was overhauled, and a dolphin was found fast in the leak. And then the captain had th a little silver ship made by a cunning artificer at Venice, and he and all his crew went on a pilgrimage to Tinos, and hung it up in the church of the Blessed Virgin. In the crypt beneath the church is a little chapel of peculiar sanctity. Here we found a venerable priest, who was kind and communicative. He lit a lamp and showed us all the costly offerings which hung around the altar of the Panaghea, which is of solid silver.

That night, as we strolled in the moonlight along the shore, we stopped near a house on the terrace of which a group of young girls sang to a wild but sweet air one of their simple island songs. The following is a rough translation:—

SONG OF THE CYCLADES.

For me there is no hour of rest;
Through the long night I cannot sleep;
A pain is rankling in my breast,
And day and night I do but weep.
What I want I do not know—
Δέν ἠξεύρω οὔτ' ἐγώ.

When at times I wish to die,
Hope will send a trembling ray,
Quickly then I cease to sigh,
And mournful thoughts will pass away
What I want I do not know—
Δέν ἠξεύρω οὔτ' ἐγώ.

You are the mistress of my soul,
In my heart of hearts you live;
O'er thought and sense you hold control—
I have no life but what you give.
Oh! what I feel is wordless woe—
Δυστυχῆς δὲ νὰ γενῶ.

When you at your window stand,
And I see those loving eyes,
That rounded arm and taper hand,
My heart is rent with burning sighs.
Oh! what I feel is wordless woe—
Δυστυχῆς δὲ νὰ γενῶ.

EXHIBITION OF THE SOCIETY OF PAINTERS IN WATER COLOURS.—"THE LILY."—BY J. J. JENKINS.

FINE ARTS.

EXHIBITION OF THE SOCIETY OF PAINTERS IN WATER COLOURS.

THE accompanying Illustrations are from two of the most interesting contributions to the Exhibition of the Society of Painters in Water Colours. First is

"THE LILY." BY JOSEPH J. JENKINS

This is a sweet impersonation of female character, painted with remarkable delicacy and finish: it is altogether a charming work. Next is

"A TYROLESE CHAMOIS HUNTER." BY CARL HAAG.

The artist has here most vividly portrayed the chamois hunter in his native Tyrol, halting upon one of those stupendous heights which render the chase of the chamois a sport of enterprise fit only for the stoutest hearts to encounter. His closely-knit figure stands in sharp outline against the clear cold sky; and the Tyrolean Alps, "in huge embattled pride," in the distance. Our chamois hunter in costume resembles one of the inhabitants of Southern Tyrol, who have more of the Italian in their manners, language, and even in their dress, while the North retains more of the antique character. Mr. Haag's picture is certainly one of the most brilliant contributions to the collection.

LITERATURE.

STUART OF DUNLEATH: A STORY OF MODERN TIMES. By the Hon. MRS NORTON. Colburn and Co.

From the pen of Mrs. Norton we, at least, expected an elegant novel, over-informed with poetic beauty. We have not been disappointed. Our expectations, on the contrary, have been far exceeded. We have here a beautiful romance of real life, beautiful so far as its heroine is con-

MARBLE CHURCH AT TINOS.

cerned, but in its picture of the Scottish Aristocracy more true than attractive; one among the numerous instances of female authorship, that those who are best acquainted with society in the privileged ranks, paint it in its blackest colours. To the poetic mind, it appears the darkest. Its delicacy is offended with manners redolent of the stable, and disfigured with the associations of the kennel. What is landed wealth, with its coarse associations, but dirt, when contrasted with the moral possessions of a highly cultivated and well regulated genius? Mrs. Norton's has now attained that elevation which enables it to look down one social distinctions, and esteem the true and the beautiful for itself. "Itself," we say; for they are one. Also, there is a beauty which is terrible; and such it is when it becomes Truth, condemning with a frown the meannesses of a truckling world.

The tone and colouring of Mrs. Norton's novel, in regard to style, are rich and harmonious; and there are some snatches of verse in it which sound like loved voices of the past. The Byron of poetesses remains so in her sadness and her sweetness—in the eloquence both of her tears and her words. Her sighs are burning syllables; and those musical cadences which melt snow-like into the soul on which they fall, to soften and to purify the depths and intricate foldings of its subtle and essential tissue.

A poetical culture renders the mind too tender and relenting for the stern battle of worldly life. Brought into collision with common natures, it suffers evil where it should resent injustice. Its forbearance is a premium on injury; and yet any resort to other defences would change its character altogether, and debase it to the condition of that which wrongs it. No; genius in the world must live a martyr's life, and the true poet must, for a crown, be content with the halo which invests the dying brow of the righteous. Immortality, not happiness, is the reward of the intellectually creative.

Mrs. Norton's novel contains the contrasts which are fitting to bring out this normal truth. Stuart of Dunleath is an Educator, the fosterged of Eleanor Raymond, left by her father the guardian of herself and mother. As such he watches over her infant mind—is both parent and schoolmaster, forms and cultivates the taste of his pupil, and continues his instruction to so late a period of life that admiration ripens into love. In this task he has to contend with conflicting interests, particularly with the dogged temper and exclusive "strict-justice" principle of Lieutenant Godfrey Marsden, her half-brother, whose inflexible notions of right and wrong are outraged by the poetic manifestations of a milder creed on the part of "Guardie" and his charge. And to this man's harsh censure is Stuart at last truly liable. A strong desire to repossess himself of his family estate of Dunleath leads him to speculate with the trust property of his wards. A stoppage comes, and this amiable man, having yielded to one temptation, is fain to seek refuge from his shame in suicide. But he has involved her in his ruin—her whom he loved, who loves him. Deserted, penniless, over persuaded by misjudging friends, she yields to the suit of Sir Stephen Fenrhyn, a Scotch laird, rough, coarse, and violent. The usual results of an uncongenial marriage take place.

We cannot trust ourselves to describe the different members of the laird's family, and their complete unfitness to consociate with a lady so educated as his wife had been.

The mother of two children, Eleanor has to regret their death through the brutal indiscretion of Sir Stephen. How she had loved them is best told in numbers:—

THE BIRDIE'S SONG.

As I came o'er the distant hills,
I heard a wee bird sing,
"Oh, pleasant are the primrose buds
In the perfumed breath of spring!
And pleasant are the mossy banks,
Beneath the birchen bowers;
But a home wherein no children play
Is a garden shorn of flowers!"

And once again I heard the bird,
His song was loud and clear
"How glorious are the leafy woods
In the summer of the year!
All clothed in green, the lovely boughs
Spread wide o'er land and lea;
But the home wherein no son is born
Is a land without a tree!"

The birdie ceased its happy song,
I heard its notes no more;
The water rippled silently
To the blue lake's quiet shore.
But a mother sang her cradle hymn,
"All hallow'd be your rest,
And angels watch the shining heads
That lean'd on Jesu's breast!"

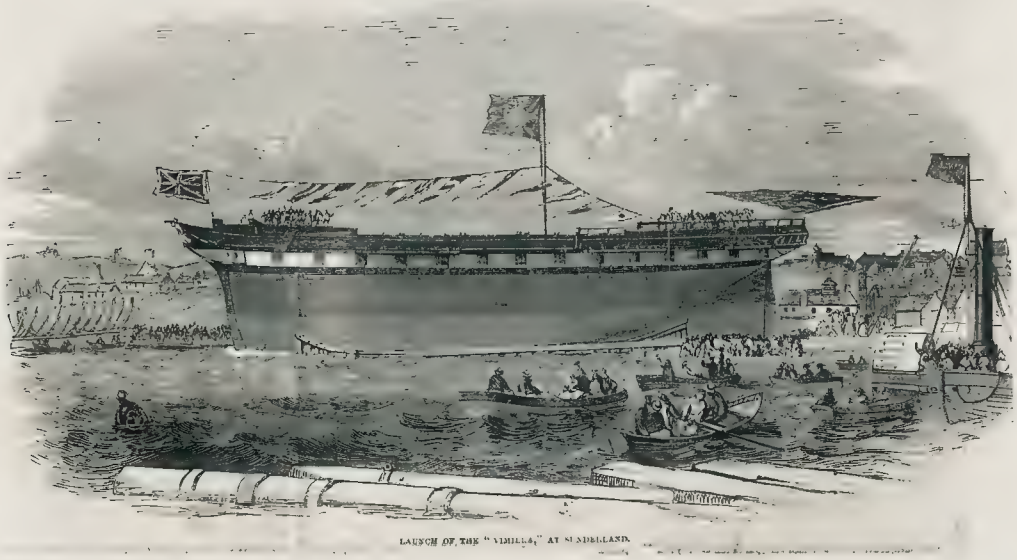
The misery of the ungenially wedded was further increased by the discovery that Stuart still lived, having been saved from suicide; and, in America, put in possession of the means of recovering the property he had supposed to be lost. Sir Stephen claims this, as Eleanor's husband; is unfaithful to her, besides; defies her efforts towards a divorce; and, in fine, survives her. Death only is Mrs. Norton's solution of an unhappy marriage in England, or even Scotland. The interest of the narrative is powerfully sustained. We close the book with an impression that it deserves to be read a second time.

EXHIBITION OF THE SOCIETY OF PAINTERS IN WATER COLOURS.—"A TYROLESE CHAMOIS HUNTER."—BY CARL HAAG.

LAUNCH OF THE "VIMIERA."

THIS noble and beautiful ship, intended to trade between London and Sydney, was launched on Monday, the 16th inst., from the building yard of Mr. James Laing, the eminent ship-builder, of Sunderland, and is the largest vessel ever built on the Wear. The river at the spot where it took place is scarcely a furlong wide, and the practicability of launching a vessel of the *Vimiera*'s tonnage with safety in such a very limited space was doubted by many; but, with every disadvantage arising in this narrow and crowded stream, the arrangements were so good that the launch proved to be a most interesting scene. There was a great concourse of people to witness the sight, both in the immediate neighbourhood and on the opposite cliff, whose picturesque summits were studded with well-dressed groups. The day was fine, but very windy. The ceremony of christening the ship was most ably performed by Mrs. Ferguson, a relative of Mr. Laing; and amid loud cheering the ship slowly and majestically entered the water: she was soon after taken in tow, and conveyed to the south dock, where she is now being rigged, previously to her proceeding to London

As we have previously stated, the *Vimiera* is the largest vessel which has ever been built in this port: her dimensions are as follow:—Extreme length, 197 feet; extreme beam, 33 feet; depth of hold, 23 feet; length of keel on the blocks, 160 feet; and tonnage, new measurement, 1037 tons. Her build and proportions have been much admired by competent judges; and we may mention, that the beautiful model sent to the Crystal Palace by Mr. James Laing is one of this vessel. She is wholly constructed of teak and English oak, strapped with iron throughout; and there are five orlop beams in the lower hold. The figure-head is a graceful representation of Fame blowing a trumpet



LAUNCH OF THE "VIMIERA," AT SUNDERLAND.

carved by Mr. Brooks, of Mayfport; and the ornaments on the stern consist of tastefully-arranged groups of banners, &c., in the centre of which is a shield with a lion rampant, the whole executed in first-rate style by Mr. Bridges, of Sund-land. The outfit of anchors, iron knees, chains, &c. was furnished by Messrs. Wight and Son, from Seaham works. The internal fittings will be very splendid and complete.

The *Viniera* presents one of the most magnificent and exquisitely-finished specimens of naval architecture ever produced by the shipwrights of the Wear, and one which will serve to keep up and extend their reputation as builders; while it is enough to say that the model, so ably designed by Mr. Laing, has been completed with equal ability by his workmen.

The interest evinced by men not belonging to Mr. Laing's yard was shown by the fact that a large number of carpenters employed by other builders left their work to be present at the launch.

The *Viniera* is the property of Mr. Duncan Dunbar, the eminent Protectonist shipowner; and the ship's commander is one of the finest of his immense fleet, which, according to a statement published some time since, numbers 33 ships, representing upwards of 22,000 tons. She will be commanded by Captain Heatby.

In connexion with the launch, about 200 of Mr. Laing's workmen were entertained at supper, on Wednesday evening, in the moulding-room attached to the building-yard. After supper the wives and families of the men were introduced into the room, which was tastefully decorated, and the dancing kept up with much spirit till an early hour next morning.

CALENDAR FOR THE WEEK.

SUNDAY, June 29.—2nd Sunday after Trinity.
MONDAY, 30 Earl of Argyll beheaded, 1685.

On this occasion will appear Madame[illegible]Sering, Caroline Degreef Alaimo, Giuliani, Ida Bertrand, Formosini, Marie Cruvelli, Sofia Cruvelli, and Madame Ugalde; Signori Gardoni and Calzolari, Mr Sims Reeves and Signor Fornasi, Signori Giorzi, Ferranti, F Labocetta, and Lablache. The whole under the direction of Mr Balfe. Signor Silver, (engaged expressly for this occasion) will execute two admired Pieces of Paganini. The Concert will commence at Two o'clock precisely. [illegible]17, 2s 6d, to be had at [illegible]

MDLLE. RACHEL'S PERFORMANCES, ST. JAMES'S THEATRE.—[illegible]Sunday, Friday, and Saturday.—Arrangements for [illegible] the celebrated tragedy of MARIE STUART, on Monday, July 7, and on Wednesday, July 9, in consequence of the continued demand, the popular Play of Adrienne Lecouvreur will be repeated. Friday, July 4th, in compliance with numerous and earnest requests, the last time. [illegible]ctacle will commence with [illegible]ctures and Stalls [illegible] Doors open at Half-past Seven, and at the Box-office [illegible]

MRS. FANNY KEMBLE'S READINGS of SHAKSPEARE, AT JAMES'S THEATRE.—Mrs FANNY KEMBLE will read on MONDAY MORNING, 30th, the Play of HENRY THE EIGHTH. Wednesday Morning, July 2, the Merchant of Venice. Commencing each Morning at Two o'clock precisely. Doors open at Two.—Reserved Stalls, 7s: Boxes, 5s; and Family Tickets may be secured at Mr. MITCHELL'S Royal Library, 33, Old Bond-street, and at the Box-office of the Theatre.

GUILD OF LITERATURE AND ART, HANOVER-SQUARE ROOMS.—THE FIFTH PERFORMANCE by the AMATEUR COMPANY of the GUILD of LITERATURE and ART, in the Theatre constructed for the purpose, and first opened at December last, will take place at the Hanover-square Rooms on WEDNESDAY EVENING, JULY 2, when will be performed Sir Edward Bulwer Lytton's New Comedy, in Five Acts, entitled NOT SO BAD AS WE SEEM, or, Many Sides to a Character; and a New Farce by Mr Charles Dickens and Mr Mark Lemon, entitled MR NIGHTINGALE'S DIARY.—Tickets (all the seats being reserved), 10s each; or Family Tickets, for the ten persons, £1 1s, to be had of Mr Mitchell, 33, Old Bond-street; Mr Andrews, 167, New Bond-street; Messrs Chappell, 50, New Bond-street; Mr Robert Olivier, 19, Old Bond street; Mr Sams, 1, St James's-street; Messrs Cramer and Beale, 201, Regent-street; Messrs Addison, Hollier, and Lucas, 61, New Bond-street; Messrs Keith and Co., 69, New Bond street; and at the Box-office of the Theatre. [illegible]

ROYAL PRINCESS' THEATRE, Oxford-street. MONDAY JUNE 30, THE DUKE'S PAGE, APARTMENTS, and the ALHAMBRA; Tuesday, July 1, Love in a Maze, Faraon, and the Alhambra; Wednesday, the Duke's Page, Apartments, and the Alhambra; Thursday, the Wife's Secret, Faraon, and the Alhambra; Friday, the Duke's Page, Apartments, and the Alhambra; Saturday, the Duke's Page, Faraon, and the Alhambra.

ROYAL PRINCESS' THEATRE, Oxford-street.—Mr. and Mrs. CHARLES KEAN respectfully inform the public that their BENEFIT will take place on MONDAY, 14th July.—Private Boxes, to seat four persons, and the second circle, may be secured at Mr. Keasbarne, at the Box-office, daily, from Eleven till Five o'clock; or at Mr. C. Kean, No 3, Tavistock-square.

ASTLEY'S ROYAL AMPHITHEATRE.—Proprietor and Manager, Mr. W BATTY.—Great and continued success of the present splendid entertainments, which, however attractive, must positively be withdrawn after the present week, as the [illegible]ecoupes" on Monday next, July 7.—On MONDAY, JUNE 30, and during the week, will be performed for the last six nights, the popular spectacle of SOLOMON or ABRAHAM or, the Queen of France and England. To be concluded by Batty's Scenes of the Arena. Introducing the extraordinary performances of the first equestrian talent of the day. The whole concluding with the Splendid Equestrian Spectacle of MR. [illegible]. Dancing and Horse-dealing. Tickets may be had at the Box-office from 11 to 4.

BATTY'S HIPPODROME, KENSINGTON.—The success which has attended the opening of this Establishment has exceeded the Manager's most sanguine expectations. The vast attendance of Nobility and Gentry at each performance is the best criterion of the high estimation in which the Entertainments are held. Mr. BATTY, therefore, respectfully announces the same routine of performances will take place next week, commencing as on First Opening, at Six. As usual, on MONDAY and FRIDAY PERFORMANCE will take place on THURSDAY, JULY 3rd, commencing at Two o'Clock. On Monday, June 30, Mr. Hengrove will make his first appearance in his magnificent Act of Single Stick previously, and the doors will on that occasion be opened at Four. A number of persons having expressed a wish to attend in the day of the Opening, Mr. Batty has much pleasure in stating he so will please apply to Mr. Hengrove, on the ground. Admission to Private Boxes, to Reserved Seats, 3s., First Class, 2s., Second, 1s., Third, 6d.

Preise der Plätze nach Cambridge und wieder zurück, 1ste Classe, 6s, 2te Classe 4s, 3te Classe, 2s.

COUNTY FIRE OFFICE, 50, REGENT-STREET, and 2, ROYAL EXCHANGE BUILDINGS, LONDON. Established [illegible]
It is respectfully notified to parties holding Policies in the Office, the renewals of which fall due at Midsummer, that the same should be paid at one of the Offices or Agencies.
The terms of the County Fire Office are highly advantageous to the Insured, and have secured to it a large share of public approbation. All claims are settled with promptitude and liberality. Prospectuses may be had at the Offices, or of any of the Agents.
Persons desirous of becoming Proprietors of the Company's Shares are requested to apply at the Offices, or by post, addressed to the Secretary.
JOHN A. BEAUMONT, Managing Director.

THE ROYAL EXCHANGE ASSURANCE OFFICE.—Incorporated A.D. 1720 by Charter of King George the First. Chief Office, Royal Exchange. Branch, 29, Pall Mall.
FIRE and MARINE ASSURANCES on liberal terms.
LIFE ASSURANCES with BONUS (which has averaged 46 per cent. on the premiums); or, at lower rates, without Bonus.
Moderate Premiums and an equitable division of Surplus.
Exemption by the Charter from the liabilities of Partnership.
The security of a large Capital Stock, and the moral guarantee afforded by 131 years' existence and reputation.
The soundness of a thoroughly-tested Office, with all the real improvements of modern practice.
ALEX. GREEN, Secretary.

THE ILLUSTRATED LONDON NEWS.

LONDON, SATURDAY, JUNE 28, 1851.

THE Parliamentary proceedings of the week have not been of a nature to excite much interest; the weather has been too warm, and the Exhibition too attractive, to allow either the Legislature or the public to indulge to any great extent in political excitement. The Papal Aggression Bill is still unpassed, and the Budget has yet to be debated; but both will doubtless become the law of the land, amid a languor the combined result of atmospheric heat and a moral indifference not altogether unallied to contempt. There is, however, one Parliamentary achievement of the week which will excite more interest. The doom of the most gigantic nuisance that ever existed in a great city has been sealed. The bill for the removal of Smithfield market beyond the limits of the metropolis has passed its third reading in the House of Commons; and, as there is not the remotest possibility that the House of Lords will interfere with, or even delay to carry into effect the decision of the Commons, we may consider that the question is finally decided, and Englishmen of the nineteenth century proved after all to be as wise in the matter of cattle markets as their ancestors of 600 years ago. Bull driving through the streets of the most crowded, the most wealthy, the most intelligent, the most populous city in Europe, has gone the way of bull-baiting, and will cease to endanger our safety from contact with the live animals, and our health from the consumption of their fevered carcases. The struggle against the nuisance has been a long and arduous one; but success has crowned it at last, and we are too well satisfied with the result to avoid recording it with a befitting note of triumph—*Sic transit abominatio!*

We are glad to see that a new movement has been commenced for the improvement of the dwellings of the poorer classes. For this humane object there are, if we may borrow an illustration from the late Sir Robert Peel, three courses to be pursued; but, fortunately, these courses, unlike those which invariably offered themselves to the judgment or the imagination of that lamented statesman, may all be pursued simultaneously, without detriment the one to the other. The first course, which is the one that has been most generally followed, and which is recommended to the notice of all who are interested in the subject by the illustrious patronage of the Prince Consort, and the society of which his Royal Highness is the president, is to erect suitable dwellings, such as those upon a small scale which have been exhibited in proximity to the Crystal Palace; or such as those larger squares or blocks of buildings which we see in Bloomsbury, or in the St. Pancras-road, and of which still more admirable specimens were erected some years ago in the new town of Birkenhead. The second is to erect cottages either in the cuskirts of towns or in the rural districts, and to give the dwellers all possible advantage of the sanitary improvements of the present time. But in cities like London, or other large towns where ground is valuable, and the space to be traversed between the working man's house and the scene of his employment may be considerable, the erection of small cottages is attended with difficulties. Hence, in London and in the great towns, the plan of building large blocks has been generally adopted; and, by the principle of union, a portion of the working classes have been provided with well lighted and well ventilated homes, and furnished with many domestic comforts, especially as regards the water supply, and the removal of nuisances which, had it not been for the efforts of the sanitary reformers who originated this humane movement in their favour, they never would have been enabled to enjoy. But hitherto these efforts have necessarily been but partial; and in many instances they have been impeded by the difficulty, on the one hand, of finding convenient sites for such dwellings, and, on the other, by the unwillingness of the working classes themselves to remove from their old abodes into these large buildings. Besides suggesting to them too often, by their architectural construction, the idea of the union workhouse, the model lodging-houses interfered to some extent, by their necessary rules and regulations, with the freedom which, even amid squalor and discomfort, the working man enjoyed. It is under these circumstances that the third line of action has suggested itself to the mind of Lord Ingestre; which is, without taking the labouring population from their private dwellings in the districts which they now occupy, and which are convenient to them for their proximity to the scenes of their daily toil, to introduce a better system of management, by the abolition of the sub-letting and middle-man system. By the operation of this system in crowded parts of the town, while the owner of house property may only receive a fair and moderate

rental of £40 or £50 per annum, the occupiers often pay for the rent of single rooms an enormous and exorbitant charge of three or even four times that sum to the persons to whom the premises are let and sub-let. Lord Ingestre proposes to obtain possession of existing houses—to put them into decent and habitable repair, to introduce all possible improvement, and to let them off in sets of rooms, under proper management and superintendence, at rentals which would amply remunerate the owners, without overcharging the occupiers. This plan has received the sanction of the Bishop of London, the Earl of Shaftesbury, and other influential persons; and, as simply intended in aid of, and not to supersede the more extensive operations of those who would locate the working classes in larger and better constructed blocks of building, will doubtless meet with encouragement.

METROPOLITAN NEWS.

EXTRAORDINARY SCENE IN A CHURCH.—For some weeks past a series of discourses have been in course of delivery at the Sunday evening services in St. John's Church, Upper Charlotte-street, Fitzroy-square, the subject being the "Message of the Church." Last Sunday the special topic for the day was the "Message to the Poor," and the sermon was preached from Luke xx. 1, by the Rev. J. Kingsley, the well-known author of "Alton Locke." In his discourse, however, Mr. Kingsley enforced the peculiar doctrines of his creed so much attention to his public ed works. He emphatically upon the wrongs and miseries of the poor classes, attributing their poverty and ignorance, and consequent degradation, to the selfishness and hardness of the rich, while to the latter he enforced their responsibility of all the social evil that prevailed. The discourse was listened to with extreme surprise by a very crowded congregation, which, nevertheless, little expected the unexpected end that occurred at the close of the service. After the preacher had concluded the benediction, the Rector of the parish, who had occupied a pew beneath the pulpit, rose from his seat and addressed the audience in a few words about to disperse. A most painful duty, he said, had devolved upon him, namely, to condemn the discourse just delivered, and which they had just expected hearing from a pulpit. Mr. D— then, with some emotion, proceeded to administer a brief but stern rebuke on Mr. Kingsley, whose sermon he declared contained matter that was pernicious in doctrine, pernicious in tendency, and untrue in fact. He regretted that such opinions should have been uttered in the pulpit of a Christian Church, and that the preacher should have been offered to the men here as a Christian minister. This extraordinary address caused much excitement among the congregation, and a large number remained round the doors of the church for some time after they were closed, exchanging comments upon the singular scene they had witnessed.

DISTURBANCE IN STEPNEY CHURCH.—On Sunday afternoon the parish church of St. Dunstan, Stepney, was the scene of very disgraceful disturbance, arising out of the appointment of an additional curate to the parish, in addition to the two already officiating. The parishioners of Stepney claim the right, which they say has been exercised at least for two centuries, of appointing an afternoon lecturer, and have recently elected the Rev Samuel Flower Poole as the office, in opposition to the views of the Rev. Richard Lee, the rector of the parish. Mr. Poole had for some time officiated as curate, and had become very popular.

METROPOLITAN CHURCH REFORM ASSOCIATION.—On Wednesday evening the second conference of this association, the object of which is to procure a reform of the Prayer-book and public worship, and a removal of all abuses attending the church property and patronage, [illegible] masons' Tavern, [illegible] a formal declaration was adopted to the effect that the ultimate purpose being, that, when numerously signed, it is to be laid at the feet of the Throne. It will be circulated throughout the kingdom for signatures.

HOUSE OF CHARITY, ROSE-STREET, SOHO.—The fifth annual meeting of the friends of this charity was held on Tuesday at the Institution, Rose-street, the chair being taken by the Rev. W. J. Norris who had been chosen warden and chaplain in the room of the Rev. C. Wallace, resigned. The report for the year, it appears that the inmates relieved [illegible] 1851 were 368, and 234 in the year previous, and 86 in the year 1847 were [illegible] and 234 in the year through the house, have risen from 86 in the year 1847 were [illegible] and 234 in the two following years, to 300 in the year just [illegible] The number of penitents for whom an asylum has been given being of a class for whom no adequate provision is made by other charitable institutions. The chief objects, as set forth in the report, are, to aid those who from misfortune have been led into temporary difficulty, and thus save them from the necessity of asking parochial help; to afford a refuge to young females, who may be discharged from prison, and all the above to which has its assist deserving persons to emigrate. During the past year the receipts, including a previous balance of £448, have been £1172 12s. 8d., and the disbursements £1460 14s. 8d., leaving a balance of £287 18s. which will be carried forward to the next year's account. The house, and £300 for the general purposes of the charity. 138 persons have been relieved since January last, and the present number of inmates is 33.

FARNINGHAM AND HARTSMERE ROMAN CATHOLIC FREE SCHOOLS.—A very elegant *déjeûner* was given at M. Soyer's Symposium, Kensington, on Wednesday, in aid of the building fund of the above schools. The chair on the occasion was taken by the Rev. Thomas Stonor, supported by Blanco White, Morris, the Rev Dr. Manes, and about 160 ladies and gentlemen, principally members of the Roman Catholic faith. A collection was entered into, which objects of the meeting having been made. A collection was entered into, which amounted to £110. In the course of the proceedings, the Rev Dr. Manes explained that, in the Bayswater district, two small schools, for which £900 hoped it would be for £2500; and another for 300 children, for which £900 had been paid. They had also standing in the names of trustees £4000 left by a benevolent lady towards building the church; and that day they had received £110 for the schools, the whole amounting to £2300. He knew where to look for other monies which would at once raise that sum to £3000, as the subscriptions in Ireland, [illegible] expected to obtain large sums in Ireland, [illegible] Belfast, who, though differing from their creed, had promised him very valuable support, and he had no doubt of the schools being completed by that day twelvemonth.

LONDON ORPHAN ASYLUM.—A general meeting of the governors and patrons of the establishment was held, on Monday, at the London Tavern; Mr. James Capel in the chair. It appeared from the report, that during the past year, 61 children had completed their term and left the institution, 67 had taken their places, and, with the 30 to be elected, the entire number under the protection of the institution would be 410, making a total of 1902 who had received the benefits of the [illegible] The general state of the health of the establishment had been very good, and by had carried out such sanitary improvements as circumstances might require. Sixty children, taken from various parts of the kingdom, were usually elected in the course of the year, and a large expenditure was, of course, entailed in conducting its extensive operations, for which its funded property was quite inadequate: and it became operations, for which its funded property was quite inadequate: and it was therefore necessary for the raising £7000 to meet the necessary expenditure of the year. The test of the efficiency of the institution, the board called the attention of the public to the fact of it [illegible] children who had been educated in it were received into the most respectable commercial houses—[illegible] dren having entered the establishment [illegible] a reputation for [illegible] and industry as to have acquired general respect and confidence. The receipts for the last year amounted to £4980 16s. 4d., and the expenditure to £3723 16s., leaving a balance of £1 7s. 4d. A formal resolution having been passed, the election of 30 children was commenced with.

IMPROVED DWELLINGS FOR THE POOR.—A building has just been completed in New-street, Golden-square, for the purpose of affording to the poorer inhabitants of the parish of St. James, Westminster, more comfortable quarters than the distressed condition of certain parts of the district has heretofore enabled them to enjoy. It is [illegible] establishment of the kind now in operation in the metropolis, and the Committee for the poor arose from a report published in the year 1842 by the Commissioners of Health and Sanitary Improvement, upon the general state of the dwellings in that part of the parish which stands in immediate proximity to Golden-square. The building, a question in which the benefit of the poor is concerned, the cost of its construction has not exceeded £1120, the amount having been expended in accordance with the estimate furnished by Mr. Lee, the honorary architect. The sum, however, exceeds in contributions to the [illegible] ign is not less than £1400, and exertions are still being made to increase the amount. Amongst those who have taken a warm interest in the [illegible] Ingestre, who is also chairman of the committee, and gentlemen actively engaged in endeavouring to form a committee of noblemen and gentlemen in the parish—St. George, Hanover-square, for the purpose of carrying out a similar design in that parish. The building to which our attention is now directed is in the simplest possible form, but with every regard to the comfort and convenience of the occupants. There are four floors, and it was first completed in New-street, Golden-square. Three rooms, coal-cellar of apartments on every floor, each set [illegible] a small [illegible] for conveying the dust downwards, a meat-safe, sink, [illegible] and various other conveniences, such as are not often to be met with in the dwellings of the humbler classes. There are, moreover, on the basement floor four washhouses, and each containing a copper for the use of two families; and, in addition to the comforts to be derived from all these [illegible] advantage is to have been taken to procure complete ventilation throughout the building. The terms upon which it is proposed that each suite of small rooms shall be let have been fixed at the rate of 6s. per week for the first and second floors, and 5s. 4d. for the fourth. Every effort has been made to save the occupants from the necessity of incurring large expenses in furniture, and with this view many "fixtures" have been supplied which are not generally found in unfurnished houses.

THE FISHMONGERS' ALMSHOUSES, WANDSWORTH.—The ceremony of opening this institution took place on Tuesday. There was little [illegible] the court and livery using a [illegible] unaccompanied by band or any [illegible] character as movements of the wealthy companies of the city of London. On arriving at the almshouses, by way of [illegible] met by the recipients of the charity, and forthwith proceed to the chapel, where appropriate prayers were read by the Rev. J. Edwards Shaffer, the [illegible] Londesborough, and celebrated [illegible] duration a

GERMAN HOSPITAL.—The annual meeting of this hospital was held on Saturday, at the London Tavern; the Lord [illegible] Winchester in the chair. The report stated that the number of patients on the books the last year amounted to 4 [illegible] the opening to 2466. The number of out-patients during the last year was 4083. Since the opening, in 0 cher, 1845, 15,043 patients had been received. Of these patients at the Hospital Dispensary, 1000 were poor English. The income of the year had been £2951 8s. 2d., exclusive of £763 12s. received on account of the collections made for the erection of the Adolphus Ward. The expenditure had been £3000, leaving a balance at the bankers of £534 8s. 8d., besides £1900 advanced on security. [illegible] was adopted, and a vote of thanks given to the [illegible]

ST. LUKE'S HOSPITAL FOR LUNATICS.—On Wednesday the celebration of the centenary festival of this institution took place at the London Tavern, Bishopsgate-street. The chair was taken by the Right Hon. Charles Shaw Lefevre, M.P., and Speaker of the House of Commons; and the right hon. gentleman was supported by the following friends of the institution:—Lord Overstone, Lord Erskine, B. B. Cabbell, Esq., M.P. Cal. Brownlow Knox, M.P.; Captain De Bathe, R. Bakewell, Esq.; M.P. Hooker, Esq., M.P., &c. The chairman, in toasting the success of the institution, stated, that, according to the annual report, of 18,000 patients admitted from the commencement, nearly 8000 had been discharged cured; and he expressed his satisfaction that a system of coercion, which too often [illegible] under the abuse superintendence of ignorance, [illegible] operated at that hospital, was now superseded by the most cruel tyranny and torture, had passed away, and the patients had now a compassion and tenderness laid [illegible] greater share of comforts within the hospital than [illegible] enjoyed at their own homes, [illegible] with these improvements, he might mention that in the [illegible] nearly 70 per cent. of the patients admitted had been [illegible]

[illegible] The subscriptions announced during the evening amounted to [illegible]

THE METROPOLITAN JUVENILE COLLEGE.—A public meeting was held at the Hanover-square Rooms, on Wednesday, [illegible] with the view of erecting and endowing a college for the [illegible] resses of members of the middle classes, profession or their widows, and [illegible] nances of their sons, to be called the "Royal Medical College." The properties that the chair was occupied by Earl Manvers [illegible] and the principle of accommodating residences department is to be completed [illegible] two inhabitants, the [illegible] ed cost of erecting which is £10,000. The collegiate department is to provide accommodation for 100 children [illegible]

[illegible] for tutors, matron, and domestics [illegible]

[illegible] The estimated [illegible] £7,000 of which has been already subscribed. The government of the college is to be vested in the Queen, and Earl Manvers was named, in future, President of the [illegible]

ROYAL NAVAL BENEVOLENT PHILANTHROPIC SOCIETY.—On Tuesday the annual festival in aid of the funds of this charity took place at the London Tavern, [illegible] steward, and down to dinner. Lord Harrowby filled the [illegible] James Stuart Wortley, Right [illegible] Sidney G. Osborne, Mr. James [illegible] Mr. [illegible] [illegible] that the number of [illegible] inmates of the institution [illegible] 250 [illegible] from Otte Bath-fields, 98; [illegible]

[illegible] London and from [illegible] [illegible] 300 received into the asylum, [illegible] 300 and [illegible] [illegible] [illegible]

MATINEE MUSICALE AT STAFFORD-HOUSE.—(SEE PRECEDING PAGE.)

MONSTER NATIONAL HORTICULTURAL AND FLORAL EXHIBITION, AT CHELTENHAM.

THIS magnificent display took place on the 19th inst., at the Old Royal Wells, at Cheltenham, under very favourable auspices. The weather, which had been very unsettled for days before, cleared up, and a day of unclouded sunshine followed. Before the commencement of the show, the streets were more than usually filled with visitors, evidently attracted by the fame of this much-talked-of exhibition. There was a very large and fashionable attendance. The broad promenade was occupied by a handsome marquée, in which were arranged one of the most superb displays of pelargoniums ever witnessed in the town; besides splendid collections of roses, pansies, ericas, pinks, calceolarias, cockscombs, &c. The spacious pump-room was well filled with flowers and fruit (of the latter there being but a comparatively small supply, although of excellent quality). Altogether the display of flowers was magnificent; but considerable disappointment was experienced at the non-appearance of the *Victoria regia* lily, which had been announced as a prominent attraction. Arranged about the room were statuettes, looking-glasses, fountains, ornamental pottery, and devices of flowers. Mr. Dan Gibbon had an eau de Cologne fountain, from which the ladies were permitted to perfume their handkerchiefs. Some specimens of the pitcher plant also excited much attention, as did the curious orchidaceous plants, &c. The number of persons present is estimated at from 2000 to 3000. Besides the marquée for flowers, there was a tent for refreshments, and also a tent for the accommodation of the band of the 1st Life Guards, who played during the entertainment. A detachment with fifes and drums marched through the ground at intervals. The Royal Well Band performed in the orchestra erected in the grounds.

In the Long Walk there was a collection of fancy fowl, which attracted much attention.

We select the following principal prizes from the list awarded by the censors:—

PLANTS, EITHER STOVE OR MIXED (excluding Orchids).—Best eight plants: 1st prize, £13, Mr. Cole—(*Ixora coccinea, Pramnosa augusta, Cyrtoceras reflexa, Dipladenia splendens, Clerodendron Kempferi, Roudeletia speciosa, Ixora crocata*); 2nd, £6, Mr. Hodges; 3rd, £3 3s., Mr. Pope.

EXOTIC ORCHIDS, £12 for the best eight plants: Messrs. Maule and Sons—(*Aerides odorata major, Calanthe vestusca, Stanhopea oculata, Oncidium pulvinatum, Cattleya Mossia, Aerides odorata*)

The Cheltenham Silver Cup (an elegant silver claret-jug and salver, from the establishment of Messrs. Martin and Baskett, the jug emblematically embossed with flowers, fruit, &c.), for the best collection of 25 Stove and Greenhouse plants, was awarded to J. Collyer, Esq., of Dartford, Kent.

HORTICULTURAL AND FLORAL EXHIBITION AT THE ROYAL OLD WELLS, CHELTENHAM.

EXHIBITION OF THE ROYAL ACADEMY.—THE 'EVENING HOUR."—PAINTED BY T. CRESWICK, R.A.—(SEE NEXT PAGE.)

TALL CACTI.—£4 for best 5 distinct varieties in flower. Messrs. Pipe and Sons (*Ackermanii, Jenkinsonii, speciosa, speciosissima, hybrida*).

GREENHOUSE.—Best 12, 1st prize, £10, Mr Cole Best 6, 1st prize, £5, Mr Cole and Sons.

CAPE HEATHS.—Best Six plants, 1st prize, £8, Mr. Cole.

PELARGONIUMS.—Best Twelve, 1st prize, £8, Mr. Turner. Best Six, 1st prize, £3, Mr. Turner. Best Six (fancy varieties), 1st prize, £3, Mr. Turner

Best and newest plant in bloom—prize, £5, Mr. Cole.

Ditto in or out of bloom, with the most remarkable foliage—prize, £3, H. Brown, Esq., M.P.

PARIS FASHIONS FOR JULY.

THE strong and superb stuffs of winter are quite superseded by ball dresses, at the various watering places. The *élégantes* seek *toilettes* which, without being rich, are remarkable for lightness and tasteful pattern. We can especially recommend the following to our fair readers:—A white muslin dress, with three flounces, simply hemmed; a long sash of ribbon of coloured taffeta; natural flowers in the hair and on the front of the dress; a dress of coloured taffeta, white or straw ground, or blue or pink ground; these stuffs are striped, or running and small patterns, or great branches with detached bouquets. Barèges are also much worn, with white ground sprinkled with little rose-buds; silk barège, with wreaths of flowers, are newer. The shape of the bodies of evening dresses has not undergone much change. *Berthes* are still worn forming a point in front, only varying in the disposition of the ornament, interspersed with small ribbon or lace, chiefly Malines or Valenciennes, and with mousseline. Natural flowers will be mostly worn, for head-dress and bouquet. Walking dresses of these three stuffs are much in vogue—barège, mousseline, and printed (*foulard*); the body skirted, open in front, and lower down than in winter. We must mention a new dress, named *Albanaise*, made of barège. It is of several shades, but the most *recherché* are *gris poussière*, or dust grey. Five dull silk stripes begin from the bottom of the dress; then an intervening space and four other stripes; another space; and, to finish, three more stripes ending right in the belt, always diminishing in size. We have also seen a jaconet dress, embroidered *à l'Anglaise* as an apron to the waist; the body embroidered at the edge flat, as well as in the skirts and sleeves, and three knots of blue taffeta fastened the bodice. For the country, dresses of Chinese nankeen and Persian jaconet are worn; and to protect from the sun, a kind of hood, of similar stuff, is worn with the dress, and is worn with pink or blue at choice, to suit the wearer's complexion. There are a great many black lace *schales*, embroidered muslins, printed barège, square or long, with cashmere patterns.

We have noticed also a kind of *pointe*, called *pointes de Venise*, of very fine crochet-work of thread, which is certainly the lightest vesture that can be imagined.

The scarf *mantelet* is also much in fashion, and is the article which permits of the most frequent change: a point scarcely perceptible in the middle of the back makes it still more graceful. It is made in all shades, but the most *comme-il-faut* are black; it is more suitable, and sets off the freshness of the dress. It is trimmed with lace, fringe, or net, covered with small velvet dots. We have seen some quite covered with common embroidery; others embroidered with arabesques interminglied with braid and silk, and black jet

For the sea-side there are also worn many *mantelets*, which remind us of the winter by their shape; but the materials are somewhat lighter, chiefly in light summer cloth, or fois of gray shades. The Talma-shaped are preferred round behind, pointed in front, and raised at the sleeves like a *schale*

PARIS FASHIONS FOR JULY.

EXHIBITION OF THE ROYAL ACADEMY. — THE "EVENING HOUR."—PAINTED BY T. CRESWICK, R.A.

THIS picture, full of charming poetry, is one of Mr. Creswick's happiest productions. The composition is one of those beautiful scenes which poets so love to paint:—

> Twilight's soft dews steal o'er the village green,
> With magic tints to harmonise the scene.

How suggestive is such an hour and place of reflection:—

> Hail, Twilight, sovereign of one peaceful hour!
> Not dull art thou as undiscerning Night!
> But studious only to remain from sight
> Things fitting ill the distinctions. Ancient Power!
> Thus did the waters gleam, the mountains lower
> To the rude Briton, when in wolf-skin vest,
> Here, roving wild, he laid him down to rest
> On the bare rock; or through a leafy bower
> Looked ere his eyes were closed. By him was seen
> The self-same vision which we now behold,
> At thy meek bidding, shadowy Power, brought forth—
> These sunny barriers, and the gulf between;
> The floods, the stars; a spectacle of old
> As the beginning of the heavens and earth!
>
> WORDSWORTH.

COURT AND HAUT TON.

THE COURT AT BUCKINGHAM PALACE.

Her Majesty the Queen and his Royal Highness Prince Albert, accompanied by their illustrious relative, the King of the Belgians, have paid daily visits to the Great Exhibition during the past week. The illustrious party have on several occasions been accompanied by the Princess and Princesses of both the Royal families.

On Saturday the Queen and the Prince honoured the performances of the Royal Italian Opera company [illegible] with their presence. The Queen arrived at the theatre at [illegible] accompanied by the Queen Dowager, Princess Augusta, Duchess of Cambridge, Princess Sophia, and Colonel Cavendy the Hon. Mistress of the Robes, and not accompany the Royal party.

On Monday last his Royal Highness Prince Albert, after inspecting the Household Troops, in Hyde Park, went to Leicester-square, for the purpose of viewing Mr. Wyld's large model of the Globe. His Royal Highness was accompanied by their Royal Highnesses the Duke of Brabant, the Count de Flandres, and the Princess Charlotte, of Belgium.

On Tuesday, after a long day in the Exhibition, the Queen and the Prince went to Her Majesty's Theatre in the evening.

On Wednesday the Queen held a Court and Privy Council, at which M. Drouyn de Lhuys, late French Ambassador at this Court, had an audience of her Majesty, to present his recall from [illegible]. Sir Edward Disbrowe, G.C.H., her Majesty's Minister Plenipotentiary at the Hague, had an audience of leave, and kissed hands on being [illegible]. Lieutenant-Colonel the Hon. Charles Grey had the honour of a private audience of the Queen, for the purpose of presenting the Duchess of Gloucester, and a gold [illegible] of great value, [illegible].

The Earl of Morley has relieved Lord Camperdown in his duties as Lord in Waiting to Her Majesty; and the Hon. Ormsby Gore has relieved Col. the Hon. A. Nelson Hood in his duties as Groom in Waiting to the Queen.

Her Majesty and his Royal Highness Prince Albert, accompanied by his Majesty the King of the Belgians, are expected to leave Buckingham Palace, for the Isle of Wight this day (Saturday). The Royal visit to Osborne is expressly for the purpose of showing the King of the Belgians Her Majesty's beautiful marine residence. The Royal party will return to town on Monday.

The Countess de Neuilly and the Duke de Nemours visited his Majesty the King of the Belgians on Tuesday, at Buckingham Palace. His Royal Highness Prince Gustavus, of Wasa, also paid a visit to the King of the Belgians on Tuesday.

We regret to learn that his Serene Highness the Prince of Leiningen is suffering from an attack of measles.

The Prince Alexander Lieven has arrived in town from Paris.

The Duke of Rutland has embarked in his Grace's schooner yacht, the *Resolution*, on a cruise off the French coast.

The Countess of Mar gave birth to a daughter on Saturday last.

The marriage of the Earl of Kintore with Miss Louisa Madeline Hawkins, second daughter of Captain Hawkins, of Celynn Bank, Perthshire, was solemnised on Tuesday, at St. George's Church, Hanover-square.

IRELAND.

STEAM COMMUNICATION WITH THE UNITED STATES.—The *North America* is advertised to sail from Galway on or about the 7th of next month. As that vessel was to have sailed from New York on the evening of the 17th, she will be looked for off the Galway coast on Tuesday next, although it may be some days later before she makes her appearance. The preparations for the reception of the American ship in Galway, and for turning the American experiment to the best advantage, are carried on with much spirit. The *Freeman* says:—"We have been favoured with a communication from the Chairman of the Midland Great Western Railway, from which we learn that the directors have made arrangements to forward to Dublin a special express with the papers, despatches, and letters which the *North America* will bring, and that a splendid steamer, selected from the admirable fleet of the City of Dublin Steam-packet Company, will be stationed at Kingstown, to convey the English portion of the despatches to Holyhead, from whence they will be despatched by [illegible] to the leading English towns; and no matter at what hour the *North America* shall arrive at Galway Bay, it is the intention of the great companies interested in the traffic between Galway and Liverpool or Holyhead, to take means that a moment be not lost in forwarding the despatches so as to bring the period occupied in their transmission from New York to Dublin, Liverpool, and London, within the shortest possible limits.

THE CENSUS.—An impression prevails that the result of the Irish census shows the population to be less than six millions and-a-half. In 1841 the population of Ireland was 8,000,000; in 1841, it was 6,176,000; and at the same ratio it is calculated that it should, under ordinary circumstances be at present nearly ten millions. The abstract of the returns, however, has not yet been published.

THE WAR MEDAL DINNER TO THE DUKE OF RICHMOND.—The dinner given by the war officers, subscribers to the testimonial presented to his Grace the Duke of Richmond, in token of the high and grateful sense entertained by them of his successful exertions on their behalf, took place at Willis's Room, King-street, St. James's, on Saturday last, the 36th anniversary of the battle of Vittoria. The chair was taken by Lieutenant-General the Right Hon. Lord Saltoun, P.C., G.B.C., and the vice-chair by Admiral Sir G. Eden Hamond, Bart., K.C.B. Among the company present were the guest of the evening, his Grace the Duke of Richmond, the Earl of Cardigan, Sir Hugh Rose, &c. The testimonial was exhibited on the occasion. It is as yet unfinished, some of the figures in relief being represented by plaster models. It was placed on a triangular pedestal of ebony, in a recess behind the chairman, the whole to be completed by Messrs. Hunt and Roskell, in solid silver, the value of the plate being about 1800 guineas. An apology was made by the firm for presenting it in an incomplete state, but it was stated that it would be completed by the 4th of August.

The command at Sheerness has been conferred on Vice-Admiral the Hon. Jocelyne Percy, C.B., recently posted to the Victory.

COLONELCY OF THE 97TH INFANTRY REGIMENT.—It is now decided that Major-General Riddell, K.H., is to succeed to the colonelcy of this regiment.

NATIONAL PUBLIC SCHOOL ASSOCIATION.—A public meeting was held on Wednesday evening, at the Hall of Commerce, Threadneedle-street, City, for the purpose of taking into consideration the formation of a National Public School Association for promoting the establishment, by law, in England and in Wales, of a system of free schools, which, supported by local rates, and managed by local committees, specially elected for that purpose by the ratepayers, should impart a useful instruction only, leaving to parents, guardians, and religious teachers, the inculcation of doctrinal religion, to afford opportunities for which the schools should be closed at stated times in each week. Mr. Samuel Lucas was in the chair. The chairman, after regretting the thinness of the attendance, explained to the meeting the objects and scope of the association. He said it was a metropolitan branch of a national association formed two or three years ago at Manchester, which had its various branches. Their movement was not a destructive, but a constructive one, for they sought to build up, not to pull down. They had been several minutes made with regard to the objects of this association, and he begged distinctly to state that what he intended to grasp's with was ignorance. It had been supposed by some that they were opposing the present Government as to the system of education, but, without entering into any opinions on that subject, he denied it; the only ground on which they quarrelled with the Government being the ridiculously small amount of good it afforded, when it ought to do ten times more. (Hear, hear.) What they wished was to promote a scheme to provide schools wherever they might be required, and they wanted an act of Parliament to give to the people the power of establishing schools in every locality for themselves. They wanted to induce the Legislature not to educate the people, but to place the means of education at the door of every one. The meeting was also addressed by Mr James Vaughan, Mr. Milner Gibson, Mr. Binns Palmer, &c., setting forth the objects of the association.

AN EXPERT AND FASHIONABLE GERMAN PICKPOCKET.—John Schultz, a fashionably dressed German, who had only been discharged from the House of Correction on Monday morning, having been sent there for attempting to [illegible] on Exhibition, and who is a well-known Parisian thief, was, [illegible] Police-office by Mr. Elliott, on four different charges of [illegible] Vauxhall gardens, on Monday night. The articles of [illegible] from the pockets of the prosecutors were three gold watches and a purse.

MUSIC.

PHILHARMONIC SOCIETY.

The eighth and concluding concert took place last Monday; the "Jupiter" of Mozart and the "Pastorals" of Beethoven, two of the finest symphonies of the Philharmonic library, were performed to perfection. The overtures were Weber's "Euryanthe" and a MS. one by Mendelssohn. Both were admirably executed, but the last-mentioned work did not make the slightest sensation, so un-Mendelssohnian were the ideas and treatment.

The vocal gleanings were a trio from Mozart's "Don Juan," of "Ah! tacel," nicely sung by Madame Castellan, Pischek, and Formès; a duo from Spohr's "Faust," finely sung by the two German *bears*; a solo from the same opera, admirably rendered by Madame Castellan, an air from Weber's "Euryanthe," a quatuor from Rossini's "Count Ory," rendered by Reichart, Sidoli, Tagliafico, and Formès; a trio from Kreutzer's "Nachtlager, in Granada," given by Miller, Parry, Reichart and Stockhausen; and the terzetto from Cimarosa's "Matrimonio Segreto," sung by Grisi, Castellan, and Viardot, with much vivacity. Besides [illegible] was a concerto for the violoncello, executed [illegible] the first violoncello of the band, and the great feature of the concert. The fragility displayed at these morning entertainments is proverbial, but on this occasion the ordinarily lax reserve was quite broken through; and when the gifted artiste appeared, the chamber was filled to suffocation. Spohr and Thorne joined as heartily as the audience, lasted several minutes. Overcome as Madame Viardot was with this highly gratifying reception, she was much in her private words as to her vocal and histrionic genius, she refused to sing the "Non più mesta" variations with marvellous skill, her inexhaustible fancy and invention being displayed in a series of novel cadenze. A few seconds was necessary, but Madame Viardot returned to acknowledge the compliment. Honcom's entrance to sing the "Leonora's tomb" was also cordially greeted. Madame [illegible] sang [illegible] Beethoven's "Ah! perfido," and [illegible] Mozart's "Il Re pastore," [illegible] Mozart's "Il Re pastore," [illegible] Mozart's "Il Re pastore,"

EPITOME OF NEWS—FOREIGN AND DOMESTIC.

A somewhat singular return has just been printed by order of the House of Lords, on the motion of Lord Brougham, showing for 20 years the great advantage which it is stated has resulted from the cases treated by the Courts of Reconsistance in Denmark. It will be sufficient to give the result of the last year in the return—1846. In that year 24,625 cases were undertaken, 16,068 were adjusted or stopped, 324 were postponed, 8233 were referred to the law courts, and 2761 were pending.

The Committee of University College Hospital have received notice of a legacy of 200 guineas, free of duty, by the late Mr. John Helling, of the Hampstead road.

The Lady Godiva procession at Coventry took place on Tuesday, and was conducted with unusual spendour, a circumstance for which the favourable state of the weather may very materially contributed. There were more than 60,000 persons present, of whom at least 30,000 were strangers in the town. The procession itself was not far short of a mile in length. A large number of persons arrived by the special train from London, and about 8000 left the station at Birmingham for Coventry in the course of the morning.

A correspondent, says the *Inverness Courier*, who dates from the Tomdhu, states that her Majesty and Prince Albert have commissioned a gentleman from the north to engage the services of a Gaelic teacher for the Royal family!

The annual fancy dress ball in aid of the funds of the Caledonian Asylum and the Scottish Hospital took place on Monday night, at Willis's Rooms, and was conducted with unusual spendour, a circumstance for which the favourable state of the weather may very materially contributed. There were more than 60,000 persons present, of whom at least 30,000 were strangers in the town. The procession itself was not far short of a mile in length. A large number of personsar

MADAME UGALDE OF HER MAJESTY'S THEATRE.—FROM A PHOTOGRAPH BY KILBURN.

MADAME UGALDE.

MADAME UGALDE, the new *prima donna* at Her Majesty's Theatre, was born at Larue, in the valley of Montmorency, near Paris, in 1829: her parents were connected with the musical profession, her father, M. Beauce, being a musicseller, and her mother, a daughter of Forro, a composer and teacher of singing. Mdlle. Delphine Beauce (Mdme. Ugalde) and her sister, Mdme. Steiner-Beauce, now in Italy, received instructions from their mother. It was the Prince of Moscow (son of Marshal Ney), a distinguished amateur, who first brought Mdlle. Delphine into notice, at one of his concerts of sacred music, in 1845. She sang compositions by Marcello and Handel with the greatest effect, her voice at that time being a contralto, with little flexibility. In 1846 her mari age with Senor Ugalde, a Spaniard, took place, and she went to Madrid, where she sang at the Court concerts Donizetti's "Tyrolienne," from "Betly," Rossini's "Una voce," &c., with remarkable success, having, by practice, ascertained that her facility for the execution of complex *fioriture* was everything that could be desired. Her fame having spread to Paris, she was engaged by M. Perrin, the present director of the Opéra Comique, and made her *debût* in July, 1848, in Auber's "Domino Noir." In this opera, as also in the "Ambassadrice," "Les Diamans de la Couronne," by the same composer, and in Boieldieu's "Dame Blanche," she quite took Paris by storm. The first original part created by her was the *Modeste*, in Ambroise Thomas's piquant opera "Le Caid." In this charming parody on Verdi, Madame Ugalde achieved her most brilliant triumph. In 1849 she appeared in Lemmander's "Montenegrins," and in the "Toreador" of Adolphe Adam. In this last-mentioned work her vocalisation in the variations in "Ah! vous dirai-je, maman," created mightly a prodigious *furore*. She subsequently sang in Auber's "Haydée," and Halévy's "Fée aux Roses." Thomas wrote for her the character of *Queen Elizabeth* in "Le Songe d'une Nuit d'Eté;" but, owing to a long and severe indisposition, arising from over exertion, Madame Ugalde did not appear in it on its first representation. On her recovery, and her return from St. Sebastian, in September, 1850, she enacted the part, with signal success. Her last creation at the Opéra Comique was in Halévy's "Dame de Pique," in December, 1850, in which both as actress and vocalist she engaged the sympathies of the Parisian public as fervently as on any previous occasion.

Madame Ugalde is rather under the middle height; she is easy and graceful in her deportment, and intelligent and energetic in her acting. Her face is full of varied expression. It must not be supposed by those amateurs who have only heard Madame Ugalde in the disagreeable character of *Nefté*, in Auber's "Prodigue," that they have any notion of the brilliant capabilities of this eminent *artiste*. She must be listened to in her own peculiar *répertoire*—that of the French Opéra Comique—to appreciate her wonderful vocalisation. When she has become more habituated to the Italian language, to the size of the house, and to the largeness of the band, and is allotted a less repulsive character to sustain, Madame Ugalde's great powers will be developed in a manner to prove that her fame in Paris has not been at all exaggerated, and that she is one of the most accomplished vocalists of the age.

PLATE PRESENTD TO THE MAYOR OF BRISTOL.

A MAGNIFICENT service of plate, for which upwards of 800 gentlemen, of all shades of politics, of Bristol, contributed (the subscriptions being limited to one guinea each), was presented to the Mayor of that city, on the 4th inst., at the Council-house, as a tribute of respect and esteem.

The testimonial consists of a full dessert service, composed of a centre ornament, with emblematical figures of Justice, Commerce, and Generosity; two high fruit baskets, or side centres, with group of boys; four fruit stands, for corner dishes; and two oval fruit baskets, for top and bottom of the table, with ornamental wreath and boy figures.

The centre ornament stands nearly three feet in height. Issuing from a tripod base, are the two twisted stems of an oak-tree; around which, on each angle of the base, are grouped three finely modelled emblematical figures of Justice, with sword and scales; Generosity, attended by and pointing to a lion; and Commerce, personified by the god Mercury. Above the stems of the oak is a coronal of oak leaves and acorns, supporting a well-formed flower-basket, which is also enriched with bunches of oak foliage.

The side pieces or supporters to the centre-piece are of similar designs as to the upper portions of the ornaments; the bases being of rock-work and herbage, from which rise the oak-trees: the bases are enriched with sportive boy figures.

The corner dishes are four exquisitely modelled emblematic figures of the four Seasons, each holding up an elegant open-worked basket; the baskets being ornamented with a wreath of the flowers or fruits appropriate to the seasons represented by each figure. Spring is indicated by wreaths of spring flowers; Summer, by the clustering vine; Autumn, by wreaths of wheat; Winter, by the "mantling ivy." The modelling of these figures is admirable for grace, spirit, and truthfulness to anatomical proportion.

The top and bottom baskets are of an oval form on a rocky base, to harmonise with the other pieces. The edge is ornamented with a scalloped border of vine foliage, bunches of grapes, &c. The handles are sportive boy figures.

On one compartment of the tripod base is the civic arms of Bristol; on the next, the arms of Sir John and Lady Haberfield; and on the third compartment, the following inscription:—

To
SIR JOHN KERLE HABERFIELD, KNT.,
Six Times
Mayor of Bristol,
From his Fellow-citizens,
1851.

This superb service has been designed and manufactured for Mr. Powick, silversmith, Bristol, by MESSRS. Smith, Nicholson, and Co., Duke-street, Lincoln's Inn-fields.

DESSERT SERVICE OF PLATE PRESENTED TO THE MAYOR OF BRISTOL.

GOLD MEDAL PRESENTED TO MAJOR EDWARDES.

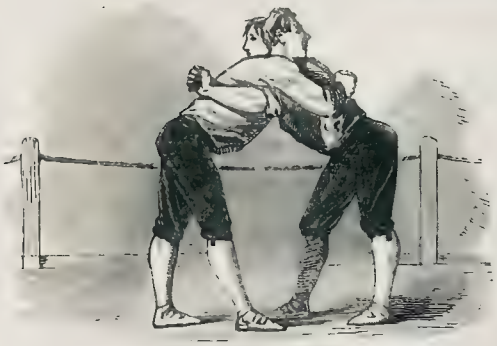
THIS magnificent testimonial to the brave Major Edwardes has been presented to him by the Honourable East India Company, in commemoration of his brilliant services in India. It is a superb work. On the obverse, within a wreath of laurel, is the following inscription:—

From the East India Company to Lieutenant and Brevet Major H. B. EDWARDES, C.B., for his services in the Punjaub, A.D. M.DCCC.XLVIII.

Below the wreath is the Infant Hercules, of serpent-strangling fame; and flanking the wreath are allegorical figures of War and Victory, supporting a shield charged with the Major's armorial bearings, and surmounted with laurel. On the reverse is the profile of her Majesty, with the legend "Victoria Regina."

THE IRISH POLITICAL EXILES.—The following communication, dated "Hobart Town, Feb. 27," brings the latest news, that has been received in the country, of the Irish political convicts. It is published in *Saunders's News Letters* (Dublin), with the signature "Wm. C. Gray":—"Since I wrote last I have seen Messrs Mitchell and Martin; they are living together at a place called Bothwell, about forty miles from here. Mrs. Mitchell and children are soon expected, as none of the Irish exiles expect a speedy return to their country and home. Mr. Meagher was married to Miss Bunnett on Saturday, the 22d inst. The Lieutenant-Governor's (Sir Wm. Denison's) order, sending M'Manus, O'Dogherty, and O'Doherne to Port Arthur for three months at hard labour, for going out of their district, was overruled by the judges in the Supreme Court on Friday, the 22d, where M'Manus appeared in his grey prison uniform, in which he had been working at Port Arthur since the 1st of January. After his acquittal, he had to walk from the court-house to an hotel, amidst the public gaze, where he had many friends to meet him. He had to borrow a suit of clothes, in order that he could at once proceed to Launceston. I heard Sir William Denison state, at the monster dinner given on the arrival of the ball, that his stay in the colony was not likely to be more than a year at two at the farthest. I have seen Frost, Williams, and Jones, the Chartists. Frost is book-keeper to a grocer here; Williams is sinking shafts, making coal experiments, near Hobart Town; and Jones keeps a watchmaker's shop near Launceston. You will see by the *Courier*, which I send, the *Vigilant* sails in a day or two for London with timber; it is (I believe) for ship-building purposes. Many colonial ships have been built in Hobart Town with such timber; it is called Cluegum, and found to answer well. Mr. M'Manus and his shipmates at Port Arthur loaded this ship *Vigilant*. N.B. Since writing the herewith, poor M'Manus is again arrested at Launceston, by the express command of Sir Wm. Denison, whose order is, that M'Manus is not to come by coach, but to walk all the way by road, a distance of 125 miles, in the custody of policemen, whether handcuffed or not, I cannot say. When he arrives in Hobart Town, Sir William Denison's orders are peremptory to proceed forthwith to Port Arthur, and join the chain-gang, at hard labour, to eat paste and brown bread, for a crime disposed of by the magistrates, whose punishment was simply a reprimand for being out of his boundary. So much for the King of the Cannibal Isles. M'Manus has taken very ill of fever, and two medical men attending him."

CREMORNE-GARDENS.—THE ORCHESTRA.



CORNISH WRESTLING.

OLD ENGLISH SPORTS AT SAVILLE HOUSE, LEICESTER-SQUARE.—(SEE NEXT PAGE.)

CREMORNE GARDENS.

THIS popular place of amusement is just now obtaining a large share of public patronage. The Gardens, apart from the variety of entertainments offered to visitors, form in themselves one of the most attractive resorts in the vicinity of the metropolis; indeed, we do not know any pleasure-grounds to which the public have access that can be compared with them. Trees centuries old, broad greensward, and spacious flower-gardens, interspersed with the choicest subjects of Grecian art, contribute to make up a scene of exquisite beauty. The visitor is removed altogether from the bustle and turmoil of London life into delicious seclusion. The park-like character of the grounds makes them a delightful resort for a summer's afternoon. But the natural charms of these gardens are not the only attraction. There are added, for those who desire it, an immense variety of amusements. Here round an orchestra, brilliant with lights and gay colours, extends a vast circle or *plateau* for the votaries of Terpsichore. Then, when the delights of the grand gala of the "Feast of the Roses" are over, "the Star of Beauty," one of Herr Deulin's pretty ballets—"The *Tableaux Vivans* of the Prize Medals of the Exhibition" (a very pretty and classical idea gracefully carried out)—the Panorama of Nineveh: its Rise and Fall—the Cosmorama of the Great Exhibition—the Ethiopian Serenaders, who brought the aristocracy in crowds to the St. James's Theatre—the "surprising exercises" of the Three Brothers Elliot—the "Double-sighted Youth"—a female conjuror, blight Milne, Tallien—to say nothing of a maze, a real live gipsy in her tent, a shooting gallery, and an American bowling-saloon—succeed each other in an ever-varying round of pleasurable and exciting change, to be finally crowned with the grand display of fire-works by Mortram. The Bohemians, too, are here, to tell the tale of wild Caffraria—here, where, uncramped by narrow walls, the savage may wander in mimic wildness, and his native habits be seen and realised, with all their domestic customs and war exercises. Monsieur Franconi—the real Franconi—of the Cirque Nationale de Paris, "with all his horses and all his men," is also engaged to delight the visitors with the performances of his unrivalled *troupe*, in a new pavilion.

The lessees, Mr. Simpson, has good cause for congratulation in both the number and class of his visitors.

On the 6th of January last, 9,350,694 gallons of wine were in warehouse under bond, in the United Kingdom, of which 5,949,862 gallons were under bond at London.

URAN-UTAN IN THE ZOOLOGICAL SOCIETY'S GARDENS, REGENT'S PARK.

THIS already popular menagerie has just received an accession which bids fair to contest attraction with the hippopotamus or the infant elephant. The Governor of Singapore, Lieut.-Colonel Butterworth, C.B., has, for the third time, transmitted a most valuable collection of living animals to the Zoological Society. Among them is the finest example of the Uran-utan which has yet been seen in Europe. The Uran-utan is, we are informed, about four years old, excessively intelligent, and as docile as most children of that age. He was accompanied when he left Singapore by a female of the same species, but she unfortunately did not survive the voyage to England. Her death is said to have had a strong effect upon the spirits of "Darby," who is now only recovering, by dint of the utmost devotion on the part of his attendant, and the Society who assist him, from the loss which he has sustained. The Uran of Borneo is, when adult, a most formidable being, and greatly exceeds the chimpanzee in bulk and power. Attaining a stature of near five feet, armed with canine teeth of enormous dimensions, and endued with muscles which infinitely transcend the most herculean development in man, he has no rival for supremacy in the primæval forests of the Archipelago. In infancy and early youth the forehead of the uran is much more indicative of intellect than at a later period, when the animal expression gains a terrible ascendency, partly in consequence of the development of the frontal sinus, and still more especially of great callosities on the cheek, which give a frightful width and flatness to the countenance. To what amount of intelligence the tailless apes of the Archipelago and Africa are capable of attaining, is a

URAN-UTAN, PRESENTED TO THE ZOOLOGICAL SOCIETY.

problem yet to be determined; but the pensive and thoughtful glance of the animal in the Society's garden cannot fail to suggest many curious speculations to an observant mind.

The numerous gifts of great value which the Society has received from Colonel Butterworth, and other of our colonial governors, within the last two years, is not only a subject of congratulation to the Society, but redounds greatly to the honour of those distinguished persons who use the influence and opportunities of their high station to advance the educational resources of their countrymen at home. We are convinced that the liberal feeling which has prompted Colonel Butterworth to advance the objects of the Zoological Society in the interesting and prolific region of his government will be amply appreciated, not only by the society, but by the public at large. It cannot but be gratifying to him to find, that, during the first week after the arrival of his gift upwards of 30,000 visitors were admitted to the Gardens—and that this influx is likely to continue, is pretty evident from the fact that upwards of 7000 were admitted on Saturday last, and 10,000 on Monday. The constant succession of new objects of interest—the beauty and order of the general arrangement, combined with the previous reputation which the Gardens of the Society have now acquired throughout Europe, render its prospects of success during the present season, only second to those of the Great Exhibition.

SAVILLE HOUSE, LEICESTER-SQUARE.

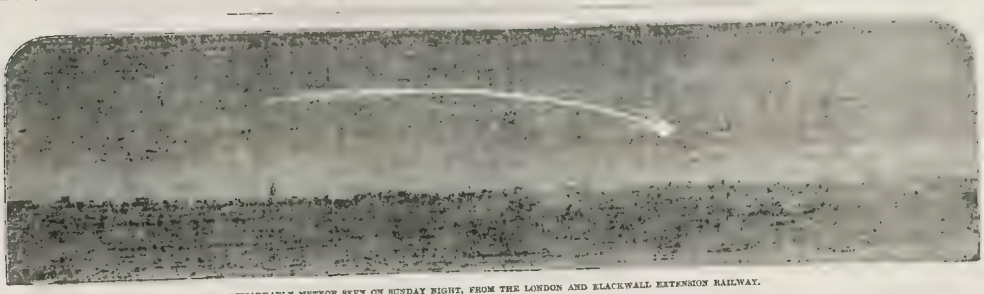
At this admirably-situated place of entertainment, a novel sight has been provided for the holiday keepers who now throng our streets and exhibitions.

The Saville House bill of fare is attractive: it offers single stick, sabre and bayonet, and glove exercise; fencing, [illegible] lesword, Frenc[illegible] canne and *bâton*, and last, though not least, *wrestling*—a genuine old English sport, yet as old as the earliest Greeks.

The two illustrations represent the Cornish and the Westmoreland practice. In Westmoreland, the antagonists grasp each other round the back, which is called "the hold." In the Cornish exercise, the antagonists take hold of each other as they can, by [illegible] part of the loose jacket or round the waist, &c., so as to give what [illegible] called a "Cornish hug."

The feats of skill in fencing, broadsword single-stick, quarring, sabre against bayonet, &c., are exhibited in [illegible] establishment; in addition to which, there is the "Saladin feat," which consists in cutting a handkerchief in two with the sabre, severing at one stroke the whole carcase of a sheep, and bars of lead, &c.

The entertainment is well conducted, and will gratify any who may pay a visit to Saville House.



REMARKABLE METEOR SEEN ON SUNDAY NIGHT, FROM THE LONDON AND BLACKWALL EXTENSION RAILWAY.

REMARKABLE METEOR.

A LUMINOUS meteor of very beautiful appearance was seen from the London and Blackwall Extension Railway, on Sunday night last, 22nd instant, about eleven o'clock, between the Stepney and Bow Stations. The point of the heavens in which it was seen, judging from the position of Jupiter, would be W. by S., or in the direction of the centre of the city, over which it appeared to be at the height of half a mile. The first indication of the phenomenon was a development of a large ball of fire, of exceedingly brilliant hue; this fell for a short distance, and then a stream of fire issued from the nucleus in an opposite direction to its course, forming a beautiful curve. The instant the train thus formed had reached its limit, the brilliant head disappeared. This train remained, however, as a bright line of light in the sky for five or six minutes, and, undulating with the effect of the very slight amount of wind which existed, formed a double curve not unlike the silver edge of a cloud, when illuminated by the moon's light, and gradually disappeared. The night was remarkably clear and bright; not a cloud was to be seen in the western horizon, and the stars shone very brilliantly. The phenomenon described must be attributed to the very rarified state of the atmosphere during the previous 48 hours, Saturday having been exceedingly hot and sultry, with scarcely a cloud in the sky, whilst the morning of Sunday had been wet, but still hot and oppressive, the remainder of the day being dry and warm. The effect of the appearances described, and as shown in the Illustration, was very striking. The dark masses of building, contrasting with the still lingering twilight of the summer sky, and the bright light of the meteor as it shot downwards, rendered it at once beautiful and interesting.

DESTRUCTIVE FIRE IN SOUTHWARK.

The metropolis, which has within the last few months witnessed so many disastrous conflagrations, has been this week again visited by a devastating fire, the most extensive that has occurred in the metropolis for some years past, and occurring in a locality close to those which have suffered on the recent preceding occasions. The scene of the disaster was a large range of warehouses belonging to Mr. Alderman Humphery, M.P., in Montague-close, Southwark. The fire broke out at half-past three o'clock on Monday afternoon, and burst with great fury until seven o'clock, destroying in that period an immense amount of valuable property, and entirely gutting two warehouses. It was supposed to have been conquered shortly after seven o'clock; but at that hour the flames burst forth in another warehouse, at least 100 feet from the scene of the original fire, and laid waste, in a very short time, the whole range of premises—threatening the destruction of the beautiful Church of St. Saviour's, and a vast amount of other valuable property.

Montague-close is situated between St. Saviour's Church and a range of warehouses known as Hibernia Wharf, terminating in a handsome new building called Hibernia Chambers, conspicuously seen by passengers over London-bridge. The centre of Montague-close is occupied by a range of four very large warehouses, each having six floors besides the basement story. The warehouses are severally lettered A, B, C, and D, and the floors are numbered 1 to 24 consecutively, and were all variously occupied by merchants, importers, &c., in different branches of business. The area of the buildings was about an acre in extent.

The fire, it is thought, had been smouldering for a long time previously, and was discovered in warehouse A. The fire-engines were quickly on the spot, but there was a lack of water for a considerable period. Meantime the fire had spread rapidly, soon reaching the roof and presently descending through a trap-door into the top floor of the adjoining warehouse, B. The greatest consternation now prevailed in the neighbourhood [illegible] from the fierceness of the fire, and the rapidity of its extension, it was impossible to say how far it might extend.

Mr. Alderman Humphery, with several members of the firms occupying the premises, were all upon the spot urging and directing the firemen how they might best save the property, and prevent the progress of the flames. All the efforts of those engaged, however, failed to lessen the devastating progress of the fire until the whole of warehouse A and three floors of warehouse B were entirely gutted. During the progress of the fire the transept of St. Saviour's church had been in imminent danger, and it was only by pouring a continuous stream of water upon it that the windows were prevented from becoming ignited.

Shortly before eight o'clock it was confidently hoped that all danger of the fire extending beyond those warehouses already ignited was at an end. But it was quickly discovered that another distinct fire had broken out in warehouse D, leaving warehouse C by which the former was divided from warehouses B and A, completely untouched. That any means of communication existed by the roof or otherwise was completely disproved by the fact that Alderman Humphery, with Mr. Henderson, the foreman of the brigade on the Surrey side of the river, and Jones, the chief engineer of the West of England Fire-office, had only just previously been into the roof of warehouse C, where they could discover no traces of fire. Two iron doors communicating between warehouse B and warehouse C had some time previously become red hot; but, by the advice of Mr. Alderman Humphery, a number of Messrs. Cubitt's men, who were engaged in rebuilding a portion of Hibernia Wharf, were sent in, and by very active exertions, they succeeded in filling up the doorways with brickwork, and thus staying all danger in this direction.

The outbreak of the fire in warehouse D therefore took every one by surprise; and the opinion seemed to be generally entertained at the time that the premises had been wilfully fired. The flames soon acquired an unconquerable force, and burned with great intensity for upwards of four hours, until past one o'clock in the morning, when nothing was left of three warehouses but a mass of smouldering ruins overhung by tottering walls, which threatened to fall every

DESTRUCTIVE FIRE AT HIBERNIA-WHARF, SOUTHWARK.

moment. Throughout the night, large bodies of flame continued to ascend from the ruins, and it was not until about noon on Tuesday morning that the firemen secured the preservation of the third or of warehouses, which escaped, it may be said, almost untouched. During the remainder of the morning, and indeed throughout the centre of Tuesday, the two large floating-engines, with several land ones, were kept in busy action, throwing a vast quantity of water on the blazing ruins. It had but little effect, however, in subduing the violence of the flames, wh ch were raging within the lofty blackened walls of the devoted pile, sending forth volumes of smoke and the kept rising from the ruins, almost overwhelming the neighbourhood and continuing the excitement which so generally prevailed.

During the operations of the firemen on Monday evening, one poor fellow, Edward Burch, the engineer of the Tooley-street brigade station, in his zeal to check the progress of the flames, got down a loophole in one of the floors, and directed water on the burning part; but being nearly overcome by the heat and smoke, he returned to the trap to escape, when the flames formed like a kind of eddy round the hole, and completely enveloped the unfortunate man. Perceiving him in danger of dropping, when some of his comrades gallantly dashed forward, and, seizing the poor fellow, dragged him up out of the hole. As may be imagined, he was shockingly burned, and otherwise much injured. He was forthwith conveyed to Guy's Hospital, and, by the doctor's report, his condition is unfavourable.

Fears being entertained lest the lofty walls should fall on the Lady Chapel of St. Saviour's, and so destroy most of its antique beauties, workmen have shored them up, and prevented the possibility of so grievous a circumstance occurring. As to the origin of the fire nothing is known. Spontaneous combustion among rags in warehouse A is spoken of; but, as mentioned above, wilful firing is also hinted at.

About 15,000 pockets and bags of hops are destroyed, the salvage of very few having been effected.

The want of water was most severely felt during the evening, and Mr. Braidwood was heard to remark, "If we had had a sufficient supply of water, we should not have had half so bad a fire."

The reflection of the flames was seen from every part of the metropolis, and for many miles in every direction. The neighbourhood was crowded with spectators for several hours, and all the metropolitan bridges from Westminster to London-bridge were thronged with persons anxiously watching the progress of the fire.

Respecting the amount of insurance effected on the property, the following has been ascertained:—

LIST OF INSURANCES.

On building A, burnt down: Sun office, £2500; Union, £2500; Imperial, £2000. On goods in ditto: Kent, £8000; Phœnix, £5000; Royal Exchange, £10,000.

On building B, burnt down: Sun office, £2500; Union, £2500. On goods in ditto: Guardian, £4000. Imperial, £1000; Royal Exchange, £6000.

On building C, building damaged: Sun office, £2000; Union, £2500. On goods in ditto: Royal Exchange, £3000; Sun, £10,000.

On building D, burnt down: Sun office, £2500; Union, £2000. On goods in ditto: Guardian, £10,000; Monarch, £3000; Phœnix, £4000; Royal Exchange, £10,000.

Total, £109,500.

There are various others on provisions and sundries, which have not been ascertained by the office.

REPORT OF THE GOVERNMENT COMMISSION ON THE METROPOLITAN WATER SUPPLY.

The report sent in by the Commission appointed by Sir G. Grey to inquire into the qualities of the present water supply, and of the proposed sources, has been published this week. The questions involved in their research appear as follows:—

What is the chemical quality of the various wat rs which are now supplied to the metropolis?

What is the chemical quality of the water derived from the sources whence the Board of Health proposed to supply the metropolis?

What is the chemical quality of the water proposed to be supplied from Watford?

Whether, if the quality of the water now supplied be objectionable, any remedy can be supplied by filtration, or otherwise, without abandoning the present sources of supply?

Whether, if soft water were to be obtained in sufficient quantity for the supply of the metropolis, the expense of substituting it for the present supply, the loss of such water under the present system of distribution, and if so, whether available means may be found of obviating it?

What are the properties to be predicated in the water selected for the supply of the metropolis?

With reference to the first question, the report states that of our daily supply of nearly 46 million gallons of water, 20 millions are taken from the Thames and 26 millions from other sources. The four companies which derive their water from other sources are the New River, the East London, the Kent, and the Hampstead. The distance of the Thames water ranges from 14 degrees (Clark's scale) to 15. The New River and East London companies have water of about the same degrees of hardness; the hardness of the Hampstead Company's water is 12 degrees, and of the Kent, 15.

The Commissioners are of opinion that "it may safely be stated that no sufficient grounds exist for believing that the present supply of the water supplied to London are injurious to health." With regard to the source whence the Board of Health would derive the water supply, it is stated that the average hardness of the water would be 4 degrees, or one-seventh softer. It does not appear that the supply would be nearly sufficient from this source.

In reference to the Watford water supply, we find it stated that "The proposals of the London (Watford) Water Company extend only to a daily supply of about 8,000,000 gallons. But the area of the gathering ground at Watford, which reaches the lower fissures of the chalk hills, embraces more than 1900 square miles, and is estimated by Mr. Hemersham, the engineer of the company, as equal to a daily supply of 468,000,000 gallons; the quantity of water which it has been observed to be reduced from 17 8 to 14 degrees of hardness. Some of it, by being exposed in a shallow glass basin for eight days, was reduced to 8½ degrees. Another specimen of the water was, by being merely heated to the boiling point, reduced from 18 to 12 degrees of hardness; five minutes' boiling brought it down to 9½ degrees; an hour's boiling reduced the hardness in the chalk formations are and London there are ample stores of water which can, by boiling on Dr. Clark's process, be reduced to a very low degree of hardness, and which, being brought from a considerable depth, will be free from the organic admixtures and equable in its temperature.

As regards the last question, they say—"The properties which we would esteem of the most value in water to be supplied to the inhabitants are—1. Freedom from unfavourable organic matter. 2. Freedom from constant or even occasional discoloration by clay and vegetable matter, with perfect brightness and colourlessness. 3. Softness. 4. Coolness."

The tenor of the Commissioners' recommendation is to make use of the Watford supply, as the most abundant and wholesome.

From the annual account presented to Parliament of the importations from abroad, of wine, spirits, &c., for the year ended 5th Jan., 1851, 9,304,3.2 gallons of wine were imported. Upon 6,654,6.7 gallons duty had been paid; 1,745,718 gallons had been exported as merchandise, and 6,437,292 gallons had been retained for home consumption, after deducting the amount exported subsequently to the payment of duty. The wine retained for home consumption was principally Portuguese and Spanish, 2,814,979 gallons having been retained from the import of the former, and 2,469,034 gallons from those of the latter. The quantity of French wine retained was 429,096 gallons; of Cape wine, 246,132 gallons; of Madeira 70,360 gallons; of Rhenish, 5,668 gallons; of Canary, 19,586; of Tayal, 245 gallons; and of Sicilian and other wines, 424,056 gallons.

MONETARY TRANSACTIONS FOR THE WEEK.

(From our City Correspondent.)

The absence of all political excitement, both at home and on the Continent, added to the usual quietness that exists just previous to the termination of the year, has had the customary effect upon public securities. There is still the same absence of animation in the Market that characterised the preceding week. Consols opened on Monday at 96¾ for the July Account, at which they did not fluctuate a fraction until Thursday, when an improvement of ¼ per cent was registered. In the Unfunded Debt business has been on the most limited scale. Bank Stock, however, advanced ¼ per cent on Thursday, in consequence of an extensive purchase reported. Three-and-a-Quarter per Cents have been moderately dealt in on behalf of the public; in India Bonds there have been scarce y any transactions. When business closed for the week the market appeared tolerably firm, at the following rates:—Bank Stock, 212¾; Reduced, 97¼; New 3 per Cent Anns, 98¾. Long Anns. to expire Jan. 1860, 7¾; Ditto, 30 years, Oct. 10, 1859, 7⅝. India Bonds, £1000, 54 p. Consols for Account, 97; Exchequer Bills, £1000, 46 p.; Ditto, £500, 46 p.; Small, 46 p.

In the foreign bonus business has been more than usually limited, prices generally fluctuating only to a fractional extent. Spanish Actives on Thursday improved, in consequence of offering to find money for liquidation in the Madrid news. Russian, Buenos Ayres, Chilian, and Dutch Bonds are all firm, with an advancing tendency. Mexican mediums is firm, without much appearance of improvement. Portuguese is rather lower than last week. At the close of the week absence of business made a dull market; the last prices being, for Brazilian Bonds, 5 per Cent., New 1829 and 1839, 87; Buenos Ayres Bonds 6 per Cent., 84½; Chilian Bonds, 1825, Five per Cent, 104; Mexican, Five per Cent., Ex. Jan. Coupons, 34; Peruvian Bonds, Five per Cent., Deferred, 41¾; Portuguese, Four per Cent., New 1829 and 1838, 47; Russian Bonds, 1822, Ditto, Four-and-a-half per Cent., Stieglitz, First Cent., 1840, 2½; Ditto, Passive, 5¾; French [illegible] per Cent., 98½; Exchange, 25 5s.; Belgian, Four-and-a-Half per Cent., 94¾; Dutch, Two-and-a-half per Cent., 62; Ditto, Four-and-a-half per Cent., 101¼; Spanish Actives, 27¾; Ditto, Passive, 5¾; Ditto, Deferred, 15¾; Portuguese, Four per Cent., 47; Prussian, Four per Cent., 101¼; Russian, Five per Cent., 109¾; Ditto, Four-and-a-half per Cent., 101¼; Swedish, Four per Cent., 99¾; Turkish, Six per Cent., 92; Ditto, Four per Cent., 70; Venezuela, Three per Cent., 21¾.

The Railway Market continues to gradually decline under the pressure of constant sales, which, being generally of small amounts, is a tolerable proof that it is the result of speculation on the part of the public, who have now grown alarmed. The Lancaster takings, it will be observed, continues, but with a slight reduction, the Leeds-upon-Aire. Closing rates were:—

ORDINARY SHARES AND STOCKS.—Caledonian, 1½; Brighton and Dover, 7¾; Caledonian, 1½; Chester and Holyhead, 1½; Eastern Counties, ½; East Lancashire, 14; Great Northern, 1½; Great Western, 1½; Ditto, Quarter Shares, 1½; Ditto, Half Shares, 1½; Ditto, Three-quarter Shares, 1½; Great Western (Bristol and Exeter), 1½; Great Western (Wilts, Berks, and Hants), 5½; Lancaster and Carlisle, Quarter, 1¾; Lancaster and Carlisle, Half, 1¾; Lancaster and Carlisle, Three-quarters, 1¾; London and Blackwall, 1½; London, Brighton, and South Coast, 3¾; London and North-Western, 1½; Ditto, Quarter Shares, 2½; Ditto, Half Shares, 1½; Ditto, Three-quarter Shares, 1½; London and South-Western, 1½; Manchester, Sheffield, and Lincolnshire, 1½; Midland, 4½; Ditto, Half, 1½; Newcastle and Berwick, 1½; North British, 1½; North-Eastern (Leeds), 1½; North-Eastern (York), 1½; North Staffordshire, 1½; Shrewsbury and Chester, 1½; Ditto, Halves, 2½; South Devon, 1½; South Wales, 2½; York, Newcastle, and Berwick, 1½; Ditto, Quarters, 1¾; Ditto, Q.N.S., Purchase, 5½; York and North Midland, 2½; Ditto, Quarters, 1¾.

LOANS TO BE LEASED AT A FIXED RENTAL.—Preston and Wyre, 43

PREFERENCE SHARES.—Chester and Holyhead, 10½; Great Northern, 15½; North British, 6¾; York and North Midland, 2½ (Scrip, Purchase).

FOREIGN.—Boulogne and Amiens, 9¾; Luxembourg (£10 p id), 2¾; Namur and Liege, 6¾; Northern of France, 10¾; Rouen and Havre, 9¾; Sambre and Meuse, 3¾; Tours and Nantes, 6¾ x d.

THE MARKETS.

CORN EXCHANGE.—The present week a arrival of English wheat up to our Market coastwise and by land carriage has been on a very moderate scale. For a limits the demand has ruled sently, and in some instances the quotations seem to be obtained in a pretty free manner. Fine qualities have moved off freely at full rates, but the middling and inferior parts of barley from abroad have met a very slow sale, at barely late currency. There has been a limited inquiry for malting, and fine foreign parcels have given way 1s per quarter. Beans, peas, and Indian corn are unaltered. Rather extensive importations of foreign wheat, flour, and barley have taken place in the course of the week.

English Wheat.—Essex, Kent, and Suffolk, 40s to 43s; Norfolk and Lincolnshire, 42s to 44s; Northumberland and Scotch, 42s to 44s; Yorkshire and Irish, 41s to 43s; Foreign, Dantzig red wheat, 40s to —s; white, —s to —s, barley, —s to —s; oats, —s to —s; beans, —s to —s; peas, —s to —s per quarter. Average duty, 10s 6d per barrel.

Flour.—Town-made, 40s to 42s; Norfolk and Suffolk, 36s to 38s per sack.

The Seed Market.—The demand for linseed continues in a very inactive state, but we have no change to notice in the value.

Linseed.—The value of white seed is unchanged, 46s to 51s; Mediterranean and Odessa, 44s to 47s per qr.

Rapeseed.—The value of this seed is unchanged, 36s to 38s per last.

Coleseed.—Fine foreign is worth 40s per last.

Cakes.—Linseed, 10 per ton.

Hempseed.—Fine Dutch, 36s per quarter.

Canary.—Fine, 50s per quarter.

Clover.—Red, 30s to 40s; white, 30s to 40s per cwt.

Tares.—Winter, 6s per bushel.

Rapecake.—Foreign, £6 per ton.

Linseed Cakes.—Thick English, £10 10s per ton.

Coriander.—Fine, 20s per cwt.

Turnip.—Fine round, 6s per bushel.

Carraway.—Fine, 40s per cwt.

Mustard.—Brown, 6s per bushel; white, 6s per bushel.

Tares.—Winter, 6s per bushel.

Canary.—Fine, 50s per quarter.

Hempseed.—Fine Dutch, 36s per quarter.

Linseed Cakes.—Thick English, £10 10s per ton.

Rapecake.—Foreign, £6 per ton.

Coleseed.—Fine foreign is worth 40s per last.

Rapeseed.—The value of this seed is unchanged, 36s to 38s per last.

Linseed.—The value of white seed is unchanged, 46s to 51s; Mediterranean and Odessa, 44s to 47s per qr.

The Seed Market.—The demand for linseed continues in a very inactive state, but we have no change to notice in the value.

Flour.—Town-made, 40s to 42s; Norfolk and Suffolk, 36s to 38s per sack.

Foreign Wheat.—Dantzig red wheat, 40s to —s; white, —s to —s, barley, —s to —s; oats, —s to —s; beans, —s to —s; peas, —s to —s per quarter. Average duty, 10s 6d per barr

BIRMINGHAM AND THE GREAT EXHIBITION.—THE FETE CHAMPETRE, AT THE BOTANIC GARDENS.

pared for presentation to Prince Albert, the Royal Commissioners, and the Executive Committee. The noble Earl having assented, the senior clerk of the firm stepped forward and read a congratulatory address; in accepting which, Lord Granville expressed his gratification at the spectacle of good feeling and mutual confidence between employer and employed which he then witnessed, and praised Mr. Winfield for the attention which he paid to the comfort and intellectual improvement of his people. He concluded by assuring them that it would be exceedingly agreeable to the Royal Commission to receive from the hands engaged in one of the largest establishments in Birmingham, a spontaneous address by one of their body, who had, he understood, been twenty-five years in the employ of the firm.

Of the other manufactories thrown open to inspection, it is unnecessary to say more than that they were all surveyed with great interest, according as the taste of each stranger and the limit of time allowed him led him to visit the one or the other. Shortly after three o'clock, in compliance with the programme, a *fête champêtre* took place at the Botanic Gardens, the walks and grounds of which were thronged with the inhabitants of the town. Under a large tent upwards of 500 ladies and gentlemen sat down to an elegant cold collation, which was presided over in a very hospitable style by Mr. Lucy, the Mayor.

At the close of the repast, the Mayor gave "The Health of the Queen," and "The Health of Prince Albert," which were enthusiastically received.

The Mayor then proposed "The Royal Commission," coupling with it the name of Lord Granville. The toast having been duly responded to,

Earl Granville returned thanks on behalf of the Royal Commission, and regretted that the quantity of business to be transacted in London prevented a fuller number of the body from enjoying the festivities of the occasion. His Lordship then reviewed the important position of Birmingham in the constructive history of the Crystal Palace

The Mayor then gave as a toast, "The Foreign Commissioners," which was responded to by M. Viebahn.

The next toast proposed was "The Foreign Jurors," and was acknowledged in eloquent terms by the Baron Dupin.

The Mayor then proposed "The healths of the Executive Committee." No body of men so small in number had ever exerted themselves more ably or more successfully in a great undertaking than they had done, and the local committee of Birmingham would support him in that view. The Executive Committee merited their hearty thanks, and he therefore gave the toast coupled with the name of Mr. Cole.

Mr. Cole briefly returned thanks. If they had any merit in carrying out the wishes of their masters the Commissioners, it had been by not doing rather than doing—by leaving every person who was interested to accomplish his work for himself—therefore, instead of an executive they should rather be called a non-executive. He hoped that in another ten years they might have another Exhibition, and, if it was not a selfish wish, that it might embrace another party to Birmingham as agreeable as that which he now had the honour to address.

The "Health of the Mayor," and a final toast to "the ladies" concluded the proceedings at the *fête champêtre*; after which a *soirée* was held in the Town-hall, rendered more attractive than such entertainments usually are by a performance on the celebrated organ.

After a day most pleasantly spent, the large party of native and foreign guests returned by special train to town, which they reached in safety at a late hour.

CITY OF LONDON HOSPITAL FOR DISEASES OF THE CHEST, VICTORIA-PARK.—FIRST STONE LAID ON WEDNESDAY LAST.—(SEE PRECEDING PAGE.)

THE ILLUSTRATED LONDON NEWS

SUPPLEMENT.

VOL. XVIII.] SATURDAY, JUNE 28, 1851. [GRATIS.

THE GREAT EXHIBITION.

WE this day commence a series of Portraits, with brief memoirs of the Commissioners and other distinguished officers appointed to superintend the carrying out of the vast design of the Great Exhibition. In these characteristic sketches, we can merely glance at the attainments which qualify the several individuals for the offices which they fill with such advantage to the Great Exhibition, and honour to themselves. We commence with the Royal President of her Majesty's Commissioners,

HIS ROYAL HIGHNESS PRINCE ALBERT, K.G., F.R.S.

IN one of the German sections of the Exhibition is to be seen a curious model scene, raised on a circular mound, planted with fir-trees. In a nest amongst a group of hills stands a country mansion, with something of the appearance of a church. On the lawn in front are groups of peasants feasting, dancing round a May-pole, and enjoying sundry sights and games. It is a rural, festive, happy scene, and represents faithfully the castle of Rosenau and the festivities in celebration of Prince Albert's birth-day.

His education, like his birth-place, had more of substantial reality in it than of the usual glitter of Royalty. He was trained, not for luxurious idleness—not apart from, but as a part of the people.

The natural bent of his mind, as well as early instruction, led him in the direction of the physical sciences, natural history, and the fine arts; and there still exists a very complete cabinet of natural history entirely collected and arranged by his brother and himself. In these studies of his youth, carried on under some of the most eminent professors of the German Universities he acquired that extensive acquaintance with the productions of nature, that intimate knowledge of the laws of mechanics, and that general acquaintance with the various chemical and mechanical processes of manufacture, which enabled him to lay, with so much precision and judgment, the foundation of that threefold classification under which the industrial products of the civilised world are to be seen arranged in the Crystal Palace: and it was his early pursuit of the beautiful which induced him to add to those rougher products of nature and mechanical arts, the fourth division of sculpture, holding an appropriate place as the most perfect of all art workmanship, that by which man takes stone, or wood, or bronze, and, from the rude mass, chisels and moulds forth the form of his ideal.

In pursuit of his early predilection, his Royal Highness, very soon after his arrival in England, accepted the office of President of the Society of Arts, which, founded nearly a century since, "for the encouragement of arts, manufactures, and science, had well nigh forfeited its claim to the title. Under the presidency, however, of the Prince, it was early found that the old field was still open to the society; arts, manufactures, and science were still capable of encouragement. New vigor was infused into the society—young and energetic men joined its council—a new charter was obtained—new rules established—exhibitions of arts and manufactures opened—prizes awarded—and producers and the public brought nearer to and more interested in each other. When the way at length appeared to have been sufficiently prepared, on the 30th of June, 1849, his Royal Highness summoned to Buckingham Palace those members of the Society of Arts with whom he had been in the habit of communicating upon this subject, and announced to them his views as to the formation of a Great Exhibition of works of industry and art, to take place in London in 1851; and at the first meetings his Royal Highness himself brought forward the four great divisions of raw materials, machinery, manufactures, and plastic art, upon which the Exhibition has been actually carried out; and on the same occasion also pointed out "the vacant ground in Hyde Park, near Rotten-row, the very site on which the Palace of Industry now stands, as affording advantages for this purpose which few other places would be found to possess;" and at the first meeting, his Royal Highness expressed the opinion on which it was happily resolved to act, "that, as machinery, science, and taste are of no country, but belong as a whole to the civilised world," the Exhibition should be a cordial invitation to all members of

LIEUT.-COL. J. A. LLOYD, F.R.S., SPECIAL COMMISSIONER.

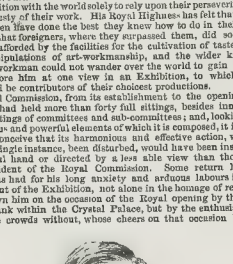
the industrial world, to show side by side, in friendly, peaceful rivalry, the utmost products of their art and skill. And then and there also, it was settled that the best mode of working out this great idea would be by a Royal commission, with his Royal Highness at its head, and the details, as to the subscriptions on a large scale, and the cooperation of the Society of Arts, were also then agreed upon.

From the date of this meeting, the plans of the Exhibition, and all the preliminary arrangements, were carried on by the Prince himself, with the aid of "those members of the Society of Arts who had been most active in originating and preparing for the execution of his plans"—Henry Cole, Francis Fuller, J. Scott Russell—until Friday, the 11th of January, when the Royal Commission held its first meeting at the Palace at Westminster, and his Royal Highness took his seat at the head of the large and powerful Commission.

The Commissioners found, at this first sitting, that the Prince had not only matured the plan six months previously, but had actually set to work upon it. He met them to explain not merely an idea, but to detail the opinions of the great manufacturing districts of this and foreign countries upon the project. He had sent forth agents into all the great towns. There was no rude scheme before the body of influential men commissioned for its execution—they were not asked to risk their reputation on a doubtful event. The Prince had already launched the plan, and made sure that it would float upon public opinion. Nor was this all: he had provided the financial arrangements for carrying out the undertaking, and had constituted an Executive, which the Royal Commission at once adopted. One of the first results of the Royal Commission is to be found in the published statement, dated February 21st, 1850, in which the original classification was extended to the most minute detail, and a practical and scientific epitome given, in a classified list of the whole of the objects of the Exhibition, almost as minute and much more systematic than that presented in the actual Catalogue. The issue of this document was also the idea of his Royal Highness, and for its completion he called around him the men most eminent of the several departments of science and practical art, and laboured with them himself as they each worked upon their several branches. In short, this document, as the Prince foresaw, has proved of the utmost importance. The Exhibition is no mere random collection of materials, manufactures, and manufacturing appliances, but a systematically classified collection, wonderfully minute in its details, connected in its branches, complete as a whole.

His Royal Highness has, throughout, been, of all the Commissioners, one of the most hard-working and constant in his attendances. From the first, in short, his heart has been thoroughly in the Exhibition; he has looked to it not alone as a show of the materials and fruits of industry, but as full of the elements of good-will and peace amongst nations, as tending, to obliterate the bitter memories of the past, and to establish on the firm footing of their common interest the brotherhood of all mankind. He has also looked to it as a great school for the education of British artizans, who have hitherto had so few aids to instruction and have been left in their competition with the world solely to rely upon their perseveringlabour and the honesty of their work. His Royal Highness has felt that the English workmen have done the best they knew how to do in their several crafts; and that foreigners, where they surpassed them, did so from the advantages afforded by the facilities for the cultivation of taste and the minute manipulations of art-workmanship, and the wider knowledge which the workman could not wander over the world to gain might be brought before him at one view in an Exhibition, to which all the world should be contributors of their choicest productions.

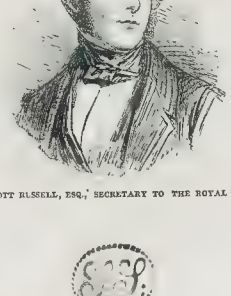
The Royal Commission, from its establishment to the opening of the Exhibition, had held more than forty full sittings, besides innumerable smaller meetings of committees and sub-committees; and, looking at the heterogeneous and powerful elements of which it is composed, it is scarcely possible to conceive that its harmonious and effective action, which has never, in a single instance, been disturbed, would have been insured by a less powerful hand or directed by a less able view than those of the actual President of the Royal Commission. Some return his Royal Highness has had for his long anxiety and arduous labours in the accomplishment of the Exhibition, not alone in the homage of respect and esteem shown him on the occasion of the Royal opening by the persons of higher rank within the Crystal Palace, but by the enthusiastic welcome of the crowds without, whose cheers on that occasion but spoke



DR. LYON PLAYFAIR, F.R.S., SPECIAL COMMISSIONER.

the universal feeling of affection of all classes, that the Prince has shown a real interest in the people, has produced a great occasion for teaching the idle portion of the world the true greatness of those who work, and has gained a hold upon the affections of the masses of the people that will never be forgotten.

Francis Albert Augustus Charles Emanuel, Duke of Saxony, Prince of Saxe-Coburg and Gotha, K.G., K.T., K.P., G.C.B., G.C.M.G., LL.D., D.C.L., Ph.D.; and second son of Ernest, Duke of Saxe Coburg and Gotha, by his first wife, Dorothea Louise, Princess of Saxe Gotha, born at Rosenau, 26th August, 1819, studied for two years with Professor Quetelet, the famous astronomer, of Brussels, and then went to the University of Bonn; was naturalised in England by the 3rd Vict., c. 1 and 2, on the 6th of February, 1840, received the title of Royal Highness; on the 7th was empowered to quarter the Royal arms; on the 8th was commissioned as Field-Marshal, and on the 10th married her Majesty Queen Victoria; on the 4th of March, in the same year, was granted by Royal warrant precedence next after the Queen, and nominated a member of the Privy Council; on the 30th of April he received the commission of Colonel in the 11th, or Prince Albert's Own Hussars. In April, 1841, he received the Order of the Golden Fleece; and in the same year was appointed Grand Ranger of Windsor-Park. On the 25th of April, 1842, he resigned the Commission in the 11th Hussars, and became Colonel of the Scotch Fusilier Guards, and about the same time was appointed Lord Warden of the Stannaries, and Chief Steward of the Duchy of Cornwall. In the May of 1843 he was appointed Governor and Constable of Windsor Castle, and in the following month First and Principal Knight Grand Cross, and Acting Grand Master of the Order of the Bath, Chief Ranger and Keeper of Hyde-Park and St. James's, and High Steward of Plymouth; in September of the same year, Captain-General and Colonel of the Artillery Company; on the 27th of February, 1847, he was elected Chancellor of the Univer-



JOHN SCOTT RUSSELL, ESQ., SECRETARY TO THE ROYAL COMMISSION.

sity of Cambridge, and, on the vacancy caused by the death of the late Sir Robert Peel, was made an Elder Brother of the Trinity House.

A Portrait of his Royal Highness has been engraved in No. 88 of the ILLUSTRATED LONDON NEWS.

LIEUT.-COL. J. A. LLOYD, F.R.S.,

MEMBER OF COUNCIL OF THE ROYAL GEOGRAPHICAL SOCIETY, ASSOCIATE MEMBER OF COUNCIL OF INSTITUTION OF CIVIL ENGINEERS, F.G.S., F.S.A., AND OF THE ROYAL SOCIETY OF ARTS AND SCIENCES, AT MAURITIUS, SPECIAL COMMISSIONER FOR THE EXHIBITION OF 1851, JOINTLY WITH DR. LYON PLAYFAIR.

JOHN AUGUSTUS LLOYD is of Welch extraction, the son of John Lloyd, Esq., of Lynn, in Norfolk, and Martha, daughter of Edward Lloyd, Esq., of Oswestry. He was educated at the Rev. Dr. Chapmanny's, at Tooting, and afterwards at a private establishment at Winchester, where he imbibed his taste for natural philosophy, chemistry, and music. He left school with the intention of entering the army; and, after passing a year in Derbyshire, where he made a survey by way of amusement of a portion of the Wirksworth mines, he proceeded on a visit to his brother, who was then King's Counsel for St. Kitt's and the Virgin Islands, and is now Attorney-General at Dominica. After passing some time in the West Indies, relieving his idleness by amateur surveys, acquiring the Spanish and French languages, he visited almost all the foreign islands, more particularly the Danish and Spanish. Impressed with an uncomquerable desire to explore the Isthmus of Darien, he prevailed on his friend and patron, Governor Maxwell, to grant him leave to visit Venezuela, with the hope of seeing the great liberator of his country, General Bolivar, and obtaining from him permission to carry into effect his ardent wishes. Through the kind offices of Sir Robert Kerr Porter, at Caracoas, and with whom he resided, our young traveller was introduced to the friendly notice of the "Libertador," and afterwards to the "Prince of the Plains," the renowned General Paez.

Bolivar immediately adopted and employed him, and, as an officer of engineers in his service, Captain Lloyd followed his noble master's fortunes until his Excellency took up his permanent residence at Bogota, the ancient capital of Columbia, and resigned to the Government both his office of President and Commander-in-Chief.

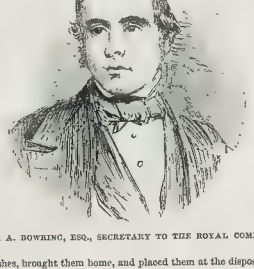
After passing some months in the city, the terrific earthquake of 1826 took place, which destroyed a great portion of the city and a great many of the inhabitants. Captain Lloyd's services were, by General Bolivar's wish made available, and he assisted in the measures for rescuing the wreck of their beautiful college from further destruction.

After this, falling under the displeasure of the Libertador for again asking to go to Panama, Lloyd was eventually taken into favour by his master, amply supplied from the observatory with scientific instruments, a staff of assistants, an old Spanish professor of mineralogy and a botanist, who were to accompany him in his expedition to the Isthmus.

Our adventurous traveller set out on his weary journey; but such was the horror entertained by every one of Panama, that, by the time Captain Lloyd had reached Carthagena, the worthy "cure" and his people, with the exception of the faithful Orinoko Indian servant, "Gambos," had all deserted him.

He arrived in Carthagena just in time to find himself one day shut out with his friend, General Montilla and his staff, from this turbulent and pestilent city, the government of which had been usurped by the brave but treacherous and savage General Padilla. As Montilla's aide-de-camp, Captain Lloyd entered the city during its greatest anarchy, with instructions from the Commandant-General to reassure the British inhabitants and the Consul, and promise them speedy relief. After being condemned to be shot the next day, Lloyd escaped with his life and a severe wound, and had the satisfaction to enter the city some time after at the head of 5000 or 6000 men, and Padilla was disgraced, and afterwards shot.

In the face of every difficulty, without money except such as was drawn from his own resources, and with the Governor-General of the province an enemy to Bolivar, he managed to obtain fifty men, and complete the surveys and levellings of the Isthmus of Panama, and by General Bol-



EDGAR A. BOWRING, ESQ., SECRETARY TO THE ROYAL COMMISSION.

var's wishes, brought them home, and placed them at the disposal of the English Government.

By desire of the late Sir George Murray, his papers were given to the Royal Society. Part were read and published by that body in 1830, and others by the Royal Geographical Society, in 1831; and after years' of subsequent exploring and surveys by other governments, this very line of junction, by railway, of the two oceans from Navy Bay, is now actually being completed by an American company.

After being employed jointly by the Admiralty and the Royal Society, in conducting the Thames Levelling Commission in 1831, he was appointed his Majesty's surveyor-general and civil engineer-in-chief at Mauritius, and sailed for that place early in the same year, where, led by his love of enterprise and exploration, he planned an expedition, and was the first man who ever ascended the Peter Botte Mountain there.

Having been encouraged by his Government, he commenced the construction of an astronomical observatory, which he founded, built, furnished, and maintained for several years—partly at the expense of Government, but at a very heavy loss to himself. Many of his observations are to be found in the archives of the Royal Society, from 1832 to 1839, and Sir John Herschell, with whom he corresponded, publis hed a most flattering eulogy on his exertions.

Previous to his departure on leave from Mauritius, he rendered the Government considerable service in turning up, mounting, and making available some of the old French guns at a moment of need; for which, amongst many other works, he received testimonials and thanks.

On leaving Mauritius he proceeded to Ceylon, and was on a visit at Kandy, and afterwards at Colombo, where he received the kindest hospitality from the governor, Lord Torrington.

Immediately after his arrival from the Red Sea he travelled with his

wife nearly to the Arctic Circle, in Norway, and he was treated with the greatest kindness by the King of Sweden and family, then at Christiania. After visiting the observatories there, at Altona and other places, he was arrested in his tour from Pomerania towards Russia, at Cracow, where the Cossack army were at the moment swarming from the plains of Austria. Passing near the Gallician territory and the Carpathian Mountains, he arrived at Vienna just in time to hear of the fall of Comorn, and to receive the kindest attention from our Minister, Lord Ponsonby.

Finally, after visiting the Tyrol and its beautiful capital, and searching out all the observatories he could, he returned by Munich and Paris to England, to enjoy a short repose

By the command of H.R.H. Prince Albert, he had the honour to be appointed Special Commissioner to assist and co-operate with Dr. Lyon Playfair. In that capacity he has visited some fifty or sixty works and manufactures, as the Emperor of the Celestials close to be sulky in the matter

He has the superintendence of the philosophical and scientific department of the Exhibition, and every hour of his time has been of late absorbed in perusing the official and illustrated catalogues, to every sheet of which, by the request of the Executive, must be attached his signature before it is submitted to the public

These labours over, he assists Dr. Lyon Playfair in attending such divisions of the British and foreign juries as come under the section of "Machinery" generally, including civil and military engineering and philosophy.

Lieutenant-Colonel Lloyd has, in the course of his career, published several papers: amongst others, his Memoir on the Isthmus of Panama, in 1830 and 1831; his Notes on the same, in 1850; and others on Madagascar, with a map, in 1849. He has contributed some papers also to the Reviews on his different voyages, for one of which he received the Telford medal

Lieutenant-Colonel Lloyd married, in 1826, Fanny Drummond, eldest daughter of Malcolm Macgregor, Esq., late of the 11th Regiment, and her Majesty's Consul at Panama, where he died.

Lieutenant-Colonel Lloyd has three sons: his eldest is at Madras, in the East India Company's Artillery; the second waits for his commission, which the good Duke has kindly promised him; and his younger, Ernest, is a cadet, by the kindness of Lord Angleses, at the Royal Military Academy, Woolwich

LYON PLAYFAIR, ESQ., PH.D., F.R.S., V.P.C.S.,

SPECIAL COMMISSIONER JOINTLY WITH COLONEL LLOYD

THE subject of our memoir, second son of Dr. George Playfair, Inspector-General of Hospitals in Bengal, was born in Bengal in the May of 1819; was sent to Scotland when about four years of age; educated at St. Andrew's, in Fifeshire; here he remained until fifteen, and already took an interest in chemistry as a recreative study: from this university he went to Glasgow in 1834, where he studied medicine, and was a pupil in chemistry of Professor Graham, then professing at the Andersonian University of Glasgow; soon after, he was appointed one of his assistants. His chemical and medical studies were interrupted by bad health; and being ordered to proceed to a warm climate he returned to India towards the end of 1835, where he entered a large mercantile house, with the arrangement that he was to become a partner: in a few months, however, his health being completely re-established, his desire to continue the study of chemistry was so great, that he gave up his commercial prospects, and returned once more to England, where he found his friend, Thomas Graham, Professor in the London University, in a degree become assistant, and continued his medical studies at the same time, and being as yet but little entitled to confer Dr. Playfair went to Giessen in 1838, to prosecute the study of this important branch of the science, under the famous Liebig. Liebig was then devoting his attention to researches in agricultural chemistry, and shortly after the arrival of Mr. Playfair requested him to translate and introduce his works into England. Having translated the work on agriculture, which was dedicated to the British Association, he attended the meeting of that body at Glasgow, to which Liebig was deputed. Shortly afterwards, and in consequence of an acquaintance made at this meeting, he was offered and accepted the management of the large calico print-works of Messrs. Thompson, of Clitheroe, at a very liberal salary. Having remained in this employment for two years, he removed, in 1843, to Edinburgh, as Professor to the Royal Institution and was at the same time appointed consulting chemist to the Highland Agricultural Society. At this period he was offered the Professorship of Chemistry in the University of Toronto, for which Professor Faraday had been requested to make the nomination. On the point, however, of his acceptance of the office, he was requested to meet some scientific agriculturists at Drayton Manor; and, by the advice of the late Sir Robert Peel, declined the appointment, and accepted a seat on the commission then constituted to examine into the sanitary condition of the large towns and populous districts. On this commission he remained for two years, personally visiting several of the large manufacturing districts, and made detailed statistical reports on what he termed the physical and moral causes of disease in Lancashire." On the close of the commission he was appointed by Sir Robert Peel Lecturer to the Museum of Practical Geology, and, during the life of that able statesman, was employed upon several Government commissions; amongst others, into the causes of the potatoe failure in Ireland, and the accidents in coal-mines

Dr. Playfair's connexion with the Great Exhibition was also at the recommendation of Sir Robert Peel, who felt the necessity of having a person connected with manufactures to represent the manufacturing and mining interests, to the general arrangements that might seem [illegible] to the Council. Chairman of the Executive Committee.

One of his chief duties was to endeavour, within the brief time at disposal, so to arrange with producers, that there should be no blanks [illegible] productions, but that every branch of industry should be fairly represented, not merely individually, but in its connexion with other branches. With this view, an elaborate classification of [illegible] was drawn up by the Executive, which [illegible] him, with the assistance of skilful manufacturers, and which has been adopted as the basis of the arrangement of the goods in the Palace, and as forming the boundary-lines for the duties of the Commissioners.

At present, in connexion with the Exhibition, Dr. Playfair holds the appointment of Special Commissioner, in charge of the department of juries, the scheme for the constitution of which, and the appointment of the [illegible] was principally decided to. The juries are now in active operation, and, as said by Lord Granville at the recent dinner at Fishmongers' Hall, "formed a picture unparalleled in the world's history—men engaged in the difficult object of deciding upon the merits of the productions of all nations, and chemistry a dream from almost every country, all working together in a common object with as much harmony as partners in the same firm

Dr. Playfair married, in 1847, Miss Agnes, second daughter of James Okes, of Riddings House, near Alfreton, Derby, and has two children, one son and daughter.

Our portrait is from a daguerréotype by Claudet.

J. SCOTT RUSSELL, ESQ., F.R.S.S.

[illegible] Secretary, at the College of Surgeons, Mr. Scott Russell, Northcote-Road, [illegible] the Royal Commissioners, originally named by her Majesty in the commission issued on the 3rd of January, [illegible] has previously been one of the three original [illegible] Exhibition, who, under the direction of his Royal Highness Prince Albert, had planned and organised the preliminary arrangements, during the six months preceding the above date, and at which [illegible] was then passed into the hands of the Commissioners and Mr. Cole; the other two original promoters then [illegible] Executive Committee, since which all three have rendered [illegible] in carrying on to its present success the work [illegible]

Mr. Scott Russell, the discoverer of the phenomenon in hydrodynamics known as the "great solitary wave of translation," has been long known as a man of science. He was born in the valley of the Clyde, in 1808, and is the eldest son of the Rev. David Russell, a Scotch clergyman, of the family of Russell, of Braidwood. Originally destined by his father for the Church, he received all the advantages of a university education and graduated with honour at the age of sixteen; but the bent of his mind towards practical mechanics had become so strongly developed, that it was soon evident he must be allowed to follow it; and his father with great judgment afforded him every opportunity of becoming a practical mechanic, by first permitting him to be employed in the workshop as an engineer, and afterwards assisting him to combine his studies in mechanics, physics, and the higher mathematics. In these he had early made such proficiency, that when Sir John Leslie, the distinguished Professor of Natural Philosophy in the University of Edinburgh, died, at the commencement of the winter term, the young engineer was selected to supply, temporarily, the deficiency, and delivered a complete course of lectures on natural philosophy to the students, who attended in unusual numbers the prelections of one much younger than themselves. From this time his career as a practical engineer became quite decided. In the course of some years he succeeded to Mr. Caird, of Greenock, as manager of one of the largest concerns in Scotland, where he continued till he removed to London in 1844.

In the meanwhile the practical man had not forgotten his science, but turned to use in the advancement of his profession those doctrines of science of which the mechanical arts are the useful applications. He became a ship-builder, and was led to investigate the laws by which water opposes resistance to the motion of floating bodies. In the course of these investigations, he discovered certain new laws, and, as a practical engineer of the well-known ship-building firm of Robinson and Russell, established the existence of the phenomenon now called the wave of translation, and invented a new form for ships, which possesses the quality of least resistance, and on which he has founded the system of naval construction, now generally known as the "wave" system. The effect of this system, which he introduced into practice about 1835, has been such, that the steam-vessels built on it have risen from the former usual rate of ten miles an hour to the present high velocities of 15, 16, and 17 miles an hour. The memoir, containing some of these discoveries, was read before the Royal Society of Edinburgh, in 1837, and obtained for the author the large gold medal, which that society awards biennially for the most important communication made to them during that period; and the memoir was soon after reprinted in Paris. He was also elected a fellow of that society, and immediately placed upon the Council. Ten years later he was elected Fellow of the Royal Society of London, and member of the Institution of Civil Engineers. He has been for many years an active member of the British Association for the Advancement of Science, where he usually occupies the position of vice-president in the section of mechanics. In 1847, Mr. Russell, in connexion with the late Sir John Robinson, he carried on a series of experiments on waves, which are to be found printed in their "Transactions"

It was as an active member of the Society for the Encouragement of Arts and Manufactures, that Mr. Scott Russell first became known to his Royal Highness Prince Albert, the President of the Royal Commission, and engaged in the efforts which ultimately led to the establishment of the Great Exhibition. For several years he acted as secretary to the Society of Arts, and held a member of council. In 1837 he married Harriette, second daughter of Sir Daniel Tyler Gooch, Bart., and of the Lady Harriett, daughter of the first Earl of Cloncurry; and has a family of two sons and three daughters.

EDGAR ALFRED BOWRING, ESQ., ACTING SECRETARY TO THE ROYAL COMMISSION

MR. BOWRING, fourth son of Dr. Bowring (late M.P. for Bolton, which he represented from 1841 to 1848, having previously, for several years, represented the Kilmarnock Burghs, and now H.B.M. Consul at Canton), was born at Hackney, in May, 1826; was sent first to a private school at the same place, and afterwards to the school of the London University, and in 1840 to University College, where he was a distinguished student, obtaining several prizes and first-class honours both in classics and mathematics. In 1841 he was appointed to the Statistical Department of the Board of Trade by the Right Hon. Henry Labouchere.

On the return to power of the Whig Government in 1846, the Earl of Clarendon became President of the Board of Trade, and appointed Mr. Bowring his private secretary, which appointment he continued to hold until Lord Clarendon, in the summer of 1847, went to Ireland as Viceroy. On the resignation, early in 1848, of Mr. Milner Gibson and Mr. Macaulay, and the acceptance by Earl Granville of the office of Vice-President of the Board of Trade, Mr. Bowring with that of Paymaster-General, he appointed Mr. Bowring his private secretary, which office he still continues to hold, in conjunction with those of private secretary and Statistical Clerk to the Board of Trade.

Since the first few weeks after the issue of the Royal Commission he has acted as one of the Secretaries, in conjunction with Sir Stafford Northcote and Mr. Scott Russell, and also as secretary to that most important of all the sub-committees of the Commission, the Finance Committee.

In 1850, a pamphlet, published anonymously at Parker's, entitled "Free Trade and its Reputed Sophisms; being a Reply to the 'Sophisms of Free Trade Examined,' by a Barrister," was generally attributed to have been the joint production of Lord Hobart and Mr. Bowring. Within the last few weeks the latter has published the poems of Schiller, complete, including all his early suppressed pieces, attempted in English.

THE CENSUS OF 1851.

AN interesting and instructive summary of the returns gathered under the Census Act, on March 31st, of the number of the people in Great Britain, was published by authority, and inserted in our Journal of Saturday last.

The [illegible] census, from which the basis of all statistics, and of all reasoning on the progress of society, demands from us some general explanations. We will first express our satisfaction that the arrangements for collecting the information have been so far improved, that the summary has now been prepared in the space of ten weeks.

The number of enumerators employed was 40,000, and each one was required to see [illegible] considerable number of important particulars was supplied. On the night of the last of March, the papers were prepared and filled up by the householders, and on the 8th of April the enumerators had to transmit all these documents, schedules, and summaries, to the local registrars. The information [illegible] Registrar-General's office was passed on to the superintendent registrars, by whom it was forwarded to the office of the Registrar-General by the 31st of May. In fourteen days, exclusive of Sundays, from that time, all the information collected, spread through 6,000,000 printed papers, weighing nearly forty tons, was epitomised and published. It required a year to prepare and publish the results of the Census of 1831, and four months to prepare and publish those of 1841. We are improving, therefore, in administrative ability, as compared with our former proficiency. In France, a whole year has been employed to make known the Census of only five years. In the United States the same period has been required for publishing the returns of a decennial survey: those of 1850 are just made known. We may infer, therefore, that England stands higher in some branches of administrative efficiency than either of those two states.

This, however, is a trifling gratification, compared with that derived from the fact, that the population of Great Britain has increased in ten years, from 18,659 981 in 1841, to 20,919,381 in 1851, or about 12 10 per cent. The females have increased more than the males, or at the rate of 12 25, while the males have only increased at the rate of 11 91.

The obvious reason of this difference, as there are generally more males born than females, is the greater mortality of males, by accidents at sea, in coal pits, and in other hazardous and destructive occupations, which much more than counterbalance the [illegible] which takes place in the proportions of the sexes in London.

Of course, the town population has increased much more than that of rural districts, if the latter have increased at all. The increase of the population of London is given, and it has risen from 1,948,369 in 1841, to 2,363,141 in 1851, or 21 33 per cent, nearly double the average of the whole increase

We are informed by the *Liverpool Mercury*, that the increase of the population of that town has been at the rate of 50 per cent. In other towns, such as Gateshead and Manchester, the increase has also been very great. It is, in fact, so much above the average, that we are inclined to suppose that the rural population must have positive y decreased

An example of such a decrease is found in Scotland. For the last few [illegible] there [illegible] almost as much from emigration as from the excess of births over deaths. The increase of population in Scotland has been much slower than in England, only 9 55 per cent. In Scotland, that part of the rural population which inhabits the Highlands has probably declined in numbers like the Irish. This is also an illustration of the general fact, of which the slow increase of the liberated African in the United States is another illustration, that an inferior race of men can only be sustained in conjunction with a superior race, by being taken under its especial care.

The general increase of the people, notwithstanding a continual emigration from Great Britain of about 43,000 per annum during the last ten years, and the increase of the town population—the most skilful, the most intelligent, and we will venture, rather in opposition to an opinion that was prevalent, to assert, the most respectable and the most virtuous—assures of the continual progress and continual improvement of society. This view is at least agreeable, for it is plain that the rural population cannot increase in the same proportion as the town population, because, as agrion tural skill increases, a less number of persons are required to provide food for society, and employment in the rural districts is diminished. On the increase of the town population, therefore, must statesmen rely for the future growth and strength of the State, and on that population must they adapt their measures. The continued increase of the town population is a new synonymous with national power and nations prosperity.

It is remarked, however, that the increase in the last decennial period has not been so great as the increase in the previous decennial periods, as follows:—

Population	Increase per Cent.	Population	Increase per Cent.
1801 10,942,646		1831 [illegible]	14 91
11 12,596,802	15 11	1841 [illegible]	13 49
1821 14,391,631	14 19	1851 20,919,381	12 11

All other causes for the increase or decrease of population are trifling, compared with the amount of food obtainable. It may be inferred, therefore, that the restrictions on the supply of food, which have been abolished in this decennial period, had begun at this commencement to tell very seriously on the increase of the population, producing all those miseries which are the consequence of slow depending starvation. It will be recollected, in fact, that the new taxes levied by the Whigs in 1840 failed to produce the revenue, and they were turned out in 1841 by the general dissatisfaction, leaving behind them a large deficiency. "The wide interval," says Mr. Rowe, in his work on prices, "from the summer of 1838 to that of 1842, must be characterised as a period of dearth," and of course, a period of suffering and decay and dawn of all improved prospect commenced with 1842, and all that time the pressure on the population was excessive.

With the return of a better time, Sir Robert Peel, deeply conversant that our [illegible] depended on the growth of the people in fairly [illegible] happy hours, or more, or less, of sunshine and rain. May did not, though the harvests improved, immediately relieve the distress, and it was not till 1845 that the prosperity began which, with one exception, except in 1847, when it was only temporarily though severely interrupted by the great railway and commercial failures. Thus in the early part of the ten years the people were suffering, and only increased slowly, or actually began to decrease.

Of their prosperity, particularly as far as the increase of population is concerned, there is no better test than the number of marriages; and we are told by the Registrar-General, in his quarterly return for the summer of 1851, "The marriages were 34,425 in the quarter ending March 31, 1850: the marriages in the corresponding quarter of 1847-48-49, were 37,480, 38,298, 39,470. The number of marriages in the first quarter of 1850 was only exceeded in the seven corresponding quarters of 1839-49, and the proportion of marriages to population on a higher in the first quarter of 1850 than in any corresponding quarter since 1839, *except the March quarter of 1845-46, when the labouring classes were in full employment*." Again, he says in his return for the end of last year, that the proportion of marriages was greater in the summer months of 1850 than it had been in the same season in any year since the registration commenced. He further states, and gives numbers to prove the statement, that marriages were almost stationary from 1838 to 1844, and that all the increase in marriages in the decennial period has been since 1844. From his statements we learn two very important facts, viz. that marriages became comparatively very numerous in 1845-46, and from that time continued to be numerous till the very latest returns. The births in all the years subsequent to 1845-46 corresponded with the increase of marriages. We have previously seen that in the earlier part of the ten years the people were in a condition of comparative distress, and the marriages in that period were proportionably few. The prosperity, then, and chief increase of the population in the ten years centre in the last half

In the same time, we know that great quantities of food have been imported in the latter part of the ten years. The greatest quantity of wheat and flour ever imported before their commencement was in the two years 1844-45, 3,343,[illegible] qrs.; while, in 1846-47, the quantity was 9,686,218 qrs., exclusive of other kinds of grain, which were imported in the two years to the extent of 10,000,000 qrs. From the great quantities of food continually imported since 1847, and from the great increase in the number of marriages which began in 1845-46, from the comparative prosperity of the people in the last half of the ten years, and from their comparative distress in the first half, we may safely come to the conclusion that the population has not been equally spread over the whole ten years, but has been much greater in the last than in the first half of the term.

This discrimination is of essential importance. If the increase have been nearly equal in every year, then is the lessening rate of increase in the ten years a proof that as time is economised the numbers increase less in proportion, but if the increase were small in the first six years and larger in the last half, then may we hope that the facilities to increase are undiminished, or even augmented, and that we begin the first year of the present decade with a prospect of the population increasing in it at a more rapid rate than in the period just elapsed

The present supplies of food are as ample as the world, there is no other limit to the growth and prosperity of England.

The discrimination is of importance, too, in a more enlarged view. One of the great objects of society is the increase of population in an accelerating ratio in proportion as it grows older and more numerous. There is in all history and in her own well authenticated increase of population as has taken place in the United States where the people have enjoyed independent force. It was as follows: —1790, 3,929,827; 1800, 5,306,325; 1810, 7,239,814; 1820, 9,638,131; 1830, 12,866,993; 1840, 17,063 353; 1850, 23,267,498. In the same period the population of England increased more than in any corresponding period of its history. As the world grows old, therefore, people increase faster; and there is so much waste and unoccupied land yet, that it is rather to be described as an untenanted world than as a thickly over-covered. Much remains, therefore, to be done, and [illegible] is, therefore, the increase of our population have been chiefly in the latter part of the period, especially since the restrictions on the supply of food were removed, we have reason to conclude that it is on an equation to the rule of population increasing in an accelerating ratio; and the statement remains true, that the increase of population is naturally more rapid when not impeded by unjust legislation, of knowledge and skill increase, and as the world grows older.

Another point mentioned in the returns worthy of notice is, that the number of inhabited houses is 37,926 less in 1851 than in 1841. At the same time, the number of inhabited houses in 1851, in England and Wales (3,276,975), has not kept quite pace with the increase of the people. We cannot, however, suppose that the demands made by the cry for increased accommodation have been wholly fruitless; and we are inclined to hope that the apparent deficiency in the number of houses may be explained in part by a larger and better class of buildings having been appropriated to the use of the poor, and by the practice of describing as one houses large and roomy buildings which give a comfortable accommodation to many small families.

FINE ARTS.

THE AMATEUR GALLERY

A very instructive and pleasing exhibition of drawings and sketches, by amateur English artists, has just been opened at 121, Pall-Mall, over against Her Majesty's Opera-house. The principal exhibitors are Lady Ashton, a Cadogan, Lady Theresa Cadogan, Mrs. Gaskell, Mrs. Hall, Mrs. Hartley, Lady Hamilton, Colonel the Hon. A. Liddell, Major-General Sir William Herries, Mr. Munro, of Hamilton-place, Piccadilly, Mr. Auldjo, of Noe-House, Kensington; and Lieutenant-Colonel Auldjo.

The collection has been brought together, we are told, in "a hope that those who have not already introduced the art into their own homes—have slighted it as a part of education, and [illegible] may be induced to do so." Here, indeed, is a good example, and one which, if followed, would, *to what a succession of wise and good purposes it may be carried by taste, well-directed study and perseverance!*

Some of the sketches are made in Australia, in both the Old and New Water Colour Societies [illegible] may learn a great deal from this Exhibition. How charming, for instance, is No. 129, "The Italian Mother," by Miss Baker—a drawing quite in the style of Cox and Perry. No. 135, by Mr. Auldjo, is a faithful and clever representation of John Knox's House at Edinburgh (136). The ladies, as might be expected, excel in this pleasing branch of the fine arts. Miss Blake carrying away the palm at present from all competitors. Much disappointment, let us add, has been felt by collectors, that many of the drawings or sketches are for sale.

LAKE SCENERY OF ENGLAND.

Mr. J. B. Pyne, called by many, and not improperly, as far as merit is concerned, "our modern Turner," is exhibiting a series of twenty-five pictures at the gallery of Messrs. Graves, in Pall-mall—of the Lake Scenery of England. The whole twenty-five pictures have been painted within the last three years; and, in point of beauty and artistic beauty, under the [illegible] greatest sweetest scenery of our island. Mr. Pyne is a great master of perspective, of distant and of light and air effects. He loves nature too well, to exaggerate, and has an eye fully alive to the most beautiful combinations of hills and streams, and clouds and rocks. If he has any serious defect, it is, at times, a certain thinness of colour. He does not seem to feel that he can pass upon his canvas. You this defect is at other times allied to a beauty. He gets transparency by it, and often obtains additional distance from its use. The pictures are to be engraved, and should be seen, as one of the artistic treats of the present season

* We take the opportunity of stating that the number of marriages in the year 1850, when it first came to hand, was stated to be 300,000, and that the number of births was stated to be 600,000. In the last decennial period there has been a slower rate than is stated by the return. It will, however, be seen that the present returns was taken on the 31 of March, while that of 1847 days, or somewhat more than [illegible] of the whole number. If very nearly 40,000, and 1 to add to the 300,000, given as the population for June 1851

A STORY OF THE PRESENT DAY.

BY AUGUSTUS MAYHEW.

BEGINS WITH ADVICE, BUT ENDS WITH HALFPENCE.

CHAPTER X.

WHEN it is said that "the London season is over," it is generally understood that the Opera is closed; that no one of fashion would think of being seen in Kensington Gardens, and that grouse shooting has begun Henceforth, to be discovered in Regent-street is a thing to tremble at, for it will imply that you are too poor to visit Boulogne. The shutters will be closed in all drawing-rooms worth dancing in, and blinds will be papered in all parlours worth dining in. The Rhine Navigation Company has begun to advertise, and long accounts of magnificent hotels and wonderfully healthy watering-places, flock into the papers. Noblemen have started for their shooting-boxes, or will soon be *en route* for one of the German towns ending in "heim," "berg," or "baden." Mountebine are being cultivated expressly for Continental use; yellow slippers and straw hats sell well at Margate, and the grouse shanger is engaged for Gravesend.

At the West End this is always understood to be the way that "the London season" is over. But in the more populous parts of the town it is quite different. There it implies that work will be scarce, and food scarcer still. Those that have been able to earn a living all the week make their hoardings last them for three meals at least. Those whose gains have been so small as to leave the future unprovided for, must shift as best they can. The woman on the street is a thing to boast of, and implies that the lounge is rich enough to keep out of the workhouse. Down the courts and alleys many of the windows will have a bing "To Let" painted in them. Shirts, children, and women with bundles under their arms, or men and boys carrying the posts and limbs of old bedsteads, will be seen hurrying to the pawnbrokers. Parish officers will begin quarrelling, and the police reports be filled with accounts of disputed settlements. The strong big-headed girls will start for the country in time for hop picking, and the lads will be off to the corn-fields to commence reaping.

Shirts last their season as well as pens; coats and waistcoats come in and go out like strawberries. For a time all hands are employed, work is plentiful enough, and for about eight months in the year the seamstress can earn a living. But the same month that brings death to the partridge, brings starvation to the needlewoman. After September, "twenty per cent. under prime cost" will not sell a shirt, and clothes that "never could have been made for the money" still remain on hand.

The establishment kept by Mrs. Lucas had been long since broken up. If it hadn't been for a cousin of hers in the slop line, she declared she could never have kept the two girls that still boarded with her. Of course, under these circumstances, she could not spare any work for Kitty. The poor thing must manage as best she could, and stay, or garter, or dance making, and waistcoating until after Christmas.

Never did any one run about as Kitty did. She would call at shop after shop, almost praying for something to do. A few good-natured old dames expressed their earnestness, and promised her aid to her family, and were moved by her story, would [illegible] the liner and the bread-pan, and make her up a bundle of the low odds and ends they could spare. But the generality of the shopkeepers would turn her away from their doors without even the kind word that softens disappointment, and adds to the hope that supports the distressed. At one house a situation was offered to her; but, though the four pounds a year and food was a great temptation, she never dreamed of accepting it, for which they did at home? Then they told her she was too old to work, and preferred begging to living by her industry, and they would never consent to help such people. One old gentleman, in a snug draper's shop, who, as he listened to her answers, rattled the tempting shillings in his breeches pockets, would have nothing to do with her because her father had not sent his children to the workhouse. "Beggars should be just as poor as they are generous," he said; "and what have you got else to share their bread with except what they were so poor? No, she should have no work from him! These people must be taught to know their station; he had no patience with them."

The poor thing knew not where to look for relief. After a day of disappointments, to be obliged to make them suffer, as she had suffered, was dreadful. But there was no escape. It was useless her trying to appear happy, for her words would contradict her looks. As she entered, they would lean at her face, trying to read in its every line the truth was known. All the day long she would [illegible] herself with visions of hope following [illegible] and seeing her laden with the work that was to [illegible] she would again and again think the truth was known, and even would grow dim, and the heavy sigh upon the chest, as if weighed down by despair.

In the evening she would support her father as he [illegible] up and down, he repeating, one to the other, all she had uttered by [illegible] glances at the spot where the loom had stood, remembering sorrowfully that the time was drawing near when he would be well enough to earn a living that way. But even that chance had been taken away from them, and what they were to do Heaven only knew. The thought of the workhouse [illegible] the flood—the clothes, that had charity branded upon them—with the separation from those faces to look upon which more than [illegible] rendered necessary to his happiness—was more than he could bear, and he felt glad when any sudden pain in his limb would compel him to think of something else.

[illegible] sometimes Joe, who had been sent for, after [illegible] which the old man, would take a [illegible] or two, or the table. [illegible] them away with him. At such times [illegible] could not look at Father [illegible] without fear, his face was [illegible] he seemed so wild. The little mother, too, would weep, although they clung to her, and tried to make her laugh and play with them. But, then, whenever Joe came in this way they always had bread for supper.

On Monday morning the landlord called for his rent. There wasn't a [illegible] in the house, and they knew, from what had already happened, that they would meet with no mercy from the man. Kitty had not dared to leave home before his visit, for fear that he might slit-treat her father on finding all their furniture had been sold. Her alarm as to [illegible] money was so excessive that she almost fainted. He knew what [illegible] meant; and, turning to Lamere, said, as he looked around the [illegible] "Where are your traps?"

"Give me till next week, master," prayed the old man, without [illegible] question.

"I [illegible] you've up to something of that sort," cried the landlord, "this is the way you poor beggars [illegible] I tell you if I don't have the money to-night, I'll drag the bed from under you the first thing on Monday morning. May my arm never come straight, if I don't." And he took his fist at his debtor.

"It shall will be done," [illegible] Lamere.

He [illegible] the door after him, making it quiver with his violence. [illegible] they heard him muttering vengeance at each step he took. For a [illegible] was so violent, that for some time not a word was spoken. At [illegible] by fear, they did not even move, but sat looking at the half open door [illegible] their staring in their ears.

"Father," said the girl, going to his bedside and shaking him, as if to arouse him from his stupor, "Father, speak! what shall we do?"

He did not answer her; he did not like to be seen weeping by his child. "If [illegible]" what will become of us? Speak, say something! I'll [illegible] you for us some here? Tell me where to go!"

"To the workhouse, my girl," answered Lamere, looking up into her face; "we must go there soon, why not now? Thank Heaven we have [illegible] to sell—[illegible] to pay—[illegible] to owe!"

She kissed his face, and [illegible] "How I have [illegible] off the [illegible] the day saying should be thrown away [illegible] No! no! Let us, at least, die near each other!"

Her [illegible] child-clothes tightly, drawing in his breath as a man [illegible] suffering acutely.

"I will go seek some one among the rich," she continued, "who will relieve us. We need not break up our home. I will throw myself at the landlord's feet and tell him our sufferings. He must help us. I know he will."

"He's a [illegible]" cried the old man. "I once thought as well of the world as you do. But time has proved to me that the rich are hard, while the poor till they fear them. We are honest, and must starve quietly."

"Then I will beg the money," she answered. "Why should I feel ashamed to beg? It is for a sick father, and there is something holy in the act."

She recollected having seen a great many gentlemen strolling about the Royal Exchange. Some of them were benevolent-looking persons with bald heads and white cravats. They were rich, because they wore heavy gold watch-seals and plenty of rings; and they were kind, because men also knew, because she had observed them dig their fingers into each others ribs, and laugh until they were purple in the face. She would go to Cornhill.

She only stopped once—at a money-changer's window, with wirework before it—to look at the wooden bowls filled with wealth. There were golden pieces as big as half-crowns, and silver ones like ounce-weights. What quantities of dirty crumpled Irish and French bank notes, scattered about like cuttings on a tailor's board! "They must be charitable, they are so rich," thought Kitty, looking in at the door. There was a clerk weighing out some moon money, taking it up in shovelfuls, and throwing it about as if it were dirt, making a clink till it sounded like music. It was foolish to stand hesitating near the door, for four or five sailor-looking men pushed by her into the shop, and before so many people she hadn't the heart to confess her misery. So, with another glance at the window treasures, she hurried on.

Begging is a science that a weaver's daughter did not understand. She was too bashful by far—seemed to be degraded, as it were, by [illegible] There was a little ragged rascal, with dust-coloured hair, and one shoulder poking out of his black shirt, who would make his shilling whilst she was earning her halfpenny. He would pocket his jew's-harp, pull up a long face, and whistle after any likely person, [illegible] so piteously, and keeping so close at his heels, that, even if he did not excite pity, he would at last tire out all patience and have a copper thrown into him merely to get rid of the nuisance. But Kitty, after she had singled out a benevolent-looking gentleman, would stand watching his [illegible], waiting for the opportunity she was too bashful to take advantage of, even when it presented itself. First of all she would wait until there were fewer people [illegible] Then, when the place was deserted, she discovered that he had taken a paper from [illegible] and if she spoke to him whilst he was reading it, he would be [illegible] A friend would stop to talk with him; and at last he would walk away, little knowing how narrowly all his movements had been watched. Now the little ragged boy generally singled out people that were reading or chatting, and seemed to wish to be alone. He got his halfpenny in one-quarter of the time. But Kitty did not know the mark of the trade.

After looking about her for nearly two hours, she at length determined on speaking to a very stout gentleman, with a frill as full as a lady's flounce. He was basking in the sunshine, whistling a soft and melancholy air, that blew out his cheeks and pouted his lips like a full churchyard cherubim. Now he would play with his ring, slipping it on and off his white finger till the bright rays shot out from the diamonds in all directions. Then he would lift up his long black velvet waistcoat till she saw the ends of his braces, and get red in the face with tugging at the watch seals, straining as if he were pulling out a cork. At [illegible] with all her resolution, the little girl crept up to him, and [illegible] big till her cheeks burned, asked him in a low stifled [illegible] for the love of God to help her. She was [illegible] a trifle from his full purse. The old fellow was [illegible] whistled more loudly, and turning round, as if he had not seen her, thrust his hands under his coat tails, and hurried off to lunch at Hoby's.

Poor girl! how ashamed and heartbroken she felt. She did not dare to raise her eyes, for she dreaded lest everybody should be staring at her. So she kept looking on the pavement, she ran off towards Cheapside. Here [illegible] were [illegible] sights, and pointed the [illegible] churchyard cherubim. How

THE AUSTRIAN PRINTING ESTABLISHMENT.

WE are not of those who believe that the State can or ought to carry on any branch of industry under its own direction; not even the pretence of nourishing or sustaining by such means any languishing trade or art could modify our objection to all and every kind of protection and interference on the part of the State. Let a nation have liberty of the press, wise laws, a free industry, in short, a Government adapted to its degree of development and civilization, and it will most certainly, sooner or later, build, plant, nourish, erect, and improve for itself all that is likely to thrive in its soil and that tends to its well-being. Notwithstanding this opinion, which our principles did not allow us to keep out of view, we are compelled to confess that the productions of the Government Printing Establishment of Vienna bear honourable testimony to its usefulness. One point in which this establishment is distinguished from all other similar ones is the union within its walls of all the different branches of graphic art tending to the multiplication of words or pictures. The president of the institution, Counsellor Auer, has made this combination the object of his peculiar care. Ten years ago the establishment was not thriving, but by his unwearied care he has raised it to one of the greatest in the whole world. At this moment it occupies, in the different branches of business, more than 500 persons, in a space extending over 51,000 square feet.

Mechanical inventions, discoveries of science, the creative genius of the artist, and the productive activity of talent, are all successfully employed in connection with the powers of nature, as steam, the moving power, lightning, the hydro-electric fluid, and light, the producer of pictures.

Five large buildings, from four to six stories high, contain all the *materiel* of the establishment: these are connected with each other by means of galleries, while two stone and three iron staircases connect the upper with the lower floors. A steam-engine of 20-horse power moves 16 printing machines, 24 copper-plate presses, and 8 glazing cylinders. It also pumps and raises cold and warm water to the different floors of the building, and, in addition, conveys through copper pipes hot air into all the rooms. Similar provisions supply four large wash-houses with the means of cleaning the types, a large high drying-house, which rises like a church between two of the other buildings, furnished with galleries all round the interior, is heated by the same means. All the workshops and rooms are lighted with gas, and provided with speaking tubes, which end in fifteen mouths in the office of the director of the establishment. There are also 41 large and 12 smaller iron letter-printing presses, 40 lithographic presses, 8 for numbering, and 5 for embossing, worked by hand. Eight type-founding machines and ten furnaces, attended by four persons each, furnish a constant supply of fresh types, of which the establishment possesses about 3000 cwt., or near 168,000 lb. of letters, all of which are kept in the nicest order. More than 300,000 sheets are printed daily, for which 600 reams of paper are required. Taking the year 1851 as an example, and comparing its productions with what is now done, the result shows that as much is now printed in thirteen days as in the whole of that year.

A series of beautiful wood engravings, and other works belonging to that branch of the arts of design, are exhibited in the Austrian department of the Crystal Palace, which are produced in the above Printing establishment at Vienna. In connexion with this institute, a school for wood engravers was established seven years ago, and great pains were taken to promote improvement in that art. A distinguished Xylograph was appointed as teacher to the school, and by degrees a number of skilful artists have arisen from it.

The wood engraving, in contradistinction to the engraving on copper, produces the design in free raised strokes. As many as 80,000 good impressions may be taken from the original block. While that may be reproduced in divers ways as clearly and distinctly as the original, but the number of impressions one, therefore, which can be taken from one wood cut may be said to be almost unlimited, and it has, besides, the advantage of being more cheaply and quickly printed on the typographic presses.

Towards the end of the mediæval period, more particularly under Maximilian I., this art had attained to great perfection in Germany; but after that time it was neglected, and has only lately been again practised and improved. Two methods or styles may be distinguished in wood engraving, the one aims at a direct imitation of copper-plate engraving, and this, although the most effective, is not the style best calculated for the nature of wood engraving; the other confines itself to the task of

WELLS, IN UPPER AUSTRIA A WOOD-CUT IN THE AUSTRIAN PRINTING ESTABLISHMENT

rendering with the greatest fidelity, and in the spirit of the artist, the drawing which he has placed upon the block; this latter method has in the present day gained a decided victory over the former.

The first Illustration is a specimen of the skill to which the artists in the Austrian State Printing establishment have attained. The design was drawn upon the block by Professor Fuhrig, and engraved by Mr Frederic Exter, teacher of wood-engraving to the school. The style and spirit of the whole are strictly mediæval, with little consideration for mere effect; but it shows the spirit of the creating artist, as well as the successful comprehension and execution on the part of the engraver. Next, we give a landscape, "Wells in Upper Austria," also by Exter. Both cuts were taken and modelled in bitumen by Messrs. Manchlin and Malle, in the Crystal Palace itself.

The greatest portion of this work is for the use of the Government offices; but the establishment exhibits a number of its best and most distinguished productions in the Crystal Palace, which attract the universal attention, as well as a just appreciation of their excellence.

The collection of types of foreign characters is the richest and most complete in the world, and shows the skill with which the distinguishing characters of the different nations have been comprehended and executed. Independent of the different sizes, there are 106 distinct kinds of alphabets presented. Works in Sanscrit, in the Turkish, Hebrew, Arabic, Persian, Japanese, and other languages, prove the practical application of this mass of types. It is worthy of observation, as showing the value and usefulness of this treasure of types, that its assistance has been applied for by learned societies and individuals in Leipsic, Erlangen, Copenhagen, and Christiania, in the publication of their respective works; and that even a distinguished publisher in London has lately received more than fifteen alphabets from the Vienna establishment to enable him to complete his polyglot work.

By the side of all these types are ranged the manuscript letters of the middle ages, as in use from the seventh to the fifteenth centuries, in four sizes; also a collection of ornamented letters from the 17th and 18th century, music notes, and types for the blind.

Two plates stereotyped in letter metal are of a larger size than has yet been produced anywhere else. By their side are shown stereotypes of the same kind in galvanoplastic copper of the same cast pressed into prepared gutta-percha matrixes. The galvanoplastic seems, upon the whole, to be generally preferred in the Vienna establishment. The productions of this art are employed partly in the type founding processes, partly in the letterpress and copper-plate printing presses, and in many other ways of art and science. Who would have imagined, twelve or fifteen years ago, that basso and alto-relievos of solid copper might be produced from wood, lead, or copper-plate engravings? Here, the results of scientific researches are reduced to practice for every-day use. We see here, for instance, fossil fishes, formed in copper, as above described, in the ordinary copper-plate press.

It might have been supposed that the durability of steel engraving would have made the multiplication of engraved plates superfluous, but in many cases this is by no means so. By means of galvanoplastic an engraved plate may be copied several times, and it thus becomes possible

WATERING-PLACES OF ENGLAND.—TEIGNMOUTH.—"THE DES SEE NEXT PAGE.)

to print smaller objects from four to eight pieces at once. Besides many other interesting works of this description, a plate is exhibited, 33 feet long and 36 inches broad, which bears witness to the extent of the apparatus employed. The refuse of galvanoplastic copper, forged, rolled, hammered, and melted, shows the quantity of the copper, and the skill with which it is treated.

Chemo-typography and galvanography are two branches lately added to the parent stem, well worthy of the consideration and attention which is bestowed upon them in the Imperial establishment.

Chronolithography, and printing in oil-colours, supply objects both useful and elegant. The Imperial establishment shows them in extraordinary beauty and variety. There are six oil-coloured prints, with three painted origin als, which are so difficult to distinguish the one from the other, that it has been found expedient to affix printed explanations to each of them; and a very great number of other objects, such as copies of fossils, butterflies, plants, antiquities, technical and anatomical objects, &c.

Photography, on paper, is here represented in some twenty-five pictures of considerable size, beauty, and effect. Objects of nature or of art, views of towns, buildings, statues, &c., are first produced by photography, that they may be afterwards reproduced by the copper-plate engraver, the lithographer, the wood-engraver, or, most astounding of all, by photography itself, for the purpose of speedy and cheap multiplication. This new art, an offspring of Albion, promises great results in the time to come; and, although the variability of the climate offers great difficulties to its successful cultivation, yet the success already obtained is on this account more surprising and more gratifying. The Imperial establishment deserves great credit for the care devoted to this art.

We refer those of our readers who take a more particular interest in all that concerns graphic art, to a history and description of the Imperial Printing Establishment at Vienna, in which more extensive information will be found. At present only a German edition is published by the establishment, but we are told that English and French translations are in course of preparation, and will soon make their appearance.

WATERING-PLACES OF ENGLAND.

TEIGNMOUTH.

THIS delightful resort, said to be the largest watering-place on the Devonshire coast, lies on the north side of the mouth of the river Teign, about sixteen miles from Exeter. In the "Route Book of Devon," the locality is thus described:—"Its peculiar pleasant situation, at the mouth of a wide navigable river, which here in its course makes a sudden sweep round, and falling into the sea by a narrow channel, forms a tongue or neck of land whereon a portion of the town is built, having the sea on one side, and the river on the other, whilst the principal part is formed around the bottom and up along the face and two sides of a hill or ridge which rises gradually from the course of land before mentioned, running towards the north, one side having a river or western aspect, and that of the sea or eastern. The most modern part, with the exception of some few houses looking towards the river, is that built on the level ground on the hill side, which presents a sea frontage in the parish of east Teignmouth. Of the town, or streets of Teignmouth, not much can be said in praise of their width or regularity; but with the fine and extensive esplanade or Den, and beautiful open beach, no watering-place in the west can vie."

The climate is mild and equable; the prevailing winds are the west and south-west, which are genial. The myrtle, and plants of much warmer countries, flourish in the open air all the year round. The beach is composed of fine sand, and is excellent for bathing: it is firm to the feet, and can be used at any state of the tide. The cliffs in the neighbourhood rise in some parts to the height of from 150 to 200 feet.

The popularity of Teignmouth, as a watering-place, dates from the latter part of the last century. It [illegible] and is the public rooms, in the centre of the [illegible] no less than the mouth of the Teign. It is also well provided with inns and [illegible].

EXHIBITION NOTES.—No. 2.

NIL ADMIRARI!—One of the most curious effects of the Exhibition, especially upon those who can see the most of it, must be the creation of a feeling of *nil admirari*. Thousands of things which have tempted us to roam all over the world, and spend our time and money in exploring and examining them, have been brought all together, and so immediately under our inspection, that we need wander no more in search of the wonders of art and mechanism or the remarkable productions of nature. The Crystal Palace holds examples of them all. For a season at least, the annual agricultural meetings may as well be postponed; for there will be no novelties in machinery, and the vast multitude of the parish can hardly be enough to warrant the congregation of landlords and tenant-farmers from all parts of the kingdom. It can be of no use travelling to Manchester or Birmingham, or Sheffield: they are all in Hyde Park, with their implements, their manufactures, their [illegible] movements. Nottingham, Glasgow, Derby, Leeds are also there: the [illegible] at work and their most beautiful fabrics produced before your eyes. We need not go to Russia, or Prussia, or Spain, or Portugal, or Switzerland, nor anywhere on the continent of Europe, for Europe has come to England, and settled close to town. Even India, and China, and Mexico, and America have brought their treasures, inventions, and peculiarities here. A French author wrote an exceedingly popular book, a "Voyage autour du Palais de Cristal" may well suffice for the grand tour, and a voyage round the world to book. Truly we are astonishing in a few months pleasures that might last a lifetime. It is almost sadd ning to look forward to years and occasions when some one is showing us a splendid *parure* of precious stones, and our remark will be, "Oh, I have seen much finer than these in the Exhibition of '51. There were the Queen of Spain's (which, by the by, though beautifully arranged, are not so well set as some of our English specimens), and there was the Koh-i-noor, *alias* the mountain of light, and the blue diamond of Hope." Stoicism and *nil admirari* must still accompany us. An exquisite piece of mechanical execution in stubborn iron is presented for our admiration. Pooh! we have witnessed a standard yard bar of the same metal, by which the 250,000th part of an inch could be ascertained and visibly marked on an index: and so on through the world's arts, sciences, and natural productions. There will be nothing new to us, nothing astonishing to excite our wonder. *Nil admirari* must be our motto for ever: and no Indian chief could be more unmoved—he than all of us shall be!

In the department of "Natural Production" (Class 3, Substances used as food) we have the result of numerous valuable experiments in the culture of grain, tea, sugar, cocoa, coffee (not a word of chicory, except once from Dublin, in which its manufacture from the dry root to the dust, for use or abuse, is exhibited), tobacco, spices, &c., the preservation of meats, &c., but very little of novelties. Starch from sago, and a new patented material; starch, hair-powder, and gluten from rice; everlasting chlorine, and essence of patchouli: meat from the rhizome (*Typha latifolia*, a creeper); sugar from crystallized malt, and from canes grown in Surrey, and consolidated milk, are among the latest discoveries and applications and least known "items."

MODELS, WITH SILK, &c.—"Vegetable and animal substances used in manufactures" form a far more prolific branch, though not so much in their meagre class (Class 4), as in a majority of other compartments, English and foreign, throughout the Exhibition. One exhibitor has invented a travelling cap for protection to the head against concussion (No. 38), which ought to be sold at all railroad stations. No. 51 is British vegetable fibre, for the manufacture of thread and paper. Here chicory figures as a dye, with wood (No. 76); and woollen yarn from the wool of the Bizon is shown as the produce of the Marquis of Breadalbane, to whom we are in debted for the re-introduction of the stately cupercaille, or cock of the woods, into the highlands of Scotland. There are many interesting specimens of woods, but we do not find in this section (South Gallery) any examples of two of the most important articles recently employed in our manufactures, the first to a considerable extent, and the last not to one hundredth part of the extent to which it must, and will, ere long, demand itself. The use of mohair is now prevalent, in consequence of the difficulties attending its weaving having been overcome. It can be rendered as flexible as silk, and, from its great strength and durability, becomes a very important adjunct to all the manufactures into which it may be introduced. The other substance to which we refer is the wild silk of India (*Melona cynthia*), and found in great profusion in the native jungles throughout that vast empire. This article is as yet almost unknown in Europe, though the population of the East have for [illegible] ages employed it in every kind of furniture and garment. It is spun by the worms in a manner somewhat similar to what we see of caterpillars' nests and webs in our own orchards, and hung suspended from the branches of the trees, and bleached and hardened in the sunshine for months of the season. Gathered, and applied to use, there is no fabric to compare with it for softness and lasting. Like the beds, &c. of our mediæval ancestors bequeathed to their descendents from generation to generation, the Hindoo families hand down their wild-silk curtains and clothes to their successors for a hundred years, without their being worn out; and we have only to note, in regard to their endurance, a very singular fact connected with natural phenomena, viz. that, to ensure their preservation, the articles must only be washed in cold water; if ever submitted to hot water they rot and perish, almost as if consumed by fire. We understand the immense quantities of this material might be imported into England, and contribute a new and most valuable addition to our silken productions.

We have no doubt but that the Exhibition will lead to other experiments, especially on vegetable or botanical fibres, for textile works; and on many useful matters and various conjunction or competition with cotton, flax, and silk. But, without anticipating what may arrive, we may say that the treasures of this World's Bazaar are already inexhaustible. Wander where we will, original conception, graceful design, or singular combinations attract the eye and rivet the attention; and we must explore the least showy nooks to discover many of these in the prominent positions, we are caught by the display of the largest, most imposing, and gaudiest fabrics of manufacture, or the wondrous produces of art, employed on mineral wealth or natural produce in [illegible] metal, borrower, we find every here and there, collected one of comparatively modest and unpretending works and fabrics, whose detailed history, if known, would be found far more important, in an industrial point of view, than others, upon which, at a superficial glance, much greater notice and value are bestowed. We have been led to these remarks from having almost accidentally stumbled before a case of mixed products, which may serve as an instance to illustrate them, though little regarded, and apparently of little original invention and talent. On examination and inquiry, however, we were agreeably surprised to find ourselves mistaken. In Class 19, behind an interesting case of Coventry manufactures, we were attracted by (No. 392) a table-cover, with 300,000 stitches, and (No. 393) a quilt, from C. Pearse, Bath, in white crochet, with the Ten Commandments worked in; and these fanciful performances carried our eye to their adjacent neighbour, "No. 394. Ribbons, gimps, fringes, silk handkerchiefs, satin-wire, bullion, and gimp, for manufacturing purposes, from Hannok, Tewkesbury, and Paris." This particular case we select on account of its exhibiting specimens of the principal mixed fabrics with which it is surrounded, and which are all eminently useful to our every-day life, though merely sewing-silks, trimmings, and other small articles of ribbons, gimps, and bullions. In this single case we find congregated the ribbons of Coventry, the handkerchiefs of Macclesfield, the minute wares of Manchester, the patent fringes of Derby, &c., fair samples of the staple trades of these busy hives of ingenuity and labour. Among these, we were told that this firm first encouraged the production by machinery of what is called satin wire, and of which an annual quantity, almost incredible, is now made by their machinery. It may amuse, as well as interest the general reader, to hear something of the process needful to form such an article as this, looking so minute in the grand scale of manufacturing commerce. A wire is longitudinally enveloped in satin, which is afterwards, or rather at the same time, covered with silk, rolled around it. By the adoption of a similar plan (suggested by an accident), a thread of cotton is covered with silk, which, being afterwards doubled two or three times, forms a netting or embroidery, which the Nottingham manufacturers consume to a large extent, and which is also used in the fringes now so much seen on ladies' dresses. The consequent progress offers a pregnant lesson of the growth of commercial enterprize upon every improvement that is made. With the whole kept supply the demand (as it will under all similar circumstances), increased, and it is to eventuate in a new branch of industry was established in England. It was estimated that a year or two ago, in the parish of Coventry, 8000 persons were employed in connexion with the making of fringes, &c. The result has been a complete revolution in that department of trade. While English consumers, for a year back, depended on the French and German manufacturers for their supply (our own being all made by hand), we now live at the sign of the Case is Altered, and the Continental consumers are supplied by the British manufacturers, and this has been brought about by the [illegible] manufacturers of the firm whose case of wares and engagement of from 2000 to 3000 or 4000 operatives has induced these reflections. *Ex uno disce omnes.* Facts such as these are of universal application; and yet they are almost certain to escape the notice of the casual or let me say, in the ordinary line of instruction more closely in this branch, we would mention as also well deserving of attentive consideration such contributions to this compartment as Mdlle. Riego's original and excellent patterns, No. 17, already spoken of; No. 75, deep bullion fringe, woven (by shape, as Mr. R. Rigby, No. 161, the Death of Douglas, in embroidery, after Landseer, by Mrs. A. Eyre; No. 879, the famous carpet wrought by the Lady Waterford and her friends for the Queen, the design by A. Fisher, [illegible] the subjects painted and work superintended by W. B. Scott, and the [illegible] curiosity or exemplary merit.

From [illegible] articles in this division, we learn, by samples of cords, bits of braid, and specimens of gimp and piping, how, according to [illegible] taken up—and the [illegible] of England [illegible] the extent of the consumption of the manufacture. The quantity of labour they employ and their value in the aggregate cannot easily be over-rated.

TOWN TALK AND TABLE TALK.

THE complaint seems still to be general among the trading community that the capacious jaws of the Crystal Palace are swallowing all their customers, and sucking ruthlessly in the myriads of shillings which would be otherwise tinkling merrily upon their counters. Since the 6th, however, of our money-spenders only resort to the Hyde-park Exhibition on one or two days in the week. I should have thought that Regent-street and Oxford-street would now have been looking up, and such is, I believe, the true state of the case. A great number of orders are now, as I hear, given, evidently suggested by patterns and designs seen in the Exhibition: ladies and gentlemen, instead of entering a shop to make a chance choice from the wares on the counter, enter, apparently, with the minds made up, and giving orders at once for particular goods or fabrics with a business-like promptitude which astonishes the assistant. The theatres are certainly doing better than they were—the Opera in particular. The rainy Whitsuntide made no little difference in the state of the finances of the theatrical world, and the other purveyors of amusement, and utterly ruining the hopes of the suburban purveyors of out-of-doors entertainments. If, however, there be any class of musicians who have cause, without one single word of remark, to bless the Exhibition, it is the [illegible] which [illegible] the energies upon our cabs and omnibuses. The latter estate of our locomotive constitution, notwithstanding, seems inclined to behave in such a manner as is likely to call down upon it, in a very practical shape, the wrath of the omnibus-riding public. Some time ago, the monopolists in conveyancing were grievously put to the rout by the appearance of the threepenny omnibuses; but they have gradually rallied their forces, and now appear to be on the eve of taking up their old ground, and changing the old fare again. The small triumph of the extension of the thirteenth passenger was amply revenged in the jump up of the fare to fourpence; and now matters are so arranged, especially in the Exhibition omnibuses, that, to all practical intents and purposes, the fare is sixpence. Each line establishes some half a dozen artfully placed points, the passing of any one of which involves the extra charge, so that a man who wishes to travel for the ordinary fare has first to study a complicated system of distances, and next, in all probability, to walk half the way to his destination. The public are, however, kicking lustily, and will, we hope, kick to some purpose. Acts of Parliament are talked of, which, however, would contradict the whole spirit of modern legislation; but another scheme is said to have been started, in the invention of no less a person than Mr. Bianconi, the founder of the Irish car system, and the proprietor of a great proportion of the car-coaches throughout the country, to come over and organise and establish an opposition system of cheap omnibuses in London. Such a step would astonish the drivers and conductors, whose present position, ruling over a decidedly put-down public, reminds one strongly of the despotic sovereigns of Europe triumphant over the extinguished embers of the spirit of 1848.

Talking of Bianconi and his vehicles, I have often wondered that Dublin street cars have never been tried in London. True, they afford no shelter in rainy weather, but in a pleasant dry day there is no vehicle so handy or exhilarating. No opening of doors or letting down of aprons: you jump without more ado upon the seat; sit upright if you please; lounge lazily along the cushion if you please, stretch your legs to a luxurious extent unknown in a cab or gig; and are all the while being rattled along, at the least, at twelve miles an hour. What a picturesque thoroughbred tatterdemalion is your true Dublin carman—a bundle of rags and jobility! Look at the knowing cut of that dirty face, and the roguish twinkle of that pug eye. There is a long and unctuous abuse of the London cabmen, but no fun—nothing like pure humour. The nearest approach to a joke I ever heard from one of the fraternity was the description of a thin gentleman as being a person in training to creep down a gas-pipe. Your London cabman, too, smart as he is, would have no idea of speaking to his fare, even did their positions permit it; at all events, until the passenger had opened the conversation. Not so the carman of Sackville-street: he has hardly shaken his reins when he is chatting and joking amicably with his employer. If he be an Englishman, which he finds out in a moment, he has scores of sly hits of fun to poke at him, dozens of characteristic objects to point out as symbols of the country and the people. He wants to know what the stranger thinks of Dublin, and of the Irish ladies, and of the Irish horses, and of the Irish potatoes, and the Irish potteen. Then he is always shouting out good-humoured chaff to those he meets or passes, or touching up with a loud and hearty joke some acquaintance on the pavement. He always goes at the most rattling pace the half-starved but still mettlesome horse can keep up; and, if there is one portion of his journey which a Dublin carman makes a point of performing at greater speed than another, it is when he is rounding a sharp turn, and has not the least idea of what may be coming up at the same speed on the other side of the corner.

Apropos of omnibuses, I was lately offered, free, gratis, and for nothing, in an omnibus, two things which I had never seen in an omnibus before. First, there was a clerical-like gentleman, of benign, though Exeter Hall-like appearance, who, after he had settled himself in the centre of the vehicle, pulled out of his pocket a bundle of tracts, which he distributed, accompanying each with a persuasive smile, to his fellow-passengers; and in a few moments the recipients were to a man deep in theology. Mistaking, in my unsuspicion, the clerical gentleman appeared to take me for a foreigner, for, as soon as our eyes met, he had recourse to another pocket, and pulled out another bundle, from which he politely handed me a French tract upon the religious phases of the Italian question. I declined the proffered kindness, but, presently, I fear, observing my eye wandering from the paper, he produced a third bundle, out of which he passed down to me a German tract in the best case for all nations, and in all tongues—a curious little pocket assortment of cheap theological literature. The other offering I had made to me was of quite a different species. The generous donor was a jolly-looking fellow—a countryman, probably, by his dialect, a West of England man. He had hardly got seated, when he pulled forth a bottle about half full from his pockets, announcing that he was glad to say as how it was as good rum as ever came out of Jamiky, and he hoped that the company would like it as well as he did himself. After the bottle had been, during which the gentleman seemed surprised that no one seemed to be about to avail himself of his liberality, he remarked that he had no glass, but he supposed that didn't signify, as the ladies would drink first. By the time he had extracted the cork, and, after carefully wiping the mouth of the bottle with a blue cotton handkerchief, he offered it in succession to the ladies who were in a state verging upon hysterics from suppressed laughter. The ladies, however, were polite, but resolute, in their refusal. "Well, dang my buttons," said the swain, in a great state of surprise and excitement, "one 'ud think 'twor physic." The refusal of the gentlemen present to partake completed the good man's consternation. "Well," he muttered, after applying the bottle to his own mouth to a great extent

NEW BOOKS, &c.

NEW WORK BY ALBERT SMITH

In the 1st of July will be published price One Shilling [illegible]

Issued Monthly) No. 1 of a new Periodical entitled

THE MONTH: A View of Passing Subjects, Manners, Home and Foreign, Social and General. By ALBERT SMITH. Illustrations by JOHN LEECH.

Published at the Office of "THE MONTH," No. 2, Whitefriars-street.

NATIONAL ILLUSTRATED LIBRARY.

All the Back Volumes are now REPRINTED, and ready for delivery. This elegant Library of Standard and Original Works appears in monthly Six volumes, each volumes containing between 300 and 320 pages, and profusely illustrated in the highest style of Wood Engraving. Price 5s 6d per Vol.

The Works already published are—

Vol. I.—BOSWELL'S LIFE of JOHNSON. Vol. I.

Vol. II.—NINEVEH; or, the Ruined City of the East.

Vol. III.—THE BOOK of ENGLISH SONGS.

Vol. IV.—BOSWELL'S LIFE of JOHNSON. Vol. II.

Vol. V.—THE ORBS of HEAVEN; or, the Planetary and Stellar Worlds. By O M MITCHEL, A.M.

Vol. VI.—A HISTORY of the MORMONS, will be ready on the 1st of July.

Published at the office of the ILLUSTRATED LONDON NEWS, 198, Strand, London; and to be had of all Booksellers.

RE-ISSUE of the ILLUSTRATED LONDON NEWS. Vol. XVIII.

JUST REPRINTED, the WHOLE of the NUMBERS from JANUARY 4, 1851, to the PRESENT TIME; for which will be found a COMPLETE HISTORY of the Progress of the GREAT EXHIBITION in HYDE-PARK.

No EXTRA CHARGE will be made in future for these numbers as Back Numbers; any Number being obtainable at the original published price.

In order to afford some idea of the value of this Volume, and enduring Pictorial Record of the Great Exhibition, we give the following List of Illustrations referring thereto which have appeared from January 4 to [illegible]

[illegible]

[illegible]

ENCAMPMENT OF FOOT GUARDS, AT THE EASTERN END OF THE GREAT EXHIBITION BUILDING.

THE GREAT EXHIBITION.

EAST AND WEST ENDS OF THE BUILDING IN HYDE-PARK.

THE first of these vignette views shows the eastern end of the Great Building, with the encampment of the Foot Guards, and in the distance the Serpentine, with its graceful bridge and the model frigate

In the second Illustration we have the entire western end of the Great Building, with a portion of the Engine-House, and the large space appropriated to the carriages of the visitors. In the centre of the picture is the Baron Marochetti's colossal statue of Richard Cœur de Lion

On Saturday last, the Queen and Prince Albert, accompanied by the King of the Belgians, visited the west end of the Crystal Palace, for the purpose of viewing the above statue and other objects of interest appertaining to the Great Exhibition, which are placed in the open air

The Queen was accompanied in this visit by the Prince of Wales and Prince Alfred; and the King of the Belgians was accompanied by the Princes and Princess of Belgium

Lady Canning, Madame de Montanclos, General Wemyss, Colonel Bouverie, and Col Baron de Meerkerke, attended the illustrious party.

THE LADIES' GUILD.

(To the Editor of the ILLUSTRATED LONDON NEWS.)

I am desirous, through the medium of your Journal, to make known a plan which has lately been commenced for the benefit of ladies The society in question, which has been named the Ladies' Guild, is peculiarly suited to lady artists, either amateur or professional. *But employment in the Guild can be found for those who have no artistic power*

There needs no long argument to prove the great desirability that women should occupy themselves with industry and ingenuity, and probably, also, it will not be denied, that it is also desirable that women should have pecuniary resources, and that the whole burden of the maintenance of society need not necessarily rest, as now, on men. But, whatever view may be taken on these points, it is most certain that there are many women who would be glad to meet with remunerative occupation, and that very few such are open to women of refined tastes and habits.

But it happens that a field (almost boundless) to artistic taste has been opened out of late to women by Miss Wallace, a lady who has obtained a patent for decorations in glass, and who, with rare generosity, has wished that such branches of her talent as women can work they should work for their own benefit.

The plan is now in operation, and ladies would do well to inquire into the arrangements, and see if they do not promise a fairer field for female talent and the accumulation of money than any other resources yet accessible to women.

Enquiries can be made personally or by letter addressed to Mrs Hill, No. 4, Russell-place, Fitzroy square, where specimens of the kind of work can be seen; as well as in the Great Exhibition, where, in No. 2, on the west wall, in the Agricultural department, Miss Wallace's inventions range with other glass works And here it must be permitted me to observe, that this singular woman, whose inventive genius does honour to her country, must be judged not by the specimens there exhibited merely, but the application of her inventions must be taken into account before her merit can be duly appreciated Miss Wallace has patented the lacing of internal and external walls with marble. Now, this idea carried out, our towns and edifices would at once assume a new and vastly superior appearance, and walls would be impervious to damp, and cleansed by water or by rain easily. She has likewise patented the art of staining glass so as to make it look well externally by day, and internally by night, thus removing the only objection to the use of stained glass; and, lastly, by producing perfect imitation of gold, silver, gems, and mother-of pearl; and she has the most brilliant means at hand for the decoration of articles of furniture It is, therefore, clear, from all this, that Miss Wallace's inventions are neither few nor small, but, on the contrary, are of exquisite beauty and of extensive application It shows the force of native genius that a woman like Miss Wallace, of birth and independent fortune, should have stepped out of her sphere, and, quitting her accustomed luxuries, should have spent years in the workshops of England and the Continent, pursuing, single-handed and with indefatigable perseverance, the researches and labours needful for the perfecting the various machines.

And now that these discoveries are made and perfected, let us hope they will meet with due encouragement the more that the patentee so nobly designs to forward through their means the best interests of her sex.

I am, sir, yours, &c.,

4, Russell-place. CAROLINE SOUTHWOOD HILL.

THE FREE CHURCH OF SCOTLAND.

(To the Editor of the ILLUSTRATED LONDON NEWS.)

TONGLAND, KIRKCUDBRIGHT, June 11th, 1851.

In the ILLUSTRATED LONDON NEWS for June 14, at page 508, in a paragraph beginning with "The *Edinburgh Witness*, a strong Free Kirk and Dissenting newspaper," &c., I cannot refrain from pointing out to you a mistake as to the views of the Free Church of Scotland upon Voluntaryism. It may not be known across the border so well as it is known in Scotland, that all the champions of the Establishment principle, during the Voluntary controversy, twelve or fifteen years ago, adhered, I might say to a man, to the Free Church, as holding the ancient principles, and maintaining the practice of the Scottish Church. What is called the Voluntary principle never found favour with Dr. Chalmers and with other distinguished men of the Church (of whom some are now in their graves), either when they were in the Church connected with the State, or in the Church not connected with the State. We repudiate the Voluntary principle in our public acts and our pulpit ministrations; and perhaps you are not aware that the Church which is just now the main object of hostility from Voluntaries and Dissenters is not the Establishment, but the Free Church of Scotland. Any one who knows anything of the state of parties here knows this much.

The Church is, no doubt, supported by voluntary contributions; and so I suppose is every Church that is not connected with the State, whether it be Presbyterian or Prelatic, whether in England or in Scotland; but this accidental circumstance is very far from proving that such Church holds the Voluntary principle.

As for the disparaging remark contained in the paragraph I allude to, I thank you will agree with me, when I say that a Church, which during the last twelve months has raised £300,000 for her own home and foreign purposes, and since the disruption in 1843 has raised two millions and a half sterling, can afford to be twitted, however ungenerously, upon the point of the free-will offerings of her people.

I am, Sir, your obedient servant,

J. RHENIUS, Minister at Tongland.

POTATOES.

To the Editor of the ILLUSTRATED LONDON NEWS.)

SIR,—I shall be too gratified if you will have the goodness to insert the following plan to cook old potatoes. After April the potatoes ought to be peeled at night for the one or two o'clock dinners; and for late dinners; any time before nine in the morning. I have repeated this experiment many times, and the improvement in the quality of the potatoes is very great. It is a well-known fact, that, owing to the inherent nature of the potato to grow, it will push in spite of every precaution to stop its growth, leaving the tuber spongy, and with much of its water extracted out of it, and this is the reason why no stale cut vegetable can ever look well: by peeling and steeping in cold spring water for ten or twelve hours, the pores and cells become filled, however flaccid the tuber may be; and in the process of boiling this fresh water is again discharged, taking with it all bad flavour, as well as partly removing the dark spots, which are often found in late kept potatoes. I tried them steeped in salt and water, thinking that in boiling the salt would remain in the cells, which it did, and gave the potato a better flavour; but the salt turned the outside very brown, and did not look well. I have also steeped cut sets, which in twelve hours became firm, and steeping seeds, no doubt, would have a beneficial effect upon late planting sets; but water takes a long time penetrating through the tough skin of a whole potato.

I am, SIR, your obliged and obedient servant,

JAMES CUTHILL, CAMBERWELL.

NATAL.

A letter addressed to Mr. S. Sidney, from a friend in this colony, dated Pieter Maritzburgh, Dec 16th, contains the following important warning:—

"I arrived here from the Orange River sovereignty last Tuesday; and though I was sick of the sovereignty, yet I am already equally sick of Maritzburgh, and long to be on the "*trek*" again. *Do all you can* to prevent poor deluded fellows from coming out here unless they have *large capital*, and either wit to handle it or courage to stand its loss. There is *no employment* for *poor men*. The 20-acre farms are a delusion. The hardships are greater than anything I ever saw in Canada or the western States, and the returns nil. On my homeward "*trek*" I paid a visit to my fellow-passenger W——. He has bought 100 acres of land in a most romantic spot, just under the Drakenberg Mountains, at the source of the Klisa river, and is living there with his wife in a tent, which, when it rains, is as bad as the open veld, and, when it blows, rather worse. They live on mealies (*maize*), eggs, and milk, and get meat about once a month. He has planted a small corner with mealies, and broken three spades in trying to make a garden. His wife milks the cows and works very hard, but it is a miserable existence, and, what is worse, it will never improve. The young fellow who takes this is disgusted with the colony, and in very sensibly making his way back. He has been here some four or five months, chiefly on the Umloro, in the lower part of the country, about which I know nothing. A Mr. Fielden, son of the late Sir John Fielden, of Manchester, has bought two *erven* at the (Natal) Bay for £1900, and is going ahead in the cotton-growing line to the tune of £10,000.

COLOSSAL STATUE OF RICHARD CŒUR DE LION.—WESTERN END OF THE GREAT EXHIBITION BUILDING.

London: Printed and Published at the Office, 198, Strand, in the Parish of St. Clement Danes, in the County of Middlesex, by WILLIAM LITTLER, 198, Strand, aforesaid.—SATURDAY, JUNE 28, 1851.—SUPPLEMENT

A STORY OF THE PRESENT DAY.

BY AUGUSTUS MAYHEW,

OF THE AUTHORS OF "THE GREATEST PLAGUE OF LIFE," "HOW TO GET MARRIED," ETC., ETC.

(Continued from page 626.)

CHAPTER XI.

Winter had come at last, sharp and savage from having been back so long, and biting at the noses and fingers ends of the Londers. He had been expected a long time, news having arrived that as on the way, and that he had stopped an unusual number of trains—steam being as nothing to this knight of the road. One t he fell upon the metropolis like a blanket. Bed-room windows laced over with frosty crystals in patterns richer than any Valenes, and water-jugs were filled with ice as clear as Wenham. The city once looked clean. The pavement was covered with the snow, ing the dust bright with the reflected light, and the cabs and carriages d by as on a feather bed. The trees were perfectly pie-bald, red on one side, just as if the harvest moon were shining, and on the nges before the houses were the marks of the sparrows' feet, the poor birds that remained looking like round black balls against the e snow. Many a prudent householder, who had laid in his tons of nth, rubbed his hands with joy at his foresight on finding that coals risen. The housemaid rushed into the parlour to tell how all the r-pipes are "frux," and the pump in the square is unpadlocked, s, with spades in their hands, knock at house after house, offering to away the snow from the door-step; and the streets echo with the ing noise. In vain does the careful housewife beg that her clean as may be spared, and the iron basket full of fire be used, for the re is as hard as bees-wax, and every one is merciless with cold. he huge flakes fell in clouds, settling on the hair and eyebrows, whiskers of the pedestrians, until they looked like powdered foot- out of livery. Old gentlemen, in warm comforters and fur coats, ir elbows bound round with list, walked carefully along, as if treading gouty toes. Many a time did they stop to shake their umbrellas he young red faced rascals that were sailing down the gutter, ite the backs the police-man had made in the slide. Clarke ir way "to office" ambled over the ground, their hands pocketed the steamy breath pouring from their puffed out cheeks, and their es bent forward to protect the face from the blinding storm. On wood pavement you could tell where the horses had fallen, by straw that had been thrown about. Let an old red-nosed lady, and snow-balls were hurled at her from unseen hands, leaving r huge white stars on her red shawl. Before the bakers' shops the t-shade that holds the fire to roast her apples. night many a rich gentleman, after he had stirred up the fire uriously as if he was trying to knock all the heat out of it, said, in r, as his fifth glass of port warmed up his blood, "What will become he poor?" "Ah! God help them!" his wife would answer, throwon more coals, as if the very size of their misery called for it; and he would both remain silent, watching the bright flame as it went ing up the chimney. Other gentlemen would wish the frost would time for many a week, that they might figure on the ice in their k tights, astonishing the ladies with their graceful figures of eight. here was one great sorrowful starving family that longed with all their hearts the warm summer sun. To them the winter had no joys. By the ing hearth, no doubt, they would have talked with wonder on its cities. Their limbs all wrapped up in warm clothing, the little ren would have clapped their hands, as the sugary flakes floated in the and the father's eye have sparkled as he gazed upon the endless fields whiteness hemmed in by the black leaden sky. But as their limbs ed with the cold, and their blood seemed frozen in their veins, they ver had such a time of suffering. They had changed their home long e; afraid lest their landlord might turn them into the streets when ter had sat in, they had sought out another abode. They were livin a garret—the cheapest they could find—compared with which ir old room was a princely dwelling. In some of the back streets of talfields there are cottage-looking buildings, with shelving roofs, that rly reach the ground—so tottering with age and decay, that, but for numberless props about them, they would fall with the first north d. The air around reeks with the stench of ill-cleansed pig-sties, mounds of filth that had rotted until they formed the very ground walk upon. In one of these Lamere had found a refuge. The house, h its five rooms, was a home to no fewer than twenty-three poor le.

t was a curious place to live in. At one end, the tiles of the roof nted down to the loose boards that were placed for a floor. The old n could stand upright only in the middle of the room, and even then ye was a chance of his hitting his head against the rafters. It was ngerous walking, for the boards would move under the foot, requiring utmost care to prevent a precipitate entrance into the drawing-room eath. Before they came, the place had served as a sort of dog fan- 's warehouse; and as the July sun shining on the roof made the room warm as an oven, the proprietor had cautiously removed several of the s. Pieces of old boarding now supplied their place; but the covering far from water-tight, and at night, as they lay in their beds, they ld often see the stars shining through the openings.

ne of those rooms which indulged in extremes. In summer was a vapour bath; in winter it was an ice-well. They could not p warm. The cold seemed to enter into their very bones, stiffening ring on the bricks that formed their fire-place, gave about as much t as a candle would have done, and the children made torpid by the st, sat huddled together in a corner, trying to borrow a little warmth m each other.

The furniture they had left only served to throw a mournful look r the chamber—the mattress rolled up in a corner, the deal plank ting on a few bricks to form a bench, the old table with one of the s found round with string, and the bit of broken looking-glass, fixed to three nails near the window.

The children sat crying the day long, their limbs blue with the frost, till at last they fell asleep. Without food or clothes to warm them y would creep under a few old sacks that the dog proprietor had left them, covering their very faces with them. When the little stock firing was used up, the old man hobbled forth with his basket, searching about for dry twigs or bits of broken wood—anything that would rn. He would follow a coal-waggon, picking up the pieces that jolted of the full sacks, or creep over with his crutch the heaps of rubbish ere a house had been pulled down, to hunt after any broken laths at had been thrown out.

Every day some sorrowful tale would reach them, rebuking them for eir murmurings, by proving that there were others in the world less ivoured than they. At one time the frozen body of a houseless wanrer had been found under the arches of the Blackwall Railway; at nother, a family of dead and dying had been discovered in a cellar at t. Giles'. This sort of news always circulates quickest in the winter, hen they had but their last house, they had prayed Heaven that ney might fall in to the hands of a kinder landlord than they untied. But their prayer had not been heard. The owner of the row f houses in which they lived was a small capitalist, who had come dered upon the punctual payment of his tenants. To show mercy to re in winter would be, he thought, to set a frightful example to the hers, so he had always made it a principle with him, to save the pound by not permitting certain rents prosecuting all defaulters with the most rigorous severity. With the poor the rent is the chief expenditure To gather it together, every effort is used—every privation endured. The ain of the executive hunts them day and night, and at the time when ouse-lords, starvation is ushered with patience, rather than the shilling or two which he wanting to keep the roof over their heads.

Two days the collector been set away without his money, and on the third week came "the master" himself. Like all landlords, his first act was to look round the room to see what kind of furniture there was. The survey he made seemed anything but satisfactory, mattresses just then being worth almost nothing. It was clear his tenant was a scoundrel of the worst kind—owed rent and had no effects worth seizing.

"Now then, I want four and sixpence, you sir," he said, seating himself on the edge of the ticksetty table. "Why do you make my clerk call so often for? Do you think he's too fall o' flesh, that he should waste it running up your stairs for nothing?"

"We may have work next week, sir," answered Lamere; "and then"——

The visitor interrupted him, crying with an oath, "Confound your thens? I'm for now, I is. Do you think butchers and bakers is to be humbugged with a then? Have you got the money?"

"No, sir, not now: next week—give me till next week," answered the debtor, trembling.

Without deigning a reply, the proprietor went to the window, and thrusting it open, called to some one in the court, and in a few moments a heavy pair of boots were heard ascending the stairs. When a rough-looking fellow, with a pimply face and a dingy pipe sticking out of his waistcoat pocket, had entered the room, the landlord said to him, "Bill, take stock, whilst I fetch the warrant," and let the room.

The man seated himself on the turned up mattress, and looking at Lamere, said with a slang nod of the head, "It's all up old 'un: draw two lines under your futur prospex, and write, settled. He'll break yer up as clean as sealing-wax."

As Lamere did not answer him, he continued, "My eye! aint you worth four and six? Here's a pretty bankrupt! Amount of debts four six; bad debts zero; by sale of furniture"—and he looked round as if valuing the property—"two bob; brought furrard; and deduct twos from fours is twos and carry sixpence. There's yer shed's!"

"Let him take all," growled the crippled weaver, in despair. "There's no chance of work—it's useless hoping. Give us until Monday, and he shall have the room. He wont turn us into the street to-night, will he?"

"Go and ax the fast floor, at No. 6," returned the man: "they'll tell. He never turns 'em out—oh no! gives 'em a week to provide themselves, he does."

In half an hour the landlord returned with a broker, and the poor family crouching in one corner of the room saw their wretched furniture, even down to the bit of glass, carried to the truck below. When the ceremony was finished, the master, turning to Lamere, ordered him to be off.

"Dont turn us into the streets to-night, sir!" prayed the debtor; "we should die in the streets. Give us until Monday morning—only till then."

"Not an hour! Be off you, and all the litter—be off!"

"Look at these children—it will be murder. Say till Monday, sir."

"Be off with you!"

"Give till to-morrow, then. What difference could a few hours make? Spare us till to-morrow—in charity spare us."

"By heaven, if you aint off in ten minutes," threatened the landlord, taking out his watch.

"Have you no heart, man?" cried Lamere, growing bold with rage. "I tell you it would be murder to trust us into the streets on such a day as this. Look at the snow, feel the sharp wind, and say if a night, such as this under such a sky would not be death?"

"Five minutes," muttered the landlord, without moving his eyes from the watch

"For mercy's sake," begged the father in an altered tone, "have charity. A few pence from your full pocket"—

"Who the deuce told you it was full?" snarled the man—"it aint such as you that fills it. Four minutes!"

"I won't stir to-night," roared the weaver: "I won't see these children grow stiff with killing frost. If you are ready for murder, I am not. I don't stir to-night."

"You won't; you dely me, do you? You won't."

"I said I won't."

"Very well—very well. Don't blame me then, if you're dead by to-morrow morning. You won't go?"

"No! if we are to die, we'll do it here."

The fellow with the pimply face touched his hat and looking at the master, asked, "The old dodge, I suppose, sir?—Undressing?"

"Yes!" was the answer; "don't leave a tile to keep the snow out; strip off everything like a shelter. I'll see whether sich as you is to defy the law of the land. To work, Bill."

It didn't take long to strip the roof. In a short time the rafters were as bare as the ribs of a skeleton. The snow falling through had already covered the boards with whiteness. The landlord opened his umbrella and stood under its shelter, giving his directions.

"Now for the winder, Bill—off with it!" he cried; and the casement was quickly unhinged.

"Take down the door; leave nuthin", was the order, and to work went the hammer until the rusty clasps were battered off.

"Off with the boards!" continued the proprietor, taking up some of them with his own hands as if to hurry the proceedings. "They'll go falling through and breakin' the ceiling under. First floor pays regular, sir, and might object to seeing feet shaken through," expostulated the servant, as if some touch of pity had entered his heart.

"If it cost a thousand pounds, it'll be done," answered the master, stamping his foot with rage. "For to go and defy the law of the land! What next? A precious Chartist lot! It is such muck as this as is undermining our constitution. Off with the floor! do ye hear?"

The boards were piled up one on another, until there remained only the half-dozen Lamere and the children were sitting on. The man was ordered to lift up even these, and shoot off the defaulting tenants like rubbish from a cart. The fellow knelt to the task and tried to raise them; but though he got very red in the face, he did not use much strength. "Might as well try to raise mustard and cress in a clean shirt," he said in a straining voice, and winking to Lamere. "Never felt such a heavy 'un as the old chap is in all my life. If he were fed on lead, he could not be weightier. Its no use, master."

"Try again; I'll help you—it must be done."

Bill had another strain, but with no further result than raising a cloud of dust as the board sprang back. "No go, sir," he said, wiping his forehead. "Better leave 'em; they're chock full of nails like a dog's collar. Might as well sleep on porkeypines—can knock a few more in if you likes."

"Well, that'll do. And now we'll see, you sir, who'll be tired of this game first. After this move, yours will soon follow, I'll be bound. A set of mutinous Chartists, that ought to be hung by the legs, if Parliament knew what was right. I only wish to God I was a legislator, that's all. If it keeps a snowing like this, you'll not want for sheets;" and followed by his man he stepped on the beams as if walking on a ladder, and left the room.

They had left a small space of boarding, about the size of the landing on a scaffolding. The snow fell upon them, at first melting with the warmth of the body, but at last, as the limbs chilled, forming a white mound over them. They did not attempt to shake it off—they could think of nothing but their misery.

But soon sharp pains of bitter coldness roused them from their apathy. Lamere rose up, and looking round to see what had best be done, took up a board or two, and placing them on the rafters, formed a rude shelter. The heavy flakes thickening on the wood made a sort of thatch.

Kitty had been out all the morning seeking for firing. The frost made her father's wounded leg ache so cruelly, that she had at last forced him to let that share of the labour fall to her. When she returned, the basket of fuel fell from her blue hands in horror at the sight. The tears flowed from her eyes as she listened to the old man telling the story of the brutal visit and she beat her bosom in anguish as he talked of the death that awaited them.

Once more she would beg—once more she would suffer as she had done that night. Oh! why would they not give her work? Why could she not earn her bread by honest labour? It shamed her to think that hands that itched for work should have to hold the begging cup. She must not think of what she did, but for whom she did it.

With the child in her arms, she was walking towards London-bridge, when some one touched her on the shoulder. It was a tall pale-faced girl, whose hair, cut quite short, hung like a fringe over her forehead. Kitty thought she knew the face; she remembered the pale blue eyes, but where she had seen her she could not call to mind.

"You forget me," smiled the girl. "It's my hair that alters me; I once had ringlets that curled to my waist." Yes, it was the fair-haired girl that used to work for Mrs. Lucas.

"Have you had a fever," asked Kitty, looking at the scanty locks.

"No; I've been well," she answered. Then bursting out laughing, she added, "I don't mind telling you. I sold my hair a month ago when I was starving."

"Sold it! Are there people that will buy hair?" and a look of hope lighted up her eyes.

"Buy it? yes. I got eighteen-pence for mine. I'd give five shillings to get it back again, though. I've got a place at last."

"I'm glad to hear it. Where does the man live that buys hair? Do tell me?"

The address was given, and Kitty, crossing the bridge, sought out one of the low streets that abound in Bermondsey.

At last she came to a small barber's shop. The door was sunk in the pavement, with stone steps leading down to it. There was no vain display of waxen busts of rosy gentlemen with coral lips, or fascinating ladies coquetting with a stuffed canary on the finger. A few horn combs and dusty pots of pomatum, piled round a crockery-ware bear, formed the whole stock in trade. In the upper panes were hung bunches of hair in cardboard handles, like Indian fly-whisps, arranged round a placard announcing that hair was bought and sold there.

She entered a small parlour, smalling of sawdust and hair-oil, and carried in a gentleman with curly locks, like a cloak collar, and a comb stuck on one side. He was closely examining the head of an Irishwoman, whose raven tresses were hanging over her shoulders, so long and glossy that Kitty stood wondering at their beauty.

The barber, at a glance, understood the girl's business, and pointing to a chair, told her to be seated. "And take off your bonnet and let it down, I've no time to spare." Then, turning to the Irishwoman, he said, "What do you want for this here stuff?" He sneered at it, as all knowing dealers do, to cheapen the goods he wanted.

"Stuff is it, darlint?" answered the woman, with nettled vanity; "it's drinking you've been, to call it stuff. Well, now I'll just ax four shillings for the stuff."

"Four shillings! Ha! ha!" chirruped the merchant, tossing the hair from him. "Do you think I'm a bell-smith, and short of wire? Go to an upholsterer's, and ax the price of horse-hair. Four shillings for this stuff!"

"Ay, black and shiny stuff, old scissars," returned the big-boned creature, who being short of money, couldn't afford to knock him down; "black and shiny I do ye hear?"

"So's a hearse-horse's tail, and less scurf.—Come, I'll give yer two. If boys' hair caps weren't the fashion, I couldn't afford to do it."

Now the honest, as the usual tricks of trade: the seller holding out, and buyer walking way with a don't-care look. Then the seller calling her back; and at last the buyer is gaining his point, and grumbling as if he were being robbed.

Taking hold of a huge lock of hair, the barber snapped his shears and cut it off. Then he would tie the end tightly with a piece of thread, and place it away in the drawer. When the man had finished "his reaping," as he called it, the woman rose from the chair, and ran to the glass to look at herself. Herein of her only beauty, her face seemed hideous and fiend-like. She was shocked, for the tears seemed to start into her eyes; but it was only for a moment, for, turning round, she cried "It's close as a footman's breeches you've cut it. By St. Patrick, it's lucky I'm married, or sorry a husband I should get. It's mighty chilly it is, too; and bad luck to the cold in the nose I shall have to-morrow. I ought to have got used to it before I had it cut off. Hang me, if I don't look like a charity-boy;" and putting on her bonnet, she rushed out at the door.

"Now then, come here," said the dealer to Kitty. When she was seated, he began the examination. He took up the brown silken tresses, rubbed them in his hands to test their softness. He was pleased, because the girl—thanks to the glass opposite—could see him smiling with delight. He must find fault though, he thought; so, as he examined the ends, he said, "the tips is split, they is, and there's so plaguy little of it. What's the price?"

"Would three shillings be too much, sir?" stammered Kitty.

"Whew!" whistled the man; "make it sovereigns, or you'll lose by it. Three shillings for red hair! Never heard of such a thing!" He took a foot rule, and measured the length; but he couldn't complain of that. "Give you a shilling," he said at last. "I might as well chuck it into the pool-ace; but I'll give you a shilling."

As she hesitated, being too timid to bargain well, he continued, "You ought to give it for nothin, you ought. To think that a countess might buy it, and your hair stuck all over with diamonds, go dancing about in the first of circles. By Jove, you ought to pay me for taking it, you ought!"

But Kitty didn't think so, and at length proposed eightcenpence as the sum, which the dealer, after much hesitation, consented to give.

Out came the scissars, making her tremble as they clicked together. "I shall want one lock, if you please, sir!" she sobbed out, as the thought of her father stole over her; "one little lock, anywhere that you can spare it."

The man grumbled again, and asked jeeringly, if she'd like it made into a bracelet with gold clasps; but it was a good bargain, and he promised her a little short piece.

Curl by curl fell off, and was tied up. It was useless her praying him to be quick and make haste; he wasn't going to hurry himself; and she was forced to endure the torture with patience. One thought consoled her: when she begged at night, there was less chance of any one recognising her.

The lock was wrapt up in paper, and placed in her bosom. The treasure that was to rescue them from the winter's cold was already begun.

Depressed by want of food and suffering from the sharp frost, that seemed to freeze the very breath on his lips, Lamere crouched over a few burning sticks. In the corner lay the children, wrapt up in a blanket he'd got by pawning overcoat. The bright winter's moon was shining in, making the icy crystals sparkle with her rays. The snow that still fell was blown into every corner of the room, and carried by the wind through the open window—now circling in whirlwinds, or rising in clouds from the dirt beams it covered. It was cold to the very verge of pain his stiffening limbs. He drew his old tattered coat over his breast, as if to shut in the little warmth that was yet left in his body; but the blood seemed to thicken in his veins.

His thoughts turned to the man who had fled from all this misery, leaving his children to the mercy of those whose wants were sufficient to drive all mercy from the bosom. He felt angry that Bradley was not there to share their sufferings, had escaped from the wintry pangs they endured; and, as his teeth chattered together, he could almost have cursed him for his cowardly flight.

The clocks around striking twelve, and Kitty not returned. Where was she? had she, too, fled from him? No, he would not think that. Misery had clung to her even in the streets, and chased the hearts of want away at her. Had she been successful, she would have hurried home to share her good fortune with them. Yes, there was a cruel fate hanging over him and his, killing them limb by limb, the slow torture of want was at work. It should have an easy victory: he was too sick at heart to fight against it any longer, it should rack his mind and body now, and not a groan escape him.

The hours stole on, and still his girl was absent. Now he knew the cause. He saw her—in his fancy—stretched beneath some gateway; her body covered with snow, the moon shining in her pale face, gasping in the agonies of death. He clasped his hands in horror at the picture he had conjured up, and tried to shake the fancy from him. But it clung to him, the moaning wind sounding in his ears like the groanings of his girl.

Suppose she was dead! What then? why should he weep and beat his bosom? It was well for those who lived in plenty to sorrow over the body of the loved. There the pleasures of the world has been left—all its countless joys—and happy home forfeited by death. The love that would have proved itself in gifts and luscious offerings has been disappointed of its fondling. Let them weep. But with him how different! He should clap his hands and shout for joy. As he loved her that had left him, he should rejoice that she had given the griping poverty the slip, and reached the land of peace at last. Now she would not miss the crust she had hungered for in vain. Now, sanctified by her patient suffering, could look down upon him, and hear him long for the hour that should restore a father to his child.

A fearful thought entered his brain. Why should he live? why should he remain behind, lingering out his lot of years, grouning out his share of time—when one pang, one moment's pain, would bless him with endless happiness? The morrow would bring the tortures he had suffered to-day, only finding him less ready for the struggle. He would give up his share of air—free the earth of his presence. They might call

him coward, scoff at his name, speak of him as one who fled from life's battle with the first wound that reached him; let them! the burial at cross roads had no horrors to him—he only saw it as the boundary where persecution ceased, and safety, peace, and comfort were ready to receive him.

He died not because he hated life, but because it was denied to him. He would lend destiny a helping hand, and seek for death when he was yet fit to die. He was walking in a rich garden, with luscious fruit hanging over him, that he was to hunger for but never reach—whose dazzling beauties pressed him to remain, whose temptations warned him to be gone. He had eyes like other men, to sparkle as he watched the tender crumpled leaves of spring uncurl before the warming sun; he had ears to listen to nature's music, tracing the lark by her song; his heart would swell in gratitude for the violet's perfume and the sweet luxury of rest: but the curse of never-ending misery hung over him, the pangs of hunger, that ruled the eye, the ear, the heart, had seized upon him, till the world with all its beauties had changed to the tyranny of a prison.

The moaning of the sleeping children turned his thoughts from himself. How would they fare in the world when he was gone? If he, a man, was unequal to the contest, how could their weak arms wrestle with misfortune? Say that pity, roused up by his wretched death, should for a time feed them with the bread of charity. The spasm caused by horror, the sympathy called forth by bleeding despair, would soon die away, and then how would they, poor things, bear the heavy load of misery. Before they had ceased to be children, they would shake off the simplicity of childhood. Hunger would teach them cunning in the shape of knowledge; sin would appear sanctified by bravery, brazen shame seem glorious as golden honesty. For a time, success, like a heavy mist, would hide the yawning gulf on whose brink they trod. Without the friend to warn from vice by raising up the hope of brighter days, how would they learn to bear the death-bed struggle? Death would come upon them, not as the comforting friend, the stayer of grief, the herald bringing tidings of the newly-opened kingdom; but as the punisher of wrongs, the harsh gaoler, whose prison bars no file could pierce, whose chains no desperate strength could snap.

They should die too, with the purity of youth still upon them Crime should be cheated of its victims! He would have company as he journeyed heavenwards.

From his coat pocket he drew an old rusty knife. Holding it in the moonlight, he felt the edge with his thumb. Use had rounded and notched the blade till it was useless, and the deed he had to do must be done quickly.

His body burnt with fever; his brain was on fire with excitement; the winter's cold gnawed at his limbs no more than if his bones were cased in stone. Going to the window he cleared with his trembling hand the snow that covered the stone coping, and bending forward, began to whet the blade, with his long grey hair floating in the wind, his straining eyes fixed on the steel that glittered in the moonbeams; his body half leaning from the casement, he looked like some warlock preparing the midnight charm. Never did headsman sharpen axe as he did that knife. Panting for breath, he pressed both hands upon the iron till the sparks flew out, and it grew burning hot with the friction.

At length the time had come. His eyes shone as he felt the keen edge that was to do the deed so well; and grasping the handle firmly, he crept up to the children.

He put his head close down to listen to their breathings till the warm breath touched his cheek. They slept soundly, locked in each others arms—brother clinging to brother, as if in fear. Kneeling by their side, he gazed upon their pinched faces, and watched the heavings of their bony chests. The sight unmanned him; he rose for fear his resolution should give way, and snatching up a handful of crisp snow held it to his forehead.

Once more he was prepared—firm as iron, no smile should turn the knife aside this time! He listened for a moment to see if all was silent, and again crouched to his work. He would take one hasty look—one short farewell, and then strike hard, deep, and surely. They should die as if still in their dreams.

One of the little things whispered out his name, the other restless in its sleep, threw out its little arm as if trying to ward off his blow. He must be quick, or the tears would blind him. Twice did he raise the murderous weapon, and twice he drew it back. The remembrance of home had stolen in upon him, softening the muscles of his arm, and holding back his hand with angel strength. Up rose the pictures of his youth, quick and fresh into his mind. The parent prayer for safety, the mother's "Good night" rang in his ears. He saw the anxious face creep silently into the room, to pay the midnight visit, shading the taper with her hand, for fear its rays should wake her slumbering little one. He saw her bending over the cot, to take the unknown kiss, then cast the anxious eye around to see that all was well. It was his mother, rebuking him by the remembrance of her love for raising his hand against the motherless.

He flung the knife from him, and with bending knees sank to the ground weeping with anguish. His clasped hands shook with the trembling of repentance. As he prayed, the words now whispered forth, now bursting loudly from his lips, as the sorrow came bursting from his heart, the little ones started from their sleep, clinging to his neck.

He threw his arms around them, clasping them tightly to his bosom. "My God!" he cried, "teach me to forget the morrow, that I may patiently endure to-day."

When the red, heatless sun rose, its rays fell upon the pale figure of the weaver watching by the bed of those whose lives, a few hours since his soul had hungered for.

CHAPTER XII.

CONCLUSION.

It is a bad time for begging when the snow is on the ground. The frost is too sharp for charity then; it hardens all the sap of kindness, making one think too much of self to listen to the tale of misery. To take the hands from the warm pockets into the biting cold, is enough to keep back the penny. Now and then a comfortable face, peeping over the blinds of the fire-lit parlour, may wince a bit as it looks at the chilblained feet of the wretched lad shuffling along through the snow, hugging his rags to shield his trembling limbs. But it is only a wince; the weather is too bitter to open the window; and the heart, conscious of its sluggard charity, will find a thousand excuses to bring back ease again. There are a few genial souls who will brave the chilly draft that rushes from the street into the well-heated passage. With them, the starving hours of winter, the blue frozen flesh, and chattering jaws are stimulants to pity, and, kept warm by kindly impulses, they will risk the sharp air, to carry to the wretched the food or thick clothing hoarded up with bounteous foresight.

Though scarcely four o'clock, the lamps in the streets were lighted, melting from their iron roofs the snow that had fallen there during the day. The pavements were so slippery with the constant treading that the wayfarers had deserted them, taking to the road. Everybody was running along silently, their eyes fixed on the ground, some of them showing by their coats that they had encountered many a tumble. The omnibuses and cabs crowded past, the drivers leading their trembling horses, whose hoofs slipped from them as if they were kicking. The butchers' and fishmongers' shops looked strange with their fronts closed in by glass windows, and the potato sheds had heaps of coal piled up to the ceiling, sparkling in the gas jet.

The thin, well-worn shawl that Kitty wrapped round her was of little use in the night wind. The cold seemed to soak through it to her shoulders. There was plenty of exercise, that was one good thing; for if she wished to speak to any one, she had to trot roundly to keep by his side. It was strange she did not feel so cowed as she had done the last time she begged. She gained courage from thinking, that, altered as the loss of her hair had made her, even her friends would not know her again. She felt no shame within herself, it was the world's harsh tongue she feared.

What cruel answers the people gave her. She would have obeyed a kindly one as quickly. After trotting after one old gentleman—who whistled out his breath, the half-pence in his pocket rattling with each jolt he took—until she panted with exertion, he only stopped to look around for the police, wondering what they were after, and why they didn't keep the streets clear of such pests. Another little dapper man, who skipped along like a cricket, crossed to the other side of the street directly she spoke to him. One fellow, nearly covered with rich fur, no sooner found her following him, than he thrust both his hands into his coat pockets, as if he thought she was seeking to rob him. That cut her to the heart, and she left him directly.

"Spare me one halfpenny, kind sir; indeed I want it sorely," she would mutter out. But either they didn't believe her, or took her for a street imposter. One party that she met were laughing and talking as they walked quickly along, dressed so sprutely, and looking so happy that she hurried after them. They were talking of the theatre they were bound for, discussing the merits of the pieces and the powers of the actors. Just as she was close at their heels, the baby awoke from its sleep and began crying. One of the gentlemen looking back, no sooner found it was a beggar woman, than he must have some fun

"Fond of music, Bill?" he said to his companion. "Nice walking with a band, isn't it?" There was a general tittering, and the gentleman continued, "Give it another pinch, and let's have a bit from Herz."

"'Adone, Edward, or I'll slap you," simpered one of the young ladies.

"Just take the child's mouth out of my ear," continued the wag.

"One halfpenny, kind sir—one halfpenny! I am hungry and tired," begged Kitty, still following.

"Give the poor thing one, Edward," added the young lady; "never mind the play-bill, we must change for oranges."

The copper was tossed backward over the shoulder, and fell in the snow. She was soon on her knees, looking after the treasure. She scooped away the flakes with her hand; but the mound was deep, and by the dim light of the gas-lamp she could not find it. For half an hour she turned the heap over and over again, but in vain: the only charity that had been shown was lost. Her finger-ends were aching with the cold till she could have cried, and it was useless wasting further time with running about so much. The hunger that had tormented her all day grew to be intolerable. Her limbs were weak with fatigue and want of food, and smarted with the frost. She groaned with sorrow to think that she would be forced to change her little store. It must be done; for, should she sink, what would become of them?

In the next street she remembered to have seen a baker's shop. She would go and stand a time on the pavement over the oven and get warm; perhaps, too, the smell of the bread might quiet her stomach.

Never was such temptation placed before a starving girl. Scarcely had she run her eyes over the tall glasses filled with biscuits of all shapes and sizes, like the bits of a Chinese puzzle, than a man placed in the window a pile of newly-baked bread, smoking with the heat of the fire. She watched the steam rising from their white sides till they seemed to draw the very eyes from her head with their enticing powers. It was in vain that she turned aside and looked through the panes at the snug parlour at the back of the shop, the bright fire shining over the white linen curtains her head would in the end steal back again to the brown crisp loaves, the savoury newly-baked bread.

She was untying the knot in her shawl that held her little fortune, while a gentleman entered the shop, stamping on the floor. Out came the landlady rubbing her hands, half vexed to be forced to leave her warm fire even for a customer. "I will wait a little bit," thought Kitty, "perhaps by that time the hunger will pass off, and I shall save my money."

Peeping through the glass, she passed her time watching the customer. He was a rare extravagant fellow, eating as if he cared no more for money than if he were a bank director. How he bit at the three-cornered tarts, biting out half circles big enough for hen-holes. The flakey pasty fell all about him with most shameful waste. She would have been content to feast off the crumbs of this Dives. The jam, too, stuck to his lips, making him smack them with enjoyment, till hers almost smacked too in sympathy. Another tart! and that made three, and yet he didn't eat slower, as if growing satisfied.

Once his eyes met hers beaming through the frosty panes, and instead of being confused at finding he was watched, he stared at her so hard that she was obliged to fall back a little. But as she saw him take up still another dainty, she was forced to have another peep at the glutton. She almost began to tremble lest he should eat himself into an apoplexy, and fall to the ground a martyr to three-cornered puffs.

At last he was satisfied, and, drawing a deep sigh, brushed the crumbs from his coat. Again their eyes met, and he seemed so struck by her greedy, prying look, that he fairly laughed. He was a kind-hearted fellow, though; and if he smiled, it was not from any bad feeling, for he went to the door and beckoned Kitty in. "What will you have, little girl," he asked her.

"Some new baked bread, thank you, sir."

"Wouldn't you like tarts better? They are very nice." And he smacked his lips with the air of an authority.

"Some bread first, please sir?"

She had a large piece given her—so hot that she could not hold it long, and had to shift it from hand to hand. How good it was—so comforting and so nourishing! It would put more strength and hope into her body. It was useless his asking her any questions; she could not answer him, if her life depended on it. With the bread held fast in her two hands, she could look at him, and that was just all.

"Now, then, run a-tart," he laughed out, when the last piece of bread had disappeared. "Here, put the child down; it does one good to look at you;" and he handed her a tart in the plate, as if she were a lady. As he looked on at her, his eyes bright with pleasure, he actually took the baby on his knee and nursed it.

She never tasted anything like that tart. No wonder he had eaten six of them. It was strawberry, the jam she liked above all others. The thin sweet crust, too, that broke in pieces directly she touched it. How she longed to save a piece for the poor little ones at home.

"You were very hungry, my poor girl" he said, with a look of pity.

"With many thanks to you, sir," she answered, blushing at the confession, "it is the first bread I have eaten since yesterday morning. The little food I begged the child has eaten."

"Are you so poor, then?"

"God knows we are, sir! I am now richer than any of our family, for I am no longer hungry."

"Poor thing! poor thing!" he muttered, throwing down a piece of money on the counter. Kitty had risen to depart, but he told her to stay a little.

When the change had been given to him, he placed it in her hand. Eight silver pieces clinked as they fell into her palm.

Her eyes opened with astonishment. Was it for her, all that money—was it for her, or was it done to mock her?

"That will make you more comfortable! You are welcome to it."

At first she stared in his face half stupified by his bounty. But soon the full tears came bubbling up, and a wild gratitude seized upon her. Her knees tottered as she tried to curtsey, and her wish, and the sobs burst forth she fell at his feet, hiding her face in her hands. She could not speak the blessings the heart dictated, her joy choked its utterance.

She left the shop with so light a heart that she could scarcely bear to think of the time it must take before she could lay her fortune in her father's hands. She ran along so fast, that before she had well reached the next street she had to lean against the wall to recover her breath. A tall fellow in an old velveteen coat closely buttoned up, and his chin nearly hidden in a dirty red comforter, came up to her.

"You had a good hand, young 'un," he said, in a voice half smothered by the folds of his neck tie; "how much did the cove give you?"

She felt so frightened she could not answer him.

"Come, no lies; I saw him through the glass," he continued, looking up and down the street. "What are you going to stand?"

"Let me go, and I will give you a shilling," and the witless girl took up the corner of the shawl that served her as a purse.

Without answering, he pushed violently against her, and then taking to his heels, ran off with all his speed. The shawl had been cut with a sharp knife—her gift was gone.

It was useless her wringing her hands and stamping with her feet upon the ground; the ruffian was far off—the treasure was stolen. The silver pieces that were to have showered plenty on the starving parent were doomed for the beer-shop.

Why had the money been given; she could have borne denial easily; but to be made rich only to have her riches snatched from her, was a double loss, making her poorer than ever. The hair that she had sacrificed, the woman's vanity that she had conquered—all lost, lost, lost.

Now she must put up with insult, cutting words, anything: for the loss must be made good again. She would not be shaken off by an answer, she would become importunate, bold with desperation. They should be forced to charity.

The first one she met she ran up to. "Give me money," she said, more as if commanding than seeking for alms.

The gentleman laughed sneeringly and walked on. But she rushed before him, crying, "You must; you shall; we shall die." He laughed again, and forced her on one side with his stick; but she sprang forward in a moment, and again stopped him.

"Here—police! police!" he shouted.

Terrified at the cry, she shuffled off. It was a useless contest that would add disgrace to despair, and the thought calmed her as it brought back her reason. How many times she flew up and down that road, she could not tell. She felt no fatigue, knew not the miles she walked: she could only remember that she was poor, past hope, wronged beyond all retribution.

Time began to wear off the excitement of her body; the reaction came, taxing her remaining strength to the utmost. Her legs bent under her as she crept along; the cold began to pierce her thin clothing. The hours, too, were wearing on, the streets began to empty, and the clatter of the closing shops was heard on all sides.

What should, what could she do? Return home? No! no! She could scarcely bear her own misery, much less that of others more dear to her than she to herself. She would beg on—still try if chance would mend.

Her teeth chattered with the cold; the skin seemed tight on her limbs, pressing in the flesh like any torture. Her very breath seemed to freeze as it left her lips

Resting every now and then, she crawled slowly over the ground. She had not even the strength to call to the passers-by: she let them go their way, following them with a bitter look. She only beat her hands to try to bring back the warm blood to them, for she could scarcely feel the child she held in her arms—they were so dead to the touch.

At last, fairly spent with weariness, she reached one of the West-end squares. Not a sound was to be heard; it was silent as the grave, and here she vowed to rest for the night. Before one of the doors she saw a portico a light was burning within, giving it a look of comfort that drew her towards its shelter.

The stones were cold as ice, but there was no snow to cling about her, and cover her with its freezing touch. She would couch down in one corner, away from the wind, and sleep on the night dis away.

She sat silent and motionless as an Indian. If she moved a limb the pain was terrible, she was so stiff with frost. When quiet she could bear the aching numbness without complaining.

The only fear that harassed her was, lest she should be driven from her covering. She listened anxiously at every distant footstep, gladdening as it died away in the distance. The policeman's tramp caused as he trod along the clean-swept pavement, making her hold her breath in extreme trembling.

Twice he passed by the door of her chamber, and she could have shrieked with alarm. He would be sure to turn her out, to endure again the torments that were now leaving her.

How were they faring at home? They had no roof there; the snow fell in upon them; the wind swept over them. Oh! she was always more fortunate than they; it was unjust to let them suffer more than she did.

A weariness fell upon her, and her eyelids would droop in sleep: she knew that to slumber was to die, and would rouse herself from time to time, even though to move her head was pain, for the hair was stiffened with ice. But she could not resist the lassitude that weighed her down: her eyes would close of themselves; her head would sink upon her bosom, despite all her efforts. Her very brain seemed asleep.

To sleep was to die—to sleep for ever! Well, it was a kindly death—far easier than the end starvation dealt out. How softly the feeling crept over her whole frame. There was no winter's snow now to crouch at—no icy wind to weep round her shivering body. She felt peaceful and happy, as though the morrow were to be some great holiday, and friends were waiting to receive and welcome her to her home. Farewell the world! farewell to all she loved! She would rest awhile before she set out upon her long journey!

* * *

Midnight had scarcely passed when a carriage stopped before the portico where lay the dying girl. The windows were white with the breath that had collected on them; and the footman crept slowly from the box, and, blowing his fingers, mounted the stone steps. In the corner, against the door, was the body of a woman, her knees drawn up closely against her chest, and her crushed bonnet resting on them.

"Get up, you there!" cried the man; and, as there was no answer, he shook her by the arm, and then by the leg. The whole body, stiffened by frost, rocked as it sat with each push he gave.

The man's face turned pale, and he ran to the carriage. "I'm afraid, sir," he stammered out, "there's a woman and her child been and killed herself."

"Good God! What do you say? Let me out!" cried a voice suddenly roused from sleep "Where? where? Let me out!"

He sprang from the carriage, and when he had reached the door-steps knelt down to examine the body, the hands were cold—the heart had ceased to beat. He forced up the eyelid, and peered into the glazed ball between his fingers. The pupil contracted as he squeezed it—life still remained. The child was dead.

The knocker thundered at the door without ceasing. As soon as it was opened, he lifted the senseless body in his arms, and rushed into the passage. There was a fire in the parlour, burning briskly, and before it he placed the poor girl.

A lady and her two daughters entered hurriedly, their faces pale with fear. With their rich ball dresses still upon them, they knelt on the rug, gazing with pity on the blue frozen face; and urged by their father's voice, they were soon at work, chafing with their heated palms the icy hands and feet of the sufferer.

Hot water was quickly ready, and brandy was forced down the firmly closed mouth. Each one sought to do their utmost—pity urging them on, despite the tatters of the victim. The housemaid, urged on by curiosity, would peep round the door-post, to try to catch a glimpse of the "poor frose-out creature." The parts that rubbed were often weary, the stooping back ached again; but the labour never ceased; the good heart was not tired, and forced the sinews to obey.

At length the girl opened her eyes for a moment, and the lip quivered as life came slowly back. The faces around grew red with joy as the flush of success rose to their cheeks.

"Thank Heaven we left so soon!" said the youngest of the girls, the one that at the time had grumbled most.

Before an hour had passed, Kitty, weakened by her sufferings, sat in an easy chair, propped up by pillows, the fire shining full upon her. She would look at one face after another in mute astonishment; her dull, heavy stare being answered by the heartfelt joy that beamed from every countenance.

No questions were asked that night, no cruel tale demanded, to weaken by the remembrance of her sufferings the girl just rescued from death. She was carried to a room so richly furnished, that Kitty's eyes opened with wonder as she stared round the place.

Early in the morning she was awake. She felt weak and ill; and as the remembrance of the over night crept over her, she raised herself on her arm to gaze upon the chamber. The rich carpet, that she almost feared to walk upon, the costly curtains so thick and full of colours, the large mirrors reflecting the whole body, all filled her with wonder. She could guess at the sequel of her miserable story, and her eyes filled with the tears of gratitude towards her deliverers. So rich and yet so kind; then riches did not always harden the heart, but it could help and succour the sinking poor.

"God grant they may never know the misery I have suffered," she prayed, as she lay in the soft white bed.

One thought alone haunted her: what had become of the child? Was it safe, or it had it sunk under the bitterness of that terrible night? Her father, too—how had he braved the snow and frost? She could not cease to pray until she had learnt their fate.

It was late before any one entered her room. The first to come was the young girl who had given up her bed, so that her poor aching limbs might be softer. She drew the curtains aside to gaze upon the senseless one. Their eyes met, and in the one might be seen the gratitude sparkling, that, lacking words, found its way out in looks; in the other, the pleasure that attends on good deeds.

"Lie still," she said, in a soft sick-bed voice; "you must not move; your friend shall be sent for, if you have any," she added, in a kindly tone, fearing to pain by raising up the orphan's remembrance.

When the good family had gathered round her bed, Kitty told them her story, truthfully as it had happened. As she spoke, the recollection of her suffering would bring the tears to her eyes, choking her utterance. She blamed none, hurled no cruel invectives at those who had persecuted them, but rather sought to excuse those whose conduct had been harsh, as she would wish others to think lightly of her faults. She told them of their struggligs to live honestly, confessed to them how

e had begged for alms—how, in despair, she had sold her
r hair for bread, and how death had at last seized upon
, as, crouching at their door-step, she was waiting for
e light that would help her to renew her efforts.
"You are a good girl," said the old gentleman, when, as
e finished her tale, she buried her blushing face in the
flow. "Why should you feel shame for the very acts
at ennoble you? There is a glory in patient suffering
at sanctifies the sufferer. You have spoken the truth,
usting us without fear; and, in return, we will try to
ish the good work we have begun, by making the future
re life like than the past has been."
When three weeks had passed, the weaver's family
re safely housed in an old mansion, to live there till a
nant could be found. They spent the day in a long room
at looked splendid with its gilt cornices and painted
iling, grand enough for any duke. At night they slept
richly-papered chambers, with tall, large-paned windows,
d countless cupboards and doors around to lead into
aller apartments, as if each person needed his or her cham-
rs. Of an afternoon, they would wander over the huge
ilding, seeking out the unvisited places; or roam about
e drawingrooms, looking with curious eyes upon the black
ctures of armed men that hung against the wall. They
uld wonder what their names could be, and what were
e gallant deeds of arms they had performed, until at night
ch one would dream of the steel clad gentlemen.
On Christmas-day they feasted like princes of the land;
ey had plenty of company to share their cheer; Joe and
a sister—a tall bony girl of forty, who wore her back hair
a knot the size of an egg, placed on the crown of her head
being among the number. The piece of beef made the
ble wobble furiously as it was placed upon it; and the
um pudding, spotted like a carriage dog, with its huge
ums, was brought in alight, brandy being bought at the
arest public-house for the express purpose. They had
me rare games of fun, too, in the empty drawingroom,
here there was plenty of room to chase everybody, es-
cially Tom's sister, who was set upon by each blind-buff's rear
a way that showed there was cheating.
At night, when the party broke up, there was a huge slice of pudding
r each one to take with them—for the children it was said; but as
e bachelors and spinsters didn't leave their parcels behind for all that.
In the spring there came a letter with a large sum to pay in postage.
was stamped with red in a good many places, and couldn't have
oked more like a foreign letter if it had worn mustachios.
It was from Tom Bradley; and each one was so anxious to peruse it
rst, that at last it was determined that Kitty should read it aloud.
"He wouldn't write before," he said, "because he wished to wait until
he good news he sent should be, as it were, an excuse for his de-
arting them. He had fared well earned money until his pockets
ere filled, and now he prayed them to join him in his prosperity,
nd accept his home as frankly as he had entered theirs."
At some parts of the letter Kitty stopped suddenly, and read them
herself. She told them it was nothing; but it was strange she
hould blush so much if it were nothing.
"God's will be done!" said Lamere, when, the letter ended, his
aughter looked anxiously into his face. "We will carry
ith us the feelings that alone make the home—the love
e bear to each other."
By this time, if matters have turned out rightly, there
ust rather a numerous family of the Bradleys to be found in
ustralia. Old Grandpapa Lamere has enough to do to
omp with all the sturdy little ones. They pull him
bout sadly, clinging to his coat tails, and never letting
im have a moment's peace. He taught countless parrots
ow to talk; and if, in an unlucky moment, one of the
apegrace urchins should get into trouble, he knows full
ell to whom to fly for help and excuses.

(*Concluded.*)

"THE PASSIONATE SHEPHERD TO HIS LOVE."—"BOOK OF ENGLISH SONGS."

ILLUSTRATED LITERATURE.

THE NATIONAL ILLUSTRATED LIBRARY. 196, Strand.

ix volumes of this already popular series are now before the pub-
c, and well represent the novelty as well as variety upon which
he projectors rest their claims upon the reading public.

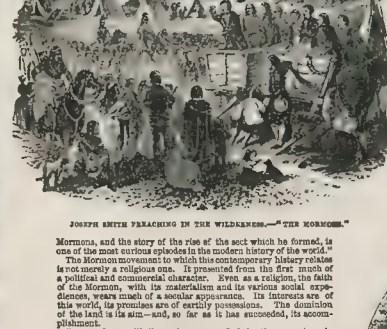
"MY SWEET SWEETING."—"BOOK OF ENGLISH SONGS."

Already have appeared two volumes of *Roscoll's Life of Johnson*, and *Newcastle Durrett City*, followed by the *Book of English Songs from the Sixteenth to the Nineteenth Century*. This collection has been very tastefully made; the songs are classified, the name of the author and the date are prefixed to each song, so that the volume possesses a literary interest far beyond that of ordinary song books. Thus, we have "Songs of the Affections;" and, to borrow from one of Shakspeare's fools, songs pastoral and rural, convivial, novel, and satirical, sea, patriotic and military, sporting, mad, and miscellaneous. Next is the *Orbs of Heaven, or the Planetary and Stellar World*, by O. M. Mitchell, A.M., Director of the Cincinnatti Observatory, to the building of which he lectures.

The work is arranged in ten lectures, illustrating the great discoveries and theories of modern astronomy, in which, says the writer, one single object has engaged his attention—"the structure of the universe, so far as revealed by the mind of man." There is a valuable appendix, by Professor Olmsted, LL.D. The illustrations, fifty in number, comprise some very interesting portraits of great astronomers and discoverers. The volume last published is *The Mormons, or Latter-day Saints*; with memoirs of Joseph Smith, the "American Mahomet."

This is a work which must command serious attention in these days. A Mahomet has appeared and evanesced in the Occident, and bequeathed to the world new religion. The brief history of the system is contained in these words:—

"In the year 1825 there lived, in a small village in the United States of America, an obscure young man—of little or no education, of no fortune, and of but indifferent character. That obscure young man had meditated for five years before this time the establishment of a new religion. In 1830, being then in the twenty-fifth year of his age, he began to carry his design into effect. In the following year he became the head of a sect numbering five persons, among whom were included his father and three brothers. In the course of a few weeks, the number of his adherents increased to thirty. At the present time, the sect so established numbers 300,000 people; has its own Bible, and zealous missionaries to preach it in every part of the Christian world, and, besides this, inhabits and possesses a fertile and beautiful territory almost as large as England, and aspires to obtain admission, on equal terms, as a free State, into the great confederation of American Republics. The name of this young man was Joseph Smith—of his new Bible, "the Book of Mormon"—of his sect, the "Church of Jesus Christ of Latter-day Saints," or, in the parlance of those not members of it, the Mormons, or Mormonites; and of the state or territory of which they have taken possession, Utah, or Deseret, in New California. The Mormons have thriven amid oppression of the most cruel and pertinacious kind; they have conquered the most astonishing difficulties; they have triumphed over the most vindictive enemies, and over the most unrelenting persecution; and from the blood of their martyrs have sprung the courage, the zeal, and the success of their survivors. They can boast not only an admirable and complete organisation, but the possession of worldly wealth, influence, and power. Their progress within the last seven years has been rapid to a degree unparalleled in the history of any other sect of religionists. The remarkable career of Joseph Smith, the Prophet of th



JOSEPH SMITH PREACHING IN THE WILDERNESS."—"THE MORMONS."

Mormons, and the story of the rise of the sect which he formed, is one of the most curious episodes in the modern history of the world."

The Mormon movement to which this contemporary history relates is not merely a religious one. It presented from its first inception a political and commercial character. Even as a religion, the faith of the Mormon, with its materialism and its various social experiences, wears much of a secular appearance. Its interests are of this world, its promises are of earthly possessions. The dominion of the land is its aim—and, so far as it has succeeded, its accomplishment.

In accordance with these views, as we find in the present work, the Mormons, with their leaders, and the founders of the sect have ever shown themselves practical political economists. Their love of gain is one of the objections urged upon them with most appearance of proof by their controversial adversaries. Mr. Bowes, in his "Mormonism Exposed," charges them with promising all kinds of blessings upon those who give money to their apostles and go to America.

From the beginning, as we have said, it must be confessed that the whole affair bore the marks of a trading speculation. The whole family of the Smiths were adventurers; and, as it would appear, of the genuine American go-ahead school. There is, however, no sound reason why they should be individually distinguished by censure on that account. They were morally no worse than their neighbours; but, as the result has successfully shown, they were not only more speculative, but more intelligent.

Their aims were indeed higher than those of ordinary speculatists and traders. Their objects were, indeed, far-reaching, and their perseverance indomitable. On the "Book of Mormon," now numbering its readers by the millions, and its bel overs by the thousand, they placed a market value, and professed the means of maintaining its saleability. Like many other publishers of inferior articles, they became prodigious puffers of their literary ware; but they were wise in their choice of advertising, and succeeded. Their selected channel to publicity was peculiar, but effectual.

In the nature of the fraud perpetrated, we have a key to the character of the perpetrator. The impostors takes rank at one of the class of "pious frauds," and these generally imply enthusiasm in the agent. It would, accordingly, be primarily probable, as some of the statements in the excellent volume before us suggest, that Joseph Smith commenced life as a religious fanatic, and that there would be reason to distrust the accounts of his profligacy, at least to the extent charged by his enemies. But, as is remarked in the book before us, the politician is too apt, in the affairs of the world, to make little account of men of his order of mind.

"Yet have they been, at all times, the men of a crisis—the fomenters of revolutions—the authors of new dispensations. Pious frauds to such individuals are no more than legal fictions to the lawyer. They serve them in the place of axioms and postulates; they are assumptions which enable them to take the first step in the practical argument which they mean to maintain against the world. To them they are unquestionable data, and the more supernatural their character the more unquestionable do they become. Frequently there is some shadow of a fact, which serves as the original basis; this soon, however, becomes modified into fiction; and ultimately completed in a well-rounded myth.

"Whatever Joseph Smith may have been, the present race of Mormons are satisfied with him. They say—'There is our statement; there are the witnesses; there is the book.' Armed with these credentials, the apostles of the new belief have at last founded not only a Church, but a State.

"The longer the original imposture has remained before the world, the more difficult it has become to overthrow it. Joseph Smith was slain, and thus acquired sanctity in the eyes of his followers. Other 'witnesses' drop off, and the myth becomes more and more mythological. Thus, we learn from an obituary in the *Millennial Star* (July 1st, 1850), that one of the 'three witnesses' has lately died. 'Elder Walker informs us, that Oliver Cowdery died last February, of consumption. Brother Cowdery is one of the THREE WITNESSES to the Book of Mormon. For rebellious conduct he was expelled from the Church some years since. Although he has stood aloof from the Church for several years, he never in a single instance cast the least doubt on the truth of his former testimony. Some time in 1847 or 1848, he sought to be re-admitted to the fellowship of the Saints. His return to the fold was hailed with great joy by the saints, who still remembered him with a kindly recollection as one who had suffered much in the first rise of Church. He has now gone the way of all the earth. May he rest in peace, to come forth in the morning of the first resurrection until eternal life, is the earnest desire of all Saints.'

"A similar record will shortly, in the natural course of things, be made of the other witnesses; the seal of the grave will be set upon their testimony; and thus Mormonism—even if Sidney Rigdon should divulge his secrets—will, to the hearts of thousands, who would believe it on far less evidence—stands as firm as Buddhism stands, or Mahomedanism, or any other false creed, which millions believe to be true."

The detail of the extraordinary history of the rise and spread of Mormonism we must leave to the reader of the admirable work that affords occasion for these remarks, but their success points much that is worthy of imitation by other communities apart from their religious system. They have, for instance, availed themselves where possible of the advantage of machinery, and in their new state of Deseret, or Utah, substituted manual labour by the inventions of science.

ENCAMPMENT OF MORMONS ON THE MISSOURI RIVER."—"THE MORMONS."

Nor have they neglected the arts; but, as we find from an article in the Millennial Star, the leading periodical of the sect, announce an intention, under the patronage of Mr. Owen Spencer, to "illustrate by paintings the history of the [Mormon] Church." They propose, also, to establish a museum. All, indeed, in their community are busy and active; and the results obtained are such as could not have been so readily accomplished by an appeal to reason as by one to fanaticism. There is much, however, in the vigour of the Mormon intellect that suggests to the candid mind the probability of his outgrowing this slavery and shame. We have frequently thought, while perusing Mormon controversial writings, now exceedingly numerous, that we perceived a broad grin nine times in ten on the weather-bronzed countenance of the Mormon advocate. Superior to, he seems to despise his opponents. We perceive this especially in his habit of recrimination. Always he affects to defend his own superstition by attacking that of his enemy, whom it is evermore his object to put on the defensive. One thing is clear, that, in the whole economy of life, he has already become a more rational being than he was. In one item of his creed, the Mormon at least has reason on his side. He believes that "God never meant that men and women, children, cattle, and unclean animals, should be cooped up, penned and hemmed in, and crowded upon one another, as they are in the numerous and increasing cities of the old world, in lanes, courts, closes, entries, cellars, and attics, amid filth and disease, most dire and awfully fatal." "He purposed" (continues the Mormon from whom we now quote) "that His children should be gathered together upon various places, according to His revelations, according to their necessities."

The evident aim of the Mormon is to gather men under a theocratic constitution wherever they settle, not to scatter them into unregulated hordes, acknowledging no shepherd. As a social and secular institution, Mormonism already plays a very noteworthy part, both in this country and in America.

"The West has had its prophet as well as the East; and whatever may have been the original character of the man, the sect which he founded has arrived at such a growth, that no arguments founded upon the fraud or absurdity of his pretensions will be of the slightest avail in preventing the development of Mormonism. The sect established in its own home—treats all adverse criticism with the same indifference as the Mahomedans or Buddhists show to all who impugn the truth of their religions. They pity the objectors—treat their arguments either as folly or blasphemy, and entrench themselves in the impregnable fortress of their own faith. If this were not the natural course of things, and

FORMATION OF A BRIDGE."—"THE MORMONS."

strictly in accordance with all experience, there would at this time be but one form of religion in the world."

To these remarks we have little to add. The volume is embellished with some forty illustrations of persons and places, the Mormon leaders, and the various *locales* touched at in their routes. We have several portraits of Joseph Smith, both friendly and adverse. That by M. Didier differs widely from those by F. Piercy and Gahagan. In like manner, readers of different persuasions will judge of a very different manner of the men who are the heroes of the eventful narrative which these portraits illustrate. The work cannot fail of being exhaustively successful.

FINANCIAL POSITION OF THE CONTINENTAL STATES.

THE people of Europe are now beginning—in many parts *only* beginning—to pay some little attention to the monetary concerns both of their own States and of their neighbours. And a most important subject it is, deeply affecting not only the condition of our pockets, but the destinies of nations; so true it is, that, whilst money constitutes the sinews of war, the absence or refusal of money must enforce the preservation of peace. In a social point of view, moreover, and in reference to the future relative positions of the nations of the Old World and the New, which one of these days must come to a trial of strength, resulting in a process of absorption, or at least in the assertion of supremacy and dependency between them—on the occurrence of such a trial as this, we say, the fiscal burthens and general involvement of the European States must tell fearfully to their disadvantage. At the present moment, when Europe is just recovering from a terrible struggle which has shaken many institutions to their bases, and, above all, when England is still discussing the provisions of her own Budget, it may be interesting to take a brief survey of the financial position of our Continental neighbours.

FRANCE.

The revenue of France is derived from a variety of sources, of which the duties upon landed property, and the registrations upon transfer of it, amount to a very considerable proportion—perhaps about 40 per cent. Though the taxation has been very high—amounting to from £40,000,000 to £60,000,000 sterling per annum—there has been for many years, almost without intermission, a deficit. In the year 1840 these arrears had accumulated to the amount of 256,000,000 francs (£10,000,000 sterling), and with no means of liquidation at hand to meet them. In 1842, however, a law was passed, which provided that all deficits in years subsequent to 1840 should be paid out of the accumulations of the sinking fund. The years 1840 to 1844, both inclusive, showed deficits which amounted in the aggregate to 306,000,000 francs. The year 1845 gave a trifling surplus of 4,250,000f.; the year 1846, a deficit of 62,500,000f.; and the year 1847, a deficit of 81,000,000f.—making, with the deficits for eight years (1840-47), of 444,000,000 francs, which was met in the way provided by the act above mentioned. Still, every succeeding year showed a deficit in the public accounts—indicating a weakness of resources on the part of the executive, which in a great measure accounted for the political convulsions which were about to ensue. The Budget of 1848 showed, in the first instance, an income from ordinary sources of 1,371,000,000f., and an expenditure of 1,446,000,000f. —probable deficit, 75,000,000f. Very early in the session, however, new charges were voted or foreseen, raising the expenditure to 1,610,000,000f. the probable revenue being reduced to 1,346,000,000f.; anticipated deficit, 264,000,000 francs. In February, 1848, the Revolution broke out, and dashed even these calculations to the ground. Nothing can be conceived of its kind more alarming—more hopelessly alarming—than the position to which the public accounts of France were now reduced, and the confusion which ensued. In the months May and June three successive Ministers endeavoured to face the difficulty, or at least to explain the real position of affairs to the country; but every new attempt seemed only to leave the case more inexplicable, more intractable than before. Extraordinary temporary imposts were adopted to meet the difficulty; but, on the other hand, the Assembly reduced the duty upon salt two-thirds, and totally abolished the tax upon drinkables from and after the 1st January, 1850. It is true, that, in the course of last year, the Finance Minister succeeded in obtaining some new taxes, trifling in amount; and the commerce of the country having in great measure recovered from the shocks of 1846-48, and the Customs improving with it, the Budget for the current year presents a more healthy appearance, so far as the mere balance of debtor and creditor goes, than any which has preceded it for a long time.

Still, however, there is this plain and stubborn fact before us that, with an amount of taxation annually increasing, there is still a deficit, more or less, at the close of every financial year. The estimated expenditure for the current year is 1,336,000,000—deficit, 44,000,000. Looking back some dozen years only, we find that the Budget of 1838 amounted to 1,065,000,000; showing an increase in the year 1850-51 of nearly 300,000,000—an excess of nearly one-third on the former amount.

The public Funded Debt of France may be reckoned at 6,000,000,000 (£240,000,000); whilst the Unfunded Debt (notwithstanding the contributions from the resources of the Sinking Fund) has grown to the extent of 575,000,000 francs (£23,000,000)

AUSTRIA.

In Austria the Sovereign has always had the sole and irresponsible control over both the income and expenditure of the country; and, as it has always been the practice to throw as much mystery as possible over the public accounts, it becomes a difficult matter to investigate them in their details. Some few facts, however, may be arrived at, which are by no means indicative of a healthy state of financial affairs. It may be proper to explain, that the dominions under the rule of the House of Hapsburg consisting of various nations of distinct origin and very dissimilar resources, so the income derived from them varies in nature and amount. A very considerable portion of the income of the state is that derived from Crown lands and mines, and from royalties and monopolies of trade; but the greatest part proceeds from taxes and rates, which, as already intimated, are not subject to any uniform system for the whole State. The taxes are direct and indirect Of the direct taxes, the most important in amount is that upon landed property, and it has always prevailed in all the States, except the military confines; but it is collected upon different scales in different parts, and the greatest confusion and uncertainty has been found to result in consequence. In 1817 it was attempted to prescribe a new system for the collection of the tax upon real property upon a uniform principle, having regard to the net profits; and the scales and tables necessary to carry it out have been for many years in course of formation.

A few instances will suffice to illustrate the perplexing confusion which prevails in the financial arrangements of the empire. The Venetian territory is subject to the tax, but slightly modified, which it paid at the period of the French invasion. In a great part of the Milanese territory exists the *catasto*, a tax founded upon a valuation of the last century. In Dalmatia the tithe which used formerly to be paid has been converted into a money rent. Tyrol continues to pay the taxes which were imposed by the Emperor Charles VI., which are levied upon lands, houses, industrial occupations, and incomes. The property tax in Hungary amounted, previously to 1847, to about 1,365,000 florins, and this was the only direct tax to which this portion of the empire was then subject as regarded the land revenue. Another branch of direct taxation is a poll-tax, or tax upon persons, which exists in the Italian provinces. Only a portion of the produce of this tax, however, comes to the Imperial treasury, the rest being received by the *communes*. The same description of tax exists in the provinces forming the military confines.

The gross revenue and expenditure of the Austrian Empire during the seven years 1841-47 ranged from 140,000,000 to 150,000,000 florins (£14,000,000 or £15,000,000 sterling), the general balance upon that period being in favour of the revenue to the extent in the aggregate of 38,731,367 florins. The year 1847 was one of deficit to the extent of 5,606,063 florins. The estimates for the year 1848 showed a revenue of 155,722,000 florins, and an expenditure of 155,805,000 florins, leaving a deficit of 83,000 florins. The events of the year 1848, however, completely altered the aspect of affairs. The taxes from Hungary and the Italian provinces, which together constituted above a third of the whole revenue, ceased to be paid from an early period of the year, whilst those from other parts of the empire came in but slowly

In the year ending October 31, 1848, there was a deficit of 64,000,000 florins; in the year 1849, a deficit of 140,000,000 florins, the expenditure having doubled (284,000,000 florins), while the income remained stationary. To meet these difficulties there was no alternative but to borrow money, and augment the public debt which already amounted to 1,200,000,000 florins (£120,000,000). As soon as the independence of Hungary was crushed by the aid of Russian arms, the Austrian Finance Minister set himself seriously to work to devise means for increasing the revenue and diminishing the expenditure of the Imperial Government. Amongst the former, as may be supposed, new taxes for Hungary form a prominent feature, the object being to subject that state (constitutionally held by the head of the House of Hapsburg as an independent kingdom) to the same fiscal burthens as Austria; a pretension most unjust and contrary to all precedent, Hungary, besides her contributions to the Imperial treasury, having always borne the expenses of her own local government. Of the result of these schemes we have no accurate information as yet. A consideration of the preceding facts will, however, lead to the conviction that the finances of the Austrian Empire are in a state of great, increasing, and alarming difficulty.

At the moment of correcting this article for press advices reach us from Vienna to the effect that the Minister of Finance has before him no less than three projects, on which he is undecided, for meeting the pecuniary exigencies of the Government. The first is to contract a new loan; the second is to sell Crown lands to the value of 400,000,000 florins (£40,000); and the third is to convert the already existing Five per Cents into new bonds, the dividends upon which shall be payable in silver, upon the holders giving 3000 florins of the old bonds, and 1000 florins cash, for every 4000 florins of the new. Upon the last-named projects comment would be superfluous, it speaks for itself.

PRUSSIA.

Up to the year 1847 the finances of Prussia were, upon the whole, in a satisfactory state; income and expenditure balanced, and the public debt decreasing. The Budget for the year in question exhibits an income and expenditure, equally balanced, of 64,038,697 thalers (£9,160,000). In 1848, also, there was an estimate of somewhat similar amount. The political events which commenced at an early period of that year, however, soon proved that these calculations would not be realised; and the Finance Minister addressed a memorial to the Assembly of the States on the 12th of July, in which he calculated upon a failure of revenue to the extent of 5,000,000 thalers in customs and taxes upon provisions, &c., whilst on the other hand there would be extraordinary charges, accruing out of the disturbed state of the times, of 22,500,000 thalers. The deficiency in revenue he proposed partially to retrieve by an increased duty upon sugar and some other articles; but there still appeared a deficiency of 29,000,000 thalers, 14,000,000 of which he met by drawing from the accumulations in the treasury and the bank, and 15,000,000 of which he proposed to raise by means of voluntary loans at 5 per cent., falling which by forced loans at 3½ per cent.

The Budget of 1849 showed an estimated expenditure, ordinary and extraordinary, of 93,000,000 thalers; and that for 1850, an expenditure of 96,000,000 thalers (£12,400,000), being an increase of 32,000,000, or 50 per cent. upon the estimates of 1847; and of this amount 90,000,000 is for regular or ordinary expenditure, so that there seems to be little hope of a reduction from this head for the future.

The State debt of Prussia amounted, on the 1st of January, 1813, to 206,733,171 thalers. By a Royal decree of the 17th January, 1820, the accounts of the Public Debt Department were to be balanced every ten years, starting from 1st Jan., 1813. In the course of the three decennial periods finishing on the 1st Jan., 1843, the amount of 67,872,084 thalers had been paid off the debt, leaving a balance of 138,861,087 thalers in the last-named year. Recent events, however, have had their effect in adding to the burthens of this, as well as of other States; and, accordingly, we find that the public debt of Prussia, which had been progressively diminishing for many years (being 126,000,000 thalers on the 1st January, 1846), became 137,000,000 (£24,000,000) on the 1st January, 1850, showing an increase of 61,000,000 thalers. The debt due on the 1st January, 1848, paid 3½ per cent., amounting to 39,885,887 thalers per annum. The subsequent debt has been incurred at interest of 5 per cent., and the whole interest of the debt, for the year 1849, amounted to 4,980,846 thalers.

HANOVER AND OTHER GERMAN STATES.

Hanover, in like manner, shows a considerable increase of expenditure within the last two years. In the year ending July, 1849, the Budget exhibited an expenditure of about 4,000,000 thalers, leaving a trifling surplus of income. For the year ending July 1, 1850, the estimates rose to 7,698,050 thalers; and, for the current year, there is a still further increase, namely, to 7,709,969, the revenue falling short of that amount by more than 300,000 thalers. The public debt of Hanover, January, 1850, was 32,333,340 thalers; the interest, 1,386 thalers

As for the other German states, they all exhibit a condition of finances utterly inconsistent with all ideas of national independence and progress. In Bavaria we have an expenditure of 37,835,159 florins, against an income of 37,835,159 florins. The Saxon State debt was 126,000,000 florins on the 1st October, 1847; and, since that period, three or four voluntary loans of 7,000,000 each have been added to it, making the total now 154,000,000 florins at least. Wurtemberg shows an income of 10,500,000, and an expenditure of 11,750,000 florins; deficit 1,500,000, or 12 per cent. In the little Duchy of Baden, in 1848-49, was an issue of paper to the amount of 2,000,000 florins, notwithstanding an estimated surplus then in hand of 2,500,000, and an excess of 4,000,000 on account of extraordinary events, upon an average expenditure of about 11,000,000. Recent events have still further aggravated the financial riot; but we have not the details as yet. The Duchy of Mecklenburg-Schwerin shows an income of 1,600,000 florins, and an ordinary expenditure of 4,000,000 added to an extraordinary expenditure of 3,000,000 more; total deficit, 7,000,000; public debt, 10,250,000 florins. Nassau shows an expenditure for the year of 5,700,000 florins, against an estimated income of 2,750,000; deficit, 1,250,000. Oldenburgh income, 848,000 thalers; expenditure, 1,048,000 thalers. Principality of Lubeck income, 126,000 thalers; expenditure, 174,600. Duchy of Birkenfeld income, 111,300 thalers; expenditure, 180,000. But it is scarcely worth while going into such petty details, except that it shows how the same spirit of improvidence prevails everywhere, from great to small. Amongst republics, the free town of Hamburg, with a debt of 32,000,000 marks, shows a small surplus of income over expenditure, the estimates for the year being about 6,000,000 marks. But Bremen has an expenditure of 1,000,000 thalers, and an income of 800,000 only. Frankfort has an expenditure of 1,800,000 florins against an income of 1,000,000; deficit, 800,000, in great part supplied from the sinking fund. debt, 6,922,081 florins

RUSSIA.

In Russia, where the Government is arbitrary and irresponsible in the highest degree, the condition of the finances has always been a State secret, jealously kept from the knowledge of the world at large. The consequence is, that great diversity of opinion exists, and has always existed, as to the actual extent of the monetary resources, and the general financial position of this empire. *Omne ignotum pro magnifico*, however, is a maxim of which the Russian autocrat has certainly enjoyed the advantage to a considerable extent amongst the money speculators of Europe. A certain ostentatious display of some millions of loose cash, four years ago, at the very moment when the money markets of the western states were in a depressed condition, gave colour to the vulgar rumour of the inexhaustible reserves of the precious metals lying idle in the coffers of the Czar. Subsequent loans, however, notably one of five millions sterling, through the Barings, ostensibly for the purpose of completing the railway to Moscow, but more probably for the liquidation of the expenses of the Hungarian expedition, and the issue (August, 1849) of five new series of Treasury bills of 3,000,000 roubles each (making in all nearly £2,500,000), avowedly for the latter object, have somewhat contradicted such Calculations. Upon the whole, we think we may conclude that the Emperor of Russia, with all his boasted wealth, has but enough for carrying on the ordinary machinery of internal government, with little or no surplus for the accomplishment of public works demanded by the advanced spirit of the age, as more or less exemplified throughout the rest of Europe

After the establishment of the European peace the general revenue of the Russian Empire (not including Poland) was estimated at 215,000,000 paper roubles, nearly one quarter of which was derived from domains of the Crown, and another quarter from regalian dues and from the producers of monopolies. Both the revenue and expenditure have considerably increased since that period, although we can only arrive approximately at the accounts. In 1831-32, according to Berghaus ("Annalen des Etats de L'Europe"), the revenues of the State amounted to 254,268,000 paper roubles—equivalent to 101,719,478 silver roubles; the expenditure being about 118,000,000 roubles (about £18,000,000), in addition the revenue of Poland was 11,500,000 roubles; the expense, 12,000,000 roubles. We have no more recent data to add, except in regard to one branch of the revenue, namely the customs duties of 1848, which, according to the *St. Petersburg Gazette*, amount, in round numbers, to 31,000,000 roubles (£5,000,000).

The public debt of Russia was stated by the Minister of Finance, at a sitting of the Council (16th August, 1850), to have been, on the 1st January, 1850, 336,219,492 roubles; to which should be added bills of credit to the amount of 300,000,000 roubles—making a total of 636,000,000 roubles, or about £106,000,000—not to go into the figures of further responsibilities under the form of assignats upon the Bank, &c., which circulate at a depreciated value. Against all this amount of debt, the only known reserves in the form of coin or bullion are those in the fortresses of St. Peter and St. Paul, at St. Petersburgh, which are said to amount (1st January, 1850) to 99,763,351 roubles (£16,000,000). Where, however, a system of paper currency is carried on in such a wholesale manner as it is in Russia, and more particularly when it so prevails in the absence of any responsible Government, or ostensible guarantees of adequate amount, doubt and misgiving must hang over commercial relations, repressive alike of healthful enterprise and social advancement.

DENMARK.

Denmark has had to pay dearly for the protracted struggle of 1848-50. The Budget for the year 1848 calculated upon a receipt of 16,709,285 rix-dollars (£1,850,000), and an expenditure of 16,686,502, including the provisions for the sinking fund, and interest of the State debt. In the above estimates the contributions of Holstein and Lauenburg are included. The Budget for 1849 exhibited a receipt of 11,032,990 rix-dollars, and an expenditure of 23,318,901, showing a deficit of upwards of 10,000,000 rix-dollars.

Exertions have, of course, been made by the Government of Denmark to bring the expenditure and income of the country more nearly to a balance; and, accordingly, we find that the Budget for the year ending the 1st April, 1851, calculates upon an expenditure of 22,871,150 rix-dollars, and an income somewhat larger: the important fact in which statement is, that the people of Denmark are now subjected to an amount of taxation about fifty per cent. greater than the estimates for the whole territory of Denmark, Holstein, &c., of three years ago.

The public debt of Denmark was 106,000,000 in 1847; it was 112,000,000 in February, 1850: and may now be estimated at considerably more—perhaps 130,000,000 (£14,444,000).

SWEDEN

Shows an income, from ordinary and extraordinary sources, of 10,500,000 crowns, against a regular expenditure of 12,000,000, and an extraordinary expenditure of nearly 3,000,000 more: deficit, somewhere about 4,500,000, or 45 per cent. upon income.

HOLLAND,

With a population of little more than 3,000,000, stoutly battles against a debt of £120,000,000 sterling, of which it pays the interest punctually. Total budget (balanced), about 70,000,000 florins (£5,820,000), or nearly £2 per head per annum. Some modifications in the taxation of this country have been recently announced, but they do not affect the general result.

BELGIUM

Has an income and expenditure of about £4,750,000 sterling, being at the rate of a little more than £1 per head per annum. Public debt, which experienced an increase of £1,500,000 in 1848, £9,000,000 sterling.

SPAIN

The estimates for the year 1850 show a slight surplus of income over expenditure, the round figures of the former being 1,147,000,000 reals; and actual experience more than supported the favourable views taken, at the opening of the financial year, of the reviving energies and growing resources of the country. Indeed, there is good reason to believe, that, under the benign influence of peace, the productive powers of the country may be so developed as to place Spain once more in the foremost rank amongst nations. In this we speak partly as regards her internal condition; her shameless disregard of public engagements must ever remain a damning spot upon her escutcheon, and exclude her from intercourse upon an honourable and equal footing with her more respectable neighbours.

PORTUGAL.

The finances of this country have, for years past, been in a most unsatisfactory state, the income showing a progressive decline, whilst the expenditure is on the increase. The income for the year ending the 1st July, 1849, was estimated at 10,480,000,000 reis (£2,600,000); the expenditure at 11,784,000,000 reis: deficit, 1,304,000,000 reis. To meet this deficiency a reduction of 3½ per cent., not only upon all salaries and pensions, but upon the interest of the public debt, was ordered to be made. The Budget for the year ending July 1, 1850, showed upon paper a surplus of 626,000,000 reis, and an expenditure of 11,757,000,000 reis: deficit, 2,131,000,000 reis. The Budget for the year 1850-51 shows a still further deficit:—Income, 10,269,000,000 reis; expenditure, 12,551,000,000 reis: deficit, 2,281,000,000 reis

The rapid growth of the public debt in the last twenty years of war and revolution is truly alarming, and in great part accounts for the financial difficulties which now press almost hopelessly upon this kingdom. In 1827 the debt amounted to 26,823,000,000 reis; whereas, in 1846, it amounted to 79,387,000,000 reis (£15,877,400), having been nearly trebled in eighteen years. With respect to what has been done since, we have no direct information; we can only judge by inference; and, looking at the fact, that the interest and charges of the debt in 1846 amounted to 2,875,000 reis; whereas, for the year 1850-51, they are put down at 3,550,000,000 reis, being an increase of full 25 per cent., we have reason to conclude that the debt itself must have increased to an amount somewhat equivalent within the same period.

The above estimates are only of the consolidated debt, and have no reference to a floating debt or claims amounting to 10,175,000,000 reis, referable partly to ancient debts, partly to forced loans raised by Don Miguel, and partly to arrears of various kinds.

SARDINIA.

Previously to the outbreak of the recent war, the financial position of this country may be stated generally as follows:—Revenue, 79,000,000 francs; expenditure, 77,500,000: the public debt was 145,000,000 francs

For the year 1847-48 the *Gazette Piedmontese* (24th June, 1848) announced an increased expenditure and diminished revenue, leaving a deficit of 31,000,000 francs, which the Finance Minister proposed to meet by an increase of taxation, and a loan of 12,000,000 francs, secured upon the property of the orders of St. Maurice and St. Lazarus

Of the financial proceedings of the succeeding year we have no accurate record. It appears, however, according to the statement of M. Nigra, the Finance Minister (23rd August, 1849), that the ordinary and extraordinary revenue of the year 1850 was expected to amount to 90,373,460 francs, whilst the ordinary expenditure was fixed at 110,400,000 francs: deficit, 19,426,540 The State debt at the same period, including the expenses of the war, 74,000,000 of railways, and 75,000,000 indemnity to Austria, amounted to 380,000,000 francs, being an increase of 235,000,000. Since the above date the financial affairs of this country must have become still further embarrassed

PAPAL STATES

In the Papal States financial affairs have for many years worn anything but an encouraging aspect. In 1846 the receipts were 9,639,189 scudi, and the expenses 10,099,525 scudi, leaving a deficit of 460,000 scudi, besides some arrears. The revolution, followed by an armed occupation by strangers, must have essentially aggravated these financial difficulties; but we have no authentic account of the state of his Holiness's finances, save the notification of an intention of converting a floating debt of 7,000,000 scudi into Treasury bonds, bearing five per cent., beginning at 80 for the 100; failing in which conversion, the State would resort to a forced loan.

PARMA.

The State debt in 1830 was 12,000,000 francs. On the 17th of December, 1847, the period of the death of Maria Louisa, this had been reduced to 3,840,000 francs; but, as there remained at the time 2,000,000 francs in the public treasury, the debt may be considered as having been then liquidated. The last accounts, under the new dynasty, show a small beginning of the deficit system.

Upon the foregoing statements we will add but one remark, which will almost suggest itself to every reader—that the greater number of the States of Europe appear, within the last few years, to have incurred a vast increase of debt and annual fiscal burthens for unproductive outlay, which nothing short of an extraordinary development of industrial energies will enable them to meet. That extraordinary exertions, by nations as well as by individuals, will generally prove successful in face of the most discouraging obstacles, the recent history of our own tax-laden, debt-burthened island will triumphantly prove. In 1815, according to Mr. M'Culloch, we (excluding Ireland) were taxed at the rate of £3 0s. 5d. per head of the population. In 1848 we paid little more than half that amount per head, viz. £2 11s. It will be found, then, grievous as the increasing burthens of the other nations of Europe are, they fall considerably short of our own. To speak in round numbers, Holland pays a little less than £2 per head; France £1 12s.; Belgium, £1; Austria (as near as can be calculated), 16s.; and Prussia, 15s. per head.

END OF VOLUME XVIII.
